	6"-6"-6"-6" (N)			
38			35.5' to 37.0' hard drilling. 37.0' to 38.0' air hammer advanced rapidly. possible fractured rock. 38.0' to 42.0' hard drilling.	
40				0.0 ppm 0.0 ppm
42			42.0' to 43.0' very hard drilling. Took several attempts for air hammer to advance past this point. 43.0' to 45.0' hard drilling.	Note: 10 gallons of water added to borehole to cool drill bit.
44				
46			END OF BORING AT 45.0 FEET BLS. NOTE: This boring was originally started on 8/17/04. Several attempts were made to keep the borehole open to 40 feet bls. The borehole caved when the air hammer was removed due to the highly fractured rock. This location was grouted up on 8/20/04, and a new boring was drilled 2 feet west of previous boring with similar lithology on 8/23-24/04. The new location also encountered caving, but the well was able to be set at 37' bls.	Note: Monitoring Well NDAIMW03 installed in borehole with screen from 27' to 37' bls.

12:00		11							sample time, Field Dup collected

Notes:
 Pump set 2' above bottom of well
Samples collected for:
 SVOC: 2, 1L
 VOC: 3 vials
metals: 1 plastic
 dissolved metals: 1 plastic. Field filtered with 0.45 microm in-line disposable filter
 Pesticides: 1 1-L
 PCB: 1 1-L
 TDS: 1 plastic

CN added to sample parameters. Collected on 9/22/04 at 16:15 using teflon tubing and disposable bailer. Sample was crystal clear.
no additional purging. CN field duplicate also collected. One bailer of groundwater removed prior to sampling

 18:45 Equipment blank collected. HPLC water run through bladder pump into containers
 19:00 ambient blank collected with HPLC water.

SAMPLE at 1450 hrs									

Notes:

Dissolved oxygen values were discredited during this sample because even though they were stabilized, they were still fairly high. Water samples did not effervesce here. Still a strong hydrocarbon smell at this site. Upon completion of sample, D.O. membrane was changed and meter recalibrated.

		SAMPLE at 1035 hrs							

Notes:

Sampling because samples were actively effervesing (bubbling). Hard time bottling VOA samples because after filling bottle, water in sample would bubble out air necessitating further filling.

Strong hydrocarbon smell throughout sampling.

Appendix G
In-Situ Permeability Test Data Sheets and
Photographs

Definitions of Slug Test Calculation Symbols

Rw	<u>well radius - radial distance from center of well to normal K of aquifer</u>
Rc	<u>casing radius - radius of the casing or other section of the well where the rise of the water level is measured. If the water level rises in the screened or open section of the well with a gravel pack around it, the thickness and porosity of the gravel envelope should be taken into account when calculating the equivalent value of Rc for the rising water level (Bouwer and Rice, 1976)</u>
Confinement Depth	Bottom of the aquifer
Hsat	saturated thickness of the aquifer
Lw	water column in well
Le	screen length
C	dimensionless parameter as a function of Le/Rw (from Bouwer and Rice paper)
Y(o)	Y at $t=0$, on straight line drawn through points
Y(t)	Y at $t=t$, on straight line through points
t	time passed between Y(o) and Y(t), could be where straight line crosses x and y axes, must correspond with Y(o) and Y(t) data points

PROJECT ID: VIEQUES - IDW / 180357.FI.22
WORK ORDER: 2409211
DATE RECEIVED: Friday, October 22, 2004

Project Notes: For 8260 TCLP analysis, sample -01 required an additional 1:10 dilution due to excessive foaming upon the purge step. Heavy emulsions were encountered during the extraction of the 8270 samples. These emulsions may have contributed to the low surrogate recoveries in the samples. For the 8081 analysis, sample -01 had surrogate recoveries below criteria. The most probable cause for the variances is matrix effect. For the 8151 analysis, the surrogate was below criteria for the samples and QC. The samples and QC was re-extracted and re-analyzed out of hold. With acceptable criteria. Both sets of data is reported.

(†): Short Hold Time Analysis Date

Samples reported on dry weight basis

DATA QUALIFIER CODES

State of Florida, Department of Environmental Protection &
Department of Health & Rehabilitative Services / NELAC

J Estimated value; value not accurate. This code shall be used in the following instances:

1. Surrogate recovery limits have been exceeded.
2. No known quality control criteria exists for the component
3. The reported value failed to meet the established quality control criteria for either precision or accuracy
4. The sample matrix interfered with the ability to make an accurate determination
5. If the data is questionable because of improper laboratory or field protocols (e.g. composite sample was collected instead of a grab sample)

Note: a “J” value shall be accompanied by justification for it’s use, and shall not be used if another code applies (e.g. L, V, Y, Q).

L Off-scale high. Actual value is known to be greater than the value given. To be used when the concentration of the analyte is above the acceptable limit for quantitation (exceeds the linear range of the highest calibration standard) and the calibration curve is known to exhibit a negative deflection.

Q Sample held beyond acceptable holding time. This code shall be used if the value is derived from a sample that was prepared or analyzed after the approved holding time restrictions for the sample preparation or analysis.

U Indicates that the compound was analyzed for but not detected. This shall be used to indicate that the specified component was not detected. The value associated with the qualifier shall be the laboratory reporting limit. Unless requested by the client, values less than the reporting limit shall not be reported.

V Indicates that the analyte was detected in both the sample and the associated method blank.
Note: The value in the blank shall not be subtracted from associated samples.

Y The laboratory analysis was from an unpreserved or improperly preserved sample. The data may not be accurate.

DATA VALIDATION REPORT

To: Mr. Brian C. Spann
Laboratory Manager
PEL Laboratories, Inc.
Tampa, FL

From: Rafael Infante, A&V Environmental Support

Date: November 5, 2004

Re: Data set from CH2M-Hill- Vieques IDW PR License
Chemist Certification of Samples Analyzed for RCRA
Characteristics for Disposal

The enclosed analysis report is based on data generated by PEL Laboratories, Inc. of Tampa, Florida for soil and aqueous samples collected on October 21, 2004. The analytical data was obtained directly from PEL and reviewed in accordance with the quality control requirements of the methods performed. The analyses were performed in accordance with the EPA SW-846 Methods.

This report applies to the following samples:

SAMPLE ID
WEST-IDW I & EW (ground water)
WEST-IDW I & ES (SOIL)

Mr. Brian C. Spann
Data Validation Report
Page -2-

TCLP Volatiles Data.

There were one (1) liquid sample and one (1) soil sample. No trip blanks or duplicates were taken. Samples were analyzed for TCLP volatiles following method SW-846 8260B (purge-and-trap gas chromatography with Mass Spectrometry detection). This report is based on a review of holding times, initial and continuing calibration data, blank analysis results, surrogate and matrix spike recoveries, quantitation of positive results, and sample result verification.

The data package obtained for TCLP volatiles is complete.

Holding times. All samples were analyzed within the required holding time of fourteen (14) days for TCLP extraction and fourteen days for analysis- 28 days total.

BFB tuning There is no indication that the frequency and abundance of BFB tune was outside the QC acceptance criteria.

Calibration. Internal standard calibration was employed; calibration extended the concentration range found in the samples. There are no indications that initial and continuing calibration were not in compliance with the method. Surrogate recoveries were within established limits.

Blanks. No contamination was found in the method blank. Field, trip and equipment blanks were not submitted for analysis.

Matrix spikes (MS)/Matrix spike duplicate (MSD). Laboratory control samples were within acceptance limit for the samples analyzed .

Laboratory duplicates. No information on laboratory duplicates was provided with the data package.

Surrogate recovery. Recoveries of surrogate standards were within control limits.

Sample result calculation. Calculation was based on the area for characteristics peaks for analyte and internal standard, sample volume, dilution factor, and calibration factor. Sample PEL-240921101 required a 10 dilution due to excessive foaming on the purge step.

Mr. Brian C. Spann
Data Validation Report
Page -3-

Detection limits are set to meet EPA's CLP OLMO1.0 standards.

Overall assessment. Sample data meet the necessary quality control requirements for the method.

TCLP Metals by ICAP (SW-846 6010) Data.
Trace metals (As, Ba, Cd, Cr, Pb, Se, and Ag)

The following samples were analyzed for trace metals following SW-846 6010-induced coupled Argon plasma:

One (3) liquid sample and one (1) soil sample were analyzed.

The data package obtained for the trace metals is complete.

Holding times. Analytes analyzed within method holding times (180 days).

Calibration. Initial demonstration of instrument calibration- there are no indication that the calibration did not meet minimum performance criteria specific for the method. Quantification was performed by comparing emission intensity of standards with that of the sample for the wavelength characteristic for each element. Interelement correction factors were employed.

Blanks. No target analytes were detected in the initial and continuing calibration blanks except for the following:
Sample: 240921101

Analyte	Concentration, ug/L
Lead	0.0326
Selenium	0.0639
Silver	0.00924

Laboratory duplicates. Duplicates (laboratory and field) data was not provided. There are no indication on the report that duplicates were outside the established limits.

Laboratory control standards. Within the laboratory control limit.

Sample result calculation. Calculation was based on emission of the corresponding element line, sample volume, and dilution factor.

Detection limit are set to meet EPA's CLP OLMO1.0

Overall assessment. Sample data meets the necessary quality control requirements for the method.

TCLP Metals by Flameless Atomic Absorption (SW-846 7470) Data.

Mercury (Hg) by atomic absorption.

The following samples were analyzed for TCLP Hg by atomic absorption following SW-846 7470:

One (1) liquid sample and one (1) soil sample.

The data package obtained for mercury metals is complete.

Holding times. Analytes analyzed within method holding times (28 days for Hg).

Calibration. Initial demonstration of instrument calibration- there are no indication that the calibration did not meet minimum performance criteria specific for the method. Quantification was performed by using a Beer law plot (absorbance vs. concentration) for each element.

Blanks. Preparation blank contained less than the minimum detectable quantity for mercury.

Laboratory control standards. Within the laboratory control limit.

Sample result calculation. Calculation was based on absorbance measurement and the Beer's law plot for the corresponding element, sample volume, and dilution factor.

Detection limit are set to meet EPA's CLP OLMO1.0.

Overall assessment. Sample data meets the necessary quality control requirements for the method.

TCLP Pesticides/Herbicides by (SW-846 8081A/8150) Data.

The following samples were analyzed for TCLP pesticides/herbicides by gas chromatography with electron capture detection following SW-846 8081A/81500:

One (1) liquid sample and one (1) soil sample.

