1.0 INTRODUCTION

This Sampling and Analysis Plan (SAP) has been prepared by CH2M-JONES, LLC. The plan is designed for Zone C/ Site 34-Building NH-1137; Underground Storage Tank (UST) 1137-2 located at the Charleston Naval Complex (CNC), Charleston, South Carolina.

The South Carolina Department of Health and Environmental Control (SCDHEC) has designated this site as Identification Number: 17754. This SAP provides methods to further evaluate the applicability of intrinsic remediation and monitoring well abandonment as a corrective action for UST 1137-2 in accordance with SCDHEC Corrective Action Guidance, June 1997.

1.1 General Site Description

The CNC is in the city of North Charleston, on the west bank of the Cooper River in Charleston County, South Carolina as shown in Figure 1. This installation consists of two major areas: an undeveloped dredge materials area on the east bank of the Cooper River on Daniel Island in Berkeley County, and a developed area on the west bank of the Cooper River. The developed portion of the base is on the peninsula bounded on the west by the Ashley River and on the east by the Cooper River. The site is located within the developed portion of the base as shown in Figure 2. (Tetra Tech, NUS [TTNUS], Tier Standard Limited Assessment [SLA] for UST 1137, 1999).

The area surrounding CNC is "mature urban", having long been developed with commercial, industrial, and residential land use. Commercial areas are primarily west of CNC; industrial areas are primarily to the north of the base along Shipyard Creek. A site vicinity map, which exhibits adjacent properties and structures, vicinity roads, current utilities, and vicinity surface drainage, is included as Figure 2.

1.2 Objective

This SAP presents the groundwater monitoring plan to assess the down gradient plume migration and intrinsic bioremediation/natural attenuation of petroleum hydrocarbons contamination in order to validate the assumptions and calculations used in the in the SLA completed by TTNUS 1999. Details for the abandonment of monitoring wells at this site are also included in this plan.

2.0 RECEPTOR SURVEY

A receptor survey of the site vicinity was conducted by TTNUS to identify potential receptors for petroleum hydrocarbon contamination. Figure 2 depict the public utilities located within 250 feet of the former UST 1137-2 study area. Specific information concerning the depth of utilities below land surface (bls) is currently unavailable, however, utilities at this site generally are between 2 to 6 feet (ft) bls. The following utility receptors were located:

TABLE 1

UTILITY	ON-SITE OR DISTANCE/ DIRECTION FROM SITE	DEPTH TO UTILITY
Gas	80-ft east, 120-ft north	2-6-ft bls
Electrical	30-ft east	2-6-ft bls
Sewer	150-ft south, 110-ft north	2-6-ft bls
Storm Drain	20-ft east, 20-ft north, 180-ft south, 70-ft west	2-6-ft bls
Water	150-ft south, 150-ft feet west	2-6-ft bls

According to the SLA report completed by TTNUS, a survey of groundwater users within a 7-mile radius of CNC was conducted by the South Carolina Water Resources Commission to ascertain the extent of any shallow groundwater usage. Results of the water use investigation revealed that no drinking water wells, which utilize the shallow aquifer, are located within a 4- mile radius of CNC. Irrigation wells are not identified within 1,000 feet of the site. Numerous monitoring wells are located within 1,000 feet of the site.

There are no city, county or state-zoning ordinances, the property (CNC) is currently owned by the federal government. Information concerning zoning ordinances was obtained from the SOUTHDIV Remedial Project Manager located at 2155 Eagle Drive, North Charleston, South Carolina 29406 (TTNUS, 1999).

2.1 Fate and Transport Modeling

No groundwater concentrations exceeded the SCDHEC Risk Based Screening Levels (RBSLs); therefore, fate and transport modeling is not required.

2.2 Site-Specific Target Levels

According to the SLA, the only potential receptor as a construction worker ingesting or dermally contacting soil while working in a utility trench. Site soil concentrations were compared with RBSLs for ingestion or dermal contact with surficial soil. Surficial soil was not impacted at the site; however, for the construction worker pathway, exposure to subsurface soil is evaluated as surface soil because the worker is expected to have direct contact with the subsurface soil. The calculations for dermal contact and incidental ingestion can be found in the SLA completed by TTNUS.

