# 12.0 OWS Building 1602

The following sections provide a description of the OWS at Building 1602, a summary of the site characterization activities, a discussion of the site-specific geology and hydrology, discussions of the analytical results from each characterization event, and recommendations based upon the physical and chemical data collected at the site

## 12.1 Site Description

The OWS at Building 1602 is located to the south of Building 1602 (Figure 12-1). The OWS was designed to treat wastewater containing fuels, engine oil, brake fluid, and other petroleum-related wastes from Building 1602 maintenance operations on aerospace ground equipment. The capacity of the concrete-style OWS is estimated to be about 500 gallons and is surrounded by asphalt pavement. The OWS is set with half of its structure above the ground and has two sets of baffles to separate solids and petroleum products from the wastewater before discharging to the sanitary sewer. The date of installation for the OWS is not known. The original Building 1602 OWS has been decommissioned for several years after construction of a new 20,000-gallon OWS was completed on a new segment of sanitary sewer line. The OWS at Building 1602 has served as a valve pit for a natural gas line since the baffles were removed and the unit was decontaminated. No records of the decommissioning of the unit, the removal of the baffles, or the quantity of wastes removed from the unit were located (IT, 1998).

## 12.2 Site Characterization Activities

A summary of the soil and groundwater samples that have been collected at the Building 1602 site is provided in Table 12-1. The analytical methods associated with each soil sample collected at Building 1602 are also presented in Table 12-1. The locations of the soil borings are shown in Figure 12-1. The following sections discuss the investigation activities that have been performed to characterize environmental impacts relating to the OWS at Building 1602.

### 12.2.1 Phase 1 RFI Activities – IT Corporation 1997

IT collected soil samples during the Phase 1 Sanitary Sewer System RFI in 1997 (Table 12-1) from borings SB160201 and SB160202, located adjacent to the east and west corners of the OWS units (Figure 12-1). Surface soil samples MS1413 and MS1415 were collected from surface to two feet bgs at borings SB160201 and SB160202, respectively.

- IT CORP. MONITORING WELL
- GW FLOW — GROUNDWATER FLOW DIRECTION
- SEWER LINE AND DIRECTIONAL FLOW
- FENCE
- RRS 2 SURVEY BOUNDARY
- PHASE 1 RESULTS > BACKGROUND
- PHASE 2 RESULTS
- PHASE 3 RESULTS
- ANALYTE DETECTED ABOVE MSC SPLP NOT PERFORMED
- ANALYTE DETECTED ABOVE MSC IN SOIL, BUT DETECTED BELOW MSC IN SPLP EXTRACT.

## NOTES:

CONCENTRATIONS REPORTED IN MG/KG UNLESS NOTED OTHERWISE.

MSC - MEDIA-SPECIFIC CONCENTRATION

REVISED MSC - VALUE BASED ON SPLP RESULT.

NV - NO VALUE

NA - NOT ANALYZED

B - FOR INORGANICS, THE QUANTITATION IS AN ESTIMATED CONCENTRATION BETWEEN THE MDL AND PQL. FOR ORGANICS, THE CONSTITUENT WAS ALSO DETECTED IN THE ASSOCIATED METHOD BLANK.

J - THE ANALYTE WAS POSITIVELY IDENTIFIED, THE QUANTITATION IS AN ESTIMATION

VOCs - Volatile Organic Compounds
SVOCs - Semivolatile Organic Compounds
PCBs - Polychlorinated Biphenols
As - Arsenic
Cr - Chromium

629 286

Subsurface soil samples MS1414 and MS1416 were collected at borings SB160201 and SB160202, respectively, from the 2-foot interval directly above the water table (14 to 16 feet bgs). Soil samples were analyzed for inorganics (EPA Method SW6010/7471), VOCs (EPA Method SW8260), SVOCs (EPA Method SW8270), and pesticides/PCBs (EPA Method 8080) (IT, 1998)

Monitoring well WITCTA011 was installed during the Phase 1 RFI in April 1997 immediately adjacent to boring SB160201 (Figure 12-1). The well was completed to a total depth of 23 feet bgs with a screen interval from 13 to 23 feet bgs. Well WITCTA011 was developed and groundwater sample MS1576 was collected from the well in April 1997. Sample MS1576 was analyzed for VOCs, SVOCs, and inorganics (IT, 1998).

### *12.2.2 Phase 2 RFI Activities – IT Corporation 2000*

Additional soil sampling was performed by IT during the Phase 2 RFI in April 2000 (Table 12-1). Soil boring SB160203 was advanced adjacent to the eastern corner of the southwestern OWS at Building 1602 (Figure 12-1). Sample BG0029 was collected from surface to 2 feet in depth from SB160203 and analyzed for chromium to confirm the detection from SB160202. Sample BG0030 was collected from 17 to 19 feet in depth from SB160203 and analyzed for arsenic to confirm the concentration detected from SB160201. An additional groundwater sample was taken during the Phase 2 RFI from WITCTA011 and analyzed for arsenic to confirm an arsenic detection from the Phase 1 RFI.

### *12.2.3 Phase 3 RFI Activities – IT Corporation 2000*

Additional sampling was performed during the Phase 3 RFI in November 2000 (Table 12-1) to delineate chromium concentrations in the surface soil and arsenic and chromium concentrations in subsurface soils. Four soil borings (SB160204 through SB160207) were advanced at locations around the perimeter of the OWS (Figure 12-1). Soil samples were collected such that the intervals of 5 feet above and below the previous sample depths with elevated concentrations were characterized. Soil samples were collected from surface to 2 feet and 6 to 8 feet bgs at SB160204 and SB160207. Soil samples were collected from surface to 2 feet, 6 to 8 feet, and 14 to 17 feet bgs at SB160205 and SB160206.

### 12.3 Site-Specific Conditions

The following subsections discuss the site-specific geology and hydrogeology characteristics that were encountered during the investigation activities at Building 1602 site.

***Geology.*** Quaternary alluvium is found at the surface through most of the NAS Fort Worth area. The alluvium consists of floodplain and fluvial terrace deposits of gravel, sand, silt, and clay that occur as a veneer on the eroded surface of Upper Cretaceous strata. Soil boring logs (Appendix A) on the north side of the OWS at Building 1602 indicate various mixtures of clay, silt, fine to coarse sand, and gravel, generally brown in color The boring logs from SB160201/02 indicated a very dark grey to brown/black at the surface to 6 feet bgs. From 6 to 15 feet bgs, the soils changed to a reddish-brown, then to grey. The content of the soils was mostly dense, clayey sand. Soils were saturated below 18.5 feet bgs. Organic vapors ranging from 15 to 40 ppm were detected in SB160201 at a depth of 12 to 16 feet bgs.

The alluvial soils rest unconformably on the top of the weathered Walnut Formation. Underlying the Quaternary alluvium is the Cretaceous-aged Walnut Formation, which consists of 20 to 30 feet of indurated fossiliferous limestone interbedded with brown sandy clay, thinly bedded fossiliferous clay, and fissile shale. Unconformably underlying the Walnut Formation is the Cretaceous-aged Paluxy Formation. The Paluxy Formation generally consists of coarse-grained sand that grades upward into fine-grained sand with variable amounts of shale and limestone. The sandstone, composed of fine- to coarse-grained white quartz, is well-sorted, poorly consolidated, and cross-bedded. The Paluxy Formation thickness ranges from 140 to 190 feet, averaging 160 feet in Tarrant County (Radian, 1991).

***Hydrogeology.*** Shallow groundwater within the Quaternary alluvium occurs in fluvial terrace deposits of sand and gravel, which occur as a veneer on the eroded surface of the Walnut Formation. The soil description log from boring SB160201 adjacent to monitoring well WITCTA011 (Appendix A) indicates sandy clay below 4 feet bgs with sand and silt content increasing below 6 feet bgs, and saturated conditions below 18.5 feet bgs. Monitoring well WITCTA011 was installed south of the OWS at Building 1602 with the bottom of the well screen placed on the top of the Walnut Formation, from 13 to 23 feet bgs. Groundwater flow at the Building 1602 site is to the east toward the Trinity River.

### 12.4 Results from Phase 1 RFI Activities

The following sections present the analytical results from soil and groundwater samples collected by IT (1997) during the Phase 1 Sanitary Sewer System RFI at Building 1602 Surface and subsurface soil samples were collected from two boring locations and analyzed for VOCs, SVOCs, pesticides/PCBs, and inorganics. A groundwater sample was collected from monitoring well WITCTA011 for analysis of VOCs, SVOCs, and inorganics. The purpose of the RFI samples was to determine whether releases that may have occurred from the OWS at Building 1602 have produced contaminant concentrations in soil and groundwater above basewide background concentrations and/or MSCs.

Table 12-2 contains a summary of the analytes detected in the Phase 1 RFI soil samples and Table 12-3 contains a summary of the analytes detected in the Phase 1 RFI groundwater samples. Analytical detection summary tables for the soil and groundwater samples collected at Building 1602 are shown in Tables B-16 and B-17, respectively.

#### 12.4.1 Surface Soil

Surface soil samples were collected from 0 to 2 feet bgs at borings SB160201 and SB106002 for analysis of VOCs, SVOCs, pesticides/PCBs, and inorganics. Figure 12-1 shows the locations of the Phase 1 RFI boring locations. The following subsections discuss the analytical results of the surface soil samples

***VOCs.*** Two VOCs, toluene and methylene chloride, were detected above MQLs in the Phase 1 RFI surface soil samples at Building 1602. Toluene was detected in the surface soil samples from SB160201 and SB160202 at concentrations (0.044 and 0.01 mg/kg, respectively) that exceeded the MQL (0.0053 mg/kg), but are well below the MSC (100 mg/kg). These toluene detections were likely the result of toluene leaching from the sample sleeves, which were constructed of PET. Toluene was detected in a high number of the equipment blanks for the Phase 1 RFI, which were composed of rinsate collected from the sample sleeves made of PET.

Methylene chloride was detected above its MQL in the surface soil sample from SB160202, but the concentration (0.0084 B mg/kg) was affected by contamination in the associated method blank. The methylene chloride concentration was well below the established MSC of 0.5 mg/kg. Therefore, the low concentration of methylene chloride was likely the result of laboratory contamination.

Table 12-2

MSC = Media-Specific Concentration
NA = not applicable
MQL = Method Quantitation Limit
RRS 1 = Risk Reduction Standard 1
RRS 2 = Risk Reduction Standard 2
TNRCC = Texas Natural Resources Conservation Commission
UTL = Upper Tolerance Limit
Footnotes
[1] UTLs for inorganics derived from Final Draft Basewide Background Study, Jacobs Engineering, 1998 MQLs for organics were derived by taking the most conservative reporting limit for a given analyte
[2] TNRCC, 1999, "Updated Examples of Standard No 2, Appendix II Media-Specific Concentrations (MSCs) - Industrial Setting", July 14
Qualifier Definitions
= The analyte was positively identified
U = The analyte was analyzed for, but not detected The associated numerical value is at or below the MDL
N = Spiked sample recovery was not within control limits
F = The analyte was positively identified but the associated numerical value is below the reporting limit
J = For organics, the analyte was positively identified, the associated numerical value is the approximate concentration of the analyte in the sample
BJ = Estimated quantitation - possible biased high based upon blank contamination
nv = not validated

MSC = Media Specific Concentration
NA = Not Applicable
MQL = Method Quantitation Limit
RRS 1 = Risk Reduction Standard 1
RRS 2 = Risk Reduction Standard 2
TNRCC = Texas Natural Resource Conservation Commission
UTL = Upper Tolerance Limit
mg/L = milligrams per liter
Footnotes
[1] UTLs for inorganics derived from Final Draft Basewide Background Study, Jacobs Engineering, 1998 MQLs for organics were derived by taking the most conservative reporting limit for a given analyte
[2] TNRCC, 1999, "Updated Examples of Standard No 2, Appendix II Media Specific Concentrations (MSCs) - Industrial Setting", July 14
Validated Qualifier Definitions
J = For inorganics, the associated value is an estimated quantity For organics, the analyte was positively identified, the associated numerical value is is the approximate concentration of the analyte in the sample
U = The analyte was analyzed for, but not detected The associated numerical value is at or below the MDL
B = For inorganics, the reported value is an estimated quantity
nv = not validated

***SVOCs.*** All SVOC detections in surface soil samples at Building 1602 were TICs that were qualified as estimated concentrations below the PQLs (Table B-16). These TICs included unidentified hydrocarbon compounds. Although no detection limits were established for these compounds in the laboratory analysis, the values are below the PQL range (0.660 mg/kg to 3.30 mg/kg) for SVOCs described in SW846 Method 8270 (EPA, 1997). Therefore, the detected concentrations of the TICs were below the background concentration for organics, as defined by the TNRCC RRP.

***Pesticides/PCBs.*** No pesticide/PCB compounds were detected above MQLs in the surface soil samples collected at the Building 1602 site.

***Inorganics.*** The following inorganics were detected in the surface soil sample from SB160201: aluminum, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, molybdenum, nickel, potassium, sodium, vanadium, and zinc. However, none of the detected concentrations exceeded background (Table 12-2).

Results for the surface soil sample from SB160202 indicated detections of aluminum, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, mercury, molybdenum, nickel, potassium, silver, sodium, vanadium, and zinc. All of these constituents were present at concentrations below background with the exception of chromium, molybdenum, and silver. Chromium is present at a concentration of 46.5 mg/kg, which exceeds its background and MSC. Molybdenum and silver are present at concentrations that are well below the TNRCC MSC. The molybdenum concentration (1.6 B mg/kg) is likely an extreme variation in background (1.46 mg/kg), and the detected silver concentration (0.42 B mg/kg) was likely the result of matrix interferences associated with EPA Method SW6010.

### *12.4.2 Subsurface Soil*

Two subsurface soil samples were collected from soil borings (SB160201 and SB160202) at the Building 1602 site from depths directly above the saturated zones (i.e., 14 to 16 feet bgs). The subsurface soil samples were submitted for analysis of VOCs, SVOCs, pesticide/PCBs, and inorganics. Figure 12-1 shows the location of soil borings corresponding to subsurface soil samples collected for the investigation. The following subsections discuss the analytical results of the subsurface soil samples.

***VOCs.*** Methylene chloride was the only VOC detected above MQLs in the subsurface soil samples at the Building 1602 site. However, methylene chloride was qualified as laboratory contamination and was most likely the result of laboratory contamination. The concentration is well below the established MSC of 0.5 mg/kg.

***SVOCs.*** All SVOC detections in subsurface soil samples at the Building 1602 site were TICs that were qualified as estimated concentrations below the PQLs (Table B-16). These SVOCs include unidentified hydrocarbon compounds. Although no detection limits were established for these compounds in the laboratory analysis, the values are below the PQL range (0.660 to 3.30 mg/kg) for SVOCs described in SW846 Method 8270 (EPA, 1997). Because the detected concentrations of the TICs identified by the SVOC analysis were below PQLs, they are below background for organics, as defined by the TNRCC RRP

***Pesticides/PCBs.*** No pesticide/PCB compounds were detected above MQLs in subsurface soils samples at the Building 1602 site.

***Inorganics.*** Inorganic constituents detected in subsurface soil samples from SB160201 and SB160202 included: aluminum, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, molybdenum, nickel, potassium, sodium, vanadium, and zinc. In addition, arsenic was detected in the subsurface sample from SB160201 and silver and mercury were detected in the subsurface sample from SB160202.

Results for the subsurface sample from SB160201 indicated the presence of arsenic, cobalt, and iron at concentrations above background. The result for arsenic (9.1 B mg/kg), which was qualified as an estimated value, also exceeded the MSC. The detected concentration of cobalt (8.5 mg/kg) slightly exceeded background (6.19 mg/kg) and is well below its MSC (610 mg/kg), which indicates that the detection is likely an extreme, but true, background concentration. Iron is considered an essential nutrient and the detected concentration (18,300 mg/kg) is likely an extreme but true background concentration.

Results for the subsurface sample from SB160202 indicated that cobalt and silver are present at concentrations that exceed background. Silver and cobalt, which are both qualified as estimated values, do not exceed MSC The detected concentration of cobalt (6.6 B mg/kg) slightly exceeded background (6 19 mg/kg) and is well below its MSC (610 mg/kg), which indicates that

the concentration is likely an extreme but true background concentration. The detected silver concentration (0.51 B mg/kg) is likely elevated due to matrix interferences associated with EPA Method SW6010.

### 12.4.3 Groundwater

Monitoring well WITCTA011 was installed in April 1997 immediately adjacent to boring SB160201 (Figure 12-1). The well was completed to a total depth of 23 feet bgs, with a screen interval from 13 to 23 feet in depth. Well WITCTA011 was developed and a groundwater sample was collected from the well in April 1997 for analysis of VOCs, SVOCs, and inorganics. The following subsections discuss the analytical results for the groundwater sample collected at the Building 1602 site.

***VOCs.*** Methylene chloride was detected at a concentration (0.033 B mg/L) that was qualified as being affected by laboratory contamination in the associated method blank. TCE was detected at a concentration of 0.55 mg/L in groundwater sample MS1576, which is above both its MQL (0.001 m/L) and MSC (0.005 mg/L) However, because the extent of the AFP-4 TCE/DCE groundwater plume includes the area of Building 1602 and contaminants from this plume are managed under the AFP-4 Superfund Cleanup Program, the presence of TCE and its breakdown products are not considered to result from releases from the OWS at Building 1602. Chloroform was detected at a concentration above its MQL (0.015 J mg/L) but is well below its MSC (0.1 mg/L). The presence of chloroform is likely the result of the decontamination process, which used potable water from the city of Fort Worth. Chloroform has been detected in samples collected from the faucet used as the potable water source at NAS Fort Worth JRB. All other VOCs were below their MQLs.

***SVOCs.*** No SVOCs were detected above MQLs in the groundwater sample from WITCTA011.

***Inorganics.*** Inorganic constituents detected in the groundwater sample from WITCTA011 included aluminum, arsenic, barium, calcium, iron, magnesium, manganese, sodium, potassium, vanadium, and zinc. Of these inorganics, only arsenic, iron, and manganese were detected above background. Arsenic was detected at a concentration (0.0244 B mg/L) that exceeded background but was below the MSC. Manganese was detected at a concentration (0.63 mg/L) that exceeded background concentration but was below the MSC. Considering that manganese was not

detected above background in the soil samples collected at the site, the detected concentration in groundwater is likely an extreme, but true, background concentration.

### 12.5 Results from Phase 2 Activities

IT collected soil samples from one boring (SB160203) during the Phase 2 RFI in April 2000 to confirm elevated concentrations of chromium identified in surface soil and elevated arsenic concentrations identified in subsurface soil during the Phase 1 RFI samples. Additionally, a groundwater sample was collected from monitoring well WITCTA011 to confirm the elevated concentration of arsenic detected in the Phase 1 groundwater sample. Table 12-2 includes the analytical results for the Phase 2 soil samples A summary of RFI SPLP results is shown in Table 12-4. Table 12-3 includes the analytical results from the groundwater sample collected from WITCTA011. The following sections discuss the results of Phase 2 soil and groundwater samples.

#### 12.5.1 Surface Soil

Chromium was detected at a concentration (18.2 mg/kg) that was below background in the Phase 2 surface soil sample from SB160203.

#### 12.5.2 Subsurface Soil

Arsenic was detected at a concentration (8.6 mg/kg) that exceeded both background and the MSC for arsenic in the Phase 2 subsurface soil sample from SB160203. However, the SPLP analysis was performed on the sample to determine the potential for the detected concentration to leach into groundwater. Because the detected arsenic concentration using the SPLP analysis (0.0037 mg/L) was less than the MSC for arsenic in groundwater, the detected arsenic concentration detected at SB160203 (8.62 mg/kg) was established as the revised MSC for arsenic in soil at the Building 1602 site.

#### 12.5.3 Groundwater

Arsenic was not detected in the Phase 2 groundwater sample from monitoring well WITCTA011. Therefore, the result from the Phase 1 groundwater concentration collected in 1997 could not be confirmed and was likely an extreme, but true, background concentration.

**Table 12-4**

**Summary of RFI SPLP Results Compared to Background and MSCs**
**OwS Building 1602 - IT Corporation**
**NAS Fort Worth JRB, Texas**

| Location | Sample No. | Sample Date | Start Depth (ft bgs) | End Depth (ft bgs) | Parameter | Reporting Limit (mg/L) | Result (mg/L) | Laboratory Qualifier | Validation Qualifier | Background UTL[1] (mg/L) | Does Result Support Closure Under RRS 1? | TNRCC MSC[2] (mg/L) | Does Result Support Closure Under RRS 2? |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **Phase 2 - Location SB160203** | | | | | | | | | | | | | |
| SB160203 | BG0029 | 24-Apr-00 | 0 | 2 | Chromium | 10 | 0 00726 | F | nv | 0 006 | No | 0 1 | Yes |

**Laboratory Qualifier Definitions:**

" " = The analyte was positively identified
"F" = The analyte was positively identified but the associated numerical value is below the reporting limit
"nv" = not validated

### 12.6 Results from Phase 3 RFI Activities

Based upon the results of the Phase 1 and Phase 2 RFI soil samples, it was determined that additional data was necessary to delineate arsenic and chromium concentrations in soil to basewide background concentrations. Therefore, IT collected soil samples from four additional borings (SB160204 through SB160207) during the Phase 3 RFI activities in November 2000. The results from the Phase 3 soil samples at Building 1602 are included in Table 12-2. The Phase 3 analytical results are also shown in Figure 12-1. The following subsections discuss the arsenic and chromium concentrations detected in the Phase 3 RFI samples.

#### 12.6.1 Surface Soil

IT collected four surface soil samples (SB160204 through SB160207) for analysis of chromium during the Phase 3 RFI in November 2000. As shown in Table 12-2 and Figure 12-1, the chromium concentrations detected in the surface soil samples collected during the Phase 3 RFI at Building 1602 were below background for chromium. Therefore, the elevated chromium concentration detected in surface soil from Phase 1 boring SB160202 has been delineated by the chromium results from the four Phase 3 surface soil samples.