The data package obtained for pesticides and herbicides is complete.

Holding times. Analytes analyzed within method holding times. Samples 240921101 and 240921102 has surrogate recoveries below the laboratory criteria for method 8150, the sample was re-extracted and re-analyzed out of holding time. Both data are reported.

Calibration. Initial demonstration of instrument calibration- there are no indication that the calibration did not meet minimum performance criteria specific for the method. In all cases, quantification was performed using a five points calibration.

Blanks. Method blank contained less than the minimum detectable quantity of the target analytes.

Surrogate recoveries. Were within established limits except for samples 240921101 and 240921102 for method 8051 and sample 240921101 for method 8081A.

Laboratory control standards. Within the laboratory control limits.

Sample result calculation. Calculation for TCLP pesticides and herbicides was based on the peak area, response factor, sample volume, dilution factor, and calibration curve response.

Detection limit are set to meet EPA's CLP OLMO1.0

Overall assessment. Sample data meets the necessary quality control requirements for the method.

TCLP Semivolatiles by (SW-846 8270C) Data.

One (1) liquid sample and one (1) soil sample were analyzed for TCLP semivolatile organics (acids/base neutrals).

The data package obtained is complete.

Holding times. Analytes analyzed within method holding times.

Calibration. Initial demonstration of instrument calibration- there are no indication that the initial and continuing calibration did not meet minimum performance criteria specific for the method.

Blanks. Method blank contained less than the minimum detectable quantity of the target analytes.

Mr. Brian C. Spann
Data Validation Report
Page -7-

Surrogate recoveries. Were within established limits except for the following:
Sample 240921101- 2,4,6-Tribromophenol; 2-Fluorophenol

Laboratory control standards. Within the laboratory control limits.

Sample result calculation. Calculation for TCLP semivolatile organic analytes was based on the peak area, response factor, sample volume, dilution factor, and calibration curve response.

Detection limit are set to meet EPA's CLP OLMO1.0

Overall assessment. Sample data meets the necessary quality control requirements for the method.

Hazardous Characteristics Data:

Reactive cyanide by (SW-846 9012)

Reactive sulfide by (SW-846 9030-solid samples/376.1-liquid sample)

Corrosivity by (SW-846 9045-solid samples/150.1-liquid samples), and

Ignitability by (SW-846 1010)

One (1) liquid sample and one (1) liquid sample were analyzed by the methods described above.

The data package obtained for the hazardous characteristics is complete.

Holding times. Samples analyzed within method holding times.

Calibration. Initial demonstration of instrument calibration- there are no indications that calibration did not meet minimum performance criteria specific for the method. Continuing calibration were perform as per the method described frequency.

Blanks. Blanks did not have any positive results for target analytes.

Sample result calculation. Calculations were based on analyte response, sample volume, and dilution factor.

Detection limit are set to meet EPA's CLP OLMO1.0

Overall assessment. Sample data meets the necessary quality control requirements for the method.

The samples did neither exceeded the toxicity characteristic leaching procedure criteria for target analytes, nor the hazardous characteristics. Waste samples can be classified as non-hazardous.

Certification

The following samples 240921101 and 240921102 were analyzed following standard procedures accepted by regulatory agencies. The quality control requirements met the methods criteria except in the occasions described in this document. The results are valid.

VI. Generator Certification

I hereby certify that to the best of my knowledge and belief, the information contained herein is a true, complete and accurate description of the waste material being offered for disposal and all known or suspected hazards have been disclosed. All Analytical Results/Material Safety Data Sheets submitted are truthful and complete and are representative of the waste. I further certify that by utilizing this profile, neither myself nor any other employee of the company will deliver for disposal or attempt to deliver for disposal any waste which is classified as toxic waste, hazardous waste or infectious waste, or any other waste material this facility is prohibited from accepting by law. I shall immediately give written notice of any change or condition pertaining to the waste not provided herein. Our company hereby agrees to fully indemnify this disposal facility against any damages resulting from this certification being inaccurate or untrue. I further certify that the company has not altered the form or content of this profile sheet as provided by Allied Waste.

SDG NARRATIVE SDG # 8926 PROTOCOL: SW-846

SAMPLE IDENTIFICATIONS: WAR-IDW-3

The one water sample listed above was scheduled for the requested analysis of the Herbicide fraction. The requested SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction (Method 3550B), and Method 8151A were used to prepare and analyze the samples, with the exceptions and/or additions requested by the client. All pertinent Quality Assurance notices are included in the narrative section and all pertinent Laboratory notices for SDG #8926 are included in the sample data sections.

Herbicides

Extraction and analysis holding time requirements were met for the samples.

No target analytes confirmed above the reporting limits in the sample.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

All surrogate recoveries were with the method specified limits.

The method blank associated with the samples met all quality control criteria.

The Laboratory Control Sample (LCS) prepared and analyzed with the samples met all recovery and precision criteria for all spike analytes.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on CD has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

SDG NARRATIVE SDG #8926 PROTOCOL: SW-846 8270C

SAMPLE IDENTIFICATIONS: WAR-IDW-3

The one liquid sample listed above was scheduled for the requested analyses of the GC/MS Semivolatiles fraction. SW-846, 3rd Edition, Update 3, Method 1311, Separatory funnel extraction (Method 3510C) and Method 8270C were used to prepare and analyze this sample, with the exceptions and/or additions requested by the client. All pertinent Quality Assurance notices are included in the narrative section and all pertinent Laboratory notices for SDG #8926 are included in the sample data section.

TCLP GC/MS Semivolatiles

Analysis holding time requirements were met for the sample.

There were no target analytes identified above the Quantitation Limit (QL) in the sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All decafluorotriphenylphosphine (DFTPP) abundance criteria were met for tunes associated to this SDG. Overall QC criteria were met for all initial and continuing calibration verification standards (CCVs) associated to this SDG. There is no Form VII in the deliverables package for the batch analyzed on instrument 5972hp64 on 01/26/06, associated with the DFTPP tune analyzed at 1441. This batch included an initial calibration and the relevant relative response factors are all displayed on the appropriate Form VIs. The initial calibration met all acceptance criteria and therefore samples could be analyzed without having to inject a continuing calibration verification standard.

All of the surrogates met recovery criteria in the analyses of the sample. All of the internal standards met response and retention time criteria in the analyses of the sample.

The associated method blank met all quality control criteria.

There were no duplicate matrix spikes (MS/MSD) associated with this SDG.

The associated Laboratory Control Sample (LCS) met all recovery criteria.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

SDG NARRATIVE SDG # 8925 PROTOCOL: SW-846

SAMPLE IDENTIFICATIONS:

WAR-IDW-4

The one water sample listed above was received intact, properly refrigerated with proper documentation, in sealed shipping containers, on January 19, 2006. The sample was scheduled for the requested analyses of the pesticide-TCLP fraction. SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction (Method 3550B), and Method 8081A were used to prepare and analyze this sample, with the exceptions and/or additions requested by the client. This portion of the SDG narrative deals with the pesticide-TCLP fraction only.

Pesticides TCLP

Extraction and analysis holding time requirements were met for this sample.

There were no pesticide-TCLP analytes confirmed by dual column analysis above the Quantitation Limit (QL) in this sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

All of the surrogates met recovery and retention time criteria in the analyses of this sample.

The associated method blank met all quality control criteria.

There is no associated duplicate matrix spikes for this SDG.

The associated Laboratory Control Sample prepared and analyzed along with this sample (LCS) met all accuracy criteria.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. SDG NARRATIVE

SDG # 8926

The indicated Sample Delivery Group (SDG) consisting of one (1) liquid sample was received into the laboratory information management system (LIMS) on January 19, 2006 intact and in good condition with Chain of Custody (COC) Records in order, unless otherwise noted in any attachments or Quality Assurance Notices. The temperature of the sample was 4.6°C. Sample ID's reported in this data package are noted by the receiving department on the COC if they differ from those listed by the samplers on the COC.

The sample was prepared following the TCLP leaching procedure and analyzed in accordance with SW846 methodology for TCLP metals.

INSTRUMENTAL QUALITY CONTROL:

All calibration verification solutions (ICV & CCV), blanks (ICB, & CCB), and interference check samples (ICSA & ICSAB) associated with this data were confirmed to be within allowable limits.

SAMPLE PREPARATION QUALITY CONTROL:

The sample preparation procedure verifications (LCSW, & PBW) were found to be within acceptable ranges and the sample was prepared and analyzed within the specified holding times.

MATRIX RELATED QUALITY CONTROL:

No matrix spikes or duplicates were requested with this case.

The laboratory manager or his designee, as verified by the following signature has authorized release of the data contained in this hard copy data package. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

SDG NARRATIVE
SDG #8925
PROTOCOL: SW-846 8270C

SAMPLE IDENTIFICATIONS: WAR-IDW-4

The one soil sample listed above was scheduled for the requested analyses of the GC/MS Semivolatiles fraction. SW-846, 3rd Edition, Update 3, Method 1311, Separatory funnel extraction (Method 3510C) and Method 8270C were used to prepare and analyze this sample, with the exceptions and/or additions requested by the client. All pertinent Quality Assurance notices are included in the narrative section and all pertinent Laboratory notices for SDG #8925 are included in the sample data section.

TCLP GC/MS Semivolatiles

Analysis holding time requirements were met for the sample.

There were no target analytes identified above the Quantitation Limit (QL) in the sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All decafluorotriphenylphosphine (DFTPP) abundance criteria were met for tunes associated to this SDG. Overall QC criteria were met for all initial and continuing calibration verification standards (CCVs) associated to this SDG. There is no Form VII in the deliverables package for the batch analyzed on instrument 5972hp64 on 01/26/06, associated with the DFTPP tune analyzed at 1441. This batch included an initial calibration and the relevant relative response factors are all displayed on the appropriate Form VIs. The initial calibration met all acceptance criteria and therefore samples could be analyzed without having to inject a continuing calibration verification standard.

All of the surrogates met recovery criteria in the analyses of the sample. All of the internal standards met response and retention time criteria in the analyses of the sample.

The associated method blank met all quality control criteria.

There were no duplicate matrix spikes (MS/MSD) associated with this SDG.

The associated Laboratory Control Sample (LCS) met all recovery criteria.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

Dear MARK STINNETT:

Enclosed are the analytical results for sample(s) received by the laboratory on Thursday, January 19, 2006. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report. If you have any questions concerning this report, please feel free to contact your project manger.

