FINAL REMEDIAL INVESTIGATION REPORT VOLUME 4 OF 11 APPENDICES B THROUGH H SITE 41 NAS PENSACOLA FL
8/17/2005
ENSAFE/ALLEN AND HOSHALL

FINAL REMEDIAL INVESTIGATION REPORT
SITE 41 — OPERABLE UNIT 16 — NAS PENSACOLA WETLANDS

NAVAL AIR STATION
PENSACOLA, FLORIDA

SOUTHNAVFACENGCOM
CONTRACT NUMBER: N62467-89-D-0318

CTO-036

VOLUME IX OF XI
APPENDICES B — H

Prepared for:

Comprehensive Long-Term
Environmental Action Navy
Naval Air Station
Pensacola, Florida

Prepared by:

EnSafe Inc.
5724 Summer Trees Drive
Memphis, Tennessee 38134

(800) 588-7962

August 17, 2005
Revised November 16, 2007

Appendix B

Phase II Sediment and Surface Water Analytical Results

Validation Qualifiers

U **Undetected** — The analyte was analyzed for but not detected, or was also found in an associated blank at a concentration less than 10 times the blank concentration for common organic laboratory contaminants or five times the blank concentration for other target analytes or elements. The associated value shown is the quantitative limit.

J **Estimated Value** — At least one QC parameter was outside control limits.

NJ **Presumptive Identification** — NJ is used for pesticide/PCB analysis when the percent difference exceeds the QC limits by 100% or more. It indicates the presence of an analyte for which there is presumptive evidence to make a tentative identification at an estimated concentration. This qualifier is used for pesticide/PCB validation only.

UJ **Undetected and Estimated** — The analyte was analyzed for, but not detected above the listed estimated quantitation limit; the quantitation limit is estimated because one or more QC parameters were outside control limits.

D **Diluted Result** — The compound was reanalyzed at a secondary dilution factor. If one or more compounds are outside the calibration range during an initial analysis, the laboratory flags the analyte "E." When diluted, the sample results are flagged "D." Generally, values from the initial analysis will be used, except where the value exceeded the calibration range. In this case, the initial analysis value will be substituted by the diluted value to ensure the most representative data. The "D" flag will remain on the value to alert the data user that a secondary dilution value was used.

R/UR **Unusable Data** — One or more QC parameters grossly exceeded control limits.

Grain Size Analysis

GEOTECHNICAL LABORATORY TEST DATA

Project : NAS Pensacola #960039
Project No. : GTX-961
Boring No. : ---
Sample No. : 041M010101
Location : Pensacola, FL
Soil Description : Black silty sand with organics
Remarks : ---

Depth : ---
Test Date : 01/24/96
Test Method : ASTM D422

Filename : 06
Elevation : ---
Tested by : gph
Checked by : gtt

HYDROMETER

Hydrometer ID : hy100
Weight of air-dried soil = 142 gm
Specific Gravity = 2.65

Hydroscopic Moisture Content :
Weight of Wet Soil = 0 gm
Weight of Dry Soil = 0 gm
Moisture Content = 0

GEOTECHNICAL LABORATORY TEST DATA

Project : NAS Pensacola #960025
Project No. : GTX-955
Boring No. : ---
Sample No. : 041m170301
Location : Pensacola, Florida

Depth : ---
Test Date : 01/19/96
Test Method : ASTM D422

Filename : 03
Elevation : ---
Tested by : jdt
Checked by : gtt

Soil Description : Very dark gray sand, trace silt
Remarks : Hydrometer not required, fines < 10%

FINE SIEVE SET

Sieve Mesh	Sieve Openings Inches	Sieve Openings Millimeters	Weight Retained (gm)	Cumulative Weight Retained (gm)	Percent Finer (%)
#10	0.079	2.00	0.00	0.00	100

Appendix C

Phase III Sediment, Surface Water, and Biota Analytical Results

Validation Qualifiers

U **Undetected** — The analyte was analyzed for but not detected, or was also found in an associated blank at a concentration less than 10 times the blank concentration for common organic laboratory contaminants or five times the blank concentration for other target analytes or elements. The associated value shown is the quantitative limit.

J **Estimated Value** — At least one QC parameter was outside control limits.

NJ **Presumptive Identification** — NJ is used for pesticide/PCB analysis when the percent difference exceeds the QC limits by 100% or more. It indicates the presence of an analyte for which there is presumptive evidence to make a tentative identification at an estimated concentration. This qualifier is used for pesticide/PCB validation only.

UJ **Undetected and Estimated** — The analyte was analyzed for, but not detected above the listed estimated quantitation limit; the quantitation limit is estimated because one or more QC parameters were outside control limits.

D **Diluted Result** — The compound was reanalyzed at a secondary dilution factor. If one or more compounds are outside the calibration range during an initial analysis, the laboratory flags the analyte "E." When diluted, the sample results are flagged "D." Generally, values from the initial analysis will be used, except where the value exceeded the calibration range. In this case, the initial analysis value will be substituted by the diluted value to ensure the most representative data. The "D" flag will remain on the value to alert the data user that a secondary dilution value was used.

R/UR **Unusable Data** — One or more QC parameters grossly exceeded control limits.

Appendix D

2000 and 2004 Analytical Results

Validation Qualifiers

U **Undetected** — The analyte was analyzed for but not detected, or was also found in an associated blank at a concentration less than 10 times the blank concentration for common organic laboratory contaminants or five times the blank concentration for other target analytes or elements. The associated value shown is the quantitative limit.

J **Estimated Value** — At least one QC parameter was outside control limits.

NJ **Presumptive Identification** — NJ is used for pesticide/PCB analysis when the percent difference exceeds the QC limits by 100% or more. It indicates the presence of an analyte for which there is presumptive evidence to make a tentative identification at an estimated concentration. This qualifier is used for pesticide/PCB validation only.

UJ **Undetected and Estimated** — The analyte was analyzed for, but not detected above the listed estimated quantitation limit; the quantitation limit is estimated because one or more QC parameters were outside control limits.

D **Diluted Result** — The compound was reanalyzed at a secondary dilution factor. If one or more compounds are outside the calibration range during an initial analysis, the laboratory flags the analyte "E." When diluted, the sample results are flagged "D." Generally, values from the initial analysis will be used, except where the value exceeded the calibration range. In this case, the initial analysis value will be substituted by the diluted value to ensure the most representative data. The "D" flag will remain on the value to alert the data user that a secondary dilution value was used.

R/UR **Unusable Data** — One or more QC parameters grossly exceeded control limits.

Table 1
Data Qualifiers

The following codes shall be used by laboratories when reporting data values that either meet the specified description outlined below or do not meet the quality control criteria of the laboratory:[1]

SYMBOL	MEANING
A	Value reported is the arithmetic mean (average) of two or more determinations. This code shall be used if the results of two or more discrete and separate samples are averaged. These samples shall have been processed and analyzed (e.g., laboratory replicate samples, field duplicates, etc.) independently. Do not use this code if the data are the result of replicate analysis on the same sample aliquot, extract or digestate. Under most conditions, replicate values shall be reported as individual analyses.
B	Results based upon colony counts outside the acceptable range. This code applies to microbiological tests and specifically to membrane filter colony counts. The code is to be used if the colony count is generated from a plate in which the total number of coliform colonies is outside the method indicated ideal range. This code is not to be used if a 100 mL sample has been filtered and the colony county is less than the lower value of the ideal range.
F	When reporting species: F indicates the female sex.
H	Value based on field kit determination; results may not be accurate. This code shall be used if a field screening test (i.e., field gas chromatograph data, immunoassay, vendor-supplied field kit, etc.) was used to generate the value and the field kit or method has not been recognized by the Department as equivalent to laboratory methods.
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
J	Estimated value; value may not be accurate. This code shall be used in the following instances: 1. Surrogate recovery limits have been exceeded; 2. No known quality control criteria exist for the component; 3. The reported value failed to meet the established quality control criteria for either precision or accuracy; 4. The sample matrix interfered with the ability to make any accurate determination; or 5. The data are questionable because of improper laboratory or field protocols (e.g., composite sample was collected instead of a grab sample). Note: a "J" value shall be accompanied by justification for its use. A "J" value shall not be used if another code applies (e.g., K, L, M, T, V, Y, I).