#### 12.6.2 Subsurface Soil

IT collected subsurface samples from 6 to 8 feet bgs from all four Phase 3 soil borings (SB160204 through SB160207) for analysis of chromium and arsenic. Subsurface soil samples were also collected from 14 to 17 feet bgs at three Phase 3 borings (SB160204 through SB160206) for analysis of arsenic. The following subsections discuss the arsenic and chromium concentrations that were detected in subsurface soil samples collected during the Phase 3 RFI.

***Arsenic.*** Arsenic was detected at a concentration (6.85 mg/kg) slightly above background (6.58 mg/kg) in the sample from 14 to 17 feet bgs from SB160204. All other arsenic concentrations detected in the Phase 3 RFI subsurface soil samples were below background. Considering that the arsenic concentration was below background in the sample from 6 to 8 feet bgs from SB160204, the slight variance from background in the sample collected from 14 to 17 feet bgs is likely an extreme, but true, background concentration. Therefore, the elevated arsenic concentrations detected in Phase 1 boring SB160201 and Phase 2 boring SB160203 are delineated by the results from Phase 1 boring SB160202 and Phase 3 borings SB160204 through SB160206.

***Chromium.*** As shown in Table 12-2 and Figure 12-1, chromium was detected in the sample from 6 to 8 feet bgs from SB160204 at a concentration (18 F mg/kg) that slightly exceeded background. Similarly, chromium was detected in the sample from 6 to 8 feet bgs at SB160206 at a concentration (20 F mg/kg) that slightly exceeded background. The detected chromium concentration at SB160205 was below background. The chromium detections in the subsurface soil samples from SB160204 and SB160206 are likely extreme but true background concentrations, considering that they are below the background concentration in surface soil (25.86 mg/kg). These chromium detections are also below the basewide background concentration for chromium (30 mg/kg)

### *12.7 Summary and Discussion*

IT collected surface and subsurface soil samples from two locations (SB160201 and SB160202) adjacent to the OWS for analysis of VOCs, SVOCs, pesticides/PCBs, and inorganics during the Phase 1 Sanitary Sewer System RFI in 1997. IT also installed and sampled monitoring well WITCTA011 as part of the Phase 1 RFI to determine if groundwater had been impacted downgradient of the site.

In March/April 2000, IT collected soil samples from an additional soil boring (SB160203) as part of the Phase 2 RFI to confirm chromium concentrations detected in surface soil and arsenic concentrations detected in subsurface soil from the Phase 1 RFI borings. IT collected soil samples from four additional soil borings (SB160204 through SB160207) during the Phase 3 RFI in November 2000 to delineate arsenic and chromium concentrations to below background.

The following sections discuss the relevance of the parameters detected in surface soil, subsurface soil, and groundwater during investigations at the Building 1602 site.

#### *12.7.1 Surface Soil*

No SVOCs, pesticides, or PCBs were detected above MQLs in the surface soil samples collected during the Phase 1 RFI. Two VOCs, methylene chloride and toluene, were detected above MQLs in surface soil during the Phase 1 RFI. However, the detected methylene chloride concentrations were well below the MSC and were likely the result of laboratory contamination. The detected toluene concentrations were attributable to toluene leaching into the samples from the DPT sample sleeves, which were made of PET.

Chromium, molybdenum, and silver were the only inorganic compounds detected in surface soil at concentrations above background. However, the detected molybdenum concentration was virtually the same as background, and the detected silver concentration was likely biased high due to matrix interferences associated with EPA Method SW6010. The elevated chromium concentration detected in surface soil was unable to be confirmed in the Phase 2 boring (SB160203), which was placed directly downgradient from the OWS. The chromium concentrations were delineated by the chromium concentrations from the Phase 3 surface soil samples that were all below background. Considering the chromium results from the seven surface soil samples collected at the Building 1602 site, there does not appear to be a pattern of chromium contamination in surface soil at the site.

### 12.7.2 Subsurface Soil

No SVOCs or pesticides/PCBs were detected above background in the subsurface soil samples collected near the OWS unit at Building 1602. One VOC, methylene chloride, was detected above its MQLs in the subsurface samples collected during the Phase 1 RFI. However, the detected concentrations of methylene chloride were likely the result of laboratory contamination.

Arsenic, cobalt, iron, and silver were detected above background concentrations, but only the arsenic concentration from Phase 1 boring SB160201 exceeded the MSC. Arsenic was also detected above background in the sample from 17 to 19 feet bgs from Phase 2 boring SB160203. However, the detected concentration (8.62 mg/kg) passed the SPLP analysis and a revised MSC was established for arsenic at the Building 1602 site. The arsenic concentrations in Phase 3 borings SB160204 through SB160206 were at or below the background, thereby delineating arsenic detected from borings SB160201 and SB160203. Considering that the arsenic concentration detected from boring SB160201 (9.1 B mg/kg) is virtually the same as the revised MSC (8.62 mg/kg) and that the arsenic concentrations have been delineated to background, the arsenic concentrations in subsurface soil have been characterized sufficiently for closure under RRS 2 of the TNRCC RRP.

### 12.7.3 Groundwater

Methylene chloride, chloroform, and TCE and its breakdown product, cis-1,2-DCE, were the only VOCs detected above their respective MQLs in the groundwater sample from WITCTA011. The methylene chloride concentration was likely the result of laboratory contamination. The detected chloroform concentration was likely the result of the decontamination process used to

clean the sampling pump, which used potable water from the city of Fort Worth that has low concentrations of chloroform. As mentioned previously, Building 1602 is located within the extent of the TCE plume originating from AFP-4; therefore, the presence of TCE and its breakdown products in WITCTA011 are not considered to be related to the OWS at Building 1602

Arsenic, iron, and manganese were the only inorganics detected above background in the 1997 groundwater sample from WITCTA011. Iron and manganese were detected at concentrations that were likely extreme variations in background. The arsenic concentration detected in the Phase 1 sample significantly exceeded its background. However, arsenic was not detected in the Phase 2 groundwater sample from WITCTA011, which indicates that the elevated concentration detected in the Phase 1 sample was likely an extreme, but true, background concentration.

The absence of VOCs and SVOCs contained in petroleum products such as fuels, engine oil, break fluid, etc. in the groundwater sample from WITCTA011 indicates that any releases that may have occurred from the OWS at Building 1602 have not significantly impacted groundwater at the site.

### *12.8 Conclusions*

Considering that no pattern of VOCs, SVOCs, pesticides/PCBs, or inorganics above TNRCC MSCs has been identified in the soil and groundwater samples collected in the vicinity of Building 1602, it is recommended that the site be presented for closure under RRS 2 of the TNRCC RRP. The site is recommended for closure under RRS 2 because the arsenic and chromium concentrations detected in surface and subsurface soil samples have been delineated to background. In addition, the arsenic concentrations detected in subsurface soil are not likely to leach into groundwater as proven by the SPLP analysis and resulting revised MSC (8.62 mg/kg) established during the Phase 2 RFI.

The relative absence of detected concentrations of compounds contained in the influent to the OWS (e.g., fuels, engine oil, brake fluid, and other petroleum byproducts) in the soil and groundwater samples collected at the site indicates that any releases from the OWS have not significantly impacted the environment. Therefore, closure is recommended under RRS 2 for the OWS at Building 1602. Should this recommendation be accepted, a letter stating that closure of the OWS at Building 1602 was carried out in accordance with TAC §335.555, and signed by an

Air Force representative, will be transmitted to the TNRCC, along with a metes and bounds description of SWMU 35. The metes and bounds description will correspond to surveyed coordinates of the affected area shown in Figure 12-1

13.0

# 13.0 OWS Building 1643

The following sections provide a description of the OWS at Building 1643, a summary of the site characterization activities, a discussion of the site-specific geology and hydrology, discussions of the analytical results from each characterization event, and recommendations based upon the physical and chemical data collected at the site.

## 13.1 Site Description

Building 1643 has two OWSs located to the east of Building 1643 (Figure 13-1). The two OWS units are designated SWMU 40 on the RCRA Hazardous Waste Permit for NAS Fort Worth JRB. The Building 1643 Waste Accumulation Area (SWMU 39) is located between the two OWSs. Both OWSs are 20,000-gallon, two-stage units, consisting of an equalization tank and an oil separation tank. Approximately three-quarters of the concrete vault is below the ground surface, which is paved with asphalt The units were installed in 1982 and were designed to treat wastewater discharge from aircraft maintenance activities in the Building 1643 hangar. The wastewater included jet fuel, engine lubricants, cleaners, solvents, and other petroleum-related wastes (A T Kearney, 1989).

The system in Building 1643 consists of floor drains, underground conduits, and the two OWSs. The inner space of the building is subdivided into a main hangar room for parking the aircrafts and individual shops along the north and south sides. The building drainage and the OWS system consists of two distinct identical setups, one on the north side and one on the south side. There are two east-west trending trench drains in the main hangar. Floor rinsate from each trench drain, as well as from the floor drains in the shops on the same side, flows in below-ground conduits to a separator outside the east side of the building. The north side drains to the northern separator and the south side to the southern one. The building floor is paved with concrete and the floor drainage trenches and conduits are reportedly constructed of concrete (A. T. Kearney, 1989). The effluent from the two OWSs is discharged to the Sanitary Sewer System.

### 13.2 Site Characterization Activities

A summary of the soil and groundwater samples that have been collected at the Building 1643 site is provided in Table 13-1. The analytical methods associated with each soil sample collected at Building 1643 are also presented in Table 13-1. The locations of the soil borings are shown in Figure 13-1 The following sections discuss the investigation activities that have been performed to characterize environmental impacts relating to the OWS at Building 1643.

#### 13.2.1 Phase 1 RFI Activities – IT Corporation 1997

IT collected soil samples during the Phase 1 Sanitary Sewer System RFI in March 1997 (Table 13-1) from borings SB164301, SB164302, and SB164303 located adjacent to the north, east, and south corners of the OWS units (Figure 13-1). Surface soil samples MS1364, MS1368, and MS1370 were collected from surface to 2 feet bgs from borings SB164302, SB164301, and SB164303, respectively. Subsurface soil samples MS1366 and MS1367 were collected from borings SB164301 and SB164303, respectively, from the 2-foot interval directly above the water table (6 to 8 feet bgs). Subsurface soil samples MS1365, MS1369, and MS1371 were collected from borings SB164302, SB164301, and SB164303, respectively, from the 2-foot interval directly above the water table (10 to 12 feet bgs) Soil samples were analyzed for inorganics (EPA Method SW6010/7471), VOCs (EPA Method 8260), SVOCs (EPA Method SW8270), and pesticides/PCBs (EPA Method SW8080) (IT, 1998).

Monitoring wells WITCTA005 and WITCTA006 were installed during the Phase 1 RFI in April 1997 east of the borings (Figure 13-1). The wells were completed to approximate total depths of 19 to 19.5 feet bgs, with a screen intervals from about 19 feet to 11.5 feet bgs. Groundwater samples MS1558 , MS1559, and MS1589 were analyzed for VOCs, SVOCs, and inorganics (IT, 1998).

#### 13.2.2 Phase 2 RFI Activities – IT Corporation 1999, 2000

Additional soil sampling was performed by IT during the Phase 2 RFI in June 1999 and April 2000 from two soil borings (SB164304 and SB164305) (Table 13-1). SB164304 was to the east of the OWSs at Building 1643 and SB164305 was adjacent to the southeast wall of the southern OWS (Figure 13-1). Sample BG0031 was collected in June 1999 from surface to 2 feet in depth from SB164304 and analyzed for cadmium. Sample BG0032 was collected in April 2000 from surface to 2 feet in depth from SB164305 and analyzed for cadmium and lead to confirm concentrations of these inorganics detected in Phase 1 boring SB164302.

## Table 13-1

## Summary of Previous Environmental Samples Collected at Building 1643 NAS Fort Worth JRB, Texas

| Sample Location | Sample Date | Sample Number | Start Depth (ft bgs) | End Depth (ft bgs) | Sample Analysis | Analytical Method |
|---|---|---|---|---|---|---|

### 13.2.3 Phase 3 RFI Activities – IT Corporation 2000

A confirmation surface soil sample was collected by IT during the Phase 3 RFI in November 2000 (Table 13-1) from SB164306 (Figure 13-1) to confirm the maximum chlorobenzene concentration detected above background (i.e , MQL) during the Phase 1 investigation. Chlorobenzene was analyzed by EPA Method SW8260B.

## 13.3 Site-Specific Conditions

The following subsections discuss the site-specific geology and hydrogeology characteristics that were encountered during the investigation activities at Building 1643 site

***Geology.*** Quaternary alluvium is found at the surface through most of the NAS Fort Worth area. The alluvium consists of floodplain and fluvial terrace deposits of gravel, sand, silt, and clay that occur as a veneer on the eroded surface of Upper Cretaceous strata. Soil boring logs (Appendix A) for SB164301 to the east of the OWS indicated fill material from 0 to 2 feet bgs, reddish-brown, sandy moist-stiff sandy clay at 2 to 4 feet bgs, brown, dense clayey sand from 4 to 6 feet bgs, with the matrix changing to a well-graded and coarse sand to a depth of 12 feet bgs. Organic vapors of approximately 100 ppm were detected at 12 feet bgs.

Soil boring logs for SB164302 to the south of the OWS indicate dark brown loose clayey sand from 0 to 2 feet bgs, changing over to well-graded, yellowish-red, dense sand with increasing gravel and moisture content to a depth of 14 feet bgs. Organic vapors were less than 1 ppm in this soil boring. The depth to water was measured at 10.9 feet bgs.

Soil boring logs for SB164303 to the north of the OWS indicate brown, moist clayey sands from 0 to 2 feet bgs, changing over to dark-red and strong brown dense and coarse sand with increasing gravel and moisture content to a depth of 14 feet bgs. Organic vapors of approximately 130 ppm, 35 ppm, 30 ppm, and less than 10 ppm were detected at depths of 7, 9, 11, and 13 feet bgs, respectively. The depth to water was measured at 12.3 feet bgs.

The alluvial soils rest unconformably on the top of the weathered Walnut Formation. Underlying the Quaternary alluvium is the Cretaceous-aged Walnut Formation, which consists of 20 to 30 feet of indurated fossiliferous limestone interbedded with brown sandy clay, thinly bedded fossiliferous clay, and fissile shale. Unconformably underlying the Walnut Formation is the Cretaceous-aged Paluxy Formation. The Paluxy Formation generally consists of coarse-grained

sand that grades upward into fine-grained sand with variable amounts of shale and limestone. The sandstone, composed of fine- to coarse-grained white quartz, is well-sorted, poorly consolidated, and cross-bedded. The Paluxy Formation thickness ranges from 140 to 190 feet, averaging 160 feet in Tarrant County (Radian, 1991).

***Hydrogeology.*** Shallow groundwater within the Quaternary alluvium occurs in fluvial terrace deposits of sand and gravel, which occur as a veneer on the eroded surface of the Walnut Formation. Soil description from boring SB164301 (Appendix A) indicates sandy gravelly clay below 4 feet bgs with sand content increasing below 6 feet bgs, and saturated conditions at about 11 feet bgs. Monitoring well WITCTA005 was installed by overdrilling soil boring 15J3 located at east of the OWS at Building 1643. The top of the well screen was set at 11.9 feet bgs and the bottom of the well screen placed at the top of the Walnut Formation at 19.4 feet bgs. Monitoring well WITCTA006 was installed by overdrilling soil boring 15J. The depth to water was measured at 11.3 feet bgs in monitoring well WITCTA005 and 13 feet bgs in monitoring well WITCTA006. Groundwater flow at the Building 1643 site is to the east and south toward the Trinity River.

### *13.4 Results from Phase 1 RFI Activities*

The following sections presents the analytical results from surface soil samples that were collected by IT (1997) during the Phase 1 Sanitary Sewer System RFI at Building 1643. A discussion of the groundwater analytical results collected from monitoring wells installed during the investigation is also included. Table 13-2 contains a summary of the analytes detected in the Phase 1 RFI soil samples and Table 13-3 contains a summary of the analytes detected in the Phase 1 RFI groundwater samples. Analytical detection summary tables for the soil and groundwater samples collected at Building 1643 are shown in Tables B-18 and B-19, respectively.

#### *13.4.1 Surface Soil*

Surface soil samples were collected from surface to 2 feet bgs at borings SB164301 through SB164303 and analyzed for VOCs, SVOCs, pesticides/PCBs, and inorganics. The following subsections discuss the results from each of these analyses.

MSC = Media-Specific Concentration
NA = not applicable
MQL = Method Quantitation Limit
RRS 1 = Risk Reduction Standard 1
RRS 2 = Risk Reduction Standard 2
TNRCC = Texas Natural Resources Conservation Commission
UTL = Upper Tolerance Limit
Footnotes
[1] UTLs for inorganics derived from Final Draft Basewide Background Study, Jacobs Engineering, 1998 MQLs for organics were derived by taking the most conservative reporting limit for a given analyte
[2] TNRCC, 1999, "Updated Examples of Standard No 2, Appendix II Media-Specific Concentrations (MSCs) - Industrial Setting", July 14
Qualifier Definitions
= The analyte was positively identified
U = The analyte was analyzed for, but not detected The associated numerical value is at or below the MDL
F = The analyte was positively identified but the associated numerical value is below the reporting limit
J = For inorganics, the associated value is an estimated quantity For organics, the analyte was positively identified, the associated numerical value is the approximate concentration of the analyte in the sample
BJ = Estimated quantitation - possible biased high based upon blank contamination
N = Spiked sample recovery was not within control limits
nv = not validated

MSC = Media Specific Concentration
NA = Not Applicable
MQL = Method Quantitation Limit
RRS 1 = Risk Reduction Standard 1
RRS 2 = Risk Reduction Standard 2
TNRCC = Texas Natural Resource Conservation Commission
UTL = Upper Tolerance Limit
mg/L = milligrams per liter
Footnotes
[1] UTLs for inorganics derived from Final Draft Basewide Background Study, Jacobs Engineering, 1998 MQLs for organics were derived by taking the most conservative reporting limit for a given analyte
[2] TNRCC, 1999, "Updated Examples of Standard No 2, Appendix II Media Specific Concentrations (MSCs) - Industrial Setting", July 14
Validated Qualifier Definitions
J = For inorganics, the associated value is an estimated quantity For organics, the analyte was positively identified, the associated numerical value is is the approximate concentration of the analyte in the sample
U = The analyte was analyzed for, but not detected The associated numerical value is at or below the MDL
B = For inorganics, the reported value is an estimated quantity
nv = not validated

***VOCs.*** As shown in Table 13-2 and Figure 13-1, results for VOCs were below MQLs in the surface samples at Building 1643 with the exception of chlorobenzene, methylene chloride, and toluene. Chlorobenzene was detected in all three surface soil samples at concentrations (maximum of 0.0059 mg/kg) above the MQL (0 0021 mg/kg) but well below the established MSC (10 mg/kg). Field personnel noted that painting was being performed in the vicinity of Building 1643 during the Phase 1 RFI and may have impacted the surface soil samples

Toluene was also detected in all three surface samples at concentrations (maximum of 0.027 mg/kg) above the MQL (0 0053 mg/kg) but well below the MSC (100 mg/kg). As mentioned previously, toluene concentrations detected at low concentrations in soil samples was likely the result of toluene leaching into the samples from the DPT sample liners, which were constructed of PET.

Methylene chloride was detected in all three surface soil samples at concentrations that were all qualified as laboratory contamination. Methylene chloride is considered a common laboratory contaminant and the concentrations in the samples are below the established MSC (0.5 mg/kg). Therefore, the presence of methylene chloride in these surface soil samples was likely the result of laboratory contamination.

***SVOCs.*** The SVOC results from surface samples were below MQLs, excluding the detected concentrations of the following SVOCs at SB164302: benzo(b)fluoranthene, benzo(a)pyrene, chrysene, fluoranthene, and pyrene. Of these SVOCs detected above the MQL at SB164302, only the detected concentration of benzo(b)fluoranthene (1.4 J mg/kg) exceeded its MSC (0.039 mg/kg). Considering that asphalt is predominant in the area surrounding Building 1643 and these SVOCs were not detected above MQLs in the sample from 6 to 8 feet bgs at SB164302, the detected concentrations of these SVOCs were likely related to the asphalt present in the area.

***Pesticides/PCBs.*** No pesticide/PCB compounds were detected above MQLs in the surface soil samples.

***Inorganics.*** All inorganics detected in the surface soil samples collected from borings SB164301 and SB164303 were below background (Table 13-2). However, cadmium (1 B mg/kg) and lead (81.8 mg/kg) were detected in the surface soil sample from SB164302 at concentrations that exceeded background and MSCs.

### 13.4.2 Subsurface Soil

Subsurface soil samples were collected from borings SB164301 through SB164303 at two subsurface depths: from 6 to 8 feet bgs and from 10 to 12 feet bgs. The subsurface soil samples were submitted for analysis of VOCs, SVOCs, and inorganics. The following subsections discuss the analytical results from the subsurface soil samples collected at Building 1643.

***VOCs.*** Results for VOCs were below MQLs in subsurface samples with the exception of methylene chloride and toluene. Toluene was detected in the subsurface sample from 10 to 12 feet bgs from SB164303 at a concentration (0.012 mg/kg) that exceeded the MQL (0 0053 mg/kg), but was well below the MSC (100 mg/kg) As mentioned previously, toluene concentrations detected at low concentrations in soil samples were likely the result of toluene leaching into the samples from the DPT sample liners, which were constructed of PET.

Methylene chloride concentrations detected above the MQLs in the subsurface soil samples from SB164302 and SB164303 were qualified as laboratory contamination. Methylene chloride is considered a common laboratory contaminant and the concentrations were well below the established MSC of 0.5 mg/kg. Therefore, the methylene chloride concentrations detected in subsurface soil samples at Building 1643 were likely the result of laboratory contamination.