Sincerely,

Paul E. Cvetich for
Catherine S. Dover

I. SAMPLE DATA SUMMARY PACKAGE

GC by SW-846

The sample data summary package shall contain data for all samples in one Sample Delivery Group (SDG) of the Case, as follows:

- A. SDG Narrative
- B. Tabulated target compound results (Form I)
- C. Surrogate spike analysis results (Form II)
By matrix (Water or Soil), and
by concentration (Low, or Medium)
- D. Spike results MS / MSD / LCS (Form III)
- E. Blank data (Form IV)
Tabulated blank results (Form I)

LAB CODE : COMPU

METHOD: 8081A TCLP

SDG # : 8425

A. SDG Narrative

CompuChem

a division of Liberty Analytical Corporation

501 Madison Avenue

Cary, N.C. 27513

Tel: 919/379-4100 Fax: 919/379-4050

SDG NARRATIVE SDG # 8925 PROTOCOL: SW-846

SAMPLE IDENTIFICATIONS:

WAR-IDW-4

The one water sample listed above was received intact, properly refrigerated with proper documentation, in sealed shipping containers, on January 19, 2006. The sample was scheduled for the requested analyses of the pesticide-TCLP fraction. SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction (Method 3550B), and Method 8081A were used to prepare and analyze this sample, with the exceptions and/or additions requested by the client. This portion of the SDG narrative deals with the pesticide-TCLP fraction only.

Pesticides TCLP

Extraction and analysis holding time requirements were met for this sample.

There were no pesticide-TCLP analytes confirmed by dual column analysis above the Quantitation Limit (QL) in this sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

All of the surrogates met recovery and retention time criteria in the analyses of this sample.

The associated method blank met all quality control criteria.

There is no associated duplicate matrix spikes for this SDG.

The associated Laboratory Control Sample prepared and analyzed along with this sample (LCS) met all accuracy criteria.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

CompuChem's Pagination Convention

As required by the EPA CLP Statement of Work (SOW) documents, data to be delivered must be paginated (by machine or hand). In the event that the initial numbering is incorrect (a page numbered twice or a page skipped, for example), it is CompuChem's policy to add an alphabetic suffix to a page number when necessary (e.g., 100A, 100B, etc.).

Notification Regarding Manual Editing/Integration Flags

In some instances, manual adjustments to the software output are necessary to provide accurate data. These manual integrations are performed by the data reviewers, GC/MS operators, or GC chemists. An Extracted Ion Current Profile (EICP) or a GC chromatographic peak has been provided for the manual integration performed on each compound to demonstrate the accuracy of that process. The manual integrations are flagged on the quantitation report in the far right column beyond the FINAL concentration for GC/MS analysis, and in the "Flags" column for GC analysis. The manual editing/integration flags are:

- M** - Denotes that a manual integration has been performed for this compound. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- H** - Denotes that the data reviewer, GC/MS operator, or GC Chemist has chosen an alternate peak within the retention time window from that chosen by the software for that compound. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- MH** - Denotes that an alternate peak has been chosen within the retention time window from that chosen by the software for that compound and also a manual integration of the chosen peak has been performed. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- L** - Denotes that a data reviewer or GC/MS operator has selected an alternate library search. This is typically done when an additional tentatively identified compound (TIC) has been added to the number of peaks searched. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- ML** - Denotes that an alternate library search has been selected and a manual integration has also been performed. This is typically done when an additional TIC has been added and the TIC peak also required a manual integration.

The EPA CLP SOW documents require additional explanations for manual editing/integration. In the accompanying raw data packages, additional codes have been applied to the "M" flag and carry the following meanings;

- M1** - The compound was not found by the automatic integration routine.
- M2** - The compound was incorrectly integrated by the automatic integration routine.
- M3** - The co-eluting compounds were incorrectly integrated by the automatic integration routine.

These codes will appear in the GC/MS and GC raw data.

DATA REPORTING QUALIFIERS

On the Form I, under the column labeled “Q” for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. Up to five qualifiers may be reported on Form I for each compound. The qualifiers used are:

U : This flag indicates the compound was analyzed for but not detected. The Contract Required Quantitation Limit (CRQL), or reporting limit, will be adjusted to reflect any dilution and, for soils, the percent moisture.

J : This flag indicates an estimated value. The flag is used as detailed below:

1. When estimating a concentration for tentatively identified compounds (TICs) where a response factor of 1.0 is assumed for the TIC analyte,
2. When the mass spectral and retention time data indicate the presence of a compound that meets the volatile and semivolatile GC/MS identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero, and
3. When the retention time data indicate the presence of a compound that meets the pesticide/Aroclor or other GC or HPLC identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero. For example, if the CRQL (or Reporting Limit) is 10 µg/L, but a concentration of 3 µg/L is calculated, it is reported as 3J.

N : This flag indicates presumptive evidence of a compound. This flag is only used for TICs, where the identification is based on a mass spectral library search. For generic characterization of a TIC such as ‘chlorinated hydrocarbon’, the N flag is not used.

P : In the EPA’s Contract Laboratory Program (CLP), this flag is used for a pesticide/Aroclor target analyte, when there is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form I and flagged with a P. For SW-846 GC and HPLC analyses, when the Relative Percent Difference (RPD) is greater than 40% and there is no evidence of chromatographic anomalies or interferences, then the higher of the two values is reported and flagged with a P. When the RPD is equal to or less than 40%, our policy is to also report the higher of the two values, although the choice could be a project specific issue. For certain HPLC analyses, if one of the HPLC columns displays co-elution of target analytes, all results are reported from a primary column displaying no co-elution. Results are still flagged with a P if the RPD between columns is greater than 40%.

DATA REPORTING QUALIFIERS (continued)

- C : This flag applies to GC or HPLC results where the identification has been confirmed by GC/MS. If GC/MS confirmation was attempted but was unsuccessful, this flag is not applied; a laboratory-defined flag is used instead (see the X/Y/Z qualifier.)
- B : This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates probable blank contamination and warns the data user to take appropriate action. This flag is used for a TIC as well as for a positively identified target compound. The combination of flags BU or UB is not an allowable policy. Blank contaminants are flagged B only when they are detected in the sample.
- E : This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis. If one or more compounds have a response greater than the upper level of the calibration range, the sample or extract will be diluted and reanalyzed. All such compounds with a response greater than the upper level of the calibration range will have the concentration flagged with an E on Form I for the original analysis.
- D : If a sample or extract is reanalyzed at a higher dilution factor, for example when the concentration of an analyte exceeds the upper calibration range, the DL suffix is appended to the sample number on Form I for the more diluted sample, and **all** reported concentrations on that Form I are flagged with the D flag. This flag alerts data users that any discrepancies between the reported concentrations may be due to dilution of the sample or extract.
- NOTE 1: The D flag is not applied to compounds which are not detected in the sample analysis i.e. compounds reported with the CRQL (or Reporting Limit) and the U flag.
- NOTE 2: Separate Form Is are used for reporting the original analysis (Client Sample No. XXXXX) and the more diluted sample analysis (Client Sample No. XXXXXDL) i.e. the results from both analyses are not combined on a single Form I.
- A: This flag indicates that a TIC is a suspected aldol-condensation product.
- S: In the SOM01.1 SOW, this flag is used to indicate an estimated value for Aroclor target compounds where a valid 5-point initial calibration was not performed prior to the analytes detection in a sample. If an "S" flag is used for a specific Aroclor, then a reanalysis of the sample is required after a valid 5-point calibration is performed for the detected Aroclor.
- X/Y/Z : Other specific flags may be required to properly define the results. If used, the flags will be fully described in the SDG Narrative. The laboratory-defined flags are limited to X, Y and Z.

CompuChem, a Division of Liberty Analytical Corporation

I. SAMPLE DATA PACKAGE

GC by SW-846

The sample data package shall include data for all analyses of all samples in one Sample Delivery Group (SDG), including field samples, dilutions, reanalyses, blanks, matrix spikes, matrix spike duplicates, and laboratory control samples. The sample data package consists of the following:

- A. SDG Narrative
- B. Chain-of-Custody Documentation
- C. SDG Data

LAB CODE : COMPU

METHOD: 8081A TCLP

CASE # : _____

SDG # : 8925

A. SDG Narrative

CompuChem

a division of Liberty Analytical Corporation

501 Madison Avenue

Cary, N.C. 27513

Tel: 919/379-4100 Fax: 919/379-4050

SDG NARRATIVE SDG # 8925 PROTOCOL: SW-846

SAMPLE IDENTIFICATIONS:

WAR-IDW-4

The one water sample listed above was received intact, properly refrigerated with proper documentation, in sealed shipping containers, on January 19, 2006. The sample was scheduled for the requested analyses of the pesticide-TCLP fraction. SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction (Method 3550B), and Method 8081A were used to prepare and analyze this sample, with the exceptions and/or additions requested by the client. This portion of the SDG narrative deals with the pesticide-TCLP fraction only.

Pesticides TCLP

Extraction and analysis holding time requirements were met for this sample.

There were no pesticide-TCLP analytes confirmed by dual column analysis above the Quantitation Limit (QL) in this sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

All of the surrogates met recovery and retention time criteria in the analyses of this sample.

The associated method blank met all quality control criteria.

There is no associated duplicate matrix spikes for this SDG.

The associated Laboratory Control Sample prepared and analyzed along with this sample (LCS) met all accuracy criteria.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

Elsie S. Byrd
Senior Scientist I
January 26, 2006

CompuChem's Pagination Convention

As required by the EPA CLP Statement of Work (SOW) documents, data to be delivered must be paginated (by machine or hand). In the event that the initial numbering is incorrect (a page numbered twice or a page skipped, for example), it is CompuChem's policy to add an alphabetic suffix to a page number when necessary (e.g., 100A, 100B, etc.).