[1] Table 1 from Chapter 62-160, F.A.C.

Table 1
Data Qualifiers

SYMBOL	MEANING
K	Off-scale low. Actual value is known to be less than the value given. This code shall be used if: 1. The value is less than the lowest calibration standard and the calibration curve is known to be non-linear; or 2. The value is known to be less than the reported value based on sample size, dilution or some other variable. This code shall not be used to report values that are less than the laboratory practical quantitation limit or laboratory method detection limit.
L	Off-scale high. Actual value is known to be greater than value given. To be used when the concentration of the analyte is above the acceptable level for quantitation (exceeds the linear range or highest calibration standard) and the calibration curve is known to exhibit a negative deflection.
M	When reporting chemical analyses: presence of material is verified but not quantified; the actual value is less than the value given. The reported value shall be the laboratory practical quantitation limit. This code shall be used if the level is too low to permit accurate quantification, but the estimated concentration is greater than the method detection limit. If the value is less than the method detection limit use "T" below.
N	Presumptive evidence of presence of material. This qualifier shall be used if: 1. The component has been tentatively identified based on mass spectral library search; or 2. There is an indication that the analyte is present, but quality control requirements for confirmation were not met (i.e., presence of analyte was not confirmed by alternative procedures).
O	Sampled, but analysis lost or not performed.
Q	Sample held beyond the accepted holding time. This code shall be used if the value is derived from a sample that was prepared or analyzed after the approved holding time restrictions for sample preparation or analysis.
T	Value reported is less than the laboratory method detection limit. The value is reported for informational purposes, only and shall not be used in statistical analysis.
U	Indicates that the compound was analyzed for but not detected. This symbol shall be used to indicate that the specified component was not detected. The value associated with the qualifier shall be the laboratory method detection limit. Unless requested by the client, less than the method detection limit values shall not be reported (see "T" above).
V	Indicates that the analyte was detected in both the sample and the associated method blank. Note: the value in the blank shall not be subtracted from associated samples.

Table 1
Data Qualifiers

SYMBOL	MEANING
Y	The laboratory analysis was from an improperly preserved sample. The data may not be accurate.
Z	Too many colonies were present (TNTC); the numeric value represents the filtration volume.
?	Data are rejected and should not be used. Some or all of the quality control data for the analyte were outside criteria, and the presence or absence of the analyte cannot be determined from the data.
*	Not reported due to interference.

The following codes deal with certain aspects of field activities. The codes shall be used if the laboratory has knowledge of the specific sampling event. The codes shall be added by the organization collecting samples if they apply:

D	Measurement was made in the field (i.e., in situ). This applies to any value (except pH, specific conductance, dissolved oxygen, temperature, total residual chlorine, transparency, or salinity) that was obtained under field conditions using approved analytical methods. If the parameter code specifies a field measurement (e.g., "Field pH"), this code is not required.
E	Indicates that extra samples were taken at composite stations.
R	Significant rain in the past 48 hours. (Significant rain typically involves rain in excess of ½ inch within the past 48 hours.) This code shall be used when the rainfall might contribute to a lower than normal value.
!	Data deviates from historically established concentration ranges.

Barry Vittor Methods Report

TAI Environmental Sciences Inc.
Standard Operating Procedures
TAXONOMY

1.0 GENERAL METHODOLOGY

1.1 PLANKTON. TAI conducts analyses for various plankton components including Phytoplankton, Zooplankton, Ichthyoplankton and Chlorophyll according to the methods outlined in 1). Standard Methods for the Examiniation of Water and Wastewater Part 10200, 17th Edition APHA 1989. and 2). Biological Field and Laboratory Methods for Measuring the Quality of Surface Waters and Effluents. (EPA-670/4-73-001).

1.2 PRIMARY PRODUCTION. TAI performs in situ analyses for primary production according to the methods described in 1). Standard Methods for the Examiniation of Water and Wastewater Part 10300, 17th Edition APHA 1989. and 2). Biological Field and Laboratory Methods for Measuring the Quality of Surface Waters and Effluents. (EPA-670/4-73-001).

1.3 PERIPHYTON. TAI performs analyses on periphyton samples according to the methods described in 1). Standard Methods for the Examiniation of Water and Wastewater Part 10200, 17th Edition APHA 1989. and 2). Biological Field and Laboratory Methods for Measuring the Quality of Surface Waters and Effluents. (EPA-670/4-73-001).

1.4.MACROPHYTON TAI performs in situ analyses of macrophytic communities according to the methods described in 1). Standard Methods for the Examiniation of Water and Wastewater Part 10400, 17th Edition APHA 1989. and 2). Biological Field and Laboratory Methods for Measuring the Quality of Surface Waters and Effluents. (EPA-670/4-73-001).

1.5 MACROINVERTEBRATES. TAI performs analyses for ecological investigation of Macroinvertebrate Communities including marine, estuarine and freshwater infauna and epifauna according to the methods described in 1). Standard Methods for the Examiniation of Water and Wastewater Part 10500, 17th Edition APHA 1989. and 2). Biological Field and Laboratory Methods for Measuring the Quality of Surface Waters and Effluents. (EPA-670/4-73-001) and 3). "Macroinvertebrate Field and Laboratory Methods for Evaluating the Biological Integrity of Surface Waters" ORD Washington, D.C. November 1990.

1.6 FISHES. TAI performs analyses of fishes according to the methods described in 1). Standard Methods for the Examiniation of Water and Wastewater Part 10600, 17th Edition APHA 1989. and 2). Biological Field and Laboratory Methods for Measuring the Quality of Surface Waters and Effluents. (EPA-670/4-73-001).

2.1 PLANKTON SAMPLING. Plankton sampling is performed using the procedures and equipment described in 1). Standard Methods for the Examiniation of Water and Wastewater Part 10200, 17th Edition APHA 1989. and 2). Biological Field and Laboratory Methods for Measuring the Quality of Surface Waters and Effluents. (EPA-670/4-73-001). Equipment used is included in Table 2.1.

2.2 PERIPHYTON SAMPLING. Periphyton Sampling is performed using the procedures and equipment described in 1). Standard Methods for the Examiniation of Water and Wastewater Part 10300, 17th Edition APHA 1989. and 2). Biological Field and Laboratory Methods for Measuring the Quality of Surface Waters and Effluents. (EPA-670/4-73-001).