2.3 Soil Leaching SSTL

Site Specific Target Levels (SSTLs) were calculated for COC concentrations leaching from subsurface soil to groundwater using the SCDHEC Soil Leachability Model and Selected Minimum RBSLs. The input parameters for the leachability model were determined using the figures in the SCDHEC Risk-based Corrective Action Guidelines (January 1998), soil quality and grain size data, and the Selected Minimum RBSLs calculated for the site.

The soil leaching SSTLs calculated COCs is provided in the following table (TTNUS 2000).

TABLE 2

Chemical of Concern	Concentration in SB-01 (mg/kg)	Soil Leaching SSTL (mg/kg)
Benzene	< 0.85	5.72
Toluene	< 0.85	366.0
Ethylbenzene	< 0.85	6,796
Naphthalene	< 0.85	218,156

The soil leaching SSTL for Benzene, Toluene, Ethylbenzene, and Naphthalene is above the maximum concentrations detected (<0.85 mg/kg), indicating the soil benzene, Toluene, Etylbenzene and naphthalene levels will not leach into the groundwater at concentrations above RBSL for a construction worker.

3.0 PROPOSED REMEDIATION TECHNOLOGY

Based on the results of the Tier I and Tier II modeling, an Intrinsic Remediation with a monitoring period of 9 months will be performed for the site. The monitoring program will consist of sampling initially a total of three surrounding wells adjacent to the source point, and only sampling selected wells thereafter. The proposed monitoring program is described in detail in Sections 4.0 and 5.0 of this plan.

4.0 MONITORING WELL INSTALLATION AND ABANDONMENT

4.1 Monitoring Well Installation

Because of the amount of monitoring wells located in and around this site, no monitoring wells will be installed as part of this plan.

4.2 Monitoring Well Abandonment

Three monitoring wells will be abandoned at Building 1137 following the South Carolina Well Standards and Regulations R.61-71. The well abandonment will include grouting wells, removing stick-ups and removing all guard posts.

4.3 Surveying

Because no monitoring wells will be installed at this site, a new survey will not be conducted.

4.4 Equipment Decontamination

All drilling equipment, augers, well casing and screens, and soil and groundwater sampling equipment involved in field sampling activities will be decontaminated according to the Environmental Protection Agencies (EPA) "Environmental Investigations Standard Operating Procedures and Quality Assurance Manual (EISOPQAM).

5.0 PROPOSED GROUNDWATER MONITORING PROGRAM

5.1 Monitoring Frequency and Reporting

The groundwater monitoring program proposed at building 1137 will be performed in accordance with SCDHEC Corrective Action Guidance, June 1997, and consist of the following:

TABLE 3

Sampling date or (Quarter)	Monitoring Wells Sampled	Field Measures	Laboratory Analytical
Forth quarter ¹ 2000	MW-01, MW-001, MW-02, MW-03	T°, pH, DO, Conductivity, Depth to water, Total depth, Turbidity	Naphthalene 8260 BTEX 8260 Nitrate, sulfate, total dissolved iron, methane, alkalinity
First quarter ² 2001	MW-01, MW-001, MW-02, MW-03	T°, pH, DO, Conductivity, Depth to water, Total depth, Turbidity	Naphthalene 8260 BTEX 8260 Nitrate, sulfate, total dissolved iron, methane, alkalinity
second quarter ¹ 2001	MW-01, MW-001, MW-02, MW-03	T°, pH, DO, Conductivity, Depth to water, Total depth, Turbidity	Naphthalene 8260 BTEX 8260 Nitrate, sulfate, total dissolved iron, methane, alkalinity

1. Forth quarter is as October November and December.
2. First quarter is defined as January February and March.
3. second quarter is defined as April May and June

- **Frequency:** Initially all monitoring wells at this site will be sampled. Thereafter, groundwater samples will be collected from wells MW-01, MW-02 and MW-03.
- **Reporting:** Semi-annual groundwater monitoring reports will be submitted to SCDHEC.

Included in the semi-annual reports will be field and analytical information from the certified laboratory indicating well numbers, analytical methods used, date sampled, date analyzed, and method detection limits.

At the end of the second quarter 2001 period, (or as necessary) a performance evaluation will be submitted to SCDHEC providing the effectiveness of the intrinsic biodegradation/natural attenuation occurring and any recommendations for the site if needed. It is possible that the levels are not above the RBSLs in the groundwater, which will result in a different approach to the closure of these tanks.