CompuChem

a division of Liberty Analytical Corporation

Notification Regarding Manual Editing/Integration Flags

In some instances, manual adjustments to the software output are necessary to provide accurate data. These manual integrations are performed by the data reviewers, GC/MS operators, or GC chemists. An Extracted Ion Current Profile (EICP) or a GC chromatographic peak has been provided for the manual integration performed on each compound to demonstrate the accuracy of that process. The manual integrations are flagged on the quantitation report in the far right column beyond the FINAL concentration for GC/MS analysis, and in the "Flags" column for GC analysis. The manual editing/integration flags are:

- M** - Denotes that a manual integration has been performed for this compound. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- H** - Denotes that the data reviewer, GC/MS operator, or GC Chemist has chosen an alternate peak within the retention time window from that chosen by the software for that compound. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- MH** - Denotes that an alternate peak has been chosen within the retention time window from that chosen by the software for that compound and also a manual integration of the chosen peak has been performed. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- L** - Denotes that a data reviewer or GC/MS operator has selected an alternate library search. This is typically done when an additional tentatively identified compound (TIC) has been added to the number of peaks searched. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- ML** - Denotes that an alternate library search has been selected and a manual integration has also been performed. This is typically done when an additional TIC has been added and the TIC peak also required a manual integration.

The EPA CLP SOW documents require additional explanations for manual editing/integration. In the accompanying raw data packages, additional codes have been applied to the "M" flag and carry the following meanings;

- M1** - The compound was not found by the automatic integration routine.
- M2** - The compound was incorrectly integrated by the automatic integration routine.
- M3** - The co-eluting compounds were incorrectly integrated by the automatic integration routine.

These codes will appear in the GC/MS and GC raw data.

DATA REPORTING QUALIFIERS

On the Form I, under the column labeled “Q” for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. Up to five qualifiers may be reported on Form I for each compound. The qualifiers used are:

- U : This flag indicates the compound was analyzed for but not detected. The Contract Required Quantitation Limit (CRQL), or reporting limit, will be adjusted to reflect any dilution and, for soils, the percent moisture.
- J : This flag indicates an estimated value. The flag is used as detailed below:
1. When estimating a concentration for tentatively identified compounds (TICs) where a response factor of 1.0 is assumed for the TIC analyte,
 2. When the mass spectral and retention time data indicate the presence of a compound that meets the volatile and semivolatile GC/MS identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero, and
 3. When the retention time data indicate the presence of a compound that meets the pesticide/Aroclor or other GC or HPLC identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero. For example, if the CRQL (or Reporting Limit) is 10 µg/L, but a concentration of 3 µg/L is calculated, it is reported as 3J.
- N : This flag indicates presumptive evidence of a compound. This flag is only used for TICs, where the identification is based on a mass spectral library search. For generic characterization of a TIC such as ‘chlorinated hydrocarbon’, the N flag is not used.
- P : In the EPA’s Contract Laboratory Program (CLP), this flag is used for a pesticide/Aroclor target analyte, when there is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form I and flagged with a P. For SW-846 GC and HPLC analyses, when the Relative Percent Difference (RPD) is greater than 40% and there is no evidence of chromatographic anomalies or interferences, then the higher of the two values is reported and flagged with a P. When the RPD is equal to or less than 40%, our policy is to also report the higher of the two values, although the choice could be a project specific issue. For certain HPLC analyses, if one of the HPLC columns displays co-elution of target analytes, all results are reported from a primary column displaying no co-elution. Results are still flagged with a P if the RPD between columns is greater than 40%.

DATA REPORTING QUALIFIERS (continued)

- C : This flag applies to GC or HPLC results where the identification has been confirmed by GC/MS. If GC/MS confirmation was attempted but was unsuccessful, this flag is not applied; a laboratory-defined flag is used instead (see the X/Y/Z qualifier.)
- B : This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates probable blank contamination and warns the data user to take appropriate action. This flag is used for a TIC as well as for a positively identified target compound. The combination of flags BU or UB is not an allowable policy. Blank contaminants are flagged B only when they are detected in the sample.
- E : This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis. If one or more compounds have a response greater than the upper level of the calibration range, the sample or extract will be diluted and reanalyzed. All such compounds with a response greater than the upper level of the calibration range will have the concentration flagged with an E on Form I for the original analysis.
- D : If a sample or extract is reanalyzed at a higher dilution factor, for example when the concentration of an analyte exceeds the upper calibration range, the DL suffix is appended to the sample number on Form I for the more diluted sample, and **all** reported concentrations on that Form I are flagged with the D flag. This flag alerts data users that any discrepancies between the reported concentrations may be due to dilution of the sample or extract.
- NOTE 1: The D flag is not applied to compounds which are not detected in the sample analysis i.e. compounds reported with the CRQL (or Reporting Limit) and the U flag.
- NOTE 2: Separate Form Is are used for reporting the original analysis (Client Sample No. XXXXX) and the more diluted sample analysis (Client Sample No. XXXXXDL) i.e. the results from both analyses are not combined on a single Form I.
- A: This flag indicates that a TIC is a suspected aldol-condensation product.
- S: In the SOM01.1 SOW, this flag is used to indicate an estimated value for Aroclor target compounds where a valid 5-point initial calibration was not performed prior to the analytes detection in a sample. If an "S" flag is used for a specific Aroclor, then a reanalysis of the sample is required after a valid 5-point calibration is performed for the detected Aroclor.
- X/Y/Z : Other specific flags may be required to properly define the results. If used, the flags will be fully described in the SDG Narrative. The laboratory-defined flags are limited to X, Y and Z.

Revision 9 (12-6-2005)

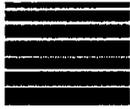

B. Chains-of-Custody

The laboratory shall include a copy of the Chain-of-Custody (CoC) documentation for all of the samples in the SDG. The CoC documents shall be arranged in increasing Client Sample ID number order, considering both letters and numbers.

COMMENTS:

c. Method Blank Summary (Form IV)

If more than a single form is necessary, forms shall be arranged in chronological order by date of analysis of the blanks, by instrument.

2. Sample Data

Sample data shall be arranged in packets with the Organic Analysis Data Sheet (Form I), followed by the raw data for samples. These sample packets shall be placed in increasing Client Sample ID number order, considering both letters and numbers.

a. Target Analyte Results (Form I)

Tabulated results (identification and quantitation) shall be included.

b. Copies of Chromatograms

Positively identified compounds shall be labeled with the names of compounds, either directly out from the peak on the chromatogram, or on a printout of retention times on the data system printout if retention times are printed over the peak on the chromatogram. Include for each sample or sample extract, including dilutions and reanalyses. The chromatogram shall contain the following header information: Client Sample ID number, volume injected (μL), date and time of injection, GC column ID, and GC instrument ID.

c. Copies of Chromatograms from the Second Column
(if necessary)

d. Data System Printout

A printout of retention time and corresponding peak height or peak area shall accompany each chromatogram. Where edits have been made, initialing, dating and integration time range are required.

At least 3 peaks are required for identification of multicomponent analytes.