Table 2.1 Equipment Used For Field Collection of Various Biological Community Components

Method	Sample Source	Component	Equipment
SM 10200	Surface Water	Plankton	Kemmerer Sampler, Plankton Nets (Wisconsin), Plankton Trap
SM 10300	Surface Water	Periphyton	Periphyton Sampler, glass slides, Natural substrates
SM 10300	Surface Water	Primary Production	Winkler Method (D.O.)
SM 10400	Surface Water	Macrophyton	Aerial Recon, Line Intercept.
SM 10500	Sediments	Macroinfauna	PonarGrab, 0.25 m Box-core, Ekman Grab, Surber Sampler, Phleger corer Hester-Dendy Sampler, Basket Sampler, Block Sampler, Scoop Nets.
SM 10600	Surface Waters	Fishes	Otter Trawl, Beach Seine, Scoop Nets, Block Nets, Electrofishing

2.3 BENTHIC MACROINVERTEBRATE SAMPLING. In general, sampling for macroinvertebrates is performed using the procedures and equipment described in 1). Standard Methods for the Examination of Water and Wastewater Part 10500, 17th Edition APHA 1989. and 2). Biological Field and Laboratory Methods for Measuring the Quality of Surface Waters and Effluents. (EPA-670/4-73-001).

2.3.1 Field collection of marine, estuarine and freshwater benthic macroinvertebrate samples can utilize a variety of sampling gear. TAI personnel have experience with many types, the most common being Boxcore, Eckman, Petersen, Ponar and Petite ponar grabs, and with Hester-Dendy and other artificial substrate samplers. Bottom sediment type, collection depth and a variety of other factors, including client specifications, will effect the choice of sampling gear.

2.3.2 Upon collection, grab samples may be horizontally or vertically sectioned and/or measured volumetrically depending on contract requirements. Collected samples are sieved using standard 500 micron sieve buckets and relaxed using a solution of magnesium sulfate, 2% buffered formalin and seawater, or they are placed on ice. Relaxed samples, and those placed on ice, are preserved with a 10% buffered formalin - rose bengal solution after several hours chilling time. The latter process has proven to be very reliable and is the method of choice. Samples are then returned to the laboratory for processing.

2.3.3 Hester-Dendy samplers are composed of 0.3 cm-thick tempered hard board with 7.6 cm round plates and 2.5 cm round spacers. The plates are separated by an increasing number of spacers along a 10 in stainless steel eyebolt. This results in the plates being spaced at increasingly greater intervals. A total of 14 large plates and 24 spacers are used in each sampler.

2.3.4 The Hester-Dendy, or other artificial substrate, is deployed in the euphotic zone of the water column. The samplers are attached by 1/8 to 1/4 inch cord to a depth of approximately 0.3 m and suspended from a float. This assures uniformity of sample depth. Samplers are normally allowed 3 weeks for colonization, but this may be extended if conditions require.

2.3.5 This general procedure may be modified to fit specific conditions of the sampling area, study design or client requirements. Regardless of technique, uniform procedures are used. Before removal from the water, samplers are enclosed in an oversized plastic bag to prevent loss of organisms. These samples are then relaxed before returning to the laboratory.

2.5 Fishes. Fish populations are sampled using the methodologies described in the following manuals: 1). Standard Methods for the Examiniation of Water and Wastewater Part 10500, 17th

Edition APHA 1989. and 2). Biological Field and Laboratory Methods for Measuring the Quality of Surface Waters and Effluents. (EPA-670/4-73-001).

3.1 BENTHIC MICROINVERTEBRATE SAMPLE CUSTODY / TRACKING

3.1. Field Sampling Operations

Immediately following collection, samples are placed in pre-labeled (numbered) containers to ensure all field samples are collected, or at least attempted. Additional labels of heavy 100% rag paper are placed inside all biological samples in order to be able to identify the sample in the event the outer label is accidently removed or obliterated. A variety of field sheets are prepared to track the samples from the collection point to the laboratory and record field measurements, observations, and collection notes.

All samples collected are accompanied by chain-of-custody documents. The chain-of-custody forms identify all aspects of the transfer (collector, time of transfer, recipient, etc.) and are completed on a real-time basis.

3.2. Laboratory Operations

Upon receipt of the biological samples at the laboratory, chain-of-custody forms are completed and the samples are inventoried. One copy of the inventory is used in the sorting phase and another for the identification/enumeration phase.

In the sorting phase, the sorting technician removes the sample from the storage shelf and signs that sample out in the sample log book and records the date and time of removal. Upon sorting completion, the sorter puts the sample on the appropriate shelf and signs the sorted sample back in. The same procedure is utilized during the identification/enumeration phase. The taxonomist signs the sample out, using the Invoice of Specimen sheet , processes the sample, and signs the sample in upon completion. The completed samples and the residual materials are stored for QC checks and subsequent final verification and curation.

4.0 TAXONOMIC PROCEDURES

4.1 Sample Sorting

4.1.1 Initial removal of organisms from sediment and debris and separation into major phylogenetic categories are performed by experienced laboratory personnel Samples undergoing processing are routinely checked by an assigned QAQC referee and/or the Taxonomy Task Manager. QAQC checks occur on no less than 10% of the samples processed.

4.1.2 Removal of organisms from Hester-Dendy, or similar type, artificial substrate samplers is accomplished by dismantling the sampler in a tray filled 2cm deep with a 40% isopropyl alcohol solution. Plates and spacers are then brushed and carefully scraped into the tray. The sample is then sieved through a 0.5 mm mesh screen. This method has proven to be very effective in preventing excessive fragmentation or mutilation of organisms.

4.1.3 Sorting of the organisms is accomplished by pouring just enough sample into the sorting tray to cover the bottom and scanning with a magnification lamp. All organisms, previously stained bright red, are removed with fine tipped forceps or pipette and placed in shell vials containing a 40% isopropyl alcohol solution. Shell vials are arranged in racks marked with the appropriate phylogenetic category to prevent errors. Stereo and compound microscopes are readily available for verification of any questionable objects or samples.

4.1.4 Typical phylogenetic categories for saltwater samples may consist of Polychaeta, Crustacea, Mollusca, echinodermata, Rhynchocoela, Turbellaria and Miscellaneous. This will vary depending on sample diversity.

4.2 Sample Analysis

4..2.1 All identifications are done by experienced taxonomists and checked by our QAQC program. QAQC checks, including secondary identifications and/or comparison of samples to the voucher collection, occur on no less than 10%, randomly chosen, of the samples processed. All identifications and enumerations are recorded on standardized sheets for consistency and ease of data entry.

4..2.2 TAI's taxonomic team includes in-house and associate taxonomists. TAI maintains in-house expertise in chironomid, polychaete, mollusc, oligochaete, ichthyoplankton, zooplankton, finfishes and local crustacean and echinoderm identifications. Associate taxonomists are used to complement our in-house expertise by providing specialized identifications and performing secondary identifications as part of our QAQC program.

4.2.3 TAI maintains an extensive voucher collection of freshwater, estuarine and marine flora and fauna against which identified specimens are verified. The voucher collection is continuously upgraded with new specimens and a computer data file for easier location and quicker verifications. This will also be a continuously expanding project.

4.2.4 Following final verification, all samples are curated for a minimum three year period from the ending date of the corresponding contract. This allows for later verification or further data analysis.

4.2.5 Curation for long term storage is accomplished by placing each sample in a shell vial with a permanent label, and storage in air-tight, labelled containers filled with 40% isopropyl alcohol solution. Samples are stored in the TAI warehouse until the end of the curation period. These samples are then incorporated into the voucher collection or discarded.

4.2.6 TAI is experienced in wet weight, dry weight and ash weight biomassing. These procedures are performed as per Standard Methods 18 ed. Weighing is performed on a Mettler AE 163 dual beam balance with 0-31g and 0-162g ranges, touch control tare setting, automatic calibration adjustable time integration and a linearity of 0.02 mg and 0.1 mg on the respective ranges. Calibration is performed before each set of biomassing measurements, and after each subsequent 100 measurements. This insures accuracy and consistency.