***SVOCs.*** Results for SVOCs were below MQLs in subsurface samples with the exception of unidentified hydrocarbon compounds, which were tentatively qualified as estimated concentrations below the PQLs (Table B-18). Although no detection limits were established for these compounds in the laboratory analysis, the values were below the PQL range (0 660 mg/kg to 3.30 mg/kg) for SVOCs described in SW846 Method 8270 (EPA, 1997). Therefore, the detected concentrations of these TICs identified during the SVOC analysis are below the background for organics, as defined by the TNRCC RRP.

***Inorganics.*** Selenium was the only inorganic detected at concentrations above background in the subsurface soil samples collected during the Phase 1 RFI at Building 1643. Selenium was detected in the sample from 6 to 8 feet bgs from SB164301 at an estimated concentration (1.3 J mg/kg) that slightly exceeded background, but was below the MSC. Similarly, selenium was detected in the sample from 6 to 8 feet bgs from SB164303 at an estimated concentration of 0.9 J mg/kg. Considering that selenium was not detected above background in the samples collected

from 0 to 2 feet bgs and 10 to 12 feet bgs at these locations, it is likely that the selenium detections were extreme, but true, background concentrations. The detections are similar to the background concentration for selenium in surface soil (0.907 mg/kg).

### 13.4.3 Groundwater

Monitoring wells WITCTA005 and WITCA006 were installed in April 1997 immediately adjacent and downgradient to the OWS at Building 1643 (Figure 13-1). Groundwater samples were collected from the wells and analyzed for VOCs, SVOCs, and inorganics. The following subsections discuss the analytical results from groundwater samples collected at Building 1643

***VOCs.*** VOCs detected above MQLs in groundwater included methylene chloride, cis-1,2-DCE, and TCE. Methylene chloride detections were all qualified as laboratory contamination, with a maximum concentration of 0.0088 B mg/L detected in the groundwater sample from WITCTA005. This concentration exceeds the groundwater MSC established for methylene chloride (0.005 mg/L). Considering that methylene chloride is a common laboratory contaminant and was detected in the laboratory blanks for these samples, the detected concentrations were likely the result of laboratory contamination.

TCE and cis-1,2-DCE concentrations detected in monitoring wells WITCTA005 and WITCTA006 exceeded both MQLs and MSCs However, because the extent of the AFP-4 TCE groundwater plume includes the area of Building 1643 and contaminants from this plume are managed under the AFP-4 Superfund Cleanup Program, TCE and its breakdown products, such as DCE, are not considered to result from releases from the Sanitary Sewer System and will not be addressed in this report.

***SVOCs.*** No SVOCs were detected above MQLs in the groundwater samples collected from wells WITCTA005 and WITCTA006.

***Inorganics.*** Inorganic constituents detected in groundwater samples above background included antimony, arsenic, manganese, and iron. Of these, antimony was the only inorganic that also exceeded its TNRCC MSC. Antimony was detected in the field duplicate from monitoring well WITCTA005 at an estimated concentration (0.0237 B mg/L) that exceeded the background concentration (0 002 mg/L) and MSC (0.006 mg/L). However, considering that antimony was

not detected in the regular sample from WITCTA005, the detected concentration in the field duplicate is likely an extreme but true background concentration.

Arsenic was detected in monitoring well WITCTA006 at a concentration (0.0282 B mg/L) that was above background (0.0049 mg/L), but below the MSC for arsenic (0.05 mg/L). Manganese was detected in each monitoring well at concentrations ranging from 1.66 mg/L to 3.4 mg/L, which exceed background (0.175 mg/L) but are well below the MSC (14 mg/L). Considering that manganese concentrations detected in surface and subsurface soils were all below background, the detected concentrations in groundwater are likely not related to a release from the OWS at Building 1643.

### 13.5 Results from HGLs RFI at SWMU 39

HGL (2000) collected a surface (0 to 2 feet bgs) and subsurface (5 to 7 feet bgs) soil sample in the vicinity of the OWS at Building 1643 during their RFI at SWMU 39 (Building 1643 Waste Accumulation Area). Figure 13-1 displays the location of boring BHGLSWMU39001 in the center of the two OWSs at Building 1643. The soil samples were submitted for analysis of Appendix IX constituents, including VOCs, SVOCs, pesticides/PCBs, and inorganics. Table 13-4 presents a summary of the concentrations detected in the soil samples from BHGLSWMU39001. The following subsections discuss the results of the surface and subsurface soil samples collected at SWMU 39 by HGL.

#### 13.5.1 Surface Soil

No VOCs, SVOCs, or pesticides/PCBs were detected above MQLs in the surface soil sample collected from BHGLSWMU39001. Similarly, no inorganics were detected at concentrations above background.

## Table 13-4

F = The analyte is present but the value is below the PQL
J = The analyte was positively identified, the quantitation is an estimation

### 13.5.2 Subsurface Soil

No VOCs, SVOCs, or pesticides/PCBs were detected above MQLs in the surface soil sample collected from BHGLSWMU39001. All inorganic concentrations, excluding lead, were below background. The detected lead concentration in the sample from 5 to 7 feet bgs at BHGLSWMU39001 was 15.4 mg/kg, which is above the background concentration (12.66 mg/kg) and MSC (1.5 mg/kg). However, considering that the lead detection is lower than the background concentration in surface soil (30.97 mg/kg) and that no compounds related to fuels or solvents were detected in the sample, it is likely that the lead detection is an extreme, but true, background concentration.

## 13.6 Results from Phase 2 Activities

IT collected soil samples from two borings (SB164304 and SB164305) during the Phase 2 RFI in April 2000 to confirm cadmium and lead concentrations detected in surface soil during the Phase 1 RFI at Building 1643 Table 13-2 includes the analytical results for the Phase 2 soil samples and the results from SPLP analyses are listed in Table 13-5. The following subsections discuss the analytical results for cadmium and lead detected in the Phase 2 RFI samples.

***Cadmium.*** As shown in Table 13-2 and Figure 13-1, cadmium was not detected in the surface soil sample collected from SB164304. The cadmium concentration detected in the surface soil sample from SB164305 (0.186 mg/kg) was below background. Therefore, because the cadmium concentration detected in the surface soil sample from Phase 1 boring SB164302 was not confirmed by the result from Phase 2 boring SB164305, there does not appear to be a pattern of cadmium concentrations above background at the site.

***Lead.*** As shown in Table 13-2 and Figure 13-1, the lead concentration detected in the surface soil sample from SB164305 (21.5 mg/kg) was below background. Therefore, because the elevated lead concentration detected in the surface soil sample from Phase 1 boring SB164302 was not confirmed by the result from Phase 2 boring SB164305, there does not appear to be a pattern of lead concentrations above background at the site.

### 13.7 Results from Phase 3 RFI Activities

Upon reviewing the data from soil samples collected during Phase 1 and Phase 2 RFIs, it was determined that the chlorobenzene concentrations detected in surface soil during the Phase 1 RFI should be confirmed to determine whether the constituent is present at the site or whether the painting activities had impacted the surface soil samples collected during the Phase 1 RFI A surface soil sample was collected from boring SB164306 during the Phase 3 RFI in November 2000. Boring SB164306 is located adjacent to Phase 1 boring SB164301, where the maximum concentration of chlorobenzene (0.0059 mg/kg) was detected during the Phase 1 RFI.

As shown in Table 13-2 and Figure 13-1, chlorobenzene was not detected in the surface soil sample from Phase 3 boring SB164306. Therefore, it is apparent that the chlorobenzene concentrations detected in surface soil samples collected during Phase 1 Sanitary Sewer System RFI were likely the result of painting activities that were being completed at the time of sampling.

### 13.8 Summary and Discussion

IT collected surface and subsurface soil samples from three locations (SB164301 through SB164303) adjacent to the two OWSs at Building 1643 for analysis of VOCs, SVOCs, pesticides/PCBs, and inorganics during the Phase 1 Sanitary Sewer System RFI in 1997. IT also installed and sampled monitoring wells WITCTA005 and WITCTA006 as part of the Phase 1 RFI to determine if groundwater had been impacted downgradient of the site. HGL (2000) also collected surface and subsurface soil samples from a boring (BHGLSWMU3901) located between the two OWSs at Building 1643 and analyzed the samples for Appendix IX constituents, including VOCs, SVOCs, and inorganics.

In April/May 2000, IT collected soil samples from two additional soil borings (SB164304 and SB164305) as part of the Phase 2 RFI to confirm cadmium and lead concentrations detected in surface soil during the Phase 1 RFI. IT collected a surface soil sample (SB164306) to confirm the maximum concentration of chlorobenzene detected during the Phase 1 RFI. The following sections discuss the relevance of the parameters detected in surface soil, subsurface soil, and groundwater during investigations at the Building 1643 site.

### 13.8.1 Surface Soil

Three VOCs, chlorobenzene, methylene chloride, and toluene, were detected above MQLs in surface soil during the Phase 1 RFI. Chlorobenzene was detected in all three surface soil samples at concentrations ranging from 0.0031 mg/kg to 0.0059 mg/kg. However, the detected concentrations were likely the result of airborne particulates from painting activities taking place at Building 1643 during the Phase 1 RFI. Chlorobenzene was not detected in the surface soil sample (SB164306) collected during the Phase 3 RFI in November 2000 near the former Phase 1 RFI boring with the maximum chlorobenzene concentration (SB164301). The detected methylene chloride concentrations were well below the MSC and were likely the result of laboratory contamination. The detected toluene concentrations were attributable to toluene leaching into the samples from the DPT sample sleeves, which were made of PET.

Five SVOCs were detected above MQLs in the subsurface soil from SB164302. One of these SVOCs, benzo(b)fluoranthene, was detected at a concentration that exceeded its MSC. However, considering that these SVOCs were not detected above MQLs in the sample collected from 6 to 8 feet bgs from SB164302 and that the surrounding area is paved with asphalt, the concentrations were likely associated with the asphalt rather than a release from the OWSs at Building 1643. No other SVOCs or pesticides/PCBs were detected above MQLs in the surface soil samples collected at Building 1643.

Cadmium and lead were the only inorganic compounds detected in surface soil samples at concentrations above background Cadmium and lead were detected in the surface soil sample from one boring (SB164302) at concentrations exceeding both background and MSCs. However, cadmium and lead were detected at concentrations below background in a surface soil sample collected next to former boring SB164302 during the Phase 2 RFI in March 2000, indicating that the concentrations detected during the Phase 1 RFI were extreme, but true, background concentrations. Considering the absence of compounds associated with petroleum-type wastes in the surface soil samples, the elevated cadmium and lead concentrations detected during the Phase 1 RFI were not likely related to releases that may have occurred from the OWS at Building 1643.

### 13.8.2 Subsurface Soil

Two VOCs, methylene chloride and toluene, were detected above their MQLs in the subsurface soil samples collected during the Phase 1 RFI. However, the detected concentrations of

methylene chloride were likely the result of laboratory contamination. The detected toluene concentrations were attributable to toluene leaching into the samples from the DPT sample sleeves, which were made of PET. No SVOCs were detected above MQLs in the subsurface soil samples collected at Building 1643.

Selenium and lead were the only inorganics detected at concentrations exceeding background. Selenium was detected in two Phase 1 RFI borings from 6 to 8 feet bgs at concentrations (0.9 J mg/kg and 1.3 J mg/kg) that were likely extreme but true variations in the background. Lead was detected at a concentration (15.4 mg/kg) very similar to background in a subsurface soil sample collected during the RFI at SWMU 39 (Building 1643, Waste Accumulation Area). This detected lead concentration is lower than the basewide background concentration for lead in surface soil (30.97 mg/kg) and is likely an extreme, but true, background concentration Considering the absence of compounds associated with petroleum-type wastes in the subsurface soil samples, the elevated lead and selenium concentrations detected during the Phase 1 RFI were not likely related to releases that may have occurred from the OWS at Building 1643.

### *13.8.3 Groundwater*

Methylene chloride and TCE and its breakdown product, cis-1,2-DCE, were the only VOCs detected above their respective MQLs in the groundwater samples from WITCTA005 and WITCTA006. The methylene chloride concentration was likely the result of laboratory contamination. As mentioned previously, Building 1643 is located within the extent of the TCE plume originating from AFP-4; therefore, the presence of TCE and its breakdown products in WITCTA005 and WITCTA006 will not be considered as evidence of a release from the OWSs at Building 1643.

Antimony, arsenic, iron, and manganese were the only inorganics detected above background in the 1997 groundwater samples. Antimony was detected in the field duplicate from monitoring well WITCTA005 at an estimated concentration (0.0237 B mg/L) that exceeded background and MSC However, antimony was not detected in the regular sample from WITCTA005. Arsenic was detected in monitoring well WITCTA006 at a concentration (0.0282 B mg/L) that was above background, but below the MSC for arsenic. Manganese was detected in each monitoring well at concentrations ranging from 1.66 mg/L to 3.4 mg/L, which exceed background but are well below the MSC Considering that antimony, arsenic, and manganese concentrations detected in

surface and subsurface soils were all below background, the detected concentrations in groundwater are likely not related to a release from the OWS at Building 1643.

The absence of VOCs and SVOCs contained in petroleum-type products in the groundwater samples at Building 1643 indicates that any releases that may have occurred from the OWS at Building 1643 have not significantly impacted groundwater at the site.

### 13.9 Conclusions

Field observations and analytical results in the vicinity of the OWS at Building 1643 indicate that there has been no evidence of a release of contaminants from the OWS system. Although lead and cadmium were detected above background and MSCs in one Phase 1 surface soil sample, confirmation samples collected during the Phase 2 RFI indicated that these inorganics were below background. Phase 3 confirmation sampling indicated that the chlorobenzene concentrations detected in surface soil during the Phase 1 activities were likely related to painting activities being performed at the time of sampling. Several PAHs were detected in one surface soil sample; however, the absence of PAHs in the sample from the 6- to 8-foot sampling interval indicates that the PAHs were associated with asphalt used for pavement at the site.

The chlorinated solvents detected in groundwater at the site are associated with the regional TCE plume originating from AFP-4; therefore, TCE and its breakdown products were not considered as evidence of a release from the OWS at Building 1643. Although arsenic and manganese were detected at concentrations above background in groundwater samples collected at the site, the absence of elevated concentrations of these inorganics in soil samples collected adjacent to the OWSs indicates the concentrations are likely extreme variations in background.

Because the analyte concentrations exceeding RRS 1 values in soil and groundwater samples collected at Building 1643 are likely either extreme, but true, background concentrations or are associated with either laboratory or field contamination (e.g., toluene and methylene chloride) or past practices associated with the OWSs (e.g., PAHs below asphalt), NFA is warranted at the subject site and the OWS at Building 1643 (SWMU 40) is recommended for closure under RRS 1.

- ANALYTE DETECTED ABOVE MSC SPLP NOT PERFORMED

## NOTES:

CONCENTRATIONS REPORTED IN MG/KG UNLESS NOTED OTHERWISE

MSC - MEDIA-SPECIFIC CONCENTRATION.

NV - NO VALUE

TENTATIVELY IDENTIFIED COMPOUNDS (TIC) ARE NOT SHOWN.

B - FOR INORGANICS, THE QUANTITATION IS AN ESTIMATED CONCENTRATION BETWEEN THE MDL AND PQL FOR ORGANICS, THE CONSTITUENT WAS ALSO DETECTED IN THE ASSOCIATED METHOD BLANK

J - THE ANALYTE WAS POSITIVELY IDENTIFIED, THE QUANTITATION IS AN ESTIMATION

VOCs - Volatile Organic Compounds
SVOCs - Semivolatile Organic Compounds
PCBs - Polychlorinated Biphenyls

As - Arsenic
Cd - Cadmium
Pb - Lead

Soil samples were analyzed for VOCs (EPA Method SW8260), SVOCs (EPA Method SW8270), inorganics (EPA Methods SW 6010/7000 and 7471 for mercury), and pesticides/PCBs (EPA Method SW8080).

Monitoring well WITCTA001 was installed during the Phase 1 RFI in April 1997 immediately adjacent to boring SB335801 (Figure 14-1). The well was completed to a total depth of 22 feet bgs, with a screen interval from 9.5 to 21.75 feet in depth. Well WITCTA001 was developed and groundwater sample MS1562 was collected from the well in April 1997. Groundwater sample MS1562 was analyzed for VOCs, SVOCs, and inorganics (IT, 1998).

### *14.2.2 Phase 2 RFI Activities – IT Corporation 2000*

An additional soil sample was collected by IT during the Phase 2 RFI in April 2000 (Table 14-1) One soil boring (SB335808) was advanced southeast of the OWS at Building 3358 (Figure 14-1). Sample BG033 was collected from surface to 2 feet in depth from SB335808 and analyzed for arsenic and lead to confirm concentrations of these inorganics detected in Phase 1 boring SB335801.

### *14.2.3 Phase 3 RFI Activities – IT Corporation 1997-1998*

A confirmation surface soil sample (BS335809) was collected by IT during the Phase 3 RFI in November 2000 (Table 14-1) to confirm the arsenic, cadmium, and lead concentrations that exceeded both background and MSCs during the Phase 1 investigation. Soil samples were collected from SB335809 (Figure 14-1) at depths of 0 to 2 feet and 5 to 7 feet bgs and analyzed for arsenic, cadmium, and lead to adequately characterize concentrations at this location.

## *14.3 Site-Specific Conditions*

The following subsections discuss the site-specific geology and hydrogeology characteristics that were encountered during the investigation activities at Building 3358 site.

***Geology.*** Quaternary alluvium is found at the surface through most of the NAS Fort Worth area. The alluvium consists of floodplain and fluvial terrace deposits of gravel, sand, silt, and clay that occur as a veneer on the eroded surface of Upper Cretaceous strata. The soil types encountered in soil boring SB335801 (Appendix A) adjacent to the OWS at Building 3358 included loose, moist, brownish-yellow, silty sand grading to moderately stiff, slightly moist, red sandy silt from 0 to 2 feet bgs. The next sample from 12 to 14 feet bgs was slightly stiff/moist, yellowish-red, silty fine sand, and from 14 to 16 feet bgs the soil was loose, wet, brown, coarse

sand/fine gravel. The soil characteristics from boring SB335802 included some fill material in the first foot of the profile, then slightly moist, very stiff, red silty clay from 1 to 2 feet bgs. The next sample from 12 to 14 feet bgs was slightly stiff/moist, yellowish-red, silty fine sand, and from 14 to 16 feet bgs the soil was loose, moist, brown fine sand. Total depth of both borings was 16 feet bgs. No odors or staining were observed in the soil samples.

The alluvial soils rest unconformably on the top of the weathered Walnut Formation. Underlying the Quaternary alluvium is the Cretaceous-aged Walnut Formation, which consists of 20 to 30 feet of indurated fossiliferous limestone interbedded with brown sandy clay, thinly bedded fossiliferous clay, and fissile shale. Unconformably underlying the Walnut Formation is the Cretaceous-aged Paluxy Formation. The Paluxy Formation generally consists of coarse-grained sand that grades upward into fine-grained sand with variable amounts of shale and limestone. The sandstone, composed of fine- to coarse-grained white quartz, is well-sorted, poorly consolidated, and cross-bedded. The Paluxy Formation thickness ranges from 140 to 190 feet, averaging 160 feet in Tarrant County (Radian, 1991).

***Hydrogeology.*** Shallow groundwater within the Quaternary alluvium occurs in fluvial terrace deposits of sand and gravel, which occur as a veneer on the eroded surface of the Walnut Formation. Soil borings SB335801 and SB335802 on the east and northwest side of Building 3358 (Appendix A) indicated silty fine sand below 12 feet in depth, and moist/wet conditions below approximately 16 feet in depth Monitoring well WITCTA001 was installed by overdrilling SB335801 adjacent to Building 3358 to screen the sand down to the top of the Walnut Formation, encountered at approximately 20 feet bgs.

The water level for monitoring well WITCTA001 at Building 3358 is at 15.5 feet bgs. The predominant groundwater flow direction in the area of the Building 3358 site is to the north and east toward Lake Worth.

### *14.4 Results from Phase 1 RFI Activities*

IT collected soil samples in March 1997 from borings SB335801, located adjacent to the OWS, and SB335802, located on the northwest side of Building 3358 (Figure 14-1). A second round of sampling occurred in January 1998 from five additional shallow DPT samples (SB335803 through SB335807) collected around the wash rack. No subsurface samples were obtained during the second round. Monitoring well WITCTA001 was installed and sampled in April 1997 immediately adjacent to boring SB335801. Soil samples were analyzed for VOCs, SVOCs,

inorganics, and pesticides/PCBs. The groundwater sample from WITCTA001 was analyzed for VOCs, SVOCs, and inorganics.

Table 14-2 contains a summary of the analytes detected in the Phase 1 RFI soil samples and Table 14-3 contains a summary of the analytes detected in the Phase 1 RFI groundwater samples. Analytical detection summary tables for the soil and groundwater samples collected at Building 3358 are shown in Tables B-20 and B-21, respectively. The following sections present the results from soil and groundwater samples that were collected during the Phase 1 RFI at Building 3358.

### *14.4.1 Surface Soil*

Surface soil samples were collected with DPT from soil boring locations SB335801 and SB335802 during the first round of sampling in March 1997. A second round of surface soil samples were taken from 1 to 2 feet bgs from borings SB335803 through SB335807 to avoid asphalt contamination (Figure 14-1) The surface soil samples were analyzed for VOCs, SVOCs, inorganics, and pesticides/PCBs. The results from these surface soil samples are discussed in the following subsections.

***VOCs.*** The two VOCs detected above the MQLs in surface soil samples were toluene and methylene chloride. Toluene was detected above its MQL (0.0053 mg/kg) in one surface soil sample (SB335801) at a concentration of 0.0099 mg/kg, which is well below the MSC for toluene (100 mg/kg). As mentioned previously, toluene detected at low concentrations in soil samples was likely the result of toluene leaching into the samples from the DPT sample liners, which were constructed of PET.