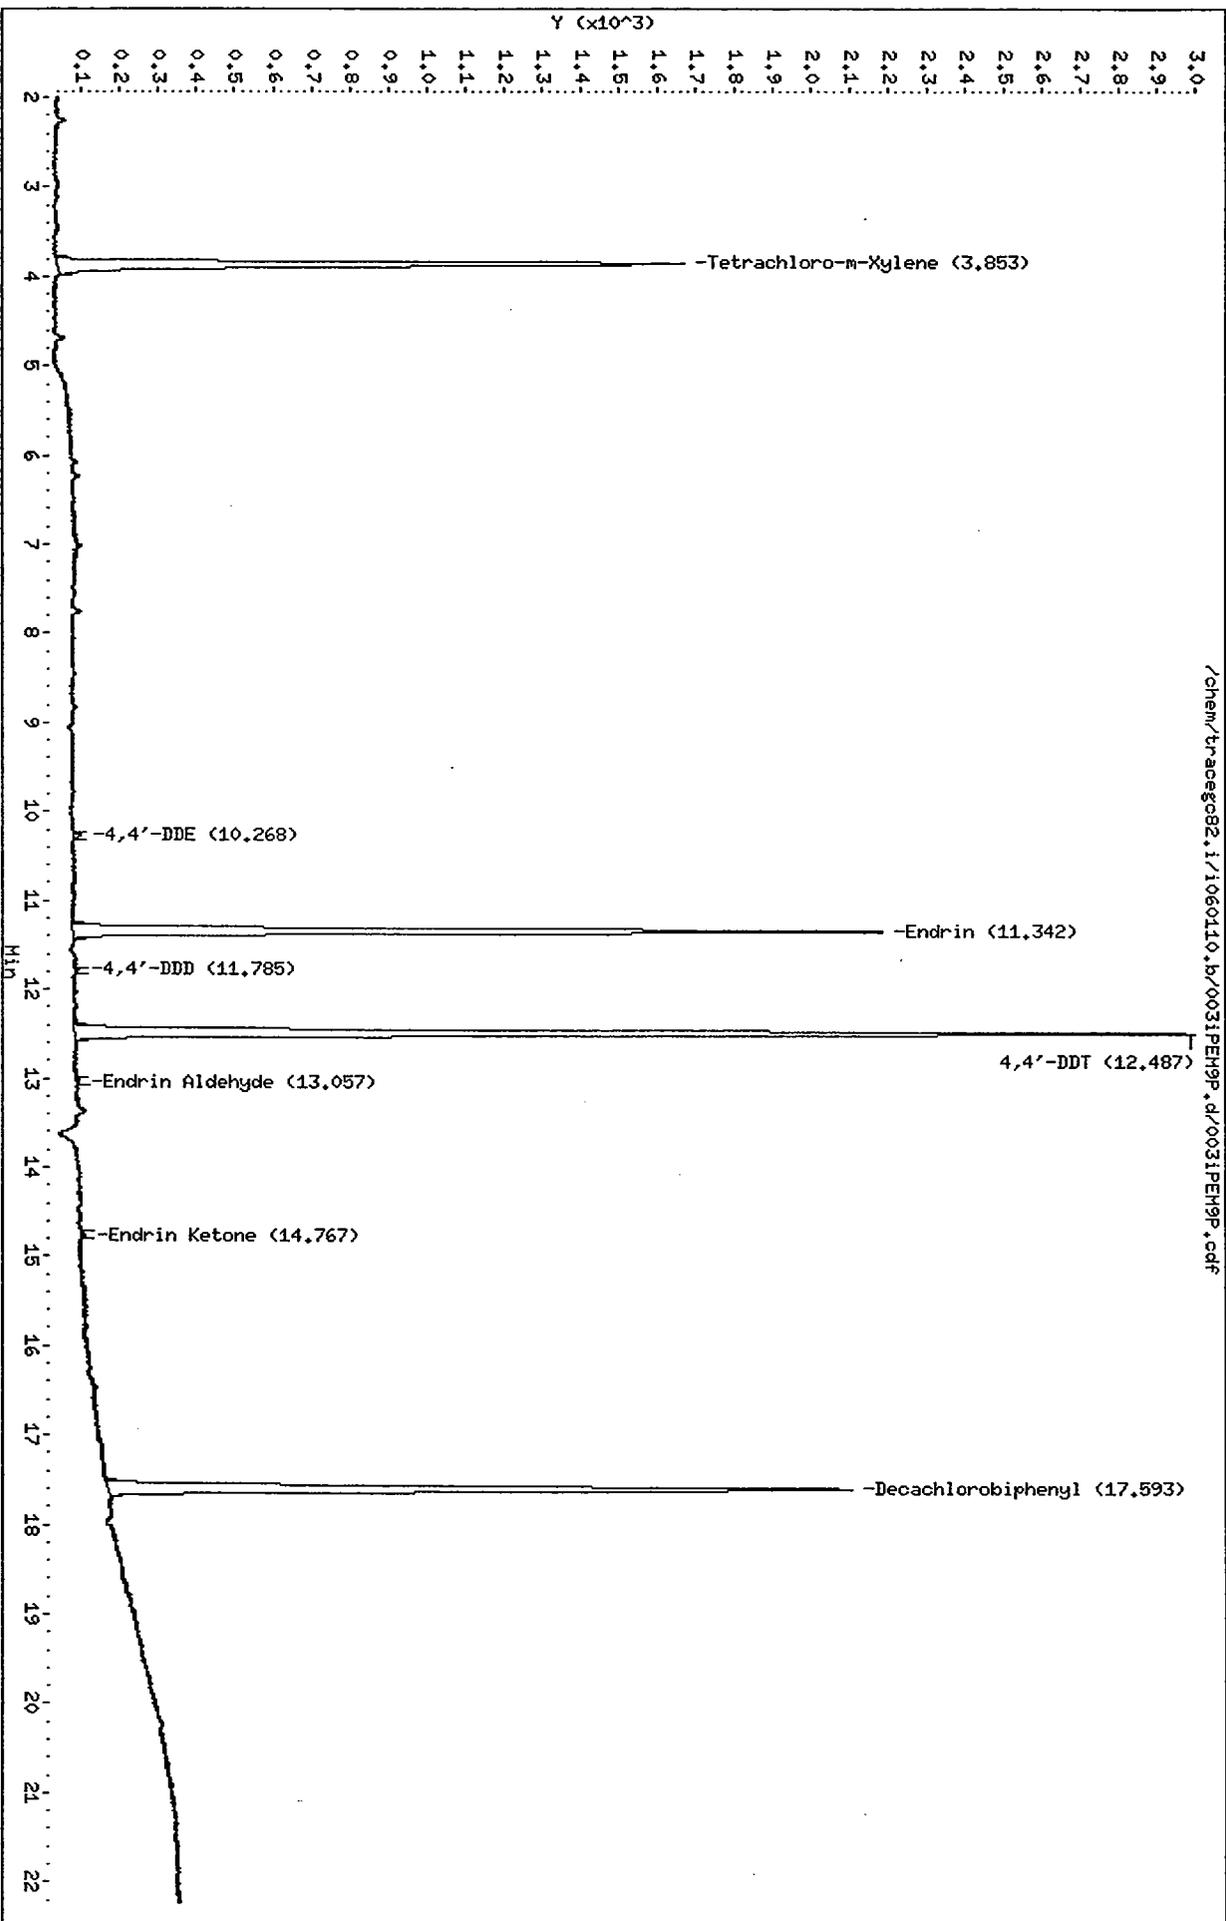

f. Chromatograms and Data System Printouts

For all methods, standards packages shall include the following:

- Performance evaluation mixtures (8081 only)
- Initial Calibration Standards
- Second Source Initial Calibration Verifications
(if required by client)
- Continuing Calibration Verification Standards
- The quantitation report must include the Client Sample ID number.
- The chromatograms shall include the following:
Client Sample ID number for the standard, labeled standard peaks, volume injected, for each standard, date and time of injection GC column identifier, and GC instrument identifier.

SUPERVISOR APPROVAL Kane Palmer

DATE 1/10/06 Hexane Lot No 05760

The presence of the Chemist's/Analyst's employee ID number, or signature, on this run log attests that strict compliance with the method's SOP has occurred. Any SOP deviations require documentation by the responsible chemist/analyst together with the chemist's/analyst's initials and the initials of the lab supervisor and a QA department representative, signifying approval of the deviation.