4..2.7 Size class separations utilize a series of stackable sieves constructed of PVC and nylon plankton netting of 6500, 3500, 2000, 1000, 900, 650, 500 and 250 micron mesh sizes. Other mesh sizes are available upon request. Organisms are gently washed through the screens with a steady flow of water to prevent excess fragmentation or mutilation. Upon completion, each subsample is recorded in the Daily Taxonomy Log.

Table 4.1. Major Taxonomic References

polychaetes	Fauchald, 1977 Uebelacker and Johnson, 1984
oligochates	Brinkhurst, 1986 Hiltunen and Klemm, 1980
freshwater invertebrates	Pennak, 1953 Edmondson, 1959
estuarine/marine invertebrates	Gosner, 1971 Heard, 1982
freshwater algae	Smith, 1950

5.0 TAXONOMIC QA/QC

5.1.1 QA/QC checks occur on no less than 10% of the samples processed. For sorting tasks, at least 10% of all sorted samples are checked for completeness. Completeness checks are accomplished by resorting the residual material from a sample by a different technician. If the animals removed from the residual material total 5% or more of the total number of animals in the sample, this constitutes a QC failure, and all samples sorted by that technician shall be resorted back until the time of the last acceptable QC check.

5.1.2 For identification tasks, at least 10% of all identified samples are checked for identification and enumeration accuracy. Taxonomic checks are performed by the reidentification of the selected samples by a different taxonomist. A discrepancy of 5% or more constitutes a QC failure and all samples performed by the taxonomist on that project are reworked. Identification QC failures seldom occur as a result of the close working relationship that exists between TAI taxonomists. A voucher collection is prepared for each new project. As each species is encountered for the first time, all taxonomists inspect the specimen and become familiar with the key characters and voucher and consistency cards are prepared for that species. Therefore, any identification errors are corrected when the voucher collection is verified by outside expert taxonomists.

5.1.3 Data entry is facilitated by the use of standardized sheets for recording identification, enumeration and biomass of each sample. A visual check of all data is performed by an experienced referee or by the Taxonomy Task Manager to assure completeness and accuracy of the data.

6.0 TAXONOMY DATA REDUCTION AND REPORTING

6.1 Data Reduction, Analysis and Reporting

6.1.1 Data reduction begins after all raw data has been checked for completeness and accuracy. Preliminary statistical reports of the data are utilized (both tabular and graphical methods) to check the data for completeness, and to screen out questionable information. Simple descriptive statistics (Means, Range, Standard Deviation) of data is performed with the Symphony (T.M.) software system.

6.1.2 TAI can produce a number of analyses that present benthic invertebrate data by trophic type, abundance, ranked in order of abundance, diversity and cluster analysis. These, or additional analyses, are included as per client needs.

6..1.3 Diversity (Shannon-Wiener index) and evenness indices are calculated utilizing the machine methods described in the EPA 670/4-73-001, Biological Methods Manual (Weber, 1973). Log to base 2 is utilized unless otherwise requested by the client.

6.1.4 A cluster analysis package which runs on the IBM-PC has been developed by TAI. It is capable of analysis using a 150 x 150 species/station matrix and provides up to 12 similarity indices. The program has provisions for various standardizations, transformations and for both normal (Q) and inverse (r) mode analyses. Generally, the Bray-Curtis and/or Morisita indices are used for routine benthic analyses.

6.1.5 Additionally, TAI has experience in preparing customized symphony and Lotus 1-2-3 worksheets for biological data for governmental clients and private consulting organizations. We are thoroughly familiar with developing macros for the Lotus System to perform the data summaries and preparing specialized statistics such as diversity and similarity, indices, and for outputting data for further statistical analysis.

6.2 Data Validation

6.2.1 TAI uses a comprehensive QAQC program to assure accuracy and completeness of processing, identifications, data analysis and reporting, as per DEP-SOP (DER-QA-001/92, 30 September 1992 Section 10.3). Aspects of this plan have been mentioned throughout the manual.

6.2.2 The major elements of this plan are presented diagrammatically in Figure and include corporate experience, taxonomy task manager, experienced taxonomists, voucher collection, referee taxonomists, frequent data audits, sample tracking sheets, daily log sheets, standardized forms, and sample curation.

6.2.3 Data Storage

6.2.3.1 Copies of all forms, notes and reports are maintained on file for a minimum 3 year period from the ending date of the corresponding contract.

7.0 TAXONOMY CORRECTIVE ACTION

7.1 Taxonomic corrective action (as stated earlier in Section 5.3) may occur at the sorting level and/or the identification/enumeration level. During the sorting phase, the residual material is retained and at least 10% of these are reexamined for completeness. If the animals removed from the residual material total 5% of more of the total number of animals in the sample, this constitutes a QC failure, and all samples sorted by that technician shall be resorted back until the time of the last acceptable QC check.

7.2 For identification tasks, at least 10% of all completed samples are checked for accuracy by a reference taxonomist. A discrepancy of 2% or more constitutes a QC failure and all samples analyzed by that taxonomist on that project are reworked. This corresponds to the acceptance criteria according to Section 11, Table11.1 in DEP-SOP (DER-QA-001/92, 30 September 1992).

Ecology - Experience

PROJECT EXPERIENCE

BENTHIC MACROINFAUNA TAXONOMY

Benthic Invertebrate Identification and Enumeration, White River, and adjacent Streams, Indianapolis, Indiana. USGS. (1994-1997) *ongoing*

Macroinvertebrate Identification and Enumeration, Streams near Macon, Georgia. (1995-2000) *ongoing*

Macroinfauna, fishes and *auf wuchs* community near Wando River, South Carolina. Industrial Client (1997).

Macroinvertebrate and Fish Study, Industrial Facility near Greenville, South Carolina. RMT Engineers. (1996)

Ecological Survey for RI/FS study, Chanute AFB, Illinois. Included Macroinvertebrate, dip net, fish and phytoplankton studies, including RBPIII assessment. Parson's Engineeering Sciences. (1995)

Macroinvertebrate, Fish and Periphyton Sampling, Including EPA RBPIII assessments of streams and lakes around Petroleum Refinery, Houston, Texas. Parson's Engineering Sciences (1995)

Macroinvertebrate Identification, Proposed Industrial Site, Argentina. Parson's Engineering Sciences. (1995)

Macroinvertebrate Sampling, Dip Net and RBPIII Assessment. Amoco Refinery Site, Near Norco, Louisiana. Montgomery-Watson Engineers (1991-1992)

Benthic Invertebrate Characterization. Lake Maggiore, St. Petersberg, Florida. CH2M Hill (1990-91).

Baseline characterization of the macroinvertebrate community for assessing the effects of thin-layer dredge disposal on an estuarine environment. Fowl River, Alabama. (1986-88).

Baseline pre-disposal characterization of the benthic invertebrate community of several ocean disposal sites. Charlotte Harbor, Fort Pierce and Miami, Florida. (1986-89).

Benthic characterization for evaluation of potential impacts resulting from construction, development and initial operation of Navy homeports in the Gulf of Mexico. Pensacola Bay, Florida. (1986).

Characterization of benthic communities within natural and man-made embayments in Charlotte Harbor, Florida. (1986).

Characterization of the benthic community collected by core sampling in the Waccamaw River floodplain, South Carolina. (1986).

Identification and analysis of benthic invertebrates collected in estuarine and salt marsh areas of the Northern Gulf of Mexico. (1989).

Identification and characterization of benthic invertebrates collected on artificial substrates. Key West, Florida. (1986).

Characterization of the benthic community, both pre-and post-discharge, in a freshwater wetlands area. Pasco County, Florida. (1985-Present).

Identification and analysis of the benthic invertebrates of St. John's Harbor, Florida. (1985-Present).

