LABORATORY DATA PACKAGE, 1700792, NAWC TRENTON, NJ 07/22/2017 VISTA ANALYTICAL LABORATORY

July 22, 2017

## Vista Work Order No. 1700792

Ms. Mary Mang<br>Tetra Tech<br>661 Andersen Drive, Foster Plaza 7

Pittsburgh, PA 15220
Dear Ms. Mang,
Enclosed are the results for the sample set received at Vista Analytical Laboratory on June 29, 2017. This sample set was analyzed on a standard turn-around time, under your Project Name 'NAWC Trenton'.

Vista Analytical Laboratory is committed to serving you effectively. If you require additional information, please contact me at 916-673-1520 or by email at mmaier@vista-analytical.com.

Thank you for choosing Vista as part of your analytical support team.

Sincerely,

## 

for

Martha Maier<br>Laboratory Director

## Vista Work Order No. 1700792

Case Narrative

## Sample Condition on Receipt:

Eleven aqueous samples were received in good condition and within the method temperature requirements. The samples were received and stored securely in accordance with Vista standard operating procedures and EPA methodology. A sample ID for "FRB-20170628" was resolved by following the Chain-of-Custody format, as requested.

## Analytical Notes:

## Modified EPA Method 537

The aqueous samples were extracted and analyzed for a selected list of 14 PFAS using Modified EPA Method 537.

Samples "West Ditch In-20170627", "MH388.9-20170628" and "RB01-20170628" were re-extracted due to very low recoveries of 13C2-PFDoA and 13C2-PFTeDA in the original extractions. The PFDoA, PFTrDA and PFTeDA results are reported from prep batch B7G0033 for those samples.

## Holding Times

The samples were extracted and analyzed within the method hold times.

## Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with each preparation batch. No analytes were detected in the Method Blanks above $1 / 2$ the LOQ. The OPR recoveries were within the method acceptance criteria

The labeled standard recoveries outside the acceptance criteria are listed in the table below.

## QC Anomalies

$\mathrm{H}=$ Recovery was outside laboratory acceptance criteria.

In addition, the laboratory QC officer must read and sign a copy of the Quality Assurance Review Form displayed on the next page of this Attachment. Electronic deliverables are not considered to be complete without the accompanying Quality Assurance Review Form.

$\qquad$ , as the designated Quality Assurance Officer, hereby attest that all electronic deliverables have been thoroughly reviewed and are in agreement with the associated hardcopy data. The enclosed electronic files have been reviewed for accuracy (including significant figures), completeness and format. The laboratory will be responsible for any labor time necessary to correct enclosed electronic deliverables that have been found to be in error. I can be reached at (916)673-152dy there are any questions or problems with the enclosed electronic deliverables.

Good Morning Karen,
You are correct. Please use the sample ID shown on the COC.
Thank you,
Mary

Karen,
I will need to get back to you tomorrow morning on the sample ID.
Please notes, we ARE to analyze for the 14 PFAS analytes for both surface water and groundwater.. The confusion is that the change was made, but is not in the SAP.

Thanks,
Mary

Subject: Vista Work Order \#1700792; NAWC Trenton
Mary,
Please find attached the sample receiving acknowledgement for Vista Analytical Work Order: 1700792.
Please note the anomaly described on the last page of the attachment: The sample ID on the COC for "FRB-20170628" does not match the sample ID on the bottle label "FRB01-20170628". The sample is currently logged in using the sample ID on the COC. Please confirm the correct sample ID.

Please review the Sample Inventory Report found on page 3 to ensure that the samples were logged in correct.
These samples will be analyzed by Modified EPA Method 537 for PFOA, PFOS, and PFNA only.
If you have any questions, please contact me or Martha Maier at (916) 673-1520. We appreciate your business.

## Best Regards,

Karen L. Volpendesta

\section*{ADDITIONAL INFORMATION:}
- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acid to the methyl ester.
- Contains \(\sim 0.3 \%\) of native perfluoro-n-hexadecanoic acid.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE
Certified By:

Date: \(\qquad\)
(mm/dd/yyyy)

\section*{INTENDED USE:}

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compound it contains.

\section*{HAZARDS:}

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

\section*{SYNTHESIS / CHARACTERIZATION:}

Where possible, all of our products are synthesized using single-product unambiguous routes. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

\section*{HOMOGENEITY:}

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be \(<5 \%\) RSD. New solution lots of existing products are compared to older lots in the same manner, which further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers.

\section*{UNCERTAINTY:}

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, \(u_{c}(y)\), of a value \(y\) and the uncertainty of the independent parameters
\(x_{1}, x_{2}, \ldots x_{n}\) on which it depends is:
\[
u_{e}\left(y\left(x_{1}, x_{2}, \ldots x_{n}\right)\right)=\sqrt{\sum_{i=1}^{n} u\left(y, x_{i}\right)^{2}}
\]
where x is expressed as a relative standard uncertainty of the individual parameter.
The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of \(\pm 5 \%\) (calculated with a coverage factor of 2 and a level of confidence of \(95 \%\) ) is stated on the Certificate of Analysis for all of our products.