4. Raw QC Data

a. Blank Data

b. Laboratory Control Sample Data

c. Matrix Spike Data

d. Matrix Spike Duplicate Data

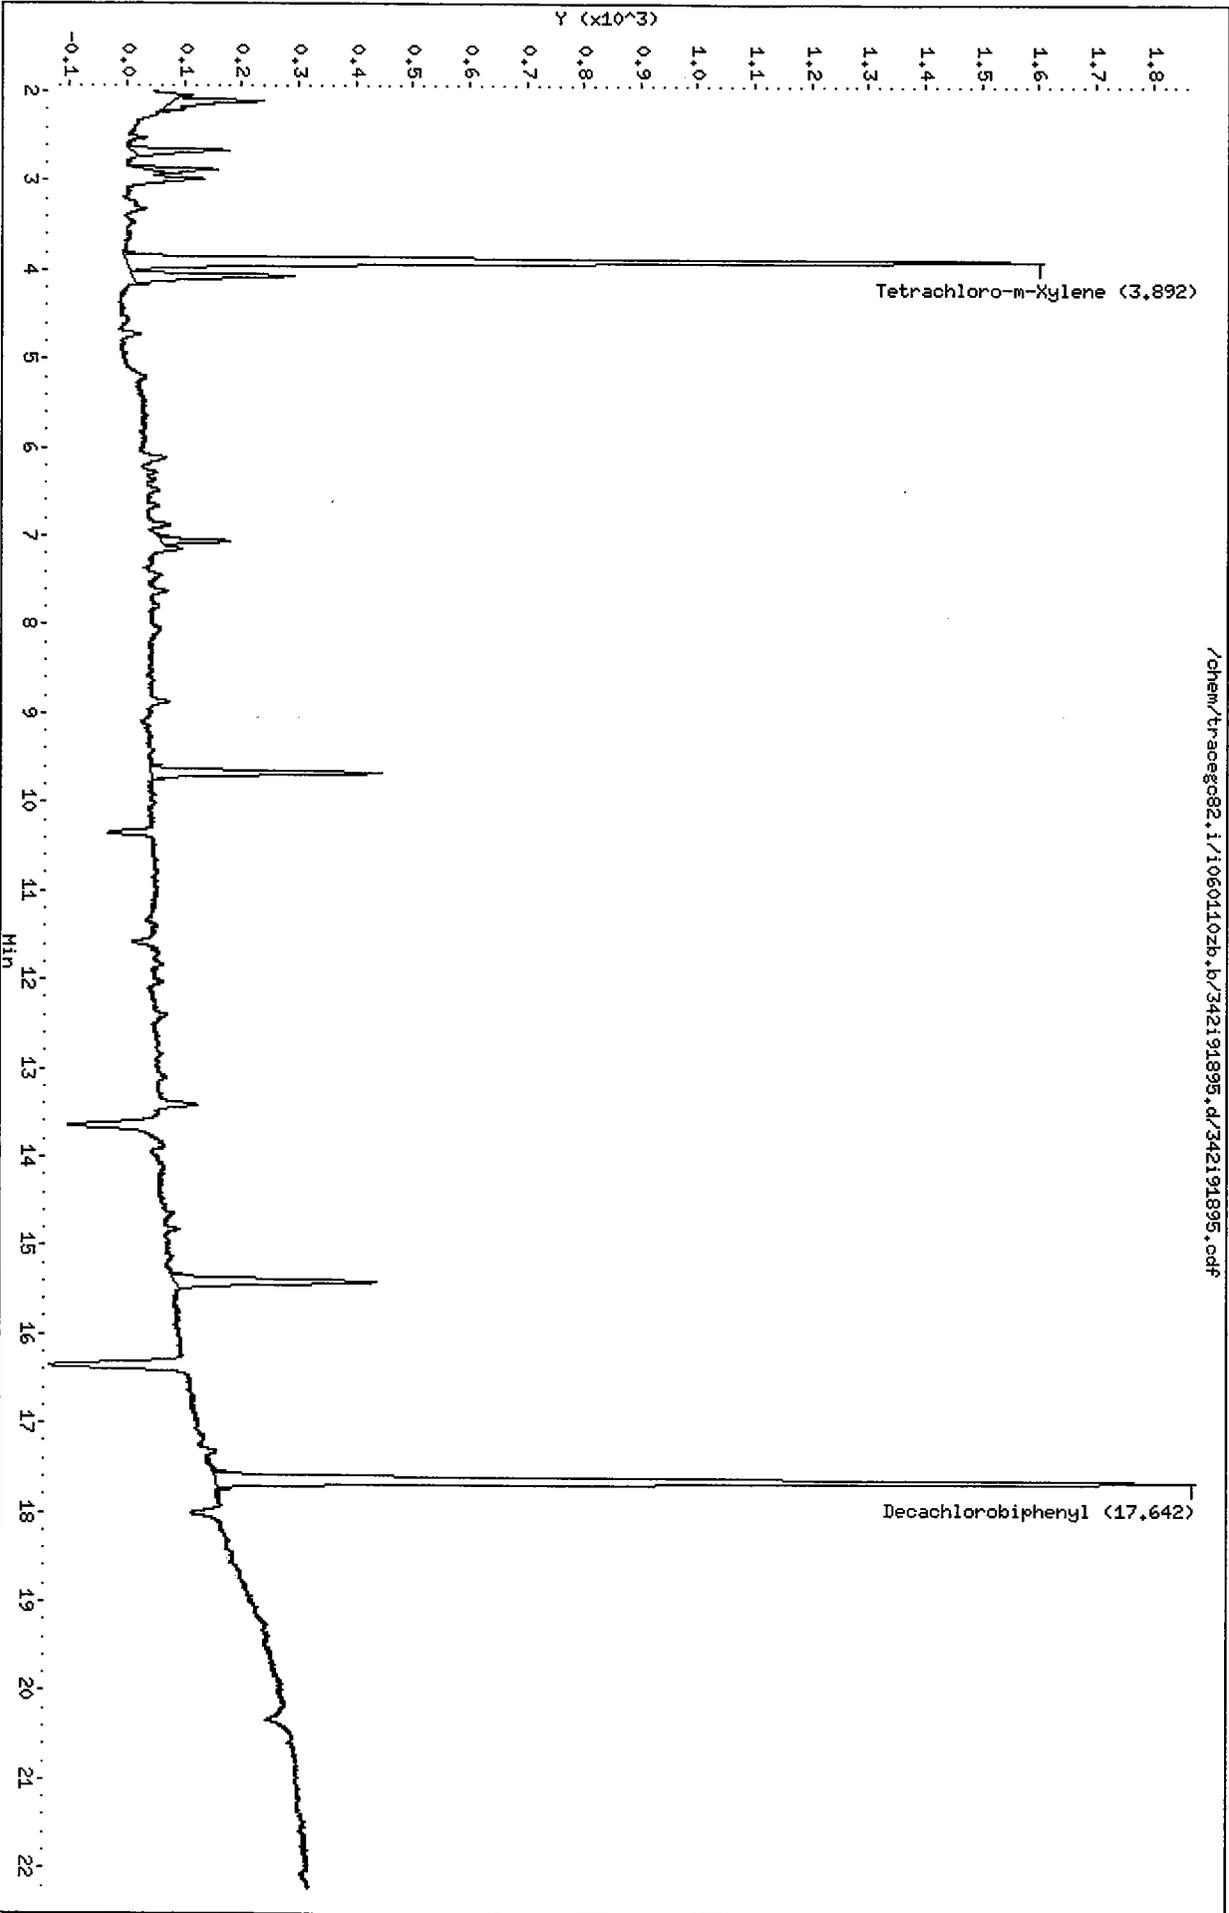

a. Blank Data

Arranged by type of blank (method, then instrument), and shall be in chronological order, by instrument.

- Tabulated Results (Form I)
- Chromatograms and data system printout(s)
by instrument used for analysis.

I. SAMPLE DATA SUMMARY PACKAGE

GC by SW-846

The sample data summary package shall contain data for all samples in one Sample Delivery Group (SDG) of the Case, as follows:

- A. SDG Narrative
- B. Tabulated target compound results (Form I)
- C. Surrogate spike analysis results (Form II)
By matrix (Water or Soil), and
by concentration (Low, or Medium)
- D. Spike results MS / MSD / LCS (Form III)
- E. Blank data (Form IV)
Tabulated blank results (Form I)

LAB CODE : COMPU

METHOD: 8151A

SDG # : 8925

A. SDG Narrative

CompuChem

Tel: 919/379-4100 Fax: 919/379-4050

SDG NARRATIVE

SDG # 8925

PROTOCOL: SW-846

SAMPLE IDENTIFICATIONS:

WAR-IDW-4

The one water sample listed above was received intact, properly refrigerated, with proper documentation, in sealed shipping containers, on January 19, 2006. The sample was scheduled for the requested analyses of the herbicide fraction. SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction and Method 8151A were used to prepare and analyze these samples, with the exceptions and/or additions requested by the client. This portion of the SDG narrative deals with the herbicide fraction only.

Herbicide-TCLP

Extraction and analysis holding time requirements were met for this sample.

There were no herbicide project analytes confirmed by dual column analysis above the Quantitation Limit (QL) in this sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

The surrogate met recovery and retention time criteria in the analyses of this sample.

The associated method blank met all quality control criteria.

There is no associated duplicate matrix spikes for this SDG.

The associated Laboratory Control Sample (LCS) prepared and analyzed along with this sample met all accuracy criteria.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

Elsie S. Byrd
Senior Scientist I

CompuChem's Pagination Convention

As required by the EPA CLP Statement of Work (SOW) documents, data to be delivered must be paginated (by machine or hand). In the event that the initial numbering is incorrect (a page numbered twice or a page skipped, for example), it is CompuChem's policy to add an alphabetic suffix to a page number when necessary (e.g., 100A, 100B, etc.).

CompuChem

a division of Liberty Analytical Corporation

Notification Regarding Manual Editing/Integration Flags

In some instances, manual adjustments to the software output are necessary to provide accurate data. These manual integrations are performed by the data reviewers, GC/MS operators, or GC chemists. An Extracted Ion Current Profile (EICP) or a GC chromatographic peak has been provided for the manual integration performed on each compound to demonstrate the accuracy of that process. The manual integrations are flagged on the quantitation report in the far right column beyond the FINAL concentration for GC/MS analysis, and in the "Flags" column for GC analysis. The manual editing/integration flags are:

- M** - Denotes that a manual integration has been performed for this compound. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- H** - Denotes that the data reviewer, GC/MS operator, or GC Chemist has chosen an alternate peak within the retention time window from that chosen by the software for that compound. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- MH** - Denotes that an alternate peak has been chosen within the retention time window from that chosen by the software for that compound and also a manual integration of the chosen peak has been performed. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- L** - Denotes that a data reviewer or GC/MS operator has selected an alternate library search. This is typically done when an additional tentatively identified compound (TIC) has been added to the number of peaks searched. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- ML** - Denotes that an alternate library search has been selected and a manual integration has also been performed. This is typically done when an additional TIC has been added and the TIC peak also required a manual integration.

The EPA CLP SOW documents require additional explanations for manual editing/integration. In the accompanying raw data packages, additional codes have been applied to the "M" flag and carry the following meanings;

- M1** - The compound was not found by the automatic integration routine.
- M2** - The compound was incorrectly integrated by the automatic integration routine.
- M3** - The co-eluting compounds were incorrectly integrated by the automatic integration routine.

These codes will appear in the GC/MS and GC raw data.

DATA REPORTING QUALIFIERS

On the Form I, under the column labeled “Q” for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. Up to five qualifiers may be reported on Form I for each compound. The qualifiers used are:

- U : This flag indicates the compound was analyzed for but not detected. The Contract Required Quantitation Limit (CRQL), or reporting limit, will be adjusted to reflect any dilution and, for soils, the percent moisture.
- J : This flag indicates an estimated value. The flag is used as detailed below:
1. When estimating a concentration for tentatively identified compounds (TICs) where a response factor of 1.0 is assumed for the TIC analyte,
 2. When the mass spectral and retention time data indicate the presence of a compound that meets the volatile and semivolatile GC/MS identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero, and
 3. When the retention time data indicate the presence of a compound that meets the pesticide/Aroclor or other GC or HPLC identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero. For example, if the CRQL (or Reporting Limit) is 10 µg/L, but a concentration of 3 µg/L is calculated, it is reported as 3J.
- N : This flag indicates presumptive evidence of a compound. This flag is only used for TICs, where the identification is based on a mass spectral library search. For generic characterization of a TIC such as ‘chlorinated hydrocarbon’, the N flag is not used.
- P : In the EPA’s Contract Laboratory Program (CLP), this flag is used for a pesticide/Aroclor target analyte, when there is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form I and flagged with a P. For SW-846 GC and HPLC analyses, when the Relative Percent Difference (RPD) is greater than 40% and there is no evidence of chromatographic anomalies or interferences, then the higher of the two values is reported and flagged with a P. When the RPD is equal to or less than 40%, our policy is to also report the higher of the two values, although the choice could be a project specific issue. For certain HPLC analyses, if one of the HPLC columns displays co-elution of target analytes, all results are reported from a primary column displaying no co-elution. Results are still flagged with a P if the RPD between columns is greater than 40%.

DATA REPORTING QUALIFIERS (continued)

- C : This flag applies to GC or HPLC results where the identification has been confirmed by GC/MS. If GC/MS confirmation was attempted but was unsuccessful, this flag is not applied; a laboratory-defined flag is used instead (see the X/Y/Z qualifier.)
- B : This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates probable blank contamination and warns the data user to take appropriate action. This flag is used for a TIC as well as for a positively identified target compound. The combination of flags BU or UB is not an allowable policy. Blank contaminants are flagged B only when they are detected in the sample.
- E : This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis. If one or more compounds have a response greater than the upper level of the calibration range, the sample or extract will be diluted and reanalyzed. All such compounds with a response greater than the upper level of the calibration range will have the concentration flagged with an E on Form I for the original analysis.
- D : If a sample or extract is reanalyzed at a higher dilution factor, for example when the concentration of an analyte exceeds the upper calibration range, the DL suffix is appended to the sample number on Form I for the more diluted sample, and **all** reported concentrations on that Form I are flagged with the D flag. This flag alerts data users that any discrepancies between the reported concentrations may be due to dilution of the sample or extract.
- NOTE 1: The D flag is not applied to compounds which are not detected in the sample analysis i.e. compounds reported with the CRQL (or Reporting Limit) and the U flag.
- NOTE 2: Separate Form Is are used for reporting the original analysis (Client Sample No. XXXXX) and the more diluted sample analysis (Client Sample No. XXXXXDL) i.e. the results from both analyses are not combined on a single Form I.
- A: This flag indicates that a TIC is a suspected aldol-condensation product.
- S: In the SOM01.1 SOW, this flag is used to indicate an estimated value for Aroclor target compounds where a valid 5-point initial calibration was not performed prior to the analytes detection in a sample. If an "S" flag is used for a specific Aroclor, then a reanalysis of the sample is required after a valid 5-point calibration is performed for the detected Aroclor.
- X/Y/Z : Other specific flags may be required to properly define the results. If used, the flags will be fully described in the SDG Narrative. The laboratory-defined flags are limited to X, Y and Z.

I. SAMPLE DATA PACKAGE

GC by SW-846

The sample data package shall include data for all analyses of all samples in one Sample Delivery Group (SDG), including field samples, dilutions, reanalyses, blanks, matrix spikes, matrix spike duplicates, and laboratory control samples. The sample data package consists of the following:

- A. SDG Narrative
- B. Chain-of-Custody Documentation
- C. SDG Data

LAB CODE : COMPU

METHOD: 8151A

CASE # : _____

SDG # : 8925

A. SDG Narrative

CompuChem

a division of Liberty Analytical Corporation

501 Madison Avenue

Cary, N.C. 27513

Tel: 919/379-4100 Fax: 919/379-4050

SDG NARRATIVE

SDG # 8925

PROTOCOL: SW-846

SAMPLE IDENTIFICATIONS:

WAR-IDW-4

The one water sample listed above was received intact, properly refrigerated, with proper documentation, in sealed shipping containers, on January 19, 2006. The sample was scheduled for the requested analyses of the herbicide fraction. SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction and Method 8151A were used to prepare and analyze these samples, with the exceptions and/or additions requested by the client. This portion of the SDG narrative deals with the herbicide fraction only.