Methylene chloride was detected above the MQL in seven surface soil samples at concentrations ranging from 0.005 to 0.0062 mg/kg, which are below the MSC for methylene chloride (0.5 mg/kg). All of the methylene chloride concentrations detected in surface soil samples were qualified as laboratory contamination. Considering that methylene chloride is a common laboratory contaminant and the concentrations in the samples are low, the detected concentrations are likely the result of laboratory contamination.

Qualifier Definitions
= The analyte was positively identified
U = The analyte was analyzed for, but not detected The associated numerical value is at or below the MDL
F = The analyte was positively identified but the associated numerical value is below the reporting limit
J = For inorganics, the associated value is an estimated quantity For organics, the analyte was positively identified, the associated numerical value is the approximate concentration of the analyte in the sample
BJ = Estimated quantitation - possible biased high based upon blank contamination
nv = not validated

Validated Qualifier Definitions
B = For inorganics, the reported value is an estimated quantity

***SVOCs.*** Results for SVOCs were below MQLs in surface soil samples with the exception of di-n-butylphthalate, which was qualified as laboratory contamination. In addition, the detected concentration of di-n-butylphthalate (0.95 B mg/kg) was well below the established MSC (1000 mg/kg). Several unidentified hydrocarbons and organic acids were detected and tentatively qualified as estimated concentrations below PQLs (Table B-20). Although no detection limits were established for these compounds in the laboratory analysis, the values are within the PQL range (0.660 to 3 30 mg/kg) for SVOCs described in SW846 Method 8270 (EPA, 1997). The only SVOC without a detection limit that exceeded this PQL range was cholesterol, which was detected slightly above the 3.30 mg/kg range with a result of 4 7 mg/kg. An MSC cannot be determined for these compounds

***Pesticides/PCBs.*** No pesticide/PCBs compounds were detected above MQLs in the surface soils sampled at the Building 3358 OWS site

***Inorganics.*** Inorganic compounds detected above background included: arsenic, cadmium, lead, and zinc. The levels of arsenic (7.8 mg/kg) and cadmium (0.97 mg/kg) also slightly exceeded MSCs. In addition, lead (91.6 mg/kg) exceeded its MSC. The detected concentration of zinc (91.5 mg/kg) was considerably lower than its MSC (3100 mg/kg), and considering that zinc was detected above background (38 8 mg/kg) in only one of seven surface soil samples, the detected zinc concentration at SB335801 was likely an extreme, but true, background concentration.

Although arsenic, cadmium, and lead exceeded background (and MSCs) in the surface soil sample from SB335801, the second round confirmation sample results at SB335803 through SB335807 were below the background concentrations for these inorganics and do not indicate any significant contamination or vertical/lateral migration of arsenic, cadmium, or lead. Thus, the single occurrence of arsenic, cadmium, and lead above background may be a localized anomaly.

### *14.4.2 Subsurface Soil*

Subsurface soil samples were collected from 12 to 14 feet and 14 to 15.5 feet bgs from locations SB335801 and SB335802, respectively, for VOC, metals, SVOC, and pesticides/PCBs analyses. No subsurface samples were taken in the second round of sampling at borings SB335803 through SB335807. The following subsections discuss the analytical results from these subsurface soil samples collected during the Phase 1 RFI at Building 3358.

***VOCs.*** VOCs were below MQLs in the subsurface soils sampled at the Building 3358 site.

***SVOCs.*** Results for SVOCs were below MQLs in subsurface samples, with the exception of di-n-butylphthalate from SB335802, which was qualified as laboratory contamination. In addition, the detected concentration of di-n-butylphthalate (1.1 B mg/kg) was well below the MSC (1000 mg/kg). Several TICs detected in the SVOC analysis were qualified at estimated concentrations below PQLs (Table B-20). Although no detection limits were established for these TICs in the laboratory analysis, the values are within the PQL range (0.660 mg/kg to 3.30 mg/kg) for SVOCs described in SW846 Method 8270 (EPA, 1997). Considering that the detected concentration of di-n-butylphthalate was the likely the result of laboratory contamination and the detected concentrations of the TICs were below PQLs, all SVOC concentrations are below background for organics, as defined by the TNRCC RRP.

***Pesticides/PCBs.*** No pesticides/PCBs compounds were detected above MQLs in subsurface soil samples at the Building 3358 site.

***Inorganics.*** Inorganic compounds detected in subsurface soil samples from SB335801 and SB335802 included aluminum, barium, beryllium, calcium, cadmium, chromium, cobalt, copper, iron, lead, magnesium, manganese, molybdenum, nickel, potassium, sodium, vanadium, and zinc. However, none of the inorganic concentrations exceeded background.

### *14.4.3 Groundwater*

Monitoring well WITCTA001 was installed and sampled in April 1997 for analysis of VOCs, SVOCs, and inorganics. The following subsections discuss the analytical results from the groundwater sample collected at Building 3358.

***VOCs.*** Methylene chloride was detected at a concentration of 0.00068 mg/L in the groundwater sample from WITCTA001, but the result was qualified as laboratory contamination. Chloroform (0.0017 mg/L) and bromodichloromethane (0.001 mg/L) were also detected. Methylene chloride, chloroform, and bromodichloromethane detections were below the MSCs established for these compounds. Methylene chloride is considered a common laboratory contaminant and its detection is likely the result of laboratory contamination. The detections of chloroform and bromodichlormethane may be attributed to the presence of the compounds in the City of Fort Worth water supply, which was verified in method blanks collected during the RFI. These

compounds may be from potable water leaks at the wash rack or residual contamination from decontamination of the sampling equipment with potable water.

***SVOCs.*** Results for SVOCs were below MQLs in groundwater samples collected from WITCTA001. Several TICs were identified in the SVOC analysis and were qualified at estimated concentrations below PQLs (Table B-21). No detection limits were established for these compounds in the laboratory analysis but the values are within the PQL range (0.01 to 1.0 mg/L) for SVOCs described in SW846 Method 8270 (EPA, 1997). Therefore, all SVOC concentrations detected in the groundwater sample from WITCTA001 were below background for organics, as defined by the TNRCC RRP.

***Inorganics.*** Inorganic compounds detected in the groundwater sample from WITCTA001 included potassium, barium, sodium, calcium, zinc, iron, magnesium, and manganese. However, none of these compounds exceeded background concentrations in groundwater

### 14.5 Results from Phase 2 Activities

IT collected a surface soil sample from one boring (SB335808) during the Phase 2 RFI in April 2000 to confirm arsenic and lead concentrations detected in Phase 1 RFI boring SB335801. As shown in Table 14-2 and Figure 14-1, the detected arsenic concentration (4.36 mg/kg) in the Phase 2 surface soil sample from SB335808 was below background. Likewise, the lead concentration (11 5 mg/kg) detected in the Phase 2 surface soil sample from SB335808 was below background

### 14.6 Results from Phase 3 RFI Activities

IT collected one surface and one subsurface soil sample from DPT boring SB335809 during the Phase 3 RFI to confirm arsenic, cadmium, and lead concentrations detected at Phase 1 boring SB335801. The results from the Phase 3 soil samples at Building 3358 are presented in Table 14-2. The Phase 3 analytical results are also shown in Figure 14-1. The following sections discuss the analytical results from the Phase 3 RFI samples.

#### 14.6.1 Surface Soil

The detected concentrations of arsenic, cadmium, and lead were all below respective background in the surface soil sample collected from 0 to 2 feet bgs at SB335809. Therefore, considering that arsenic and lead concentrations were below background in the four surface soil samples collected near SB335801 (i.e., Phase 1 borings SB335804 and SB335805, Phase 2 boring

SB335808, and Phase 3 boring SB335809), the elevated arsenic and lead concentrations detected at SB335801 were likely extreme, but true, background concentrations. Similarly, cadmium was not detected above background in the surface soil samples from SB335804, SB335805, and SB335809; therefore, the elevated cadmium concentration detected at SB335801 was likely an extreme, but true, background concentration.

### 14.6.2 Subsurface Soil

The detected concentrations of arsenic, cadmium, and lead were all below their respective background concentrations in the subsurface soil sample collected from 5 to 7 feet bgs at SB335809.

## 14.7 Summary and Discussion

IT collected surface and subsurface soil samples from two borings (SB335801 and SB335802) during the first round of the Phase 1 RFI for analysis of VOCs, SVOCs, pesticides/PCBs, and inorganics. Monitoring well WITCTA001 was installed directly downgradient from the OWS at Building 3358 and sampled for VOCs, SVOCs, and inorganics. IT collected surface soil samples from five additional boring locations (SB335803 through SB335807) during the second round of the Phase 1 RFI. A surface soil sample was collected from Phase 2 boring SB335808 to confirm arsenic and lead concentrations detected at Phase 1 boring SB335801. IT collected a surface (0 to 2 feet bgs) and subsurface (5 to 7 feet bgs) soil sample at Phase 3 boring SB335809 in November 2000 to confirm arsenic, cadmium, and lead concentrations found in the surface soil from Phase 1 boring SB335801. The following sections discuss the relevance of the parameters detected in surface soil, subsurface soil, and groundwater during investigations at the Building 3358.

### 14.7.1 Surface Soil

Arsenic, cadmium, and lead were detected in one surface soil sample (SB335801) at concentrations that exceeded both background and MSCs. However, these inorganics were not detected above background concentrations in confirmation samples collected from the two borings (SB335804 and SB335805) during the second round of the Phase 1 RFI, or from Phase 3 boring SB335809. Arsenic and lead concentrations were also below background in the surface soil sample collected from Phase 2 boring SB335808 Therefore, the arsenic, cadmium, and lead concentrations detected in the surface soil from SB335801 were likely extreme, but true, background concentrations.

Toluene and methylene chloride were the only VOCs detected in surface soil samples but these contaminants were attributable to other sources (i.e., toluene from DPT sample liners and methylene chloride from laboratory contamination). One SVOC, di-n-butylphthalate, was detected above its MQL, but was qualified as being laboratory contamination. No pesticides or PCBs were detected above MQLs.

### 14.7.2 Subsurface Soil

No VOCs, SVOCs (excluding di-n-butylphthalate), or inorganics were detected above MQLs or background in the subsurface soil samples collected at Building 3358. The detected concentrations of di-n-butylphthalate were qualified as being affected by contamination in the associated method blank and were likely the result of laboratory contamination.

### 14.7.3 Groundwater

The detections from monitoring well WITCTA001 in groundwater sample MS1562 are not indicative of a significant release to groundwater from the OWS at Building 3358. Chloroform, bromodichloromethane, and methylene chloride were the only VOCs detected above MQLs in groundwater. The detected concentrations were below the MSCs established for these compounds. The detected concentration of methylene chloride was likely due to laboratory contamination. The detections of chloroform and bromodichloromethane may be attributed to the presence of the compounds in the City of Fort Worth water supply, which was verified in method blanks collected during the RFI. No SVOCs or inorganics were detected at concentrations exceeding background/MQLs

## 14.8 Conclusions

Field observations and analytical results in the vicinity of the OWS at Building 3358 indicate that there has been no evidence of release of contaminants from the OWS system. Although arsenic, cadmium, and lead were detected above background and MSCs in one Phase 1 surface soil sample (SB335801), confirmation samples collected during Phase 2 and Phase 3 RFI activities indicated that these inorganics were below basewide background concentrations. Therefore, it was concluded that the concentrations detected slightly above background in the Phase 1 RFI were extreme, but true, background concentrations, and were not an indication of a release from the OWS at Building 3358. Because the analyte concentrations exceeding RRS 1 values in the soil and groundwater samples collected at Building 3358 were likely extreme background concentrations that were unable to be confirmed or resulted from laboratory or field

contamination (e.g., methylene chloride, toluene, and di-n-butylphthalate), NFA is warranted at the subject site and the OWS at Building 3358 is recommended for closure under RRS 1.

# 15.0 OWS Building 4146

The following sections provide a description of the OWS at Building 4146, a summary of the site characterization activities, a discussion of the site-specific geology and hydrology, discussions of the analytical results from each characterization event, and recommendations based upon the physical and chemical data collected at the site.

## 15.1 Site Description

The OWS at Building 4146 is located adjacent to the north edge of Building 4146 and is located about 170 feet east of the main Base taxiway (Figure 15-1). The OWS is a below-ground concrete vault operated by gravity flow and connected to the Sanitary Sewer System (SWMU No. 66). Building 4146 is currently used as an engine test cell. The OWS has a 20,000-gallon capacity and was installed in 1983 to remove jet engine fuel from wastewater collected in the building floor drains. Discharge from the OWS goes directly to the City of Fort Worth sewer line at manhole P1 Base personnel have not reported any problems associated with the OWS and visual observations did not indicate any apparent problems associated with the integrity of the separator unit (IT, 1998).

## 15.2 Site Characterization Activities

A summary of the soil and groundwater samples that have been collected at the Building 4146 site is provided in Table 15-1. The analytical methods associated with each soil sample collected at Building 4146 are also presented in Table 15-1 The locations of the soil borings are shown in Figure 15-1. The following sections discuss the investigation activities that have been performed to characterize environmental impacts relating to the OWS at Building 4146.

### 15.2.1 Phase 1 RFI Activities – IT Corporation 1997

IT collected soil samples during Phase 1 of the Sanitary Sewer System RFI in April 1997 (Table 15-1) from borings SB414601, SB414602, SB414603, and SB414604, all located adjacent to the OWS at Building 4146 One surface soil sample and one subsurface soil sample were collected from each of the four soil borings. Surface soil samples collected were MS1223, MS1225, MS1228, and MS1230. Surface soil sample MS1226 was collected as a field duplicate of MS1225. Subsurface soil samples (MS1224, MS1227, MS1229, and MS1231) were collected from the 2-foot interval directly above the water table (16 to 18 feet bgs).

VOCs - Volatile Organic Compounds
SVOCs - Semivolatile Organic Compounds
PCBs - Polychlorinated Biphenyls
Pb - Lead
Ag - Silver

Figure 15-1 shows the locations of the soil borings. Samples were analyzed for VOCs (EPA Method SW8260), SVOCs (EPA Method SW8270), inorganics (EPA Methods SW6010/7000 and 7471 for mercury), and pesticides/PCBs (EPA Method SW8080) (IT, 1998).

Monitoring well WITCTA039 was installed during the Phase 1 RFI in April 1997 immediately adjacent to boring SB414601 (Figure 15-1). The well was completed to a total depth of 26 feet bgs, with a screen interval from 14.3 to 24.3 feet depth bgs. Well WITCTA039 was developed and groundwater sample MS1582 was collected from the well in May 1997. Sample MS1582 was analyzed for VOCs, SVOCs, and inorganics (IT, 1998).

### 15.2.2 Phase 2 RFI Activities – IT Corporation 2000

An additional soil sample was collected by IT during the Phase 2 RFI in April 2000 (Table 15-1). One soil boring was advanced northeast of the OWS at Building 4146 (Figure 15-1) Sample BG0034 was collected from surface to 2 feet in depth from SB414605 and analyzed for lead to delineate a concentration detected at SB414603.

### 15.2.3 Phase 3 RFI Activities – IT Corporation 2000

Two soil borings (SB414606 and SB414607) were sampled during the Phase 3 RFI in November 2000 (Table 15-1). SB414606 was sampled to delineate lead concentrations (EPA Method SW6010) in surface soil to the west of the site. Additionally, a confirmation soil sample was collected from SB414607 to confirm the lead concentration that exceeded background and MSC during the Phase 1 investigation. Samples were collected from surface to 2 feet and 5 to 7 feet bgs at SB414606 and SB414607 (Figure 15-1). Analysis for silver by EPA Method SW7761 series was performed on the confirmation surface sample (SB414607) to provide evidence that silver concentrations detected during the previous investigations were the result of matrix interferences associated with Method 6010.

## 15.3 Site-Specific Conditions

The following subsections discuss the site-specific geology and hydrogeology characteristics that were encountered during the investigation activities at Building 4146 site.

***Geology.*** Quaternary alluvium is found at the surface through most of the NAS Fort Worth area. The alluvium consists of floodplain and fluvial terrace deposits of gravel, sand, silt, and clay that occur as a veneer on the eroded surface of Upper Cretaceous strata. Four soil borings

were driven and sampled in the alluvium adjacent to the OWS at Building 4146 (Figure 15-1). SB414601 and SB414603 were driven to total depths of 22 feet bgs, and SB414602 and SB414604 were driven to 20 feet bgs.

Soil description logs (Appendix A) for the four soil borings at the Building 4146 site indicate similar sequences of soil types. Brown, yellowish-brown or reddish-brown, moist clay and gravelly clay with minor amounts of sand and silt was found from 0 to 18 feet bgs at soil borings SB414601 and SB414603, from 0 to 14 feet bgs at SB414604, and from 0 to 6 feet bgs at SB414602. Below this clay unit was yellow, reddish-yellow or yellowish-brown, very moist clayey gravel with varying amounts of sand and silt. Saturated conditions existed below approximately 20 feet bgs. Black staining was noted on the soil description log for SB414601 from 8 to 10 feet bgs, and on the log for SB414604 from 11 to 13 feet bgs.

The alluvial soils rest unconformably on the top of the weathered Walnut Formation. Underlying the Quaternary alluvium is the Cretaceous-aged Walnut Formation, which consists of 20 to 30 feet of indurated fossiliferous limestone interbedded with brown sandy clay, thinly bedded fossiliferous clay, and fissile shale. Unconformably underlying the Walnut Formation is the Cretaceous-aged Paluxy Formation. The Paluxy Formation generally consists of coarse-grained sand that grades upward into fine-grained sand with variable amounts of shale and limestone. The sandstone, composed of fine- to coarse-grained white quartz, is well-sorted, poorly consolidated, and cross-bedded. The Paluxy Formation thickness ranges from 140 to 190 feet, averaging 160 feet in Tarrant County (Radian, 1991).

***Hydrogeology.*** Shallow groundwater within the Quaternary alluvium occurs in fluvial terrace deposits of sand and gravel, which occur as a veneer on the eroded surface of the Walnut Formation. Soil borings SB414601, SB414602, SB414603, and SB414604 on the north side of Building 4146 (Appendix A) encountered gravel and sand below 14 to 18 feet in depth, and saturated conditions below approximately 20 feet in depth. Monitoring well WITCTA039 was installed north of Building 4146 to screen the gravel and sand down to the top of the Walnut Formation, at approximately 26 feet in depth. Groundwater flow at the Building 4146 site is to the south and east toward Farmers Branch Creek.

### 15.4 Results from Phase 1 RFI Activities

As discussed in Section 15.2, IT collected surface and subsurface soil samples in April 1997 from borings SB414601, SB414602, SB414603, and SB414604, all located adjacent to the OWS at Building 4146. The soil samples were analyzed for VOCs, SVOCs, inorganics, and pesticides/PCBs. Monitoring well WITCTA039 was installed in April 1997 and sampled for VOCs, SVOCs, and inorganics. The purpose of the Phase 1 RFI soil samples was to determine whether there was evidence of a release of hazardous constituents from the OWS at Building 4146.

Table 15-2 contains a summary of the analytes detected in the Phase 1 RFI soil samples and Table 15-3 contains a summary of the analytes detected in the Phase 1 RFI groundwater samples. Analytical detection summary tables for the soil and groundwater samples collected at Building 4146 are shown in Tables B-22 and B-23, respectively. The following sections present the results from soil and groundwater samples that were collected during the Phase 1 RFI activities at Building 4146.

#### 15.4.1 Surface Soil

Surface soil samples were collected from 0 to 2 feet bgs with DPT at soil boring locations SB414601 through SB414604. Samples were submitted for analysis of VOCs, SVOCs, pesticides/PCBs, and inorganics. The following subsections discuss the analytical results from these surface soil samples.

***VOCs.*** Two VOCs, toluene and methylene chloride, were detected in the surface samples from all four soil borings (SB414601 through SB414604) at concentrations exceeding MQLs. The results for toluene and methylene chloride are well below MSCs. The methylene chloride concentrations were qualified as laboratory contamination. Methylene chloride is considered a common laboratory contaminant and the low concentrations were likely the result of laboratory contamination. As mentioned previously, toluene concentrations detected at low concentrations in soil samples were likely the result of toluene leaching into the samples from the DPT sample liners, which were constructed of PET.

MSC = Media-Specific Concentration
NA = not applicable
MQL = Method Quantitation Limit
RRS 1 = Risk Reduction Standard 1
RRS 2 = Risk Reduction Standard 2
TNRCC = Texas Natural Resources Conservation Commission
UTL = Upper Tolerance Limit
Footnotes
[1] UTLs for inorganics derived from Final Draft Basewide Background Study, Jacobs Engineering, 1998 MQLs for organics were derived by taking the most conservative reporting limit for a given analyte
[2] TNRCC, 1999, "Updated Examples of Standard No 2, Appendix II Media-Specific Concentrations (MSCs) - Industrial Setting", July 14
Qualifier Definitions
= The analyte was positively identified
U = The analyte was analyzed for, but not detected The associated numerical value is at or below the MDL
F = The analyte was positively identified but the associated numerical value is below the reporting limit.
J = For inorganics, the associated value is an estimated quantity For organics, the analyte was positively identified, the associated numerical value is the approximate concentration of the analyte in the sample
BJ = Estimated quantitation - possible biased high based upon blank contamination
nv = not validated

Footnotes
[1] UTLs for inorganics derived from Final Draft Basewide Background Study, Jacobs Engineering, 1998 MQLs for organics were derived by taking the most conservative reporting limit for a given analyte
[2] TNRCC, 1999, "Updated Examples of Standard No 2, Appendix II Media Specific Concentrations (MSCs) - Industrial Setting", July 14
Validated Qualifier Definitions
B = For inorganics, the reported value is an estimated quantity

Four unidentified hydrocarbons were reported at estimated concentrations of 0.016, 0.027, 0.026, and 0.013 mg/kg as part of the SW8260 analysis for the surface soil sample collected at soil boring SB414603 (Table B-22). The PQL value anticipated for analysis of VOCs in soil by SW846 Method 8260 is approximately 0.005 mg/kg. The PQL is described as highly dependent on a sample matrix and may not always be achievable (EPA, 1997). Because these estimated values are within a factor of 5 of the anticipated PQL, they are judged to be consistent with the PQL for the method used. Because the specific compounds are not identified, calculation of MSC values according to the methods specified in TNRCC guidance is precluded. However, because the reported concentrations of these compounds are consistent with the range of PQL values for the analytical method used, they meet the requirements of RRS 1.