\section*{TRACEABILITY:}

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly tested by an external ISO/IEC 17025 accredited calibration company. In addition, their calibration is verified prior to each weighing using NIST and/or NRC traceable external weights. All volumetric glassware used is of Class A tolerance and has been tested according to the appropriate ASTM procedures, which are ultimately traceable to NIST. For certain products, traceability to international interlaboratory studies has also been established.

\section*{EXPIRY DATE / PERIOD OF VALIDITY:}

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

\section*{LIMITED WARRANTY:}

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

\section*{QUALITY MANAGEMENT:}

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO GUIDE 34 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

**For additional information or assistance concerning this or any other products from Wellington Laboratories Inc., please visit our website at www.well-labs.com or contact us directly at info@well-labs.com**

\(x_{1}, x_{2}, \ldots x_{n}\) on which it depends is:
\[
u_{c}\left(y\left(x_{1}, x_{2}, \ldots x_{n}\right)\right)=\sqrt{\sum_{i=1}^{n} u\left(y, x_{i}\right)^{2}}
\]
where x is expressed as a relative standard uncertainty of the individual parameter.
The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of \(\pm 5 \%\) (calculated with a coverage factor of 2 and a level of confidence of \(95 \%\) ) is stated on the Certificate of Analysis for all of our products.

\section*{TRACEABILITY:}

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly tested by an external ISO/IEC 17025 accredited calibration company. In addition, their calibration is verified prior to each weighing using NIST and/or NRC traceable external weights. All volumetric glassware used is of Class A tolerance and has been tested according to the appropriate ASTM procedures, which are ultimately traceable to NIST. For certain products, traceability to international interlaboratory studies has also been established.

\section*{EXPIRY DATE / PERIOD OF VALIDITY:}

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

\section*{LIMITED WARRANTY:}

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

\section*{QUALITY MANAGEMENT:}

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO GUIDE 34 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

- Contains 4 mole eq. of NaOH to prevent the conversion of the acetic acid moiety to the methyl ester.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Certified By

Date: \(\qquad\)

\section*{INTENDED USE}

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compound it contains.

\section*{HAZARDS}

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

\section*{SYNTHESIS / CHARACTERIZATION:}

Where possible, all of our products are synthesized using single-product unambiguous routes. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

\section*{HOMOGENEITY:}

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be \(<5 \%\) RSD. New solution lots of existing products are compared to older lots in the same manner, which further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers.

\section*{UNCERTAINTY:}

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, \(u_{c}(y)\), of a value \(y\) and the uncertainty of the independent parameters
\(x_{1}, x_{2}, \ldots x_{n}\) on which it depends is:
\[
u_{c}\left(y\left(x_{1}, x_{2}, \ldots x_{n}\right)\right)=\sqrt{\sum_{i=1}^{n} u\left(y, x_{i}\right)^{2}}
\]
where x is expressed as a relative standard uncertainty of the individual parameter.
The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of \(\pm 5 \%\) (calculated with a coverage factor of 2 and a level of confidence of \(95 \%\) ) is stated on the Certificate of Analysis for all of our products.

\section*{TRACEABILITY:}

In addition, their calibration is verified prior to each weighing using NIST and/or NRC traceable external weights. All volumetric glassware used is of Class A tolerance and has been tested according to the appropriate ASTM procedures, which are ultimately traceable to NIST. For certain products, traceability to international interlaboratory studies has also been established.

\section*{EXPIRY DATE / PERIOD OF VALIDITY:}

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

\section*{LIMITED WARRANTY:}

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

\section*{QUALITY MANAGEMENT:}

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO GUIDE 34 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

**For additional information or assistance concerning this or any other products from Wellington Laboratories Inc., please visit our website at www.well-labs.com or contact us directly at info@well-labs.com**

\section*{ADDITIONAL INFORMATION:}
- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acid to the methyl ester.
- Contains \(<0.1 \%\) of \({ }^{13} \mathrm{C}_{1}\)-PFNA.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Certified By:

Date: \(\qquad\) (mm/dodnwn)

\footnotetext{
Wellington Laboratories Inc., 345 Southgate Dr. Guelph ON N1G 3M5 CANADA 519-822-2436 • Fax: 519-822-2849 • info@well-labs.com
}

\section*{INTENDED USE:}

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compound it contains.

\section*{HAZARDS:}

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

\section*{SYNTHESIS / CHARACTERIZATION:}

Where possible, all of our products are synthesized using single-product unambiguous routes. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

\section*{HOMOGENEITY:}

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be \(<5 \%\) RSD. New solution lots of existing products are compared to older lots in the same manner, which further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers.

\section*{UNCERTAINTY:}

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, \(u_{c}(y)\), of a value \(y\) and the uncertainty of the independent parameters
\(x_{1}, x_{2}, \ldots x_{n}\) on which it depends is:
\[
u_{c}\left(y\left(x_{1}, x_{2}, \ldots x_{n}\right)\right)=\sqrt{\sum_{i=1}^{n} u\left(y, x_{i}\right)^{2}}
\]
where x is expressed as a relative standard uncertainty of the individual parameter.
The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of \(\pm 5 \%\) (calculated with a coverage factor of 2 and a level of confidence of \(95 \%\) ) is stated on the Certificate of Analysis for all of our products.