- **Groundwater Sampling**

Prior to any groundwater sampling, each well will be measured for water levels and total depth and each well will be purged in accordance the EPA EISOPQAM.

5.2 Analytical Parameters

The following constituents will be analyzed for each groundwater sample:

- Naphthalene using method 8260.
- BTEX using method 8260.

The following parameters will be analyzed in order to evaluate the effectiveness of intrinsic remediation:

- Nitrate (NO^{-3})
- Sulfate (SO^{-4})
- Total dissolved iron
- Methane (CH_4)
- Alkalinity

5.3 Field Measurements

The following parameters will be sampled in the field:

- Temperature
- pH
- Dissolved Oxygen
- Depth to water table
- Depth of well
- Turbidity
- Specific Conductance

Field measurements will be recorded in the field book and in field forms provided in Appendix B.

5.4 Groundwater Level Measurements

Groundwater measurements will be taken from all monitoring wells at the site during each sampling event. All water level measurements will be taken on the same day as anticipated sampling.

Measurements will be taken with an electrical water level meter or interface probe if floating product is present using the highest part of the top of the casing as a reference

point for determining depths to water and total depths. Water level measurements will be recorded to the nearest 0.01-foot in the field book.

5.5 Sample Handling

Sample Handling will be conducted in accordance with the following references:

EPA EISOPQAM (EPA May, 1996)

5.6 Sample Packing and Shipping

The following forms will be completed to complete the packing/shipping process:

- Sample labels
- Chain-of-custody labels
- Appropriate labels applied to shipping coolers
- Chain-of-custody forms
- Federal express air bills

5.7 Quality Check

Quality Control (QC) samples will be collected during sampling events. QC samples may include field blanks, field duplicates, and trip blanks. Definitions of each can be found below as described by the EISOPQAM:

- **Field Blank:** a sample collected using organic-free water, which has been run over/through sample collection equipment. These samples are used to determine if contaminants have been introduced by contact of the sample medium with sampling equipment. Equipment field blanks are often associated with collecting rinse blanks of equipment that has been field cleaned.
- **Field Duplicates:** Two or more samples collected from a common source. The purpose of a duplicate sample is to estimate the variability of a given characteristic or contamination associated with a population.
- **Trip Blank:** A sample, which is prepared prior to the sampling event in the actual container and is stored with the investigative samples throughout the sampling event. They are often packaged for shipment

- with the other samples and submitted for analysis. At no time after their preparation are trip blanks to be opened before they reach the laboratory. Trip blanks are used to determine if samples were contaminated during storage and/or transportation back to the laboratory (a measure of sample handling variability resulting in positive bias in contaminant concentration). If samples are to be shipped, trip blanks are to be provided with each shipment but not for each cooler.

5.8 Control Limits

TABLE 4

Analysis	Control Parameter	Control Limit	Corrective Action
Air Monitoring	Check Calibration of OVA daily	Calibrate to manufactures specifications	Recalibrate. If unable to calibrate, replace.
pH of water	Continuing calibration check of pH 7.0 buffer	pH= 7.0	Recalibrate. If unable to calibrate, replace electrode.
Specific Conductance of water	Continuing calibration check of standard solution	> 1% of standard	Recalibrate.

5.9 Record keeping

In addition to records kept in logbooks, forms will be kept on log sheets for soil and groundwater. See Appendix B.

5.10 Site Management and Base Support

Throughout the investigation activities, work on the CNC will be coordinated through SOUTHDIV and SCDHEC.

The primary contacts for each are as follows:

1. SOUTHDIV point of contact
Gabe Magwood
Southern Division Engineering Command
2155 Eagle Drive
North Charleston, SC 29406

CALCULATIONS:

Equation Set I - Determine soil pore water concentration resulting from physical partitioning (Cw).

Step 1 - Calculate the total organic carbon content (fcs) of the soil.

$$fcs = (foc + TPH/1.724) * 1E-6 = \underline{0.0169} \text{ decimal \%}$$

Step 2 - Calculate the concentration of COC in soil pore water (Cw) directly in contact with the contaminate soil.

$$Cw = Cs * ((Wr * 1g/cc + Bd) / ((Bd * Koc * fcs) + Wr + ((\theta - Wr) * H))) = \underline{0.6076} \text{ mg/l}$$

Equation Set II - Determine the velocity of the soil pore water (Vw).