***SVOCs.*** The SVOC detections in surface soil samples at Building 4146 are TICs. No detection limits were established for these compounds in the SW8270 laboratory analysis and are subsequently qualified as estimated concentrations below the PQLs. These TICs include unidentified hydrocarbons, 1,1,2,2-tetrachloroethane, and other named compounds (Table B-22). The reported concentrations of the unidentified compounds are within the PQL range (0.66 to 3.3 mg/kg) provided in SW846 Method 8270 (EPA, 1997). Because these compounds have not been identified, RRS 2 MSC levels cannot be calculated according to methods specified in TNRCC regulations. However, because the reported concentrations of these compounds are within the range of PQL values for the analytical method used, they meet the requirements of RRS 1 (i.e., background for organics).

***Pesticides/PCBs.*** No pesticides or PCBs were detected above MQLs in surface soil samples at the Building 4146 site.

***Inorganics.*** With the exception of calcium, lead, molybdenum, and silver in the surface soil sample from SB414603, and calcium in samples from SB414601 and SB414602, all of the inorganic detections in surface soil samples at Building 4146 were below background.

The lead detection in the sample from soil boring SB414603 (42 mg/kg) exceeded the background and MSC for lead. Although this lead concentration slightly exceeds background, lead is commonly found at similar concentrations in industrial areas of the Base. These concentrations probably result from past uses of lead in motor fuels and industrial materials.

The reported concentration of silver (0.62 B mg/kg) in the surface sample from SB414603 is below the MSC for silver (51 mg/kg) and is likely the result of matrix interferences associated with EPA Method SW6010 and not the result of a release from the OWS at Building 4146. The reported concentration of molybdenum in the surface sample from SB414603 (1.6 B mg/kg) was slightly above background for molybdenum (1 46 mg/kg) but was below the MSC (51 mg/kg). Considering the slight deviation from background, the molybdenum detection at SB164303 is likely an extreme, but true, background concentration.

### *15.4.2 Subsurface Soil*

Subsurface soil samples were collected from 16 to 20 feet bgs with DPT soil boring locations SB414601 through SB414604 for analysis of VOCs, SVOCs, pesticides/PCBs, and inorganics. The following subsections discuss the analytical results from the subsurface samples collected during the Phase 1 RFI at Building 4146.

***VOCs.*** Toluene and methylene chloride were detected in subsurface soil samples from all four soil borings (SB414601 through SB414604) at the Building 4146 site. The results for toluene and methylene chloride were below the MSCs for these compounds in subsurface soils. Methylene chloride concentrations were qualified as laboratory contamination Methylene chloride is considered a common laboratory contaminant and the concentrations are the low levels detections likely to result from laboratory contamination. The toluene concentrations detected at low concentrations in soil samples were likely the result of toluene leaching into the samples from the DPT sample liners, which were constructed of PET. All other VOCs were below MQLs.

***SVOCs.*** The SVOC detections in subsurface soil samples at Building 4146 are TICs that were qualified at estimated concentrations below the PQL. No detection limits were established for these TICs in the SW8270 laboratory analysis, and they include unidentified hydrocarbons and 1,1,2,2-tetrachloroethane (Table B-22). The reported concentrations of the unidentified compounds are within the PQL range (0.66 to 3 3 mg/kg) provided in SW846 Method 8270 (EPA, 1997). Because these compounds have not been identified, or do not have established toxicity values, MSCs cannot be calculated according to methods specified in TNRCC regulations. However, because the reported concentrations of these compounds are within the range of PQL values for the analytical method used, they meet the requirements of RRS 1.

***Pesticides/PCBs.*** Pesticide and PCB detections were below MQLs in subsurface soil samples collected at the Building 4146 site (Table 15-2).

***Inorganics.*** All reported concentrations of inorganic compounds in subsurface soil samples were below background, except for silver in the sample from SB414602, magnesium and silver in the sample from SB414603, and calcium, magnesium, manganese, and silver in the sample from SB414604. Calcium and magnesium are naturally occurring essential nutrients and the detected concentrations of these inorganics are likely natural variations in background. Manganese was detected at a concentration (859 mg/kg) that exceeded background (351.7 mg/kg), but was below the MSC (1400 mg/kg). Considering that only one manganese concentration detected in subsurface soils exceeded background and that the concentration (859 mg/kg) is similar to background in surface soil (849 mg/kg), the manganese concentration detected at SB414604 was likely an extreme, but true, background concentration.

### *15.4.3 Groundwater*

Monitoring well WITCTA039 was installed in April 1997 immediately adjacent to boring SB414601 and was sampled for analysis of VOCs, SVOCs, and inorganics. The following subsections discuss the analytical results from the Phase 1 groundwater sample from WITCTA039

***VOCs.*** TCE, cis-1,2-DCE, and vinyl chloride were detected at concentrations above MQLs and MSCs in the groundwater sample (and field duplicate) from WITCTA039. However, because the extent of AFP-4 TCE groundwater plume includes the area of Building 4146 and contaminants from this plume are managed under the AFP-4 Superfund Cleanup Program, TCE and its breakdown products, such as cis-1,2-DCE and vinyl chloride, are not considered as an indication of a release from the OWS at Building 4146.

Methylene chloride was detected in the groundwater sample from WITCTA039 at a concentration that was likely the result of laboratory contamination. No other VOCs exceeded MQLs.

***SVOCs.*** Three unidentified compounds were reported at estimated concentrations of 4.3, 8.1, and 0.0075 mg/L as part of the SW8270 analysis for the groundwater sample from WITCTA039 (Table B-23) The reported concentrations of the unidentified compounds are below the PQL

range (0.01 to 1.0 mg/kg) provided in SW846 Method 8270 (EPA, 1997). Because these compounds have not been identified, MSCs cannot be calculated according to methods specified in TNRCC regulations. However, because the reported concentrations of these compounds are within the range of PQL values for the analytical method used, they meet the requirements of RRS 1.

***Inorganics.*** Inorganic compounds detected in groundwater samples from WITCTA039 included iron, potassium, sodium, barium, calcium, manganese, magnesium, and mercury. However, all of these reported concentrations were below background (Table 15-3).

### 15.5 Results from Phase 2 Activities

IT collected a surface soil sample from 0 to 2 feet bgs from boring SB414605 during the Phase 2 RFI in April 2000 to confirm the elevated concentration of lead identified during the Phase 1 RFI. The surface soil sample was analyzed for lead using EPA Method SW6010B. As shown in Table 15-2 and Figure 15-1, the detected lead concentration in the surface soil sample from SB414605 (9.4 mg/kg) was below background.

### 15.6 Results from Phase 3 RFI Activities

Based upon the Phase 1 and Phase 2 RFI data, it was determined that additional data was necessary to confirm and delineate the elevated lead concentration identified in the surface soil sample from Phase 1 boring SB414603. Therefore, soil samples were collected from two borings (SB414606 and SB414607) during the Phase 3 RFI in November 2000. In addition to surface soil samples collected from 0 to 2 feet bgs at each boring, samples were also collected from 5 to 7 feet bgs at each location for analysis of lead. Silver was included in the analysis for the surface soil sample collected from SB414607 to confirm the silver concentration detected at this location during the Phase 1 RFI.

The results from the Phase 3 soil samples at Building 4146 are included in Table 15-2. The Phase 3 analytical results are also shown in Figure 15-1. The following sections discuss the analytical results from the Phase 3 RFI samples.

### 15.6.1 Surface Soil

The lead concentrations detected in the surface soil samples from SB414606 (14 mg/kg) and SB414607 (13.7 mg/kg) were below background. Therefore, the elevated lead concentration identified at the 1997 Phase 1 RFI boring SB414601 (42 B mg/kg) was not confirmed by the result from SB414607 and was likely an extreme, but true, background concentration.

Silver was not detected in the surface soil sample from SB414607. Therefore, the elevated concentrations detected at SB414601 were likely caused by matrix interferences associated with EPA Method SW6010 and were not indicative of a release from the OWS at Building 4146.

### 15.6.2 Subsurface Soil

The lead concentrations detected in the samples collected from 5 to 7 feet bgs from SB414606 (19 mg/kg) and from SB414607 (13.6 mg/kg) slightly exceeded background. However, considering that these concentrations are below the background concentration for lead in surface soil (30.97 mg/kg) and that lead was not detected above background in the Phase 1 subsurface soil samples or the groundwater sample from WITCTA039, it is likely that these concentrations are extreme, but true, background concentrations.

### 15.7 Summary and Discussion

IT collected surface and subsurface soil samples from four borings (SB414601 through SB414604) during the Phase 1 RFI at Building 4146 for analysis of VOCs, SVOCs, pesticides/PCBs, and inorganics. Monitoring well WITCTA039 was installed directly downgradient from the OWS at Building 4146 and sampled for VOCs, SVOCs, and inorganics. A surface soil sample was collected from Phase 2 boring SB414605 to confirm lead concentrations detected at Phase1 boring SB414603. IT collected a surface (0 to 2 feet bgs) and subsurface (5 to 7 feet bgs) soil sample at two Phase 3 borings (SB414606 and SB414607) in November 2000 to confirm and delineate lead and silver concentrations found in the surface soil from Phase 1 boring SB414603. The following sections discuss the relevance of the parameters detected in surface soil, subsurface soil, and groundwater during investigations at the Building 4146 site.

### 15.7.1 Surface Soil

Lead was detected in one surface soil sample (SB414603) at a concentration that exceeded both its background and MSC. However, lead was not detected above background concentration in

confirmation samples collected from Phase 2 boring SB414605 or Phase 3 borings SB414606, SB414606, and SB414607, which indicates that the lead concentration detected in surface soil at SB414603 was likely an extreme, but true, background concentration. The silver concentration detected at SB414603 was not confirmed in Phase 3 boring SB414607 and was most likely associated with matrix interferences commonly found in EPA Method SW6010.

Toluene and methylene chloride were the only VOCs detected above MQLs in surface soil samples but these contaminants were attributable to other sources (i.e., toluene from DPT sample liners and methylene chloride from laboratory contamination). Several TICs were identified in the SVOC analysis, but at concentrations below the PQL range for EPA Method SW8270 and therefore meet the requirements for RRS 1 No pesticides or PCBS were detected above MQLs in the surface soil samples collected at Building 4146.

### *15.7.2 Subsurface Soil*

Toluene and methylene chloride were the only VOCs detected above MQLs in subsurface soil samples but these contaminants were attributable to other sources (i.e., toluene from DPT sample liners and methylene chloride from laboratory contamination). Several unidentified compounds were identified in the SVOC analysis, but at concentrations below the PQL range for EPA Method SW8270 and therefore meet the requirements for RRS 1. No pesticides or PCBs were detected above MQLs in the subsurface soil samples collected at Building 4146.

The detected concentrations of calcium, magnesium, manganese, and silver, which exceeded background, were likely extreme, but true, background concentrations, except for the low concentrations of silver, which were likely caused by matrix interferences associated with EPA Method SW6010. Lead was detected in the two Phase 3 subsurface soil samples collected from 5 to 7 feet bgs at concentrations (19 and 13 6 mg/kg) that are slightly above the background concentration for lead in subsurface soil (12.66 mg/kg). However, considering that these concentrations were below background for lead in surface soil (30.97 mg/kg) and that lead was not detected above background in the subsurface soil and groundwater samples collected from the Phase 1 RFI sampling locations, the elevated lead concentrations are likely extreme, but true, background concentrations.

### 15.7.3 Groundwater

Other than methylene chloride and TCE and its breakdown products, cis-1,2-DCE and vinyl chloride, all of the detected concentrations of VOCs, SVOCs, and inorganics were below RRS 1 values (i.e., MQLs for organics and background for inorganics). The detected concentration of methylene chloride was likely the result of laboratory contamination. The detected concentrations of TCE and its breakdown products are associated with the TCE plume originating from AFP-4 and are not considered as an indication of a release from the OWS at Building 4146.

## 15.8 Conclusions

Field observations and analytical results in the vicinity of the OWS at Building 4146 indicated that there has been no evidence of a release of contaminants from the OWS system. Although lead was detected above background and MSCs in one Phase 1 surface soil sample, confirmation samples collected during the Phase 2 and Phase 3 RFIs indicated that lead concentrations in surface soil were below background Therefore, it was concluded that the inorganics (e.g., lead and manganese) detected slightly above background in the Phase 1 RFI were extreme, but true, background concentrations and were not an indication of a release from the OWS at Building 4146. Elevated silver concentrations detected in soil samples were not confirmed during the Phase 3 RFI and were likely the result of matrix interferences associated with Method SW6010. The chlorinated solvents (TCE, DCE, and vinyl chloride) detected in groundwater beneath the site are associated with the regional TCE plume originating from AFP-4; therefore, TCE and its breakdown products were not considered as evidence of a release from the OWS at Building 4146. Based upon this information, NFA is warranted at the subject site and the OWS at Building 4146 is recommended for closure under RRS 1.

# TAB

16.0

# 16.0 OWS Building 4210

The following sections provide a description of the OWS at Building 4210, a summary of the site characterization activities, a discussion of the site-specific geology and hydrology, discussions of the analytical results from each characterization event, and recommendations based upon the physical and chemical data collected at the site.

## 16.1 Site Description

The OWS at Building 4210 (Bomb Assembly Building) is located within the flight line area adjacent to the north-south taxiway and taxiway C (Figure 16-1) and is designated as AOC 12 on the RCRA Hazardous Waste Permit for NAS Fort Worth JRB. The OWS is a below-ground, reinforced concrete vault with a capacity of 4,500 gallons and operates by gravity. The OWS was installed in 1985 and is located in a grassy area. The separator unit was installed to service wastewater containing jet fuel, lubricants, and petroleum products from Building 4210. Building 4210 is currently inactive (Law, 1995).

Law (1995) performed a visual inspection, reviewed records, and conducted interviews with Base personnel during a September 1993 site inspection. Visual observations indicated no apparent deficiencies in the structural integrity of the OWS unit. Maintenance records did not indicate any problems with the OWS.

Pumping and steam cleaning of the OWS at Building 4210 was completed August 10, 1995 (CRA, 1995). The OWS at Building 4210 was also included in a pumping and steam cleaning effort by D.D. and Beauty, a nonhazardous liquid waste removal company, during April and May 1993 (CB, 1994).

## 16.2 Site Characterization Activities

A summary of the soil and groundwater samples that have been collected at the Building 4210 site is provided in Table 16-1. The analytical methods associated with each soil sample collected at Building 4210 are also presented in Table 16-1. The locations of the soil borings are shown in Figure 16-1. The following sections discuss the investigation activities that have been performed to characterize environmental impacts relating to the OWS at Building 4210.

### 16.2.1 Initial Site Investigation – Law 1994

Law (1995) collected soil samples from four soil borings near the perimeter of the OWS in 1994 (Figure 16-1). Soil borings 4210-SB01 through 4210-SB04 were advanced to depths ranging from 6 feet (borings 4210-SB01, 4210-SB03, and 4210-SB04) to 16 feet (boring 4210-SB02) bgs. No surface samples were collected from this site by Law. Eight subsurface samples were collected at depths of 4 to 16 feet bgs on April 21, 1994. A duplicate sample was collected from soil boring 4210-SB04. Samples were analyzed for VOCs (EPA Method SW8240) and inorganics (EPA Method SW6010) (Law, 1995).

### 16.2.2 Phase 1 RFI Activities – IT Corporation 1997

IT collected soil samples during the Phase 1 Sanitary Sewer System RFI in April 1997 (Table 16-1) from borings SB421001 and SB421002 located near the northeast and southeast corners of the OWS, respectively. Surface soil samples MS1195 and MS1193 were collected from surface to 2 feet bgs at borings SB421001 and SB421002, respectively (Figure 16-1). Subsurface soil samples MS1196 and MS1194 were collected at borings SB421001 and SB421002 at depths ranging from 2 to 4 feet and 21 to 23 feet bgs (the 2-foot interval directly above the water table or refusal), respectively Soil samples were also collected adjacent to manhole MH-51, which is approximately 10 feet east of the OWS. Soil samples were analyzed for VOCs (EPA Method SW8260), SVOCs (EPA Method SW8270), inorganics (EPA Methods SW 6010/7000 and SW7471 for mercury), and pesticides/PCBs (EPA Method SW8080) to supplement soil samples collected and analyzed by Law (IT, 1998).

Monitoring well WITCTA020 was installed during Phase 1 of the RFI in April 1997 approximately 30 feet south of the southeast corner of the OWS and manhole MH-51 (Figure 16-1). The well was completed to a depth of 26 feet bgs, with a screen interval from 20.8 to 25.6 feet bgs. The well was developed and groundwater sample MS1569 was collected on April 29, 1997. The sample was analyzed for VOCs, SVOCs, and inorganics (IT, 1998).

### 16.2.3 Phase 2 RFI Activities – IT Corporation 2000

Additional soil sampling was performed by IT during the Phase 2 RFI in April 2000 (Table 16-1). Two soil borings (SB421003 and SB421004) were located northwest of the OWS at Building 4210 (Figure 16-1). Sample BG0035 and BG0036 (FD) were collected from 21 to 23 feet in depth at SB421003. These samples were analyzed for arsenic, cadmium, and vanadium to delineate concentrations of these inorganics detected in 4210-SB01 through 4210-SB04. Sample

BG0037 was collected from 21 to 23 feet in depth at SB421004 and analyzed for arsenic, cadmium, and vanadium to delineate concentrations of these inorganics detected in 4210-SB01 through 4210-SB04.

### 16.2.4 Phase 3 RFI Activities – IT Corporation 2000

Additional sampling was performed by IT during the Phase 3 RFI in November 2000 (Table 16-1) to delineate arsenic, cadmium, cobalt, copper, lead, and/or manganese concentrations exceeding background in surface and subsurface soil samples. Additionally, confirmation soil samples were collected to confirm arsenic, cadmium, copper, and/or lead concentrations exceeding background and MSCs from previous investigations. Four soil borings (SB421005, SB421006, SB421007, and SB421008) were advanced to depths of 16 to 17 feet bgs (Figure 16-1). Soil samples were collected from surface to 2 feet, 4 to 6 feet, 10 to 12 feet, and 15 to 17 feet bgs at SB421005. The samples collected from surface to 2 feet and the 4 to 6 feet bgs were analyzed for cadmium and lead (EPA Method SW6010). The samples collected from 10 to 12 feet and 15 to 17 feet bgs were analyzed for arsenic, cadmium, and copper. Soil samples were collected from surface to 2 feet, 4 to 6 feet, 10 to 12 feet, and 15 to 17 feet bgs from SB421006. The samples collected from surface to 2 feet and the 4 to 6 feet bgs at SB421006 were analyzed for cadmium and lead, and the samples collected from 10 to 12 feet and 15 to 17 feet bgs were analyzed for arsenic, cadmium, cobalt, copper, and manganese. Soil samples were collected from surface to 2 feet, 4 to 6 feet, 9 to 11 feet, and 14 to 16 feet bgs from SB421007. The samples collected from surface to 2 feet and the 4 to 6 feet bgs were analyzed for cadmium, and the samples collected from 9 to 11 feet and 14 to 16 feet bgs were analyzed for arsenic, cadmium, copper, and lead. Soil samples were collected from surface to 2 feet, 4 to 6 feet, 9 to 11 feet, and 14 to 16 feet bgs from SB421008. The sample collected from surface to 2 feet bgs was analyzed for arsenic, cadmium, and lead. The sample collected from 4 to 6 feet bgs was analyzed for cadmium. The samples collected from 9 to 11 feet and 14 to 16 feet bgs were analyzed for arsenic, cadmium, copper, and lead.

## 16.3 Site-Specific Conditions

The following subsections discuss the site-specific geology and hydrogeology characteristics that were encountered during the investigation activities at Building 4210 site.

***Geology.*** Quaternary alluvium is found at the surface through most of the NAS Fort Worth area. The alluvium consists of floodplain and fluvial terrace deposits of gravel, sand, silt, and

clay that occur as a veneer on the eroded surface of Upper Cretaceous strata. The soil boring log (Appendix A) for SB421001 indicated very moist, stiff, yellowish-brown, gravelly clay, possibly fill, from 0 to 2 feet bgs; very moist, loose, yellowish-brown/clayey gravel fill from 2 to 4 feet bgs; similar soil characteristics from 4 to 6 feet bgs and saturated due to a perched water table below 5 feet bgs; and saturated soft, dark yellowish-brown, gravelly silty clay soil from 6 to 8 feet bgs.

Boring SB421002 indicated slightly moist, stiff topsoil that was brown gravelly clay from 0 to 2 and 2 to 4 feet bgs; a moist, very soft, strong brown silty clay soil from 4 to 10 feet bgs. The next sampling zone at 21 to 23 feet bgs indicated a very moist stiff/waxy brownish-yellow gravelly clay soil; and from 23 to 25 feet bgs the soil was very dense brownish-yellow clayey gravel. The soil was saturated below 24 feet bgs.

Organic vapors were detected at boring SB421001. 130 ppm (0 to 2 feet bgs), 5 ppm (2 to 4 feet bgs), 3 ppm (4 to 6 feet bgs), and 12 ppm (6 to 8 feet bgs). At soil boring SB421002, the readings were 2 ppm (0 to 2, 2 to 4, and 6 to 8 feet bgs) and 3 ppm at 8 to 10 feet bgs. Background readings for both borings were 2 ppm.