Herbicide-TCLP

Extraction and analysis holding time requirements were met for this sample.

There were no herbicide project analytes confirmed by dual column analysis above the Quantitation Limit (QL) in this sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

The surrogate met recovery and retention time criteria in the analyses of this sample.

The associated method blank met all quality control criteria.

There is no associated duplicate matrix spikes for this SDG.

The associated Laboratory Control Sample (LCS) prepared and analyzed along with this sample met all accuracy criteria.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

Elsie S. Byrd
Senior Scientist I

Notification Regarding Manual Editing/Integration Flags

In some instances, manual adjustments to the software output are necessary to provide accurate data. These manual integrations are performed by the data reviewers, GC/MS operators, or GC chemists. An Extracted Ion Current Profile (EICP) or a GC chromatographic peak has been provided for the manual integration performed on each compound to demonstrate the accuracy of that process. The manual integrations are flagged on the quantitation report in the far right column beyond the FINAL concentration for GC/MS analysis, and in the "Flags" column for GC analysis. The manual editing/integration flags are:

- M** - Denotes that a manual integration has been performed for this compound. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- H** - Denotes that the data reviewer, GC/MS operator, or GC Chemist has chosen an alternate peak within the retention time window from that chosen by the software for that compound. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- MH** - Denotes that an alternate peak has been chosen within the retention time window from that chosen by the software for that compound and also a manual integration of the chosen peak has been performed. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- L** - Denotes that a data reviewer or GC/MS operator has selected an alternate library search. This is typically done when an additional tentatively identified compound (TIC) has been added to the number of peaks searched. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- ML** - Denotes that an alternate library search has been selected and a manual integration has also been performed. This is typically done when an additional TIC has been added and the TIC peak also required a manual integration.

The EPA CLP SOW documents require additional explanations for manual editing/integration. In the accompanying raw data packages, additional codes have been applied to the "M" flag and carry the following meanings;

- M1** - The compound was not found by the automatic integration routine.
- M2** - The compound was incorrectly integrated by the automatic integration routine.
- M3** - The co-eluting compounds were incorrectly integrated by the automatic integration routine.

These codes will appear in the GC/MS and GC raw data.

DATA REPORTING QUALIFIERS

On the Form I, under the column labeled "Q" for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. Up to five qualifiers may be reported on Form I for each compound. The qualifiers used are:

- U : This flag indicates the compound was analyzed for but not detected. The Contract Required Quantitation Limit (CRQL), or reporting limit, will be adjusted to reflect any dilution and, for soils, the percent moisture.
- J : This flag indicates an estimated value. The flag is used as detailed below:
1. When estimating a concentration for tentatively identified compounds (TICs) where a response factor of 1.0 is assumed for the TIC analyte,
 2. When the mass spectral and retention time data indicate the presence of a compound that meets the volatile and semivolatile GC/MS identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero, and
 3. When the retention time data indicate the presence of a compound that meets the pesticide/Aroclor or other GC or HPLC identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero. For example, if the CRQL (or Reporting Limit) is 10 µg/L, but a concentration of 3 µg/L is calculated, it is reported as 3J.
- N : This flag indicates presumptive evidence of a compound. This flag is only used for TICs, where the identification is based on a mass spectral library search. For generic characterization of a TIC such as 'chlorinated hydrocarbon', the N flag is not used.
- P : In the EPA's Contract Laboratory Program (CLP), this flag is used for a pesticide/Aroclor target analyte, when there is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form I and flagged with a P. For SW-846 GC and HPLC analyses, when the Relative Percent Difference (RPD) is greater than 40% and there is no evidence of chromatographic anomalies or interferences, then the higher of the two values is reported and flagged with a P. When the RPD is equal to or less than 40%, our policy is to also report the higher of the two values, although the choice could be a project specific issue. For certain HPLC analyses, if one of the HPLC columns displays co-elution of target analytes, all results are reported from a primary column displaying no co-elution. Results are still flagged with a P if the RPD between columns is greater than 40%.

DATA REPORTING QUALIFIERS (continued)

- C : This flag applies to GC or HPLC results where the identification has been confirmed by GC/MS. If GC/MS confirmation was attempted but was unsuccessful, this flag is not applied; a laboratory-defined flag is used instead (see the X/Y/Z qualifier.)
- B : This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates probable blank contamination and warns the data user to take appropriate action. This flag is used for a TIC as well as for a positively identified target compound. The combination of flags BU or UB is not an allowable policy. Blank contaminants are flagged B only when they are detected in the sample.
- E : This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis. If one or more compounds have a response greater than the upper level of the calibration range, the sample or extract will be diluted and reanalyzed. All such compounds with a response greater than the upper level of the calibration range will have the concentration flagged with an E on Form I for the original analysis.
- D : If a sample or extract is reanalyzed at a higher dilution factor, for example when the concentration of an analyte exceeds the upper calibration range, the DL suffix is appended to the sample number on Form I for the more diluted sample, and **all** reported concentrations on that Form I are flagged with the D flag. This flag alerts data users that any discrepancies between the reported concentrations may be due to dilution of the sample or extract.
- NOTE 1: The D flag is not applied to compounds which are not detected in the sample analysis i.e. compounds reported with the CRQL (or Reporting Limit) and the U flag.
- NOTE 2: Separate Form Is are used for reporting the original analysis (Client Sample No. XXXXX) and the more diluted sample analysis (Client Sample No. XXXXXDL) i.e. the results from both analyses are not combined on a single Form I.
- A: This flag indicates that a TIC is a suspected aldol-condensation product.
- S: In the SOM01.1 SOW, this flag is used to indicate an estimated value for Aroclor target compounds where a valid 5-point initial calibration was not performed prior to the analytes detection in a sample. If an "S" flag is used for a specific Aroclor, then a reanalysis of the sample is required after a valid 5-point calibration is performed for the detected Aroclor.
- X/Y/Z : Other specific flags may be required to properly define the results. If used, the flags will be fully described in the SDG Narrative. The laboratory-defined flags are limited to X, Y and Z.

Revision 9 (12-6-2005)

B. Chains-of-Custody

The laboratory shall include a copy of the Chain-of-Custody (CoC) documentation for all of the samples in the SDG. The CoC documents shall be arranged in increasing Client Sample ID number order, considering both letters and numbers.

COMMENTS:

2. Sample Data

Sample data shall be arranged in packets with the Organic Analysis Data Sheet (Form I), followed by the raw data for samples. These sample packets shall be placed in increasing Client Sample ID number order, considering both letters and numbers.

a. Target Analyte Results (Form I)

Tabulated results (identification and quantitation) shall be included.

b. Copies of Chromatograms

Positively identified compounds shall be labeled with the names of compounds, either directly out from the peak on the chromatogram, or on a printout of retention times on the data system printout if retention times are printed over the peak on the chromatogram. Include for each sample or sample extract, including dilutions and reanalyses. The chromatogram shall contain the following header information: Client Sample ID number, volume injected (μL), date and time of injection, GC column ID, and GC instrument ID.

c. Copies of Chromatograms from the Second Column
(if necessary)

d. Data System Printout

A printout of retention time and corresponding peak height or peak area shall accompany each chromatogram. Where edits have been made, initialing, dating and integration time range are required.

e. Identification Summary for
Multicomponent Analytes
(Form X) - if applicable

For all samples with positively identified multicomponent analytes, in order by increasing Client Sample ID number.