\section*{TRACEABILITY:}

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly tested by an external ISO/IEC 17025 accredited calibration company. In addition, their calibration is verified prior to each weighing using NIST and/or NRC traceable external weights. All volumetric glassware used is of Class A tolerance and has been tested according to the appropriate ASTM procedures, which are ultimately traceable to NIST. For certain products, traceability to international interlaboratory studies has also been established.

\section*{EXPIRY DATE / PERIOD OF VALIDITY:}

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

\section*{LIMITED WARRANTY:}

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

\section*{QUALITY MANAGEMENT:}

EXPIRY DATE: (mm/ddyyyy)
RECOMMENDED STORAGE: Store ampoule in a cool, dark place
\(\mathrm{C}_{6} \mathrm{~F}_{13} \mathrm{~S}^{18} \mathrm{O}_{2}{ }^{18} \mathrm{ONa}\)
\(50.0 \pm 2.5 \mu \mathrm{~g} / \mathrm{ml}\) (Na salt)
\(47.3 \pm 2.4 \mu \mathrm{~g} / \mathrm{ml}\) (MPFHxS anion)
>98\%
02/17/2017
02/17/2022

MOLECULAR WEIGHT: 426.10
SOLVENT(S): Methanol

ISOTOPIC PURITY: \(\quad>94 \%\left({ }^{18} \mathrm{O}_{2}\right)\)

\section*{DOCUMENTATION/ DATA ATTACHED:}

Figure 1: LC/MS Data (TIC and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

\section*{ADDITIONAL INFORMATION:}
- \(\quad\) See page 2 for further details.
- The response factor for MPFHxS \(\left(\mathrm{C}_{6} \mathrm{~F}_{13} \mathrm{~S}^{18} \mathrm{O}_{2}{ }^{16} \mathrm{O}\right)\) has been observed to be up to \(10 \%\) lower than for \(\mathrm{PFHxS}\left(\mathrm{C}_{6} \mathrm{~F}_{13} \mathrm{~S}^{16} \mathrm{O}_{3}\right)\) when both compounds are injected together. This difference may vary between instruments.
- Contains \(\sim 1.0 \%\) of sodium perfluoro-1-octane \(\left[{ }^{18} \mathrm{O}_{2}\right]\) sulfonate \(\left({ }^{18} \mathrm{O}_{2}-\mathrm{PFOS}\right)\).
- Due to the isotopic purity of the starting material ( \(\left.{ }^{18} \mathrm{O}_{2}>94 \%\right)\), MPFHxS contains \(\sim 0.3 \%\) of PFHxS. This value agrees with the theoretical percent relative abundance that is expected based on the stated isotopic purity.

\section*{DOCUMENTATION/ DATA ATTACHED:}

Figure 1: LC/MS Data (TIC and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

\section*{ADDITIONAL INFORMATION:}
- See page 2 for further details.
- The native \(8: 2\) FTS contains \(4.22 \%\) of \({ }^{34} \mathrm{~S}\) (due to natural isotopic abundance) therefore both native 8:2FTS and M2-8:2FTS will produce signals in the \(\mathrm{m} / \mathrm{z} 529\) to \(\mathrm{m} / \mathrm{z} 509\) channel during SRM analysis. We recommend using the \(\mathrm{m} / \mathrm{z} 529\) to \(\mathrm{m} / \mathrm{z} 81\) transition to monitor for M2-8:2FTS during quantitative analysis as it will be free of any native contribution (see Figure 2).

Figure 1: LC/MS Data (TIC and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

\section*{ADDITIONAL INFORMATION:}
- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acid to the methyl ester.
- Contains \(\sim 0.2 \%\) of Perfluoro-n-nonanoic acid (PFNA).

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Date: 06/13/2016
(mm/dd/yyyy)

\section*{INTENDED USE:}

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compound it contains.

\section*{HAZARDS:}

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

\section*{SYNTHESIS / CHARACTERIZATION:}

Where possible, all of our products are synthesized using single-product unambiguous routes. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

\section*{HOMOGENEITY:}

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be \(<5 \%\) RSD. New solution lots of existing products are compared to older lots in the same manner, which further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers.

\section*{UNCERTAINTY:}

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, \(u_{c}(y)\), of a value \(y\) and the uncertainty of the independent parameters
\(x_{1}, x_{2}, \ldots x_{n}\) on which it depends is:
\[
u_{c}\left(y\left(x_{1}, x_{2}, \ldots x_{n}\right)\right)=\sqrt{\sum_{i=1}^{n} u\left(y, x_{i}\right)^{2}}
\]
where x is expressed as a relative standard uncertainty of the individual parameter.
The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of \(\pm 5 \%\) (calculated with a coverage factor of 2 and a level of confidence of \(95 \%\) ) is stated on the Certificate of Analysis for all of our products.

\section*{TRACEABILITY:}

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly tested by an external ISO/IEC 17025 accredited calibration company. In addition, their calibration is verified prior to each weighing using NIST and/or NRC traceable external weights. All volumetric glassware used is of Class A tolerance and has been tested according to the appropriate ASTM procedures, which are ultimately traceable to NIST. For certain products, traceability to international interlaboratory studies has also been established.