Identification of a freshwater benthic community from Pottsburg Creek, Florida. (1982-1992)

Baseline characterization and monitoring of the benthic fauna of Mobile Bay, Alabama. (1980-1982).

Analysis of benthic invertebrates collected from the Wando River, South Carolina. (1981-82; 1989-90).

Benthic survey of MOEPSI dumpsite tract. Coastal Alabama. (1981).

Bioassays and toxicity testing of benthic invertebrates collected at numerous sites along the South Atlantic and Gulf coasts. (1978-1990).

Analysis of benthic invertebrate samples collected on BLM- MAFLA cruises. Eastern Gulf of Mexico. (1979-1980).

Baseline characterization of the benthic invertebrate community of an EPA designated ocean disposal site. Wilmington Harbor, North Carolina. (1979).

Characterization of the benthic community and assessment of impacts resulting from construction, development, and initial operation. Naval Submarine Support Base, Kings Bay, Georgia. (1978-1979).

Benthic characterization and evaluation of potential impacts for an EIS for power plant expansion. Crystal River, Florida. (1977-1978).

Characterization of benthic invertebrate communities in coastal Mississippi, Alabama, and Florida (MAFLA) lease areas. (1976-1978).

Analysis of benthic invertebrates in the vicinity of a pulp and paper plant. Apalachicola Bay, Florida. (1977).

Establishment of a benthic invertebrate reference collection. Eastern Gulf of Mexico. (1976-1977).

Design of baseline benthic studies for the South Atlantic OCS program. (1976).

Benthic surveys of MAFLA lease areas. Eastern Gulf of Mexico. (1975-1976).

Characterization of benthic invertebrate communities of coastal Louisiana for the Environmental Impact Statement (EIS) for the Gulf Intracoastal Waterway. (1975).

Analysis of benthic invertebrate community structure and assessment of impacts resulting from maintenance dredging. Gulfport, Mississippi. (1974).

Characterization and delineation of subtidal and intertidal invertebrate communities. Coastal North Carolina. (1970- 1974).

Survey of the epibenthic fauna of the Hudson Canyon. North Atlantic Ocean. (1973).

Analysis of benthic invertebrate samples collected from various sites in the Florida Keys. (1973).

Characterization of the benthos of a high energy beach. Coastal North Carolina. (1973).

Characterization of the benthos of a high energy beach system. Yorkshire Coast, England. (1972).

Survey of benthic invertebrates of the North Carolina outer continental shelf. (1972).

Studies on the physiology of benthic estuarine organisms. Florida. (1971-1982)

Characterization of the subtidal and intertidal benthos of Puget Sound, Washington. (1971).

Characterization of benthic communities of the Gulf of California. (1971).

Toxicity Test Summary Sheet

Client:	EnSafe
Project Number:	119-1817-1821, 1823-1828, 1830-1836
Study Directors:	Jeri Brecken-Folse
Test Material:	Surface water and sediment from Site 41
Date Materials Received:	26 August through 4 September 1997
Dates of Tests:	1 September through 21 October 1997
Test Conditions:	Chronic static screens
Test Animals:	*Pimephales promelas* (Lot# PP-97-18), *Chironomus tentans* (Lot# CT-97-02, 03, 04), *Leptocheirus plumulosus* (Lot# LP-97-01/02), *Neanthes arenaceodentata* (Lot# NA-97-02).
Source:	Test organisms were supplied by commercial suppliers.
Control and Dilution Water:	Moderately hard reconstituted freshwater (RCF), U.S. EPA 1993, or natural seawater.
Exposure Concentration:	One hundred percent surface water or sediment
Effect Criteria:	Survival, growth and emergence
Chronic Effects:	*P. promelas*: Growth effects were detected. *C. tentans*: Growth effects were detected. *L. plumulosus:* Survival effects were detected. *N. arenaceodentata*: Effects were not detected

INTRODUCTION

Samples of surface water and sediments were collected by EnSafe personnel on 26 August through 4 September 1997 from Site 41, Pensacola Naval Air Station, Florida. Fathead minnows, *Pimephales promelas*, were exposed to five surface water samples to determine the chronic effects of survival and growth. Midge larvae, *Chironomus tentans*, were exposed to six sediment samples to determine the chronic effects of survival, growth and emergence. The amphipod, *Leptocheirus plumulosus*, and the marine polychaetae, *Neanthes arenaceodentata*, were exposed to seven sediment samples to determine the chronic effects of survival and growth. Tests were conducted from 1 September through 21 October 1997. All original raw data are archived at TRAC, but copies are provided as Appendix A.

MATERIALS AND METHODS

Test Material

Five surface water samples were collected by EnSafe personnel and delivered to TRAC on 26 August 1997, in filled 9.5 L cubitainers at 26.0 - 30.9°C. Surface water stations 7501, 5A04, 5A05, 5A06 and 0301 were assigned TRAC sample numbers 1821, 1817, 1818, 1819, and 1820, respectively.

Sediment samples from six stations were collected and delivered to TRAC on 28 August 1997. Each sample filled two 0.2 L plastic containers and arrived at temperatures between 27.0 and 29.0°C. Sediment stations 7501, 5A04, 5A05, 5A06, 302, and 307 were assigned TRAC sample numbers 1828, 1823, 1824, 1925, 1826 and 1827, respectively.

Sediment samples collected from stations 3301 and 3302 were collected and delivered 27 August 1997, and assigned samples numbers 1835 and 1836, respectively. Stations 6406 (1832) and 18B1 (1833) were collected and delivered 29 August 1997; 6404 (1830), 6405 (1831) and 1603 (1834) were collected and delivered 4 September 1997. The seven stations arrived at temperatures between 29.0 and 35.2°C in filled 3.8 L plastic containers.

Interstitial salinity and whether samples needed to be press sieved was noted on chain of custody (Appendix A). All samples were logged into the "Test Material Log," refrigerated and held at 4°C until test initiation.

Control Water

Overlying water was moderately hard RCF at a $CaCO_3$ hardness of 120 mg/L for the *P. promelas* and *C. tentans* tests. Control water was natural seawater collected from the Gulf of Mexico diluted with dechlorinated freshwater to 20 ppt salinity for *L. plumulosus* tests and 28 ppt for *N. arenaceodentata* tests.

Control Sediment

Control sediment for *Chironomus tentans* tests (F18) was formulated by combining commercial grade top soil with deionized water. Grain size characteristics were determined to be

20% sand and 80% silt and clay. Control sediment for marine species, *L. plumulosus* and *N. arenaceodentata*, was collected from Perdido Bay, Florida. This sediment is referred to as C17 in the data and was 2% sand and 98% silt and clay. Physical characteristics data are in Appendix A.

Test Organisms

P. promelas (Lot# PP-97-18) were delivered by overnight courier from a commercial supplier. Animals were less than 24 hours old upon arrival and test initiation. Reference toxicant tests are routinely conducted for *P. promelas* at TRAC. Reference toxicant data and control charts are in Appendix B.

C. tentans (Lot# CT-97-02/03/04) were also delivered by overnight courier from a commercial supplier. Batches were 11 and 12 days old upon test initiation. Average initial weight of midge larvae was 0.20 mg. The culturing laboratory supplied reference toxicant data for May, June and July conducted on this population of *C. tentans*. LC 50 data are in Appendix B.

L. plumulosus (Lot# LP-97-01/02) were delivered by overnight courier from a commercial supplier. The amphipods were 2-4 mm at test initiation. TRAC conducted one reference toxicant test for this species. Trimmed Spearman-Karber estimated an LC50 of 5.9 mg/L CdCl which could only be compared with one reference toxicant test cited in ASTM guidance (1.06 mg/L CdCl).