The alluvial soils rest unconformably on the top of the weathered Walnut Formation Underlying the Quaternary alluvium is the Cretaceous-aged Walnut Formation, which consists of 20 to 30 feet of indurated fossiliferous limestone interbedded with brown sandy clay, thinly bedded fossiliferous clay, and fissile shale. Unconformably underlying the Walnut Formation is the Cretaceous-aged Paluxy Formation. The Paluxy Formation generally consists of coarse-grained sand that grades upward into fine-grained sand with variable amounts of shale and limestone. The sandstone, composed of fine- to coarse-grained white quartz, is well-sorted, poorly consolidated, and cross-bedded. The Paluxy Formation thickness ranges from 140 to 190 feet, averaging 160 in Tarrant County (Radian, 1991).

***Hydrogeology.*** Shallow groundwater within the Quaternary alluvium occurs in fluvial terrace deposits of sand and gravel, which occur as a veneer on the eroded surface of the Walnut Formation. The soil description logs from the Law borings 4210-SB03 and 4210-SB04 indicate silty to clayey fine sands below 4 feet bgs with clay content increasing below 6 feet bgs. Monitoring well WITCTA020 was installed southeast of OWS at Building 4210 with the well screen placed down near the top of the Walnut Formation at approximately 20 feet bgs.

Groundwater was encountered at a depth of 19.5 feet bgs. Groundwater flow at the Building 4210 site is to the east and south toward the Trinity River and Farmers Branch Creek.

### 16.4 Results from Initial Site Investigation

The following sections present the results from subsurface soil samples that were collected by Law (1995) during the initial site investigation at Building 4210. Table 16-2 contains a summary of the analytes detected in the samples collected by Law (1995) and compares the detected concentrations to background and MSCs. Detected analyte concentrations that exceeded background concentrations are shown on Figure 16-1.

#### 16.4.1 Surface Soil

There were no surface soil samples taken by Law (1995) near the OWS at Building 4210.

#### 16.4.2 Subsurface Soil

Eight subsurface soil samples (Table 16-1) were collected by Law for analysis of VOCs and inorganics. The following subsections discuss the analytical results from the subsurface soil samples collected by Law (1995).

***VOCs.*** Methylene chloride and acetone were the only VOCs detected above their MQLs (Table 16-2) in the subsurface soil samples collected by Law (1995). The concentrations of methylene chloride and acetone were detected below their MSCs of 0.5 and 1,000 mg/kg, respectively. All methylene chloride detections were qualified as estimated, possibly biased high based on QC data. Acetone was detected above the MQL in two samples 4210-SB01 (12 to 14 feet bgs) and 4210-SB03 (4 to 6 feet bgs), at concentrations of 0.021 and 0.034 mg/kg, respectively. Considering that both methylene chloride and acetone are common laboratory contaminants and the detected concentrations are low, the presence of these VOCs in subsurface soil samples from Building 4120 were likely the result of laboratory contamination.

MSC = Media-Specific Concentration
NA = not applicable
MQL = Method Quantitation Limit
RRS 1 = Risk Reduction Standard 1
RRS 2 = Risk Reduction Standard 2
TNRCC = Texas Natural Resources Conservation Commission
UTL = Upper Tolerance Limit
Footnotes
[1] UTLs for inorganics derived from Final Draft Basewide Background Study, Jacobs Engineering 1998 MQLs for organics were derived by taking the most conservative reporting limit for a given analyte
[2] TNRCC 1999 "Updated Examples of Standard No 2, Appendix II Media-Specific Concentrations (MSCs) - Industrial Setting", July 14
Qualifier Definitions
= The analyte was positively identified
J = For inorganics, the associated value is an estimated quantity For organics, the analyte was positively identified, the associated numerical value is the approximate concentration of the analyte in the sample
JB = Estimated quantitation - possible biased high based upon blank contamination
JH = Estimated quantitation - possible biased high based upon QC data

***Inorganics.*** The following inorganic compounds were detected in the Law soil samples aluminum, arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, nickel, potassium, sodium, vanadium, and zinc (Table 16-2). Of these inorganics, arsenic, cadmium, cobalt, copper, and manganese concentrations exceeded background in the subsurface soil samples from 4210-SB01 and 4210-SB03. Arsenic, cadmium, copper, and lead exceeded background in the subsurface samples from 4210-SB02. Arsenic, cadmium, cobalt, copper, lead, vanadium, and zinc exceeded background in the subsurface samples from 4210-SB04. Arsenic, cadmium, and lead concentrations that exceeded background also exceeded MSCs.

The vanadium concentration detected in the subsurface soil sample from 10 to 12 feet bgs at 4210-SB04 (38 mg/kg) is virtually identical to background (37.4 mg/kg) and is considered an extreme, but true, background concentration. Similarly, the zinc concentration detected in the subsurface soil sample from 10 to 12 feet bgs at 4210-SB04 (32 JH mg/kg) is virtually identical to background (31.3 mg/kg) and is considered an extreme, but true, background concentration.

### *16.5 Results from Phase 1 RFI Activities*

The following sections presents the analytical results from soil and groundwater samples that were collected by IT (1997) during the Phase 1 Sanitary Sewer System RFI at Building 4210. The following subsections presents the analytical results from surface and subsurface soil samples that were collected by IT (1997) during the Phase 1 RFI activities. A discussion of the Phase 1 groundwater investigation is also included The purpose of the Phase 1 RFI soil samples was to supplement the analytical data for VOCs and inorganics that were collected by Law (1995) during the initial site investigation. Table 16-3 contains a summary of the analytes detected in the Phase 1 RFI soil samples collected by IT and Table 16-4 contains a summary of the analytes detected in the Phase 1 RFI groundwater samples. Analytical detection summary tables for the soil and groundwater samples collected at Building 4210 are shown in Tables B-24 and B-25, respectively.

### 16.5.1 Surface Soil

IT collected surface samples SB421001 and SB421002, respectively, utilizing DPT for analysis of SVOCs and pesticides/PCBs. IT also collected a surface soil sample near manhole MH-51 (boring MH-51) during the Sanitary Sewer System RFI for analysis of VOCs, SVOCs, pesticides/PCBs, and inorganics. The following subsections discuss the analytical results of the surface soil samples collected at Building 4210 during the Phase 1 RFI.

***VOCs.*** Two VOCs, toluene and methylene chloride, were detected at concentrations exceeding MQLs in the surface soil sample from boring MH-51. The results for toluene and methylene chloride are well below the MSCs established for these compounds. Methylene chloride is considered a common laboratory contaminant and the low concentrations were likely the result of laboratory contamination. As mentioned previously, toluene concentrations detected at low concentrations in soil samples was likely the result of toluene leaching into the samples from the DPT sample liners, which were constructed of PET

***SVOCs.*** All SVOC detections in surface soil samples at Building 4210 were TICs that were qualified at estimated concentrations below PQLs (Table B-24) The TICs included unidentified hydrocarbon and phenolic compounds. Although no detection limits were established for these compounds in the laboratory analysis, the values are below the PQL range (0.660 mg/kg to 3.30 mg/kg) for SVOCs described in SW846 Method 8270 (EPA, 1997). Therefore, the detected concentrations of the TICs were below background for organics, as defined by the TNRCC RRP No other SVOCs were detected above MQLs.

***Pesticides/PCBs.*** No pesticides/PCBs were detected above MQLs in the surface soil sample collected from MH-51.

***Inorganics.*** No inorganics were detected above background in the surface soil sample collected from MH-51.

### 16.5.2 Subsurface Soil

Subsurface soil samples were collected at borings SB421001 (2 to 4 feet) and SB421002 (21 to 23 feet bgs) for analysis of SVOCs and pesticides/PCBs to supplement soil samples collected and analyzed by Law. IT also collected a subsurface soil sample from 24 to 26 feet bgs at boring MH-51 for analysis of VOCs, SVOCs, pesticides/PCBs, and inorganics. The following

subsections discuss the analytical results of the subsurface soil samples collected at Building 4210 during the Phase 1 RFI.

***VOCs.*** Methylene chloride was the only VOC detected at a concentration above its MQL in the subsurface soil sample from MH-51. The detected concentration (0.013 mg/kg) was below the MSC (0.5 mg/kg) and considering that methylene chloride is a common laboratory contaminant, the result was likely the result of laboratory contamination.

***SVOCs.*** Several TICs (e.g., unidentified hydrocarbons) were detected in borings SB421001, SB421002, and MH-51. Although no detection limits were established for these compounds in the laboratory analysis, the values are below the PQL range (0.660 mg/kg to 3.30 mg/kg) for SVOCs described in SW846 Method 8270 (EPA, 1997). Therefore, the detected concentrations of the TICs were below background for organics, as defined by the TNRCC RRP. No other SVOCs were detected above MQLs.

***Pesticides/PCBs.*** No pesticides/PCBs were detected above MQLs in subsurface soil samples.

***Inorganics.*** No inorganics were detected above background concentrations in the subsurface soil sample collected from MH-51.

### *16.5.3 Groundwater*

Monitoring well WITCTA020 was installed by IT in April 1997 about 30 feet south of boring 4210-SB03 and manhole MH-51 (Figure 16-1) The well was sampled for analysis of VOCs, SVOCs, and inorganics. The following subsection discuss the analytical results from the groundwater sample collected from WITCTA020.

***VOCs.*** VOCs detected at concentrations exceeding MQLs include TCE and methylene chloride The methylene chloride concentration was qualified as blank contaminated and is most likely the result of laboratory contamination. TCE was detected at 0.0078 mg/L, which is slightly above its MSC limit (0.005 mg/L). However, because the extent of the AFP-4 TCE groundwater plume includes the area of Building 4210 and contaminants from this plume are managed under the AFP-4 Superfund Cleanup Program, the presence of TCE was not considered to be the result from releases from the OWS at Building 4210.

***SVOCs.*** No SVOCs were detected in the groundwater sample from WITCTA020.

***Inorganics.*** Twelve inorganics were detected in groundwater (Table B-25). Only beryllium and iron were detected at levels that exceeded background (Table 16-4). The detected beryllium concentration (0.00051 B mg/L) did not exceed the MSC (0.004 mg/L). Iron is an essential nutrient and the detected iron concentration in groundwater (0.306 mg/L) is likely a natural variation in the background concentration.

### 16.6 Results from Phase 2 Activities

IT collected subsurface soil samples from two borings (SB421003 and SB421004) during the Phase 2 RFI in April 2000 to confirm and delineate arsenic, cadmium, and vanadium concentrations detected during the Law (1995) investigation. Additionally, a groundwater sample was collected from monitoring well WITCTA020 to confirm the elevated concentration of beryllium detected in the Phase 1 groundwater sample. The analytical results for the Phase 2 soil and groundwater samples are included in Table 16-3 and Table 16-4, respectively, and are compared to background and MSCs. A summary of RFI SPLP results are shown in Table 16-5. The following sections discuss the results of Phase 2 soil and groundwater samples.

#### 16.6.1 Subsurface Soil

As shown in Table 16-3 and Figure 16-1, the arsenic, cadmium, and vanadium concentrations detected in the subsurface soil samples collected from 21 to 23 feet bgs at Phase 2 borings SB421003 and SB421004 were all below background.

#### 16.6.2 Groundwater

Beryllium was not detected in the Phase 2 groundwater sample collected from monitoring well WITCTA020 (Table 16-4). Therefore, the beryllium concentration detected in the 1997 groundwater sample from WITCTA020 was likely an extreme, but true, background concentration.

**Table 16-5**

"nv" = not validated

### 16.7 Results from Phase 3 RFI Activities

Upon further review of the Law (1995) data, it was determined that additional sampling was required to confirm and delineate several inorganics to background (e.g., arsenic, cadmium, cobalt, copper, lead, and manganese). Therefore, IT collected surface and subsurface soil samples from four additional borings (SB421005 through SB421008) during the Phase 3 RFI in November 2000. Samples were collected at the depths that showed inorganic concentrations above background in the Law (1995) investigation. In addition, samples were collected at depths 5 feet above and below the former interval(s), which showed elevated inorganic concentrations.

The results from the Phase 3 soil samples at Building 4210 are included in Table 16-3. The Phase 3 analytical results are also shown in Figure 16-1. The following sections discuss the analytical results of the Phase 3 confirmation/delineation samples collected during the Phase 3 RFI at Building 4210.

#### 16.7.1 Surface Soil

IT collected surface soil samples from borings SB421005 through SB421007 to delineate cadmium and lead concentrations. A surface soil sample was collected from SB421008 in an attempt to replicate arsenic, cadmium, and lead identified in former Law (1995) boring 4210-SB02 so that the SPLP analysis could be performed. The SPLP analysis was planned to determine the potential for the elevated concentrations identified by Law (1995) to leach into groundwater. The following subsections discuss the arsenic, cadmium, and lead concentrations detected in Phase 3 RFI surface soil samples at Building 4210.

***Arsenic.*** The arsenic concentration detected in confirmation soil sample SB421008 (4.55 mg/kg) was below background and no SPLP analysis was performed.

***Cadmium.*** The cadmium concentrations detected in all four surface soil samples collected from the Phase 3 borings were below background. The cadmium concentrations ranged from 0.0782 mg/kg to 0.422 mg/kg.

***Lead.*** The lead concentrations detected in surface soil samples from SB421005 (7.06 mg/kg), SB421006 (14.2 mg/kg), and SB421008 (14.3 mg/kg) were all below background

### 16.7.2 Subsurface Soil

IT collected subsurface soil samples at three depths from borings SB421005 through SB421007 to delineate arsenic, cadmium, cobalt, copper, lead, and manganese concentrations detected by Law (1995) to background. Subsurface soil samples were also collected from SB421008 in an attempt to replicate arsenic, cadmium, and lead identified in former Law (1995) boring 4210-SB02 so that the SPLP analysis could be performed. The SPLP analysis was planned to determine the potential for the elevated concentrations identified by Law (1995) to leach into groundwater. The following subsections discuss the analytical results from subsurface soil samples collected during the Phase 3 RFI activities at Building 4210.

***Arsenic.*** Arsenic concentrations detected in the Phase 3 subsurface soil samples were at or below background. Arsenic was detected at a concentration (7 43 mg/kg) that slightly exceeded background in the sample from 15 to 17 feet bgs at SB421005. Arsenic was also detected at a concentration (8.17 mg/kg) that slightly exceeded background in the sample from 15 to 17 feet bgs at SB421006. The arsenic concentration detected in the sample from 14 to 16 feet bgs at SB4210 (6.79 mg/kg) also slightly exceeded background. The arsenic concentrations detected in the samples collected from 9 to 11 feet bgs and 14 to 16 feet bgs at confirmation boring (SB421008) were below background. Therefore, the SPLP analyses were not performed.

Considering that arsenic was not detected above background in the samples from 9 to 12 feet bgs at borings SB421005 through SB421007, and that arsenic concentrations were below background in the Phase 3 boring (SB421008) located closest to the OWS, the arsenic concentrations detected in samples collected from 14 to 17 feet in borings SB421005 through SB421007 were likely extreme, but true, background concentrations.

The arsenic results from the Phase 2 and Phase 3 subsurface samples have delineated arsenic concentrations to background. The results from Phase 2 boring SB421006 and Phase 3 boring SB421008 indicate that the arsenic results reported by Law (1995) were likely extreme, but true, background concentrations.

***Cadmium.*** The cadmium concentrations detected in the twelve subsurface soil samples collected during the Phase 3 RFI were below background, including those from confirmation boring SB421008. Therefore, the elevated cadmium concentrations detected in the four Law (1995) borings (4210-SB01 through 4210-SB04) have been delineated to background by the

results from Phase 1 boring MH-51 (east), SB421007 (northeast), SB421003 (northwest), SB421006 (west), and SB421005 (south). The cadmium results reported by Law (1995) appear to be biased high, considering that the elevated cadmium concentrations found in former Law (1995) boring 4210-SB02 were not replicated by the results from SB421008 and that no cadmium concentrations have been detected above background in any of the surface or subsurface soil samples collected by IT at Building 4210.

***Cobalt.*** The cobalt concentration (5.06 mg/kg) detected in the sample from 10 to 12 feet bgs from SB421006 was below background but the concentration (7.67 mg/kg) detected from 15 to 17 feet bgs slightly exceeded background Considering that the cobalt concentrations detected in former Law (1995) boring 4210-SB01 (7.0 mg/kg and 7.9 mg/kg) and in the 15- to 17-foot interval from SB421006 are well below the MSC (610 mg/kg) and are only slightly higher than the background indicates that these cobalt concentrations are likely extreme but true background concentrations. These concentrations are below the background concentration for cobalt in surface soil (11.05 mg/kg).

***Copper.*** Copper concentrations detected in the subsurface soil samples from the four Phase 3 borings were all below background. Therefore, the elevated copper concentrations detected in the four Law (1995) borings (4210-SB01 through 4210-SB04) have been delineated to background by the results from Phase 1 boring MH-51 (east), SB421007 (northeast), SB421003 (northwest), SB421006 (west), and SB421005 (south). The elevated copper concentration identified at former Law (1995) boring 4210-SB02 was not replicated in the samples collected at confirmation boring SB421008. Therefore, the copper concentrations detected by Law (1995) were likely extreme, but true, background concentrations.

***Lead.*** The lead concentrations detected in the Phase 3 subsurface soil samples were all at or below background. The lead concentration detected in the sample from 9 to 11 feet bgs from SB421008 (14.8 mg/kg) was slightly above background. However, this concentration is below both the basewide background concentration for lead (15 mg/kg) and the basewide background concentration for lead in surface soil (30.97 mg/kg). Therefore, the lead concentration detected in the sample from 9 to 11 feet bgs from SB421008 is likely an extreme, but true, background concentration.

The elevated lead concentrations detected in former Law (1995) borings 4210-SB02, 4210-SB03 and 4210-SB04 have been delineated to background by the results from Phase 3 borings SB421005 through SB421007. Considering that the lead concentration detected at 4210-SB02 (58 mg/kg) was not replicated by the results from confirmation boring SB421008, it appears that the elevated lead concentrations detected by Law (1995) were extreme, but true, background concentrations.

***Manganese.*** The concentration (194 mg/kg) detected in the sample from 15 to 17 feet bgs was below background, but the manganese concentration (411 mg/kg) detected in the sample from 10 to 12 feet bgs at SB421006 slightly exceeded background Considering the slight variance from background and that the concentration is below the background concentration in surface soil (849 mg/kg), the manganese concentration detected in the sample from 10 to 12 feet bgs at SB421006 is likely an extreme, but true, background concentration. Therefore, the elevated manganese concentrations detected at former Law (1995) boring 4210-SB01 have been delineated.

### *16.8 Summary and Discussion*

Law collected subsurface soil samples from four soil borings (4210-SB01 through 4210-SB04) for analysis of VOCs and inorganics during the initial site investigation of the OWS at Building 4210. IT collected surface and subsurface soil samples (SB421001 and SB421002) for analysis of pesticides/PCBs during the Sanitary Sewer System RFI in 1997. IT also collected surface and subsurface soil samples for analysis of VOCs, SVOCs, pesticides/PCBs, and inorganics from manhole MH-51 located approximately 10 feet downgradient from the OWS during the Phase 1 RFI. Monitoring well WITCTA020 was installed and sampled for VOCs, SVOCs, and inorganics during the Phase 1 activities.

IT collected subsurface soil samples from two borings (SB421003 and SB421004) during the Phase 2 RFI in April 2000 to confirm and delineate the elevated concentrations of arsenic, cadmium, and vanadium identified in the Law borings. IT collected surface and subsurface soil samples from four additional borings (SB421005 through SB421008) during the Phase 3 RFI to better confirm and delineate inorganic concentrations identified in the Law borings. The following sections summarize the results of these investigations.

### 16.8.1 Surface Soil

The surface soil samples collected from the Phase 1 borings SB421001 and SB421002 indicated that no SVOCs or pesticides/PCBs were detected above MQLs The surface soil sample from MH-51, located approximately 10 feet east of the OWS at Building 4210 contained two VOCs, methylene chloride and toluene, at concentrations above MQLs. The methylene chloride concentration was likely due to laboratory contamination and the toluene was the result of the DPT sample liner, which was made of PET. No SVOCs, pesticides/PCBs, or inorganics were detected above MQLs/background in the surface soil sample from MH-51.

### 16.8.2 Subsurface Soil

The subsurface soil samples collected by Law (1995) indicated that several inorganics (arsenic, cadmium, cobalt, copper, lead, manganese, vanadium, and zinc) exceeded background concentrations. Of these, vanadium and zinc were detected above background in one sample, each at concentrations that were likely extreme, but true, background concentrations. Arsenic, cadmium, and lead concentrations detected above background in the Law samples also exceeded MSCs. Therefore, additional sampling was performed during the Phase 2 and Phase 3 RFI activities to confirm the inorganic concentrations that exceeded MSCs and to delineate all inorganic concentrations to basewide background concentrations.

As shown in Figure 16-1, the inorganic concentrations detected in the Law borings have been delineated by the results from the Phase 1 boring MH-51, Phase 2 borings SB421003 and SB421004, and Phase 3 borings SB421005 through SB421007. Arsenic, cobalt, and manganese concentrations slightly exceeded background in a few samples in the Phase 3 delineation borings, but the detections were indicative of extreme, but true, background concentrations.

The results for arsenic, cadmium, and lead detected in Law (1995) samples could not be replicated in the samples collected by IT during the RFI. At confirmation boring SB421008, arsenic was detected at a concentration (5.96 mg/kg) below background at 14 to 16 feet bgs, whereas arsenic was detected at 11 mg/kg in the sample from 14 to 16 feet from former Law boring 4210-SB02. Similarly, lead was detected at a concentration (6.76 mg/kg) below background at 14 to 16 feet bgs, whereas lead was detected at 58 mg/kg in the sample from 14 to 16 feet from former Law boring 4210-SB02. Cadmium was not detected above background in any of the soil samples collected by IT in borings SB421003 through SB421008. Considering

the results from the samples collected by IT, there does not appear to be a pattern of elevated concentrations of arsenic, cadmium, or lead above background at the Building 4210 site.