\section*{EXPIRY DATE / PERIOD OF VALIDITY:}

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

\section*{LIMITED WARRANTY:}

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

\section*{QUALITY MANAGEMENT:}

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO GUIDE 34 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE
Certified By:

Date: \(\qquad\)
(mm/dd/yyyy)

\section*{Wellington Laboratories Inc., 345 Southgate Dr. Guelph ON N1G 3M5 CANADA 519-822-2436 • Fax: 519-822-2849 • info@well-labs.com}

\section*{INTENDED USE:}

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compound it contains.

\section*{HAZARDS:}

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

\section*{SYNTHESIS / CHARACTERIZATION:}

Where possible, all of our products are synthesized using single-product unambiguous routes. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

\section*{HOMOGENEITY:}

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be \(<5 \%\) RSD. New solution lots of existing products are compared to older lots in the same manner, which further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers.

\section*{UNCERTAINTY:}

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, \(u_{c}(y)\), of a value \(y\) and the uncertainty of the independent parameters
\(x_{1}, x_{2}, \ldots x_{n}\) on which it depends is:
\[
u_{c}\left(y\left(x_{1}, x_{2}, \ldots x_{n}\right)\right)=\sqrt{\sum_{i=1}^{n} u\left(y, x_{i}\right)^{2}}
\]
where \(x\) is expressed as a relative standard uncertainty of the individual parameter.
The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of \(\pm 5 \%\) (calculated with a coverage factor of 2 and a level of confidence of \(95 \%\) ) is stated on the Certificate of Analysis for all of our products.

\section*{TRACEABILITY:}

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly tested by an external ISO/IEC 17025 accredited calibration company. In addition, their calibration is verified prior to each weighing using NIST and/or NRC traceable external weights. All volumetric glassware used is of Class A tolerance and has been tested according to the appropriate ASTM procedures, which are ultimately traceable to NIST. For certain products, traceability to international interlaboratory studies has also been established.

\section*{EXPIRY DATE / PERIOD OF VALIDITY:}

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

\section*{LIMITED WARRANTY:}

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

\section*{QUALITY MANAGEMENT:}

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO GUIDE 34 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

In addition, their calibration is verified prior to each weighing using NIST and/or NRC traceable external weights. All volumetric glassware used is of Class A tolerance and has been tested according to the appropriate ASTM procedures, which are ultimately traceable to NIST. For certain products, traceability to international interlaboratory studies has also been established.

\section*{EXPIRY DATE / PERIOD OF VALIDITY:}

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

\section*{LIMITED WARRANTY:}

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

\section*{QUALITY MANAGEMENT:}

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO GUIDE 34 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

**For additional information or assistance concerning this or any other products from Wellington Laboratories Inc., please visit our website at www.well-labs.com or contact us directly at info@well-labs.com**

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Certified By:

Date: \(\qquad\)

Wellington Laboratories Inc., 345 Southgate Dr. Guelph ON N1G 3M5 CANADA 519-822-2436 • Fax: 519-822-2849 • info@well-labs.com

\section*{INTENDED USE:}

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compound it contains.

\section*{HAZARDS:}

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

\section*{SYNTHESIS / CHARACTERIZATION:}

Where possible, all of our products are synthesized using single-product unambiguous routes. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

\section*{HOMOGENEITY:}

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be \(<5 \%\) RSD. New solution lots of existing products are compared to older lots in the same manner, which further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers.

\section*{UNCERTAINTY:}

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, \(u_{c}(y)\), of a value \(y\) and the uncertainty of the independent parameters
\(x_{1}, x_{2}, \ldots x_{n}\) on which it depends is:
\[
u_{c}\left(y\left(x_{1}, x_{2}, \ldots x_{n}\right)\right)=\sqrt{\sum_{i=1}^{n} u\left(y, x_{i}\right)^{2}}
\]
where x is expressed as a relative standard uncertainty of the individual parameter.
The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of \(\pm 5 \%\) (calculated with a coverage factor of 2 and a level of confidence of \(95 \%\) ) is stated on the Certificate of Analysis for all of our products.

\section*{TRACEABILITY:}

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly tested by an external ISO/IEC 17025 accredited calibration company. In addition, their calibration is verified prior to each weighing using NIST and/or NRC traceable external weights. All volumetric glassware used is of Class A tolerance and has been tested according to the appropriate ASTM procedures, which are ultimately traceable to NIST. For certain products, traceability to international interlaboratory studies has also been established.

\section*{EXPIRY DATE / PERIOD OF VALIDITY:}

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

\section*{LIMITED WARRANTY:}

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

\section*{QUALITY MANAGEMENT:}

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO GUIDE 34 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

\(x_{1}, x_{2}, \ldots x_{n}\) on which it depends is:
\[
u_{c}\left(y\left(x_{1}, x_{2}, \ldots x_{n}\right)\right)=\sqrt{\sum_{i=1}^{n} u\left(y, x_{i}\right)^{2}}
\]
where x is expressed as a relative standard uncertainty of the individual parameter.
The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of \(\pm 5 \%\) (calculated with a coverage factor of 2 and a level of confidence of \(95 \%\) ) is stated on the Certificate of Analysis for all of our products.