N. arenaceodentata (Lot# NA-97-02) arrived by overnight courier from a commercial supplier and were 2-3 weeks post-emergence at test initiation. The marine worms averaged 0.94 mg at test initiation. TRAC conducted one reference toxicant test for this species. The Trimmed Spearman-Karber Method estimated an LC50 of 14 mg/L CdCl which is within the range of LC50s cited by ASTM guidelines (12-22 mg/L CdCl).

Test Conditions

Tests were conducted in a temperature-controlled environmental chamber under a 16-hour light, 8-hour dark photoperiod. Dissolved oxygen, pH, temperature and salinity (for marine tests) were measured in one replicate of each sample intermittently throughout each test. Tests were conducted following the EPA and ASTM guidance cited by the contract proposal and are listed in the reference section at the end of this report. Test conditions varied for each species and are summarized in Table 1. Test endpoints and water quality measurements are recorded on raw data sheets in Appendix A.

Statistical Analysis

Statistical analyses of test data were performed using TOXSTAT, a computer program developed by the University of Wyoming.

P. promelas: survival data were entered at proportions, arc sine [square root (Y)] transformed and analyzed by Dunnett's ANOVA. Weight data were not transformed but analyzed by Dunnett's ANOVA.

C. tentans: Fischer's Exact Test was used to analyze survival data because there were 12 replicates each containing one organism. Weight data were not transformed but analyzed by

Bonferroni's T-Test because of unequal replicates (due to mortality). Emergence data for stations 5A04, 5A05 and 5A06 were arc sine transformed and analyzed by Kruskal-Wallis because assumptions were not met for Steels Many-One Rank Test or Bonferroni's Test. Emergence data for stations 7501, 0307 and 0302 did not meet the criteria for any one of the above analyses because there was not enough sample to duplicate after press sieving.

L. plumulosus: survival data were entered as proportions, arc sine transformed and analyzed by Dunnett's ANOVA.

N. arenaceodentata: weight data were not transformed but analyzed by Dunnett's ANOVA. Survival data did not require analysis.

Results

Mean percent survival, mean individual weights and percent total emergence is presented in Table 2. Raw data calculations are recorded on raw data sheets in Appendix A.

P. promelas: there were no chronic effects for survival, but weights were significantly lower than controls for minnows exposed to surface waters at stations 5A05, 5A06, 0301 and 7501.

C. tentans: there were no chronic effects for survival, but weights were significantly lower than controls for larvae exposed to sediments at stations 5A05, 7501 and 0307. There were no chronic effects for emergence when compared to the control sediment larvae which only yielded 50 and 60% (Table 2) emerged adults. Guidance suggests that the average emergence usually observed is 60%, and the control population should yield 70%. All stations performed as well as or better than the control sediments (F18). It should be noted however, that the lowest emergence occurred in stations 5A05 and 7501 (as well as control F18) which correlated with the significantly lower weights observed for *C. tentans* at these two stations.

L. plumulosus: survival for Stations 6404 and 6406 was significantly lower (78% and 74%) than the control station (98%). Notes in the raw data indicate both stations had strong petroleum odors.

N. arenaceodentata: Chronic effects were not observed for survival and weight at any station.

File: C:\TOXSTAT\FHM.SUR

ɔT(Y))

ɔapiro Wilks test for normali

D = 0.158

W = 0.769

Critical W (P = 0.05) (n = 24)
Critical W (P = 0.01) (n = 24)

Data FAIL normality test. Try

Warning - The two homogeneity tests are sensitive to non-normal data and should not be performed.

119-1817-1821
File: C:\TOXSTAT\FHM.SUR Transform: ARC SINE(SQUARE ROOT(Y))

Hartley test for homogeneity of variance
Bartletts test for homogeneity of variance

ɜse two tests can not be performed because at least one group has zero variance.

Data FAIL to meet homogeneity of variance assumption.
Additional transformations are useless.

119-1817-1821
File: C:\TOXSTAT\FHM.SUR Transform: ARC SINE(SQUARE ROOT(Y))

STEELS MANY-ONE RANK TEST - Ho:Control<Treatment

GROUP	IDENTIFICATION	TRANSFORMED MEAN	RANK SUM	CRIT. VALUE	df	SIG
1	control	1.412				
2	1817(5A04)	1.412	18.00	10.00	4.00	
3	1818(5A05)	1.412	18.00	10.00	4.00

5	1820(0301)	1.371	16.00	10.00	4.00	
6	1821(7501)	1.266	14.00	10.00	4.00	

Critical values use k = 5, are 1 tailed, and alpha = 0.05

119-1817-1821
File: C:\TOXSTAT\FHM-WT. Transform: NO TRANSFORMATION

Shapiro Wilks test for normality

D = 0.053

W = 0.930

Critical W (P = 0.05) (n = 24) = 0.916
Critical W (P = 0.01) (n = 24) = 0.884

Data PASS normality test at P=0.01 level. Continue analysis.

119-1817-1821
File: C:\TOXSTAT\FHM-WT. Transform: NO TRANSFORMATION

Bartletts test for homogeneity of variance

Calculated B statistic = 6.98
Table Chi-square value = 15.09 (alpha = 0.01)
Table Chi-square value = 11.07 (alpha = 0.05)

Average df used in calculation ==> df (avg n - 1) = 3.00
Used for Chi-square table value ==> df (#groups-1) = 5

Data PASS homogeneity test at 0.01 level. Continue analysis.

NOTE: If groups have unequal replicate sizes the average replicate size is used to calculate the B statistic (see above).

119-1817-1821
File: C:\TOXSTAT\FHM-WT. Transform: NO TRANSFORMATION

ANOVA TABLE

SOURCE	DF	SS	MS	F

Shapiro Wilks test for normality

D = 0.094

W = 0.992

Critical W (P = 0.05) (n = 8) = 0.818
Critical W (P = 0.01) (n = 8) = 0.749

Data PASS normality test at P=0.01 level. Continue analysis.

Chiron.tentans 9/26-10/15/97
File: 119ct.eme Transform: ARC SINE(SQUARE ROOT(Y))

Hartley test for homogeneity of variance
Bartletts test for homogeneity of variance

These two tests can not be performed because at least one group has zero variance.

Data FAIL to meet homogeneity of variance assumption. - ⇒ so Steels Many-One RANK Test
Additional transformations are useless.

↓

couldnt calculate

↓

Dunnetts

↓

Bonferroni

ran even though homogeneity couldnt be calculated

Bartletts test for homogeneity of variance

Calculated B statistic = 4.00
Table Chi-square value = 18.48 (alpha = 0.01)
Table Chi-square value = 14.07 (alpha = 0.05)

Average df used in calculation ==> df (avg n - 1) = 4.00
Used for Chi-square table value ==> df (#groups-1) = 7

Data PASS homogeneity test at 0.01 level. Continue analysis.

NOTE: If groups have unequal replicate sizes the average replicate size is used to calculate the B statistic (see above).

APPENDIX B

APPENDIX B

Summary of test conditions and results of the monthly reference toxicity test for the fathead minnow (*Pimephales promelas*) to the reference toxicant, Sodium dodecyl Sulfate, in a 48 hour static acute test.