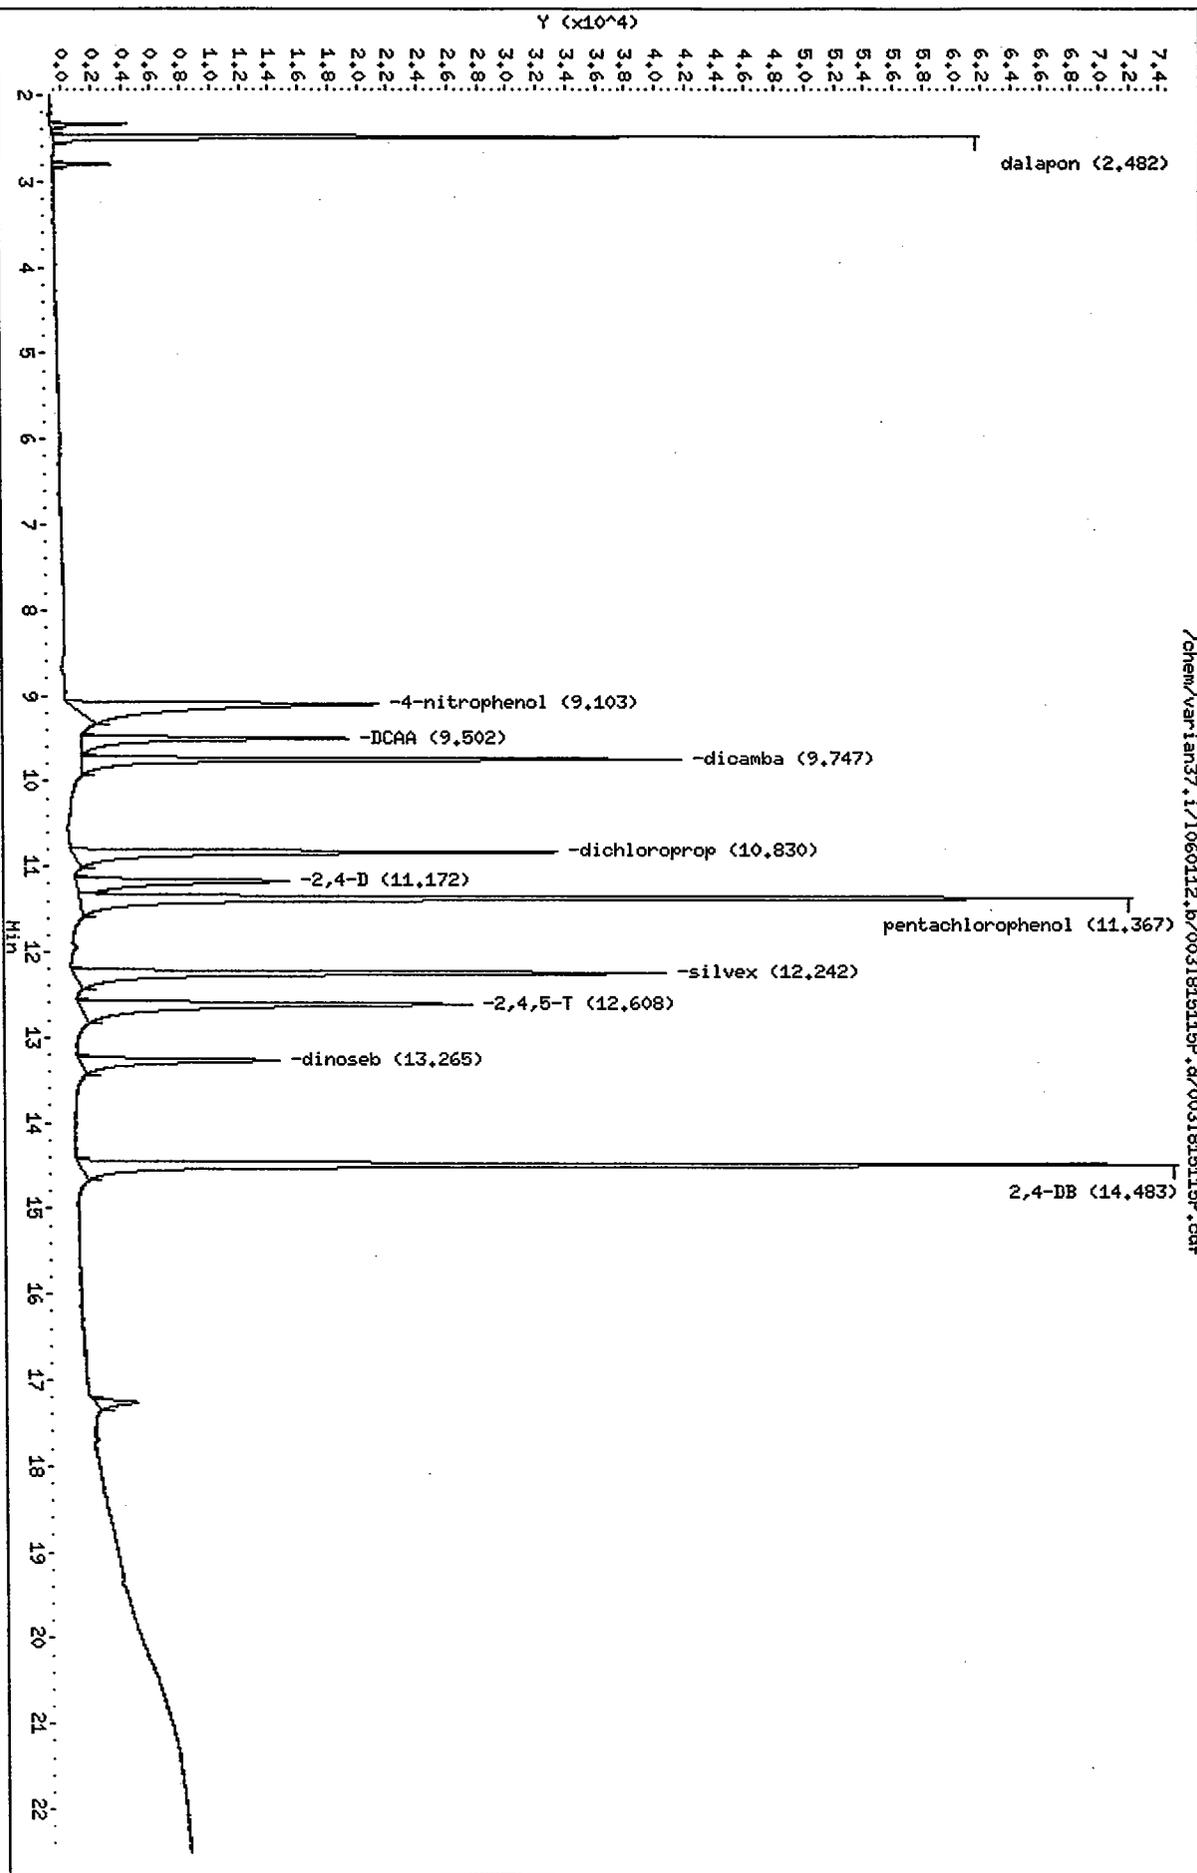

f. Chromatograms and Data System Printouts

For all methods, standards packages shall include the following:

- Performance evaluation mixtures (8081 only)
- Initial Calibration Standards
- Second Source Initial Calibration Verifications
(if required by client)
- Continuing Calibration Verification Standards
- The quantitation report must include the Client Sample ID number.
- The chromatograms shall include the following:
Client Sample ID number for the standard, labeled standard peaks, volume injected, for each standard, date and time of injection GC column identifier, and GC instrument identifier.

SUPERVISOR APPROVAL [Signature]

DATE: 1/12/06

[Handwritten initials]

The presence of the Chemist's/Analyst's employee ID number, or signature, on this run log attests that strict compliance with the method's SOP has occurred. Any SOP deviations require documentation by the responsible chemist/analyst together with the chemist's/analyst's initials and the initials of the lab supervisor and a QA department representative, signifying approval of the deviation.

4. Raw QC Data

a. Blank Data

b. Laboratory Control Sample Data

c. Matrix Spike Data

d. Matrix Spike Duplicate Data

a. Blank Data

Arranged by type of blank (method, then instrument), and shall be in chronological order, by instrument.

- Tabulated Results (Form I)
- Chromatograms and data system printout(s)
by instrument used for analysis.

DATA REPORTING QUALIFIERS

On the Form I, under the column labeled "Q" for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. Up to five qualifiers may be reported on Form I for each compound. The qualifiers used are:

- U: This flag indicates the compound was analyzed for but not detected. The Contract Required Quantitation Limit (CRQL), or reporting limit, will be adjusted to reflect any dilution and, for soils, the percent moisture.
- J: This flag indicates an estimated value. The flag is used as detailed below:
1. When estimating a concentration for tentatively identified compounds (TICs) where a response factor of 1.0 is assumed for the TIC analyte,
 2. When the mass spectral and retention time data indicate the presence of a compound that meets the volatile and semivolatile GC/MS identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero, and
 3. When the retention time data indicate the presence of a compound that meets the pesticide/Aroclor or other GC or HPLC identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero. For example, if the CRQL (or Reporting Limit) is 10 µg/L, but a concentration of 3 µg/L is calculated, it is reported as 3J.
- N: This flag indicates presumptive evidence of a compound. This flag is only used for TICs, where the identification is based on a mass spectral library search. For generic characterization of a TIC such as 'chlorinated hydrocarbon', the N flag is not used.
- P: In the EPA's Contract Laboratory Program (CLP), this flag is used for a pesticide/Aroclor target analyte, when there is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form I and flagged with a P. For SW-846 GC and HPLC analyses, when the Relative Percent Difference (RPD) is greater than 40% and there is no evidence of chromatographic anomalies or interferences, then the higher of the two values is reported and flagged with a P. When the RPD is equal to or less than 40%, our policy is to also report the higher of the two values, although the choice could be a project specific issue. For certain HPLC analyses, if one of the HPLC columns displays co-elution of target analytes, all results are reported from a primary column displaying no co-elution. Results are still flagged with a P if the RPD between columns is greater than 40%.

AMENDED SDG NARRATIVE

SDG # 8925

PROTOCOL: SW-846

SAMPLE IDENTIFICATIONS:

WAR-IDW-4

The one soil sample listed above was received intact, properly refrigerated, with proper documentation, in sealed shipping containers, on January 19, 2006. The sample was scheduled for the requested analyses of the herbicide fraction. SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction and Method 8151A were used to prepare and analyze these samples, with the exceptions and/or additions requested by the client. This portion of the SDG narrative deals with the herbicide fraction only.

Herbicide-TCLP

Extraction and analysis holding time requirements were met for this sample.

There were no herbicide project analytes confirmed by dual column analysis above the Quantitation Limit (QL) in this sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

The surrogate met recovery and retention time criteria in the analyses of this sample.

The associated method blank met all quality control criteria.

There is no associated duplicate matrix spikes for this SDG.

The associated Laboratory Control Sample (LCS) prepared and analyzed along with this sample met all accuracy criteria.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

WASTE MANAGEMENT
Waste Profile Document
Soil Profile

Approval No. _____
 Expiration Date: _____

IMPORTANT: This form must be completed by a Representative of the Waste Generator. The information on this form must be typed or legibly printed in ink and signed by an Authorized Agent of the Generator. Completed form bearing original signature must be provided to WMI PRIOR TO ACCEPTANCE AT A WMI FACILITY. If this form is submitted via facsimile, the original form MUST be received by WMI within five (5) working days.

1.0 Generator Information

- 1.1 Generator Name: US Navy, NAVFAC Atlantic 1.5 Local Registration No.: N/A
- 1.2 Generating Facility Address: former NASD 1.6 Generator's EPA ID No.: N/A
- City: Vieques Island State: PR Zip: _____ 1.7 Facility Phone: (____) _____
- 1.3 Company Representative: Pedro Ruiz 1.8 After Hours Phone: (____) _____
- Title: Environmental Engineer 1.9 Emergency Phone: (____) _____
- 1.4 Emergency Contact: Terri Fort, 540-777-6547
- Title: Business Manager

2.0 Waste Description

- 2.1 General Waste Description: soil from a subsurface investigation
- 2.2 Process Generating Waste: generated by drilling monitoring wells
- 2.3 Is this waste "Hazardous Waste" as defined by Federal, State or Local Regulations: _____ Yes No
- 2.4 Has this waste ever been "handled" or "disposed of" as a hazardous _____ material _____ waste or disposed of via a "uniform hazardous waste manifest". If yes, explain: NO
- 2.5 State/Local Regulatory Waste Identification Code Number: None
- 2.6 Waste Generation Rate: _____ Tons _____ Cubic Yards Other: 22 drums
 Per: _____ Day _____ Week _____ Year one time _____ Other
- 2.7 Waste will be transported in: _____ Roll-off Boxes _____ Drums (Type/Size): 55 gallon drums, open top
 _____ Dump Trucks Other: _____

3.0 Waste Properties at Room Temperature

- 3.1 Physical State: Solid _____ Semi-Solid _____ Powder _____ Liquid _____ Combination: _____
- 3.2 Odor: None _____ Mild _____ Strong 3.3 pH Range: 7 to 8
- 3.4 Color(s) brown
- 3.5 Percent Solid: >99% _____ % 3.6 Flash Point F°: >200