\section*{TRACEABILITY:}

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly tested by an external ISO/IEC 17025 accredited calibration company. In addition, their calibration is verified prior to each weighing using NIST and/or NRC traceable external weights. All volumetric glassware used is of Class A tolerance and has been tested according to the appropriate ASTM procedures, which are ultimately traceable to NIST. For certain products, traceability to international interlaboratory studies has also been established.

\section*{EXPIRY DATE / PERIOD OF VALIDITY:}

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

\section*{LIMITED WARRANTY:}

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

\section*{QUALITY MANAGEMENT:}

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO GUIDE 34 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

**For additional information or assistance concerning this or any other products from Wellington Laboratories Inc., please visit our website at www.well-labs.com or contact us directly at info@well-labs.com**

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Date: \(\qquad\)
05/20/2016
(mm/dd/yyyy)

\section*{INTENDED USE:}

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compound it contains.

\section*{HAZARDS:}

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

\section*{SYNTHESIS / CHARACTERIZATION:}

Where possible, all of our products are synthesized using single-product unambiguous routes. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

\section*{HOMOGENEITY:}

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be \(<5 \%\) RSD. New solution lots of existing products are compared to older lots in the same manner, which further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers.

\section*{UNCERTAINTY:}

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, \(u_{c}(y)\), of a value \(y\) and the uncertainty of the independent parameters \(x_{1}, x_{2}, \ldots x_{n}\) on which it depends is:
\[
u_{c}\left(y\left(x_{1}, x_{2}, \ldots x_{n}\right)\right)=\sqrt{\sum_{i=1}^{n} u\left(y, x_{i}\right)^{2}}
\]
where x is expressed as a relative standard uncertainty of the individual parameter.
The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of \(\pm 5 \%\) (calculated with a coverage factor of 2 and a level of confidence of \(95 \%\) ) is stated on the Certificate of Analysis for all of our products.

\section*{TRACEABILITY:}

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly tested by an external ISO/IEC 17025 accredited calibration company. In addition, their calibration is verified prior to each weighing using NIST and/or NRC traceable external weights. All volumetric glassware used is of Class A tolerance and has been tested according to the appropriate ASTM procedures, which are ultimately traceable to NIST. For certain products, traceability to international interlaboratory studies has also been established.

\section*{INTENDED USE:}

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compound it contains.

\section*{HAZARDS:}

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

\section*{SYNTHESIS / CHARACTERIZATION:}

Where possible, all of our products are synthesized using single-product unambiguous routes. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

\section*{HOMOGENEITY:}

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be \(<5 \%\) RSD. New solution lots of existing products are compared to older lots in the same manner, which further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers.

\section*{UNCERTAINTY:}

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, \(u_{c}(y)\), of a value \(y\) and the uncertainty of the independent parameters
\(x_{1}, x_{2}, \ldots x_{n}\) on which it depends is:
\[
u_{c}\left(y\left(x_{1}, x_{2}, \ldots x_{n}\right)\right)=\sqrt{\sum_{i=1}^{n} u\left(y, x_{i}\right)^{2}}
\]
where x is expressed as a relative standard uncertainty of the individual parameter.
The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of \(\pm 5 \%\) (calculated with a coverage factor of 2 and a level of confidence of \(95 \%\) ) is stated on the Certificate of Analysis for all of our products.

\section*{TRACEABILITY:}

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly tested by an external ISO/IEC 17025 accredited calibration company. In addition, their calibration is verified prior to each weighing using NIST and/or NRC traceable external weights. All volumetric glassware used is of Class A tolerance and has been tested according to the appropriate ASTM procedures, which are ultimately traceable to NIST. For certain products, traceability to international interlaboratory studies has also been established.

\section*{EXPIRY DATE / PERIOD OF VALIDITY:}

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

\section*{LIMITED WARRANTY:}

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

\section*{QUALITY MANAGEMENT:}

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAl Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO GUIDE 34 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

**For additional information or assistance concerning this or any other products from Wellington Laboratories Inc., please visit our website at www.well-labs.com or contact us directly at info@well-labs.com**

Potassium Perfluorohexanesulfonate Solution/Mixture of Linear and Branched Isomers
```

PRODUCT CODE: br-PFHxSK
LOT NUMBER:
CONCENTRATION:
SOLVENT(S):
DATE PREPARED: (mmudilyyy)
LAST TESTED: (mm/dimyy)
EXPIRY DATE: (mnldilywy)
RECOMMENDED STORAGE:
brPFHxSK0117
50.0\pm2.5 \mug/ml (total potassium salt)
45.5\pm2.3 \mu\textrm{g}/\textrm{ml}}\mathrm{ (total PFHxS anion)
Methanol
01/03/2017
01/04/2017
01/04/2022
Store ampoule in a cool, dark place

```

\section*{DESCRIPTION:}

The chemical purity has been determined to be \(\geq 98 \%\) perfluorohexanesulfonate linear and branched isomers. The full name, structure and percent composition for each of the identified isomeric components are given in Table A.