Source of test animal:	In-House
Lot number and age of animals used:	PP-97-18, 8 days old
Control and dilution water:	Reconstituted freshwater
Test material description:	White powder
Concentration (ppm) of SDS tested:	Control, 1.0, 2.0, 4.0, 8.0, and 16.0 ppm
Effect criterion:	Mortality

Results of 48-Hour LC50 Calculations
95% Confidence Limits (mg/L)

Toxicity Test Summary Sheet

Client:	EnSafe
Job Number:	**0036-001-00-138-00** (EnSafe)
Client Contact:	Barbara Albrecht
Project Numbers:	119-3646-3652
Study Director:	Dan Johnson
Test Material:	Seven whole sediment samples
Date Materials Received:	6 and 8 April 2004
Test Dates:	16 through 26 April 2004
Test Conditions:	Static, renewal, 10 day duration
Test Procedure:	EPA/600/R-99/064. Methods for Measuring the Toxicity and Bioaccumulation of Sediment-associated Contaminants with Freshwater Invertebrates.
Test Organism:	*Hyalella azteca*, (Lot # HA-04-01).
Source:	*H. azteca* were obtained from a commercial supplier.
Control and Overlying Water:	Moderately hard reconstituted freshwater
Exposure Concentration:	Negative control sediment and 100% whole test sediment
Effect Criteria:	Survival and growth
Effects:	No statistically significant survival or growth effects were observed in any test sediment.

INTRODUCTION

Seven sediment samples were collected by EnSafe personnel and tested at TRAC Laboratories, Inc., Pensacola, Florida to assess survival and growth effects on *Hyalella azteca* in 10-day whole sediment toxicity screening tests. Tests were conducted from 16 through 26 April 2004. All original raw data related to this study are stored by TRAC; however, copies are provided as Appendix A.

MATERIALS AND METHODS

Test Material

Seven sediment samples were collected by EnSafe personnel and hand delivered to TRAC on 6 and 8 April 2004. The sediment samples arrived intact at temperatures of 3.5-24.6° C, and were each contained in one 3.8 liter plastic jar. The samples were logged into TRAC's Sediment Receiving Log and maintained at 4°C until test initiation (Table 1).

Control Water

Control and overlying water was reconstituted freshwater (RCF) with a hardness of 76 mg/L $CaCO_3$ (EPA, 2002).

Negative Control Sediment

Negative control sediment was a mixture of 90% fine grain quartz sand and 10% C17 collected from Perdido Bay. The negative control sediment was obtained by TRAC personnel from Pensacola Beach (sand) and Perdido Bay (C-17) at position 30^0 19.753' N, 087^0 27.869' W.

Test Organisms

Hyalella azteca (lot # HA-04-01) were obtained from a commercial supplier and were approximately 10-11 days old upon test initiation.

An acute toxicity test with a reference toxicant and *H. azteca* from the same population as used in the sediment test, indicated the *H. azteca* were in an acceptable range of chemical sensitivity to the reference toxicant (Appendix B).

A new lot of Sodium Dodecyl Sulfate (SDS) was purchased and put into use since the last reference toxicity test was conducted in October 2003. Significantly higher LC50 values were obtained with the new lot of SDS. Two additional lots of *H. azteca* were purchased and tested to confirm the reliability of the initial LC50 value obtained with the batch of *H. azteca* used for the sediment exposures. The results of the two tests were statistically similar (LC50 values of 73.8, 67.3 and 80.0 mg/L). In addition, organisms tested at TRAC exhibited an increase in LC50

values. Therefore, the *H. azteca* exposed to test sediments are considered to be in a normal range of sensitivity.

Test Conditions

The sediment tests were conducted in a temperature-controlled (23 ± 1°C) environmental chamber under a 16 hour light, 8 hour dark photoperiod. Sediment tests were conducted in 0.5 liter plastic containers containing 100 ml of sediment and 175 ml of overlying water. Each exposure consisted of eight replicates of 10 organisms each, resulting in a total of 80 organisms per sediment exposure. Approximately 90% of the overlying water was carefully decanted off each day and replaced with an equivalent volume of fresh RCF.

Test duration was 10 days at the end of which sediments from each replicate were placed in a 250μm mesh sieve and the *H. azteca* collected. Contents of the sieve from each replicate where organisms were not completely accounted for were rinsed into collection jars and preserved with 70% isopropanol containing rose bengal stain for future examination. After final counts, surviving *H. azteca* were collected and placed, by replicate, into tared weigh boats, placed in a drying oven and dried overnight at 60°C. Each replicate was weighed after cooling in a dessicator.

Physical Parameters

Temperature and dissolved oxygen (DO) were measured initially and daily thereafter in each replicate. Aeration must be applied if DO levels fall below 2.5 mg/L, therefore it was necessary to measure DO daily. However, no aeration was required in any sediment exposure during these tests. Total ammonia, Hardness, alkalinity, pH and conductivity of overlying water were measured in one replicate of each sediment on days 0 and 10 (Table 2). DO, pH and temperature were measured daily in the RCF used for renewal of overlying water.

Feeding

Each exposure vessel was fed 1.0 ml YCT initially and daily after overlying water renewal.

Statistical Analysis

Statistical analyses are accomplished using the computer program Toxstat, developed at the University of Wyoming. *H. azteca* survival proportions and weights are tested for normality and homogeneity of variance. If assumptions of normality and homogeneity are not met, analysis is conducted using the Wilcoxon Rank Sum Test. If assumptions of normality and homogeneity of variance are met, a t-test is performed.

Results

After 10 days of exposure, no statistically significant reductions in survival were observed in any test sediment when compared to the negative control sediment. Survival after the 10-day exposure period ranged from 92.5% in sediment 041W19A102 to 100% in sediments 041M5B0501 and 041M5B0601. Negative control survival was 97.5% (Table 3).

No statistically significant weight reductions were observed in any test sediment when compared to negative control sediment (Table 4).

Deviations in Protocol

On day 0 of testing, the test chamber temperature was set incorrectly to maintain temperatures at 20^0C. The chamber temperature was adjusted to 23^0C and temperatures in selected replicates were re-measured. By the end of day 0, temperatures were within the prescribed range of 23.0 ± 1.0^0C. No other deviations form prescribed methods occurred during this testing event.

041M5B0401
File: HA.SURV Transform: ARC SINE(SQUARE ROOT(Y))

Shapiro Wilks test for normality

D = 0.139

W = 0.685

Critical W (P = 0.05) (n = 24) = 0.916
Critical W (P = 0.01) (n = 24) = 0.884

Data FAIL normality test. Try another transformation.

Warning - The two homogeneity tests are sensitive to non-normal data and should not be performed.

041M5B0401
File: HA.SURV Transform: ARC SINE(SQUARE ROOT(Y))

Bartletts test for homogeneity of variance

Calculated B statistic = 0.11
Table Chi-square value = 9.21 (alpha = 0.01)
Table Chi-square value = 5.99 (alpha = 0.05)

Average df used in calculation ==> df (avg n - 1) = 7.00
Used for Chi-square table value ==> df (#groups-1) = 2

Data PASS homogeneity test at 0.01 level. Continue analysis.

NOTE: If groups have unequal replicate sizes the average replicate size is used to calculate the B statistic (see above).

Comparison of Digestion Techniques in Analyses for Total Metals in Marine Sediments

D. L. Trimm,[1] H. H. Beiro,[1] S. J. Parker[2]

Received: 10 August 1997/Accepted: 24 December 1997

It is generally recognized that in order to achieve a complete dissolution all metals within a sediment, some combination of hydrofluoric acid (HF) with other acids is required to release all metals from their silicate structures. This is because silicates are resistant to most mineral acids. Previous studies by Loring and Rantala (1988) assessed laboratory variability in determining total metal concentrations using hydrofluoric acid (HF) and nitric acid (NA) dissolution and extraction procedures. Studies on trace metal concentrations in estuarine and coastal marine sediments from the southeast US, and Florida in particular, recognized the need for a HF digestion (Windom et al. 1989). Schropp et al. (1990) used a HF digestion method to determine 'natural' metal-to-aluminum relationships for Florida sediments.