### 16.8.3 Groundwater

Methylene chloride and TCE were the only organic compounds detected at concentrations exceeding MQLs in the Phase 1 groundwater sample from WITCTA020. The detected concentration of methylene chloride was likely the result of laboratory contamination. The detected concentration of TCE is associated with the TCE plume originating from AFP-4 and is not considered as an indication of a release from the OWS at Building 4146.

Two inorganics, iron and beryllium, were detected above their respective background concentrations in the groundwater sample from WITCTA020. Iron is considered a naturally occurring essential nutrient and the detected concentration was likely a natural variation in background concentrations. Beryllium was detected at an estimated concentration in the Phase 1 groundwater sample but was not detected in the Phase 2 groundwater sample collected from WITCTA020 in April 2000. Therefore, the beryllium detection in the Phase 1 groundwater sample was likely an extreme but true background concentration.

## 16.9 Conclusions

The lack of elevated concentrations of compounds present in jet fuel, lubricants, and other petroleum products handled by the OWS in soil and groundwater samples collected at Building 4210 indicates that releases that may have occurred from the OWS have not significantly impacted the environment. The inorganics that were detected above background in the subsurface soil samples collected by Law (1995) have been delineated to background by the results from soil samples collected during the Phase 2 and Phase 3 RFI. Additionally, arsenic, cadmium, and lead concentrations, which exceeded both background and MSCs, could not be replicated in the soil samples collected by IT, which indicates that the concentrations of these inorganics detected by Law (1995) were likely extreme, but true, background concentrations.

Considering that no pattern of inorganic concentrations exceeding MSC was observed in the subsurface samples collected by IT during Phases 1 through 3 of the RFI and that all inorganic concentrations have been delineated to background by the results from the Phase 2 and Phase 3 RFIs, NFA is warranted for the OWS at Building 4210 and the site is recommended for closure under RRS 2. Should this recommendation be accepted, a letter stating that closure of AOC 12

(the OWS at Building 4210) was carried out in accordance with TAC §335.555, and signed by an Air Force representative, will be transmitted to the TNRCC, along with a metes and bounds description of AOC 12. The metes and bounds description will correspond to surveyed coordinates of the affected area shown in Figure 16-1.

# TAB

17.0

# 17.0 Summary of Conclusions

The 13 OWS sites presented in this RFI report meet the requirements for closure under either RRS 1 or RRS 2. The following sections summarize the recommendations for closure for the 13 OWS sites presented in this RFI report.

## 17.1 RRS 1 Closure Sites

Three OWS sites (Building 1643, Building 3358, and Building 4146) meet the requirements for closure under RRS 1 of the TNRCC RRP. Confirmation soil samples collected during the Phase 2 and Phase 3 RFI at these two sites indicated that analyte concentrations were below basewide background concentrations or MQLs. No further action is warranted for the OWSs at Building 1643 (SWMU 40), Building 3358 (part of SWMU 66), and Building 4146 (part of SWMU 66), and these sites are recommended for closure under RRS 1.

## 17.2 RRS 2 Closure Sites

The following ten sites meets the requirements for closure under RRS 2 of the TNRCC RRP:

- OWS Building 1015 (SWMU 47)
- OWS Building 1027 (SWMU 44)
- OWS Building 1060 (AOC 11)
- OWS Building 1064 (AOC 10)
- OWS Building 1190 (SWMU 52)
- OWS Building 1191 (SWMU 37)
- OWS Building 1194 (SWMU 35)
- OWS Building 1414 (SWMU 41)
- OWS Building 1602 (part of SWMU 66)
- OWS Building 4210 (AOC 12).

At these ten OWS sites, elevated contaminant concentrations that were detected in the environmental samples collected by Law (1995) during their initial OWS investigation or by IT (1998) during the Phase 1 Sanitary Sewer System RFI have been delineated to background by the soil and groundwater data collected by IT during the Phase 2 and Phase 3 RFIs. Additionally, confirmation samples collected during the Phase 2 and Phase 3 RFIs indicate that there are no hazardous constituents in soil and groundwater at these OWS sites that would require remediation to RRS 2 concentrations.

Considering that no pattern of analyte concentrations exceeding MSCs was observed in the soil and groundwater samples collected by IT during the RFIs and that all inorganic concentrations have been delineated to background by the results from Phase 2 and Phase 3 RFIs, NFA is warranted for these 10 OWS sites and the sites are recommended for closure under RRS 2. RRS 2 closure for these 10 OWS sites requires a site legal survey and deed recordation of closure activities in agreeing with a plan designed to meet the TNRCC requirements according to 30 TAC §335.555.

B = For organics, the analyte was found in the associated blank, as well as the sample
J = The analyte is present, but the quantitation is an estimation.
U = The analyte was analyzed for, but not detected The associated numerical value is at or below the method detection limit
MG/KG = milligrams per kilogram

B = For inorganics, the reported value is an estimated quantity; for organics, the analyte was found in the associated blank, as well as the sample
E = The reported value is estimated because of the presence of interference An explanatory note may be included in the narrative
J = The analyte is present, but the quantitation is an estimation
N = Spiked sample recovery not within control limits
U = The analyte was analyzed for, but not detected The associated numerical value is at or below the method detection limit
MG/KG = milligrams per kilogram

B = For inorganics, the reported value is an estimated quantity, for organics, the analyte was found in the associated blank, as well as the sample
E = The reported value is estimated because of the presence of interference
J = The analyte is present, but the quantitation is an estimation
N = Spiked samle recovery not within control limits
UJ = The material was analyzed for but not detected The associated value is an estimate and may be inaccurate or imprecise
MG/KG = milligrams per kilogram

B = For inorganics, the reported value is an estimated quantity, for organics, the analyte was found in the associated blank, as well as the sample
J = The analyte is present, but the quantitation is an estimation
J- = The analyte was positively identified, the associated numerical value is the approximate concentration of theanalyte in the sample The value may be lower than the true val
N = Spiked sample recovery not within limits
q = Sample contains GC/FID characteristics for which reliable identification of a product could not be achieved.
r = This footnote is analyst defined. Define don data sheets.
MG/KG = milligrams per kilogram

B = For organics, the analyte was found in the associated blank, as well as the sample
J = The analyte is present, but the quantitation is an estimation.
U = The analyte was analyzed for, but not detected The associated numerical value is at or below the method detection limit
MG/KG = milligrams per kilogram

B = For inorganics, the reported value is an estimated quantity; for organics, the analyte was found in the associated blank, as well as the sample.
J = The analyte is present, but the quantitation is an estimation.
* = Duplicate analysis (relative percent difference) not within control limits.
UG/L = micrograms per liter

B = For inorganics, the reported value is an estimated quantity, for organics, the analyte was found in the associated blank, as well as the sample
J = The analyte is present, but the quantitation is an estimation
UJ = The material was analyzed for, but not detected. The associated value is an estimate and may be inaccurate or imprecise
MG/KG = milligrams per kilogram

## September 2000

## 1.0 Overview

Ten (10) groundwater and thirty-five (35) soil samples were collected in support of the Naval Air Station (NAS) Fort Worth Joint Reserve Base Carswell Field Phase 2 RCRA Facility Investigation Oil/Water Separators. Samples were submitted to Kemron Environmental Services (KEMM) and Severn Trent Laboratories-Chicago (STLC) and analyzed for various metals by SW6010B/SW7000 Series methodology. QC samples consisted of the following types and quantities: five (5) field duplicates (FD), two (2) matrix spike/matrix spike duplicate (MS/MSD) and ten (10) equipment rinsates (ER) An analytical summary table cross-referencing sample location, sample number, sample date and contaminants of concern is presented in Attachment A.

Ten (10) percent of samples were validated and reviewed in accordance with the *"US EPA Contract Laboratory Program National Functional Guidelines for Evaluating Inorganic Data Review (EPA, February 1994)"* Data qualifiers assigned to results were based on guidance outlined in the referenced document and the *"Naval Air Station (NAS) Fort Worth Joint Reserve Base Carswell Field Basewide Quality Assurance Project Plan (IT, February 2000)"* Table 1.0-1 and Table 1.0-2 defines validation data and laboratory data qualifiers assigned to analytical results, respectively.

**Table 1.0-1 Validation Data Qualifier Definitions**

| Validation Qualifier | Validation Data Qualifier Definition |
|---|---|
| U | The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit. |
| J | The associated value is an estimated quantity |
| R | The data are unusable. (Note. Analyte may or may not be present.) |
| UJ | The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise |
| nv | Data not validated |

**Table 1.0-2 Laboratory Data Qualifier Definitions**

| Data Qualifier | Laboratory Data Qualifier Definition |
|---|---|
| J | The analyte was positively identified, the quantitation is estimation. |
| U | The material was analyzed for, but was not detected The associated numerical value is at or below the method detection limit (MDL). |
| F | The analyte was positively identified but the associated numerical value is below the reporting limit (RL). |
| R | The data are unusable due to deficiencies in the ability to analyze the sample and meet QC criteria. |
| B | The analyte was found in an associated blank, as well as in the sample. |
| M | A matrix effect was present |
| S | To be applied to all field screening data |
| T | Tentatively identified compound (using Gas Chromatography/Mass Spectroscopy (GC/MS)) |

Data Validation Summary Report is presented in Attachment B.

## 2 0 Summary

Data were evaluated to verify compliance with precision, accuracy and completeness. To verify that project Data Quality Objectives (DQOs) were met, laboratory analytical results and data packages were examined for compliance with SW846 SW6010B/SW7000 Series method criteria. Laboratory non-conformances and discrepancies in the data were also examined to determine their impact on the data The results of this review are presented in the following sections.

### 2 1 Sample Receipt and Analytical Holding Times

All sample results generated by the laboratory during this investigation have been reviewed with respect to condition of sample receipt from the laboratory, chain of custody and analysis holding times. All coolers were received by both KEMM and STLC in good condition under proper chain of custody. All extraction and analytical holding times were met.

### 2.2 Rejected Data

No data was qualified either by validator or the laboratory as rejected ("R").

### 2.3 Blank Results

A description of the type of blank samples which were collected, processed and evaluated for background and/or process contamination during this sampling are as follows:

* Equipment rinsates (ER) is a sample of ASTM Type II reagent grade water poured into or over or pumped through the sampling device, collected in a sample container, and transported to the laboratory for analysis. Equipment rinsates are used to assess the effectiveness of equipment decontamination procedures. Equipment rinsates were collected on a daily basis during Phase 2 of this investigation.

* Method blanks are used to assess and document contamination resulting from the analytical process A method blank is an analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing The method blank shall be carried through the complete sample preparation and analytical procedure.

Field sample concentrations were evaluated to determine if the sample results could have been biased by the presence of any contamination measured in either method blanks and/or equipment rinsates. Results qualified due to equipment rinsate and/or method blank contamination are summarized in Table 2.3-1.

**Table 2.3-1 Summary of Equipment Rinsate/Method Blank Contamination**

| Sample Delivery Group | Sample Number | Contaminant | Assigned Qualifier |
|---|---|---|---|
| L0004440 | BG0015 (SPLP) | Beryllium | UJ* |
| L0004549 | BG0035 (SPLP | Cadmium | U |
| 9906G895 | BG0020 (Totals) | Cadmium | U |

* "UJ" qualified due to field duplicate RPD failure. See section 2.5.

## 2.4 Analytical Accuracy Assessment

MS/MSD & Laboratory Control Sample (LCS) were used to measure analytical accuracy as described in SW846 SW6010B/SW7000 Series methodology. Results indicate that an acceptable level of analytical accuracy was achieved. No data was qualified either by the validator or laboratory due to failing MS/MSD LCS/LCSD.

## 2.5 Analytical Precision

Field duplicate samples and duplicate spike analysis (such as MS/MSD) were used to measure precision as described by the SW846 SW6010B/SW7000 Series methodology. Analytical precision is calculated based on the following formula:

$$RPD = \left| \frac{(A-B)}{(A+B)/2} \right| 100$$

where·

RPD = Relative Percent Difference
A = original result
B = duplicate result

A high RPD between an original sample and its field duplicate may be attributable to the difference in sample matrix or distribution of the contaminant within the sample, rather than the precision of the collection process. Also, when "estimated" results are reported, there is a potential for increased variability between the primary and duplicate sample results. This occurs because, at low concentrations, the relative difference in results is magnified by the RPD calculation even though the results are comparable in absolute terms. There is also increased uncertainty in the results as the lower limit of detection is approached due to decreasing analytical accuracy. The RPD calculation cannot be performed in cases where non-detected results are reported with corresponding samples that contain detectable concentrations.

Results indicate that an acceptable analytical precision was achieved In cases where compounds exceeded acceptance criteria ($RPD_{Aqueous} > 20$, $RPD_{Soil} > 20$), results were qualified Table 2 5-1 lists samples qualified due to high RPDs when compared to its corresponding field duplicate

**Table 2.5-1 Summary of Field Duplicate RPD Failures**

| Sample Delivery Group | Sample Number | Contaminant | Assigned Qualifier |
|---|---|---|---|
| L0004440 | BG0015 (SPLP) | Beryllium | UJ |
| L0004549 | BG0035 (SPLP) | Vanadium | J |

### 2 6 Data Completeness

Completeness is calculated for the aggregation of data for each analyte measured during the Naval Air Station (NAS) Fort Worth Joint Reserve Base Carswell Field Phase 2 RCRA Facility Investigation Oil/Water Separators. Formula for calculating completeness is listed below:

% completeness = (number of valid (i.e., non-"R" flagged) results/number of possible results)x100

The requirement for completeness is 95% for aqueous samples and 90% for soil samples (Total possible results for soil matrix includes both total and SPLP analytical results).

% Completeness $_{(Aqueous)}$ = (29 / 29)x100 = 100%
% Completeness $_{(Soil)}$ = (102 / 102)x100 = 100%

### 2.7 Data Useability

Data Quality Objectives (DQOs) provide an internal guide for control and review to verify that data are scientifically sound, defensible, and of known and acceptable quality. Factors such as precision, accuracy, representativeness and completeness were evaluated to determine if the project's DQOs were met. A review of the data revealed that most QA/QC indicators were within acceptable control limits.

The overall results of the analyses suggest that representative samples were collected and analyzed, and the results are indicative of the media analyzed. The data are considered representative of site conditions and are usable for their intended purpose.

## 1.0 INTRODUCTION

Water and soil samples were submitted to Kemron and STL for analyses. Samples selected for validation are listed in Table 1-1 with sampling dates, analytical dates, and identification of associated blanks.

Samples were validated and reviewed in accordance with the "Laboratory Data Validation Functional Guidelines for Evaluating Organics Analyses" (EPA, 1999) and the "US EPA Contract Laboratory Program National Functional Guidelines for Evaluating Inorganic Data Review" (EPA, February 1994), and the associated methods.

## 2.0 INORGANIC METALS ANALYSIS by 6010B/7060A

### 2.1 Sampling Documentation

"All" (L0004440, L0004481, L0004549, L0005010, and 9906G895) Work Orders: Chain-of-custody (COC) records indicate that the sample(s) was received in good condition and properly preserved. No qualifiers were assigned

### 2.2 Holding Times

"All" Work Orders: Validated samples were analyzed within the holding time requirements No qualifiers were assigned.

### 2.3 Calibrations

#### *2.3.1 Initial Calibration Verification*

"All" Work Orders: The initial calibration verifications for all instruments were performed immediately following the standardization and met the requirements. No qualifiers were assigned.

#### *2.3.2 Continuing Calibration Verification*

"All" Work Orders: Continuing calibration verifications were within the control limits. No qualifiers were assigned.

### 2.4 Blanks

#### *2.4.1 Method/Preparation Blanks*

Work Order L0004440 (Total) The ICP associated method blank detected no contaminants. No qualifiers were assigned.

Work Order L0004440 (SPLP): The SPLP method blank detected beryllium. Beryllium results for BG0015 were changed to non-detect status (UJ-qualified to identify FD precision (RPD) problems).

Work Order L0004481 (Total): The ICP associated method blank detected no contaminants. No qualifiers were assigned

Work Order L0004481 (SPLP): The SPLP associated method blank detected no contaminants. No qualifiers were assigned.

Work Order L0004549 (Total): The ICP associated method blank detected no contaminants. No qualifiers were assigned.

Work Order L0004549 (SPLP) The SPLP associated method blank detected cadmium. Cadmium results for BG0035 were changed to non-detect status and U-qualified.

Work Order L0005010 (Total): The ICP associated method blank detected no contaminants No qualifiers were assigned

Work Order 9906G895 (Total): The ICP associated method blank detected arsenic and cadmium. Cadmium results for BG0020 were changed to non-detect status and U-qualified.

#### *2.4.2 Equipment and Field Blanks*

Work Order L0004440: The associated equipment rinsate (BG8002) detected arsenic and beryllium Sample results were greater than five time the equipment rinse (BG8002). No qualifiers were assigned

Work Order L0004481. The associated equipment rinsate (BG8003) detected cadmium, but sample results were greater than 5 times the equipment rinsate. No qualifiers were assigned.

Work Order L0004549: The associated equipment rinsate (BG8004) detected no contaminants. No qualifiers were assigned.

Work Order L0005010: The associated equipment rinsate (BG8008) detected no contaminants. No qualifiers were assigned.

Work Order 9906G895 The associated equipment rinsate (062199-ER) detected no contaminants No qualifiers were assigned.

***2.4.3 Calibration Blanks***

Work Order L0004440 (Total): The associated calibration blanks detected no contaminants No qualifiers were assigned.

Work Order L0004440 (SPLP): The associated calibration blanks detected arsenic and beryllium. Beryllium results for BG0015 were changed to non-detect status (UJ-qualified to reflect FD precision (RPD) problems).

Work Order L0004481 (Total): The associated calibration blanks detected no contaminants. No qualifiers were assigned

Work Order L0004481 (SPLP). The associated calibration blanks detected arsenic, but sample results were non-detect. No qualifiers were assigned

Work Order L0004549 (Total): The associated calibration blanks detected no contaminants No qualifiers were assigned.

Work Order L0004549 (SPLP): The associated calibration blanks detected cadmium. Cadmium results for BG0035 were changed to non-detect status and U-qualified.

Work Order L0005010 (Total): The associated calibration blanks detected no contaminants. No qualifiers were assigned.

Work Order 9906G895 (Total): The associated calibration blanks detected arsenic but the sample results were greater than 5 times the level of contamination. No qualifiers were assigned.

**2.5 Matrix Spike (MS) /Matrix Spike Duplicate (MSD)**

Work Order L0004440 (Total): The MS/MSD were evaluated No qualifiers were assigned

Work Order L0004440 (SPLP): The Total MS/MSD were evaluated and met QC requirements. The GFAA MS/MSD were evaluated and arsenic had high RPD's and % recoveries, but the sample was non-detect No qualifiers were assigned.

Work Order L0004481 (Total): The MS/MSD were evaluated. No qualifiers were assigned.

Work Order L0004481 (SPLP) The MS/MSD were evaluated. No qualifiers were assigned

Work Order L0004549: The MS/MSD were evaluated Cadmium experienced high % recoveries and RPD's; however, the sample was not part of this SDG, therefore, no qualifiers were assigned.

Work Order L0005010 (Total): The MS/MSD were evaluated. No qualifiers were assigned.

Work Order 9906G895: The MS/MSD were evaluated. No qualifiers were assigned

**2.6 Laboratory Control Sample (LCS)**

"All" Work Orders: LCS analysis exhibited acceptable results. No qualifiers were assigned.

**2.7 Interference Check Samples**

"All" Work Orders: The interference check samples analyzed were within the control limits. No qualifiers were assigned.

**2.8 Field Duplicates**

Work Order L0004440 (Total): BG0013 (original), BG0014 (FD) and BG0015 (original), BG0016 (FD) were evaluated and met QC requirements No qualifiers were assigned.

Work Order L0004440 (SPLP): BG0015 (original) and BG0016 (FD) were evaluated and beryllium had high RPD. Beryllium results for BG0015 were estimated and UJ-qualified due to blank contamination.

Work Order L0004481 (Total): BG0025 (original) and BG0026 (FD) were evaluated and met QC requirements. No qualifiers were assigned.

Work Order L0004549 (Total): BG0035 (original) and BG0036 (FD) were evaluated and met QC requirements. No qualifiers were assigned.

Work Order L0004549 (SPLP): BG0035 (original) and BG0036 (FD) were evaluated and vanadium had high RPD. Vanadium results for BG0035 were estimated and J-qualified.

Work Order L0005010 (Total): BG3009 (original) and BG3010 (FD) were evaluated and met QC requirements. No qualifiers were assigned.

**2.9 Serial Dilution**

"All" Work Orders. No serial dilutions were associated with this SDG No qualifiers were assigned.

**2.10 Compound Quantitation and Project Reporting Limits**

Based on a Level III validation, the samples were identified and generally quantified appropriately. The reporting limits listed on the Form I's were the reporting limits (RLs) specified in the QAPP.

**2.11 Overall Assessment of the Data**

The data for the validated samples are acceptable as qualified.

# Appendix C - Laboratory Reported Results

## Project No. 768579 Delivery Order 0039

## February 2001

## 1 0 Overview

Four (4) groundwater and one hundred seven (107) soil samples were collected in support of the Naval Air Station (NAS) Fort Worth Joint Reserve Base Carswell Field Phase 3 RCRA Facility Investigation Oil/Water Separators Samples were submitted to Kemron Environmental Services (KEMM) and analyzed for the following: benzene and chlorobenzene by SW8260B and metals by SW6010B/SW6020 QC samples consisted of the following types and quantities. eleven (11) field duplicates (FD), six (6) matrix spike/matrix spike duplicate (MS/MSD) and seven (7) equipment rinsates (ER) An analytical summary table cross-referencing sample location, sample number, sample date and contaminants of concern is presented in Attachment A.