\section*{DOCUMENTATION/ DATA ATTACHED:}

Table A: Isomeric Components and Percent Composition by \({ }^{19} \mathrm{~F}-\mathrm{NMR}\)
Figure 1: LC/MS Data (TIC and Mass Spectrum)
Figure 2: LC/MS Data (SIR)
Figure 3: LC/MS/MS Data (Selected MRM Transitions)

\section*{ADDITIONAL INFORMATION:}
- See page 2 for further details.
- Contains \(\sim 0.5 \%\) of perfluoro-1-pentanesulfonate and \(\sim 0.2 \%\) of perfluoro-1-octanesulfonate.
- CAS\#: 3871-99-6 (for linear isomer; potassium salt).

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

> Wellington Laboratories Inc., 345 Southgate Dr. Guelph ON N1G 3M5 CANADA 519-822-2436 • Fax: 519-822-2849 • info@well-labs.com

\section*{INTENDED USE:}

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compounds it contains.

\section*{HAZARDS:}

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

\section*{SYNTHESIS / CHARACTERIZATION:}

Where possible, all of our products are synthesized using single-product unambiguous routes. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

\section*{HOMOGENEITY:}

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be \(<5 \%\) RSD. New solution lots of existing products are compared to older lots in the same manner, which further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers.

\section*{UNCERTAINTY:}

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, \(u_{c}(y)\), of a value \(y\) and the uncertainty of the independent parameters
\(x_{1}, x_{2}, \ldots x_{n}\) on which it depends is:
\[
u_{c}\left(y\left(x_{1}, x_{2}, \ldots x_{n}\right)\right)=\sqrt{\sum_{i=1}^{n} u\left(y, x_{i}\right)^{2}}
\]
where \(x\) is expressed as a relative standard uncertainty of the individual parameter.
The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of \(\pm 5 \%\) (calculated with a coverage factor of 2 and a level of confidence of \(95 \%\) ) is stated on the Certificate of Analysis for all of our products.

\section*{TRACEABILITY:}

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly tested by an external ISO/IEC 17025 accredited calibration company. In addition, their calibration is verified prior to each weighing using NIST and/or NRC traceable external weights. All volumetric glassware used is of Class A tolerance and has been tested according to the appropriate ASTM procedures, which are ultimately traceable to NIST. For certain products, traceability to international interlaboratory studies has also been established.

\section*{EXPIRY DATE / PERIOD OF VALIDITY:}

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

\section*{LIMITED WARRANTY:}

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

\section*{QUALITY MANAGEMENT:}

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO GUIDE 34 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

**For additional information or assistance concerning this or any other products from Wellington Laboratories Inc., please visit our website at www.well-labs.com or contact us directly at info@well-labs.com**

Figure 2: LC/MS/MS Data (Selected MRM Transitions)

\section*{ADDITIONAL INFORMATION:}
- See page 2 for further details.
- Contains \(\sim 1.6 \%\) of an unknown impurity.
- The native \(4: 2 \mathrm{FTS}\) contains \(4.22 \%\) of \({ }^{34} \mathrm{~S}\) (due to natural isotopic abundance) therefore both native 4:2FTS and M2-4:2FTS will produce signals in the \(\mathrm{m} / \mathrm{z} 329\) to \(\mathrm{m} / \mathrm{z} 309\) channel during SRM analysis. We recommend using the \(\mathrm{m} / \mathrm{z} 329\) to \(\mathrm{m} / \mathrm{z} 81\) transition to monitor for M2-4:2FTS during quantitative analysis as it will be free of any native contribution (see Figure 2).

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Certified By:

Date: \(\qquad\) (mm/dd/yyyy)

\section*{INTENDED USE:}

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compound it contains.

\section*{HAZARDS:}

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

\section*{SYNTHESIS / CHARACTERIZATION:}

Where possible, all of our products are synthesized using single-product unambiguous routes. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

\section*{HOMOGENEITY:}

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be \(<5 \%\) RSD. New solution lots of existing products are compared to older lots in the same manner, which further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers.

\section*{UNCERTAINTY:}

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, \(u_{c}(y)\), of a value \(y\) and the uncertainty of the independent parameters
\(x_{1}, x_{2}, \ldots x_{n}\) on which it depends is:
\[
u_{c}\left(y\left(x_{1}, x_{2}, \ldots x_{n}\right)\right)=\sqrt{\sum_{i=1}^{n} u\left(y, x_{i}\right)^{2}}
\]
where x is expressed as a relative standard uncertainty of the individual parameter.
The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of \(\pm 5 \%\) (calculated with a coverage factor of 2 and a level of confidence of \(95 \%\) ) is stated on the Certificate of Analysis for all of our products.

\section*{TRACEABILITY:}

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly tested by an external ISO/IEC 17025 accredited calibration company. In addition, their calibration is verified prior to each weighing using NIST and/or NRC traceable external weights. All volumetric glassware used is of Class A tolerance and has been tested according to the appropriate ASTM procedures, which are ultimately traceable to NIST. For certain products, traceability to international interlaboratory studies has also been established.