Step 1 - Calculate the air filled porosity (f) in decimal percent.

$$f = \theta - Wr = \underline{0.37} \text{ decimal \%}$$

Step 2 - Determine the time for water to percolate through the vadose zone soil (from depth of worst case soil sample to the water table at site).

$$t = (l/Kf) * (L - ((Hw - Hf) * (\ln((Hw + L - Hf) / (Hw - Hf)))))) = \underline{424,860} \text{ seconds}$$

Step 3 - Determine the velocity of the water (Vw) in feet per year.

$$Vw = (L/30.48cm/ft) / (t/31,500,000sec/year) = \underline{259} \text{ ft/year}$$

Equation Set III - Determine the organic retardation effect (Vc) of the contaminant.

Step 1 - Calculate the soil/water distribution coefficient (Kd) (ml/g) for uncontaminated soil.

$$Kd = Koc * foc * 1E-6 = \underline{1.3446} \text{ ml/g}$$

Step 2 - Calculate the retardation effect of natural soil organic matter on COC migration.

$$Vc = Vw / (1 + ((Bd * Kd) / \theta)) = \underline{45} \text{ ft/year}$$

Equation Set IV - Determine biodegradation rates and provide final COC concentration (Cf) at depth of concern.

Step 1 - Calculate the time (Tc) in days required for the COC to reach groundwater.

$$Tc = 365 \text{ day/yr} * ((L/30.48cm/ft) / Vc) = \underline{28.31} \text{ days}$$

Step 2 - Calculate estimated concentration of COC in the soil pore water (Cp) necessary to protect groundwater.

$$Cp = 10^{(\log(Crsbl) + ((Tc/2.3) * (0.693/t1/2)))} = \underline{0.5112} \text{ mg/l}$$

COC concentration in soil pore water (Cw) is less than concentration necessary to protect groundwater (Cp). Not necessary to calculate SSTL

Equation Set V - Calculate the Site Specific Target Level (SSTL) for the COC in soil.

$$\begin{array}{l} \text{Csstl for BENZENE} \\ \text{in soil} \end{array} = C_p \cdot \text{DAF} \cdot \left(\frac{Bd \cdot K_{oc} \cdot f_{cs} + W_r + (F \cdot H)}{W_r \cdot 1g/cc + Bd} \right) = \underline{\underline{5.720 \text{ mg/kg}}}$$

	0.82	
COC Chemical of Concern	0.85	
Bd Soil Bulk Density (1)		TOLUENE
Crsbl Risk Based Screening Level		g/cm3 1.59
Cs Concentration of COC in soil		mg/L 5.19
DAF Dilution/Attenuation Factor (2)		mg/kg 0.85
foc Organic Carbon Content in Soil (3)		unitless 8
H' Henry's Law Constant (4)		mg/kg 16600
Hf Wetting front suction head (always negative) (5)		unitless 0.30
Hw Average Annual Recharge (3)		cm -28
Kf Soil Hydraulic Conductivity (6)		cm 25
Koc Soil/Water Partitioning Coefficient (2)		cm/s 0.0000
L Depth between soil sample with greatest COC concentration to groundwater.		m/g 133
Ø Porosity (7)		cm 107
t1/2 Biodegradation "half life" (2)		unitless 0.45
TPH Total Petroleum Hydrocarbons, EPA Method 3550		days 22
Wr Residual Water Content (8)		mg/kg 464
		volume fraction 0.08

CALCULATIONS:

Equation Set I - Determine soil pore water concentration resulting from physical partitioning (Cw).

Step 1 - Calculate the total organic carbon content (fcs) of the soil.

$$fcs = (foc + TPH/1.724) * 1E-6 = \underline{0.0169} \text{ decimal \%}$$

Step 2 - Calculate the concentration of COC in soil pore water (Cw) directly in contact with the contaminate soil.

$$Cw = Cs * ((Wr * 1g/cc + Bd) / ((Bd * Koc * fcs) + Wr + ((\phi - Wr) * H))) = \underline{0} \text{ mg/l}$$

Equation Set II - Determine the velocity of the soil pore water (Vw)

Step 1 - Calculate the air filled porosity (f) in decimal percent.

$$f = \phi - Wr = \underline{0.37} \text{ decimal \%}$$

Step 2 - Determine the time for water to percolate through the vadose zone soil (from depth of worst case soil sample to the water table at site).

$$t = (L/Kf) * (L - (Hw - Hf)) * (\ln(Hw + ((L - Hf)/(Hw - Hf)))) = \underline{424,860} \text{ seconds}$$

Step 3 - Determine the velocity of the water (Vw) in feet per year.

$$Vw = (L/30.48cm/ft) / (t/31,500,000sec/year) = \underline{259} \text{ ft/year}$$

Equation Set III - Determine the organic retardation effect (Vc) of the contaminant.