To meet the requirements of the federal Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), USEPA has established the Contract Laboratory Program (CLP) as an analytical standard. This method employs a NA digestion for estuarine and marine sediment metals analysis. However, since digestion method techniques under the CLP program are different than those used by Schropp et al. (1990), a comparison of the methods was in order. The results of this comparison could allow using the regression lines provided by FDER (1988) or Schropp et al. (1990) on sediments analyzed under the CLP for CERCLA. The overall study objective was to determine if metal data analyzed by a CLP NA digestion was comparable to metal data produced by using a HF digestion method.

MATERIALS AND METHODS

Twenty-nine locations within Pensacola Bay and Bayou Grande, Florida, were randomly selected for a

Correspondence to: D. L. Trimm

comparative sediment digestion analysis. These sampling locations were examined after selection to ensure a variety of bottom types. This was done to prevent one bottom type from dominating the study. From December 1995 to February 1996, sediment samples were collected using a stainless-steel Ekman grab (529 cm^2). Two grab samples were collected from the top 5 to 6-cm and placed in a stainless-steel mixing bowl for compositing. From this composite sample, pre-cleaned containers were filled for immediate shipment to the laboratory. Samples were stored and shipped on ice within 24 hrs by a priority delivery service.

Each of the 29 samples were divided by the lab into two aliquots to be analyzed by inductively coupled plasma (ICP) emission spectroscopy. One aliquot would be digested in accordance with the standard procedure using NA, while the other would utilize a 50:50 mixture of HF and NA (1:1). Both digestion methods use 1 g (wet weight ± 0.50 g) of sediment weighed into an acid-washed Teflon beaker. Under the CLP NA digestion, the sample is allowed to reflux at 95°C with 10 mL of 1:1 nitric acid for 10 minutes without boiling. The digestate was then allowed to cool and 30% hydrogen peroxide added in 1 mL aliquots until no further vigorous effervesce was noted. No more than 10 mL of hydrogen peroxide was added at any time. Since these samples were to be analyzed by ICP, hydrochloric acid was added to the final acid-peroxide digestate. Insoluble materials were then filtered through a Whatman no.42 filter and brought to 100 mL volume by adding ASTM Type II water.

The method was modified to include the HF by using 5 mL of HF and 5 mL of NA (1:1) allowing the mixture to sit at room temperature for eight to twelve hrs. Next gentle heat (~ 70° C) was applied and the samples were allowed to reflux for eight to twelve hrs. The higher temperatures used in the CLP procedure would cause the HF mixture to boil. It was believed that boiling the acid mixture may affect the study results. At the end of this period another 5 mL of each acid was added to the samples. The samples were again refluxed for eight to twelve hrs at ~ 70°C. As before, hydrochloric acid was added to the digestate, filtered, and brought to 100 mL volume by adding ASTM Type II water.
Both types of digestates were analyzed for total metals in accordance with the CLP inorganic statement of work ILM03.0 for ICP. To meet the requirements of this study, trace ICP emission spectroscopy was used to

provide low level analysis modifying the interference check sample to include low level arsenic and lead.

The individual metal analytical results were first tested for relationships between the two digestion procedures. To illustrate the relationship between the HF and NA digestates, scatter plots were produced. Each ordered pair (x,y) representing x = NA and y = HF was plotted as a point; the similarity between the different digestion methods is illustrated by their closeness to the x = y line. If x is greater than y, most of the data will fall below the line. When y exceeds x, the data will lie largely above the x = y line.

To test whether the HF digestion tended to produce overall larger values than those produced by NA digestion, the Mann-Whitney rank-sum test was employed (Helsel and Hirsh, 1995). This non-parametric procedure can assess whether two independent groups differ. This non-parametric approach was used rather than a parametric t-test based on the results of normality testing. Although these distributions could be transformed to approach normality, justification for the use of a non-parametric versus a parametric test was based on discussions by Blair and Higgins (1980). They found that small deviations from a normal distribution were not always detectable in normality tests on small data sets, and that the use of non-parametric methods, such as the Mann-Whitney rank-sum test, exhibited large advantages in power over the t-test.

Finally, data produced by both digestion methods were plotted on regression lines found in FDER (1988) to evaluate where each digestion distribution for each metal occurred relative to the Schropp et al. (1990) and FDER (1988) regression lines for 'clean' sediments. It was hoped that differences in the digestion methods might be clarified so that past and future CLP NA data could be assessed with these regressions.

RESULTS AND DISCUSSION

Table 1 provides a comparison of descriptive statistics produced from the two digestion procedures. Comparing the mean and median results for HF to CLP NA digestion revealed no apparent differences with the exception of nickel. The distributions are likely not normal suggested by the high standard deviations. Based on the

Mann-Whitney Test, no statistical significant difference was found between the two data sets.

Table 1. Descriptive Statistics for HF and NA Metals Digestion Methods

	N	Mean (mg/kg)	Median (mg/kg)	St. Dev.	SE Mean	Mann-Whitney[a] Results
HF-Al	29	11,869	3,640	15,836	2,941	+
NA-Al	29	8,134	3,490	10,448	1,940	
HF-As	29	5.63	2.20	6.52	1.21	+
NA-As	29	6.18	3.20	7.08	1.32	
HF-Cd	29	1.15	0.46	1.15	0.21	+
NA-Cd	29	1.03	0.45	1.03	0.19	
HF-Cr	29	54.4	13.3	72.1	13.4	+
NA-Cr	29	47.8	10.4	62.5	11.6	
HF-Cu	29	13.11	6.6	15.23	2.83	+
NA-Cu	29	11.59	6.8	12.90	2.40	
HF-Pb	29	34.73	20.8	42.64	7.92	+
NA-Pb	29	36.73	16.3	43.14	8.01	
HF-Ni	29	9.27	2.7	16.6	3.09	+
NA-Ni	29	4.46	2.6	4.9	0.91	
HF-Zn	29	54.7	18.9	66.0	12.3	+
NA-Zn	29	48.9	28.6	55.8	10.4	

NOTE:
[a] No significant difference (α=0.05) between method results indicated by +.

SE = standard error

Scatter plots provided in Figure 1 exhibit a comparison of the two methods relative to increasing metal content. A general observation should be noted that metal content appears to be directly proportional to the variability observed. The data suggests nickel is more effectively dissolved at greater concentrations by the HF digestion method. It has been suggested that this may be due to nickel remaining bound to the matrix during the NA digestion. Cadmium also exhibited extreme variability as concentrations increased. The symmetrical nature of cadmium's scatter plot (Figure 1) suggests the precision of the method may be the problem

and is not a function of the digestion technique used. The primary differences between the digestion methods were the HF addition, the length of reflux time, and the digestion temperature. Despite these differences, the aggressive HF digestion did not produce a significant difference in metals being dissolved for analysis.

The two data sets plotted on the FDER (1988) regression lines suggests that individual HF results appear higher than those produced by NA (Figure 2). This is likely due to the longer digestion time and aggressive nature of HF. Each metal has its own character of course, some metals appear identical. These findings suggest that ratios produced by the two methods are comparable. The data produced by NA methods conservatively predict anthropogenic metal contamination on the FDER (1988) regression lines.

Acknowledgments. Funding for this project was provided by Southern Division Naval Facilities Engineering Command. Special thanks to Messrs. Bill Gates and Bill Hill for their support of this study and to Dr. Steven Schropp for his technical input.