\section*{EXPIRY DATE / PERIOD OF VALIDITY:}

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

\section*{LIMITED WARRANTY:}

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

\section*{QUALITY MANAGEMENT:}

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO GUIDE 34 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).
**For additional information or assistance concerning this or any other products from Wellington Laboratories Inc., please visit our website at www.well-labs.com or contact us directly at info@well-labs.com**

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Certified By:

Date: \(\qquad\)
(mm/dd/yyyy)

\section*{INTENDED USE:}

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compound it contains.

\section*{HAZARDS:}

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

\section*{SYNTHESIS / CHARACTERIZATION:}

Where possible, all of our products are synthesized using single-product unambiguous routes. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

\section*{HOMOGENEITY:}

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be \(<5 \%\) RSD. New solution lots of existing products are compared to older lots in the same manner, which further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers.

\section*{UNCERTAINTY:}

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, \(u_{c}(y)\), of a value \(y\) and the uncertainty of the independent parameters
\(x_{1}, x_{2}, \ldots x_{n}\) on which it depends is:
\[
u_{c}\left(y\left(x_{1}, x_{2}, \ldots x_{n}\right)\right)=\sqrt{\sum_{i=1}^{n} u\left(y, x_{i}\right)^{2}}
\]
where x is expressed as a relative standard uncertainty of the individual parameter.
The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of \(\pm 5 \%\) (calculated with a coverage factor of 2 and a level of confidence of \(95 \%\) ) is stated on the Certificate of Analysis for all of our products.

\section*{TRACEABILITY:}

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly tested by an external ISO/IEC 17025 accredited calibration company. In addition, their calibration is verified prior to each weighing using NIST and/or NRC traceable external weights. All volumetric glassware used is of Class A tolerance and has been tested according to the appropriate ASTM procedures, which are ultimately traceable to NIST. For certain products, traceability to international interlaboratory studies has also been established.

\section*{EXPIRY DATE / PERIOD OF VALIDITY:}

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

\section*{LIMITED WARRANTY:}

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

\section*{QUALITY MANAGEMENT:}

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO GUIDE 34 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

& \begin{tabular}{l} 
CTO WE08 - FORMER NAWC TRENTON
\end{tabular} \\
& SDG 1700792
\end{tabular}

SAMPLES: 11 / Surface Water / PFAS
\begin{tabular}{lll} 
West Ditch In-20170627 & Spring-20170628 & Dup03-20170628 \\
MH-140-20170628 & FRB-20170628 & Dup01-20170627 \\
Interceptor-20170628 & MH318.9-20170628 & RB01-20170628 \\
Roof Drain-20170628 & MH388.9-20170628 &
\end{tabular}

The sample set for NAWC Trenton, SDG 17007892 consists of nine (9) surface water environmental samples and two (2) field quality control blank (designated FRB- and RB-). Two field duplicate pairs (Dup01-20170627/MH-118.5N-20170627 [from SDG 1700789] and Dup03-20170628/MH-140-20170628) were included in this SDG. The samples were analyzed for polyfluoroalkyl substances (PFAS).

The samples were collected by Tetra Tech on June 27 and 28, 2017 and analyzed by Vista Analytical of Sheffield, California. The analysis was conducted in accordance with modified EPA Method 537 Rev. 1.1 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters:
```

* Data Completeness
* Holding Times/Sample Preservation
* GC/MS Instrument Tuning and System Performance
* Initial and Continuing Calibration Verification Results
* Laboratory Method/Preparation Blank Analyses
* Surrogate Recoveries
* Ongoing Precision and Recovery (OPR) Results
* Matrix Spike/Matrix Spike Duplicate Results
* Laboratory Duplicate Sample Results
Internal Standard Results
Field Duplicate Precision
* Detection Limits

```

The symbol (*) indicates that quality control criteria were met for this parameter. Issues affecting data quality are discussed below; documentation supporting these findings is presented in Appendix C. Qualified Analytical results are presented in Appendix A. Results as reported by the laboratory are presented in Appendix B .

TO: M. MANG
PAGE 2
SDG: 1700792

\section*{PFAS}

The recovery of internal standard 13C2-PFTeDA was below the lower QC limit for samples Dup0120170628 and MH388.9-20170628. The non-detected results for analytes PFTeDA in these samples were qualified as estimated (UJ).

The recoveries of internal standards 13C2-PFDoA and 13C2-PFTeDA were below the lower QC limits for samples Dup03-20170628, FRB-20170628, MH318.9-20170628, RB01-20170628, Roof Drain-20170628, Spring-20170628, and West Ditch In-20170627. The non-detected results for analytes PFDoA, PFTrDA, and PFTeDA in these samples were qualified as estimated (UJ).

The recoveries of internal standards d5-EtFOSAA, 13C2-PFDoA, 13C2-PFTeDA were below the lower QC limits for sample Interceptor-20170628. The non-detected results for analytes EtFOSAA, PFDoA, PFTrDA, and PFTeDA in this sample were qualified as estimated (UJ).

Field duplicate relative percent difference (RPD) for PFOS exceeded the QC criterion of 30\% for samples \(\mathrm{MH}-118.5 \mathrm{~N}-20170627\) and Dup01-20170627. The positive results for PFOS in these samples were qualified as estimated (J).

Field duplicate RPDs for PFHpA and PFHxA exceeded the QC criterion of \(30 \%\) for samples MH-14020170628 and Dup03-20170628. The positive results for PFHpA and PFHxA in these samples were qualified as estimated (J).