Greater than ten (10) percent of samples were validated and reviewed in accordance with the *"Naval Air Station (NAS) Fort Worth Joint Reserve Base Carswell Field Basewide Quality Assurance Project Plan (IT, February 2000)"* Table 1.0-1 and Table 1.0-2 defines validation data and laboratory data qualifiers assigned to analytical results, respectively

**Table 1.0-1 Validation Data Qualifier Definitions**

| Validation Qualifier | Validation Data Qualifier Definition |
|---|---|
| U | The material was analyzed for, but was not detected above the level of the associated value The associated value is either the sample quantitation limit or the sample detection limit |
| J | The associated value is an estimated quantity |
| R | The data are unusable. (Note. Analyte may or may not be present.) |
| UJ | The material was analyzed for, but was not detected The associated value is an estimate and may be inaccurate or imprecise. |
| nv | Data not validated |

**Table 1.0-2 Laboratory Data Qualifier Definitions**

| Data Qualifier | Laboratory Data Qualifier Definition |
|---|---|
| J | The analyte was positively identified, the quantitation is estimation. |
| U | The material was analyzed for, but was not detected The associated numerical value is at or below the method detection limit (MDL) |
| F | The analyte was positively identified but the associated numerical value is below the reporting limit (RL) |
| R | The data are unusable due to deficiencies in the ability to analyze the sample and meet QC criteria. |
| B | The analyte was found in an associated blank, as well as in the sample. |
| M | A matrix effect was present |
| S | To be applied to all field screening data |
| T | Tentatively identified compound (using Gas Chromatography/Mass Spectroscopy (GC/MS)) |

Data Validation Summary Report is presented in Attachment B

## 2 0 Summary

Data were evaluated to verify compliance with precision, accuracy and completeness. To verify that project Data Quality Objectives (DQOs) were met, laboratory analytical results and data packages were examined for compliance with SW846 SW8260B and SW6010B/SW6020 method criteria Laboratory non-conformances and discrepancies in the data were also examined to determine their impact on the data. The results of this review are presented in the following sections.

### 2.1 Sample Receipt and Analytical Holding Times

All sample results generated by the laboratory during this investigation have been reviewed with respect to condition of sample receipt from the laboratory, chain of custody and analysis holding times. All coolers were received by Kemron Environmental Services, Inc. in good condition under proper chain of custody All extraction and analytical holding times were met.

### 2.2 Rejected Data

Benzene result for sample BG0080 (SB119406) was "R" qualified by the laboratory due to method calibration check compound (CCC), vinyl chloride, exceeding percent (%) difference QC criteria Sample BG0080 was validated and reviewed in accordance with the "EPA Functional Guidelines " with the benzene result being "U" qualified as non-detect.

## 2.3 Blank Results

A description of the type of blank samples which were collected, processed and evaluated for background and/or process contamination during this sampling are as follows

* Equipment rinsate (ER) is a sample of ASTM Type II reagent grade water poured into or over or pumped through the sampling device, collected in a sample container, and transported to the laboratory for analysis Equipment rinsates are used to assess the effectiveness of equipment decontamination procedures Equipment rinsates were collected on a daily basis during this investigation.

* Method blanks are used to assess and document contamination resulting from the analytical process A method blank is an analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing The method blank shall be carried through the complete sample preparation and analytical procedure.

* Continuing Calibration Blanks (CCBs) are used to assess and document contamination resulting from laboratory activities. CCBs are analyzed after every initial and continuing calibration verification

Field sample concentrations were evaluated to determine if the sample results could have been biased by the presence of any contamination measured in associated method blanks and/or continuing calibration blanks. Results affected by equipment blank, method blank and/or continuing calibration blank contamination are summarized in Table 2.3-1

**Table 2.3-1 Summary of Method Blank, Equipment Rinsate and Continuing Calibration Blank Contamination**

| Sample Delivery Group | Sample Number | Contaminant (Level of contamination) | Action |
|---|---|---|---|
| L0011565 | WG88165-BLK (SW6010B) | Total Manganese (0 692mg/kg) | No action necessary, total manganese results for all associated samples were 5x greater than the level of method blank contamination |
| | WG88038-BLK (SW6010B) | Total Cadmium (0 0002mg/L)<br>Total Copper (0 0014mg/L) | Total cadmium and copper for samples BG8010 and BG8011 should be considered estimated due to method blank contamination |
| | WG88315-BLK (SW6010B) | Total Copper (0 0015mg/L) | Total copper results for BG8012 and BG8013 should be considered estimated due to method blank contamination |
| | WG88315-BLK (SW6010B) | Total Cadmium (0.0002mg/L)<br>Total Silver (0 0008mg/L) | Total cadmium and silver results for BG8012 should be considered estimated due to method blank contamination |
| | BG8010 (ER) (SW6010B) | Total Cadmium(0 2ug/L)<br>Total Copper (1 77ug/L) | No action necessary, total cadmium and copper results for all associated samples were 5x greater than the level of equipment blank contamination |
| | BG8011 (ER) (SW6010B) | Total Cadmium(0 2ug/L) | No action necessary, total cadmium and copper results for all associated samples were 5x greater than the level of equipment blank contamination |

| Sample Delivery Group | Sample Number | Contaminant (Level of contamination) | Action |
|---|---|---|---|
| L0011565 (Continued) | BG8012 (ER) (SW6010B) | Total Cadmium(0 21ug/L) | No action necessary, total cadmium and copper results for all associated samples were 5x greater than the level of equipment blank contamination |
| | BG8013 (ER) (SW6010B) | Total Cadmium(0 21ug/L) | No action necessary, total cadmium and copper results for all associated samples were 5x greater than the level of equipment blank contamination |
| | CCB3 @ 12/04/00 11 43pm (SW6010B) | Total Cadmium(0 02mg/kg) | Total cadmium results for BG0081 and BG0082 should be considered estimated due to calibration blank contamination |
| | CCB4 @ 11/30/00 01 04am (SW6010B) | Total Cadmium(0 223ug/L)<br>Total Copper(-0 462ug/L)<br>Total Lead(0 857ug/L) | Total cadmium, copper and lead results for BG8010 and BG8011 should be considered estimated due to calibration blank contamination |
| | CCB1 @ 12/07/00 01 16am (SW6010B) | Total Cadmium(1 41ug/L)<br>Total Copper(0 223ug/L)<br>Total Manganese(1 41ug/L) | Total cadmium, copper, silver and manganese results for BG8012 and BG8013 should be considered estimated due to calibration blank contamination |
| | CCB2 @ 12/01/00 11 13pm (SW6010B) | Total Cadmium(0 092mg/kg) | Total cadmium results for BG0052, BG0053, BG0055, BG0057, and BG0058 should be considered estimated due to calibration blank contamination |
| | CCB2 @ 12/01/00 11 13pm (SW6010B) | Total Cadmium(0 092mg/kg)<br>Total Copper(-0 317mg/kg) | Total cadmium and copper results for sample BG0056 were "U" qualified due to calibration blank contamination |
| | CCB3 @ 12/01/00 12 33am (SW6010B) | Total Cadmium(0 109mg/kg) | Total cadmium results for BG0105, BG0106, BG0107, BG0108, BG0110, BG0111, BG0112 and, BG0113, should be considered estimated due to calibration blank contamination |
| | CCB2 @ 12/04/00 11 51pm (SW6010B) | Total Cadmium(0 022mg/kg) | Total cadmium results for BG0114 should be considered estimated due to calibration blank contamination |
| | CCB1 @ 12/04/00 10 55pm (SW6010B) | Total Cadmium(0 023mg/kg) | Total cadmium results for BG0165 and BG0168 should be considered estimated due to calibration blank contamination |
| | CCB1 @ 12/04/00 10 55pm (SW6010B) | Total Cadmium(0 023mg/kg) | Total cadmium result for BG0167 was "U" qualified due to calibration blank contamination |
| | CCB1 @ 12/05/00 10 34pm (SW6010B) | Total Cadmium(0 059mg/kg) | Total cadmium result for BG0129 should be considered estimated due to calibration blank contamination |

## 2.4 Analytical Accuracy Assessment

MS/MSD & Laboratory Control Sample (LCS) were used to measure analytical accuracy as described in SW846 SW8260B and SW6010B/SW6020 methodology. Results indicate that an acceptable level of analytical accuracy was achieved. Table 2.4-1 summarizes MS/MSD and LCS spike failures.

**Table 2.4-1 Summary of MS/MSD and LCS Percent (%) Recovery Failures**

| Sample Delivery Group | Sample Number | Bias | Action |
|---|---|---|---|
| L0011565 | BG0056 (MS/MSD) (SW6010B) | Arsenic (Low bias) | Total arsenic result for samples BG0056 was qualified as estimated "J" |
| | BG0167 (MS/MSD) (SW6010B) | Cobalt (Low bias) | Total cobalt result for samples BG0056 was qualified as estimated "J" |
| | BG0172 (MS/MSD) (SW6010B) | Lead (Low bias) | Total lead result for sample BG0172 was qualified as estimated "J" |
| L0012113 | BG0140 (MS/MSD) (SW6010B) | Manganese (High bias) | Total manganese result for sample BG0140 was qualified as estimated "J" |

## 2.5 Analytical Precision

Laboratory duplicate and matrix spike/matrix spike duplicate analyses were used to measure precision as described by SW846 SW8260B and SW6010B/SW6020 methodology Analytical precision is calculated based on the following formula

$$RPD = \left| \frac{(A-B)}{(A+B)/2} \right| 100$$

where

RPD = Relative Percent Difference
A = original result
B = duplicate result

A high RPD between an original sample and its field duplicate may be attributable to the difference in sample matrix or distribution of the contaminant within the sample, rather than the precision of the collection process Also, when "estimated" results are reported, there is a potential for increased variability between the primary and duplicate sample results. This occurs because, at low concentrations, the relative difference in results is magnified by the RPD calculation even though the results are comparable in absolute terms There is also increased uncertainty in the results as the lower limit of detection is approached due to decreasing analytical accuracy The RPD calculation cannot be performed in cases where non-detected results are reported with corresponding samples that contain detectable concentrations Field duplicate ($RPD_{(Metals\ \&\ Organics)} > 50$ for soil and $RPD_{(Metals\ \&\ Organics)} > 30$ for water) and MS/MSD ($RPD_{(Metals)} > 20$, $RPD_{(Organics)} > 30$ for soil and $RPD_{(Metals)} > 20$, $RPD_{(Organics)} > 20$ for water) RPD failures are summarized in Table 2.5-1

**Table 2.5-1 Summary of MS/MSD and Field Duplicate RPD QC Failures**

| Sample Delivery Group | Sample Number | Contaminant | Action |
|---|---|---|---|
| L00111565 | BG0172 (MS/MSD) (SW6010B) | Lead (20 5) | Total lead result for BG0172 was qualified as estimated "J" |
| | BG0049 (REG)/BG0050 (FD) (SW6010B) | Copper (68 8) | Total copper result for BG0049 was qualified as estimated "J" due to poor RPD with its corresponding field duplicate |
| | BG0060 (REG)/ BG0061 (FD) (SW6010B) | Arsenic (93 1) | Total arsenic results for BG0060 was qualified as estimated "J" due to poor RPD with its corresponding field duplicate |
| | BG0167 (REG)/BG0168 (FD) (SW6010B) | Cobalt (54 6) | Total cobalt result for BG0168 was qualified as estimated "J" due to poor RPD with its corresponding field duplicate |
| L0012113 | BG0071 (MS/MSD) (SW6010B) | Cadmium (26 2) | Total cadmium result for BG0071 was qualified "UJ" due to poor MS/MSD RPD |
| | BG0136 (MS/MSD) (SW6010B) | Manganese (50 63) | Total manganese result for BG0136 was qualified "J" due to poor MS/MSD RPD |
| | BG0140 (MS/MSD) (SW6010B) | Manganese (50 63) | Total manganese result for BG0140 was qualified "J" due to poor MS/MSD RPD |
| | BG0136 (REG)/BG0137 (FD) (SW6010B) | Arsenic (72 6)<br>Copper (49 1) | Total arsenic and copper results for BG0137 were qualified "J" due to poor RPD with its corresponding field duplicate |

## 2.6 Data Completeness

Completeness is calculated for the aggregation of data for each analyte measured during the Naval Air Station (NAS) Fort Worth Joint Reserve Base Carswell Field Phase 3 RCRA Facility Investigation Oil/Water Separators Formula for calculating completeness is listed below.

% completeness = (number of non-rejected (i.e., non -"R" flagged) results/number of possible results) x 100

The requirement for completeness is 100% for soil samples (possible results for soil matrix includes SPLP analytical results)

% Completeness $_{(Soil)}$ = (288/ 289) x100 = 99 6%

% Completeness $_{(Water)}$ = (44/ 44) x100 = 100%

## 2.7 Data Useability

Data Quality Objectives (DQOs) provide an internal guide for control and review to verify that data are scientifically sound, defensible, and of known and acceptable quality. Factors such as accuracy, precision, and completeness were evaluated to determine if the project's DQOs were met A review of the data revealed that most QA/QC indicators were within acceptable control limits

The overall results of the analyses suggest that representative samples were collected and analyzed, and the results are indicative of the media analyzed. The data are considered representative of site conditions and are usable for their intended purpose

## Attachment B - Data Validation Summary Report

# DATA VALIDATION SUMMARY REPORT

| | |
|---|---|
| **PROJECT:** | Carswell Air Force Base, Nov.'00' Oil/Ground Water Separators Sampling |
| **LABORATORY:** | Kemron Environmental Services |
| **WORK ORDERS:** | L0011565, L0012048, and L0012113 |
| **MATRIX:** | Soils and Waters |
| **VALIDATION LEVEL:** | III |
| **ANALYSES, METHODS:** | Volatiles by SW846 8260B and Metals by SW846 6010B |

## 1.0 INTRODUCTION

Soil and waters samples were submitted to Kemron Environmental Services for analyses. Validated samples are listed in Table 1-1.

10% of the samples were validated and reviewed in accordance with the "EPA Functional Guidelines " and associated methods. All results reported between the MDL and RL were reported as estimated by the laboratory. Validation qualifiers were assigned due to matrix, blank contamination, field duplicate precision, and serial dilution problems. No data were rejected due to laboratory QC failures. Specific findings are discussed in detail in the following sections.

Table 1-1. Sample Information

| Work Order Number | Sample Date | Sample Number | Lab ID | Volatiles By 8260B | Metals 6010B | Field QC (ER, TB) |

## 2.0 *VOLATILE ORGANIC COMPOUND by 8260B (benzene/chlorobenzene)*

### 2.1 Sampling Documentation

Work Orders L0011565, L0012048: Chain-of-custody (COC) records indicate samples were received in good condition and properly preserved No qualifiers were assigned.

### 2.2 Holding Times

Work Orders L0011565, L0012048: Samples were analyzed within the specified holding period for soil samples. No qualifiers were assigned

### 2.3 Instrument Tune

Work Orders L0011565, L0012048: Bromofluorobenzene (BFB) tunes were performed. Instrument tunes met the ion abundance criteria specified in the QAPP and method. No qualifiers were assigned.

### 2.4 Calibrations

#### *2.4.1 Initial Calibration*

Work Orders L0011565, L0012048: Samples were analyzed using a multi-point calibration. All compounds met the minimum average response factor (RRF) of 0.05 and %RSD<30%. No qualifiers were assigned.

#### *2.4.2 Continuing Calibration*

Work Orders L0011565, L0012048: Continuing calibration was performed using the RRF <0 05 QC criteria and %Difference <20%. No qualifiers were assigned.

### 2.5 Blanks

#### *2.5.1 Method/Preparation Blanks*

Work Orders L0011565, L0012048: All method blanks associated with validated samples detected no contaminants. No qualifiers were assigned.

### 2.6 System Monitoring Compounds (surrogates)

Work Order L0011565: Sample BG0080 was non-detect for all contaminants of concern but reported one surrogate with a high % recovery. Sample BG0080 was not re-analyzed. No qualifiers were assigned.

Work Order L0012048: Surrogate spike recoveries (%R) were within QC limits. No qualifiers were assigned.

### 2.7 Internal Standards

Work Orders L0011565, L0012048: Internal standard areas and retention times for all samples were within control limits. No qualifiers were assigned.

**2.8 Matrix Spike (MS) /Matrix Spike Duplicate (MSD)**

Work Orders L0011565, L0012048: MS/MSD recoveries were within QC limits. No qualifiers were assigned.

**2.9 Laboratory Control Sample (LCS)**

Work Orders L0011565, L0012048: LCS analysis exhibited acceptable results. No qualifiers were assigned.

**2.10 Field Duplicates**

Work Orders L0011565, L0012048: There were no field duplicates associated with these SDG's. No qualifiers were assigned.

**2.11 Compound Quantitation and Project Reporting Limits**

Based on a Level III validation, samples were identified and generally quantified appropriately.

**2.12 Overall Assessment of the Data**

Data for the validated samples are acceptable as qualified.

## *3.0 INORGANIC METALS ANALYSIS by 6010B*

**3.1 Sampling Documentation**

Work Orders L0011565, L0012048, L0012113: Chain-of-custody (COC) records indicate samples were received in good condition and properly preserved. No qualifiers were assigned.

**3.2 Holding Times**

Work Orders L0011565, L0012048, L0012113: Validated samples were analyzed within the specified holding time requirements. No qualifiers were assigned.

**3.3 Calibrations**

***3.3.1 Initial Calibration Verification***

Work Orders L0011565, L0012048, L0012113: Initial calibration verifications were performed immediately following instrument standardization. All calibration verifications met QC requirements. No qualifiers were assigned.

***3.3.2 Continuing Calibration Verification***

Work Orders L0011565, L0012048, L0012113: Continuing calibration verifications were within control limits. No qualifiers were assigned.

629 848

Page(s) Missing
From the Official
Government Document

Work Order L0012048: MS/MSD recoveries were within QC limits. No qualifiers were assigned.

Work Order L0012113. Manganese results for samples BG0140 were estimated ("J" qualified) due to high % recovery and RPD. Cadmium result for sample BG0071 was "UJ" qualified due to high MS/MSD RPD and calibration blank contamination.

### 3.6 Laboratory Control Sample (LCS)

Work Orders L0011565, L0012048, L0012113: LCS analysis exhibited acceptable results. No qualifiers were assigned.

### 3.7 Interference Check Samples

Work Orders L0011565, L0012048, L0012113. Interference check samples analyzed were within control limits. No qualifiers were assigned.

### 3.8 Field Duplicates

Work Order L0011565: Seven sets of original and field duplicates were evaluated. Copper result for sample BG0049 (original), arsenic result for sample BG0060 and cobalt result for sample BG0167 (original) were estimated due to %Difference>50%.

Work Order L0012048: Samples BG0156 (original), BG0157 (FD), and BG3019 (original), BG3020 (FD) were evaluated and met QC criteria. No qualifiers were assigned

Work Order L0012113: Samples BG0136 (original) and BG0137 (FD) were evaluated. Arsenic and copper results for sample BG0136 were estimated ("J" qualified) due to %Difference>50%.

### 3.9 Serial Dilution

Work Order L0011565: Cobalt result for sample BG0167 and manganese result for sample BG0099 were estimated ("J" qualified) due to serial dilution %Difference>10%.

Work Order L0012048: Cadmium result for sample BG0077 was "UJ" qualified due to serial dilution %Difference>10% and calibration blank contamination.

Work Order L0012113: Manganese results for samples BG0140 and BG0136 were estimated ("J" qualified) due to %Difference>10%.

### 3.10 Compound Quantitation and Project Reporting Limits

Based on a Level III validation, samples were identified and generally quantified appropriately.

### 3.11 Overall Assessment of the Data

Data for the validated samples are acceptable as qualified.

Work Order L0012048: MS/MSD recoveries were within QC limits. No qualifiers were assigned.

Work Order L0012113: Manganese results for samples BG0140 and BG0136 were estimated ("J" qualified) due to high % recovery and RPD. Cadmium result for sample BG0071 was "UJ" qualified due to high MS/MSD RPD and calibration blank contamination.

### 3.6 Laboratory Control Sample (LCS)

Work Orders L0011565, L0012048, L0012113· LCS analysis exhibited acceptable results. No qualifiers were assigned.

### 3.7 Interference Check Samples

Work Orders L0011565, L0012048, L0012113: Interference check samples analyzed were within control limits. No qualifiers were assigned.

### 3.8 Field Duplicates

Work Order L0011565: Seven sets of original and field duplicates were evaluated. Copper result for sample BG0049 (original), arsenic result for sample BG0060 and cobalt result for sample BG0167 (original) were estimated due to %Difference>50%.

Work Order L0012048: Samples BG0156 (original), BG0157 (FD), and BG3019 (original), BG3020 (FD) were evaluated and met QC criteria. No qualifiers were assigned

Work Order L0012113: Samples BG0136 (original) and BG0137 (FD) were evaluated. Arsenic and copper results for sample BG0136 were estimated ("J" qualified) due to %Difference>50%.

### 3.9 Serial Dilution

Work Order L0011565: Cobalt result for sample BG0167 and manganese result for sample BG0099 were estimated ("J" qualified) due to serial dilution %Difference>10%.

Work Order L0012048: Cadmium result for sample BG0077 was "UJ" qualified due to serial dilution %Difference>10% and calibration blank contamination.

Work Order L0012113: Manganese results for samples BG0140 and BG0136 were estimated ("J" qualified) due to %Difference>10%.

### 3.10 Compound Quantitation and Project Reporting Limits

Based on a Level III validation, samples were identified and generally quantified appropriately.

### 3.11 Overall Assessment of the Data

Data for the validated samples are acceptable as qualified.