Detected results reported below the Limit of Quantitation (LOQ) but above the Detection Limit (DL) were qualified as estimated (J).

\section*{Notes}

A 10X dilution was required for PFOS for sample Dup01-20170627 because the concentration in the original analysis exceeded the calibration range of the instrument. The field duplicate sample is associated with sample MH-118.5N-20170627 from SDG 1700789.

The field reagent blank (FRB-20170628) and rinsate blank (RB01-20170628) were free of contamination.
All analyses were conducted within the hold times specified by the site specific Sampling and Analysis Plan (SAP) and the analytical method.

Non-detected results were reported to the Limit of Detection (LOD).

TO: M. MANG
PAGE 3 SDG: 1700792

\section*{Executive Summary}

Laboratory Performance: Internal standard recoveries for were below the lower QC limits in several samples.

Other Factors Affecting Data Quality: Field duplicate precision exceeded the QC criterion for two analytes. Positive results below the LOQ were qualified as estimated.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Superfund Organic Methods Data Review" (January 2017). The text of this report has been formulated to address only those areas affecting data quality.

\section*{Data Qualifier Definitions}

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.
\begin{tabular}{|c|l|}
\hline \(\mathbf{U}\) & \begin{tabular}{l} 
The analyte was analyzed for, but was not detected at a level greater than or equal to \\
the level of the adjusted method detection limit for sample and method.
\end{tabular} \\
\hline \(\mathbf{J}\) & \begin{tabular}{l} 
The analyte was positively identified and the associated numerical value is the \\
approximate concentration of the analyte in the sample (due either to the quality of \\
the data generated because certain quality control criteria were not met, or the \\
concentration of the analyte was below the reporting limit).
\end{tabular} \\
\hline \(\mathbf{J +}\) & The result is an estimated quantity, but the result may be biased high. \\
\hline \(\mathbf{J -}\) & The result is an estimated quantity, but the result may be biased low. \\
\hline \(\mathbf{U J}\) & \begin{tabular}{l} 
The analyte was analyzed for, but was not detected. The reported detection limit is \\
approximate and may be inaccurate or imprecise.
\end{tabular} \\
\hline \(\mathbf{R}\) & \begin{tabular}{l} 
The sample result (detected) is unusable due to the quality of the data generated \\
because certain criteria were not met. The analyte may or may not be present in the \\
sample.
\end{tabular} \\
\hline \(\mathbf{U R}\) & \begin{tabular}{l} 
The sample result (nondetected) is unusable due to the quality of the data generated \\
because certain criteria were not met. The analyte may or may not be present in the \\
sample.
\end{tabular} \\
\hline
\end{tabular}

\section*{Qualifier Codes:}

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., \% RSDs, \%Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
\(\mathrm{G}=\) Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
\(J=\) ICP PDS Recovery Noncompliance; MSA's \(r<0.995\)
\(\mathrm{K}=\) ICP Interference - includes ICS \% R Noncompliance
\(\mathrm{L}=\) Instrument Calibration Range Exceedance
\(\mathrm{M}=\) Sample Preservation Noncompliance
\(\mathrm{N}=\) Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
\(P=\) Uncertainty near detection limit (<2 x IDL for inorganics and <CRQL for organics)
\(\mathrm{Q}=\) Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
\(\mathrm{S}=\) Pesticide/PCB Resolution
T = \% Breakdown Noncompliance for DDT and Endrin
\(\mathrm{U}=\) RPD between columns/detectors \(>40 \%\) for positive results determined via GC/HPLC
\(\mathrm{V}=\) Non-linear calibrations; correlation coefficient \(\mathrm{r}<0.995\)
W = EMPC result
\(\mathrm{X}=\) Signal to noise response drop
\(Y=\) Percent solids \(<30 \%\)
\(Z \quad=\) Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Invoice to: Name Company

\section*{Address}

\section*{Vista Work Order No. 1700792}

Case Narrative

\section*{Sample Condition on Receipt:}

Eleven aqueous samples were received in good condition and within the method temperature requirements. The samples were received and stored securely in accordance with Vista standard operating procedures and EPA methodology. A sample ID for "FRB-20170628" was resolved by following the Chain-of-Custody format, as requested.

\section*{Analytical Notes:}

\section*{Modified EPA Method 537}

The aqueous samples were extracted and analyzed for a selected list of 14 PFAS using Modified EPA Method 537.

Samples "West Ditch In-20170627", "MH388.9-20170628" and "RB01-20170628" were re-extracted due to very low recoveries of 13C2-PFDoA and 13C2-PFTeDA in the original extractions. The PFDoA, PFTrDA and PFTeDA results are reported from prep batch B7G0033 for those samples.

\section*{Holding Times}

The samples were extracted and analyzed within the method hold times.

\section*{Quality Control}

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank and Ongoing Precision and Recovery (OPR) sample were extracted and analyzed with each preparation batch. No analytes were detected in the Method Blanks above \(1 / 2\) the LOQ. The OPR recoveries were within the method acceptance criteria

The labeled standard recoveries outside the acceptance criteria are listed in the table below.