Step 1 - Calculate the soil/water distribution coefficient (Kd) (ml/g) for uncontaminated soil.

$$Kd = Koc * foc * 1E-6 = \underline{2.2078} \text{ ml/g}$$

Step 2 - Calculate the retardation effect of natural soil organic matter on COC migration.

$$Vc = Vw * (1 + ((Bd * Kd) / \phi)) = \underline{29} \text{ ft/year}$$

Equation Set IV - Determine biodegradation rates and provide final COC concentration (Cf) at depth of concern.

Step 1 - Calculate the time (Tc) in days required for the COC to reach groundwater.

$$T_c = 365 \text{ day/yr} \cdot ((L/30.48 \text{ cm/ft})/V_c) = \underline{43.33} \text{ days}$$

Step 2 - Calculate estimated concentration of COC in the soil pore water (Cp) necessary to protect groundwater.

$$C_p = 10^{(\log(C_{rsbl}) + (T_c/2.3) \cdot (0.693/t_{1/2}))} = \underline{20.3133} \text{ mg/l}$$

COC concentration in soil pore water (Cp) is greater than Crsbl, therefore the SSTL must be calculated.

Equation Set V - Calculate the Site Specific Target Level (SSTL) for the COC in soil.

Csstl for	TOLUENE	= Cp * DAF * (((Bd * Koc * fcs) + Wr + (F * H)) / (Wr * 1g/cc + Bd)) =	<u>365.755388</u> mg/kg
	in soil

SUMMARY OF SLUG TEST

SOUTH CAROLINA
 Department of Health and Environmental Control (DHEC)

Site Data

SITE ID #: 17754 **COUNTY:** Charleston
FACILITY NAME: Charleston Naval Complex Site 34, UST 1137-2 at Bldg 1137

Slug Data

See Appendix: **Table:** **Figure:** X for a list of all data measurements.
 (water level logs, etc.) (Complete as appropriate.)

Water Level Recovery Data was measured by ND
 (Hermit Data Logger, Manually with Water Level Indicator, etc.) (List Method).

Complete the following table for each well tested.

COMPLETE A SECOND SHEET IF MORE THAN FOUR WELLS ARE TESTED

Slug Test Conducted in well(s) number	047006	510-01	523-01	GDC-01
<u>Initial Rise</u> /Drawdown in well (feet)	1.6	1.19	2.77	1.94
Radius of Well Casing (feet)	0.0833	0.083	0.083	0.083
Effective Radius of Well (feet)	0.35	0.35	0.35	0.35
Static Saturated Aquifer Thickness (feet)	7.4	5.9	7.8	3.4
Length of Well Screen (feet)	7.4	5.9	7.8	3.4
Static Height of Water Column in Well (ft)	7.4	5.9	7.8	3.4

Calculations

See Appendix: **Table:** **Figure:** X for calculations. (Complete as appropriate.)

The method for aquifer calculations was: Bouwer-Rice (i.e. Bouwer-Rice, Cooper, etc.)

Calculated values by well were as follows:

Slug Test Conducted in well(s) number	047006	510-01	523-01	GDC-01
Hydraulic Conductivity (ft/min)	0.002016	0.00612	0.002004	0.0003653

Thickness of the aquifer used to calculate hydraulic conductivity was feet.
 The aquifer is confined semi-confined Water table (Check as appropriate)
 The estimated seepage velocity is feet per year based on
 a hydraulic conductivity of , a hydraulic gradient of , and
 a porosity of per cent for soil (list type i.e., silty sand, clay, etc).

SUMMARY OF SLUG TEST

SOUTH CAROLINA Department of Health and Environmental Control (DHEC)

Site Data

SITE ID #: 17754 COUNTY: Charleston
 FACILITY NAME: Charleston Naval Complex Site 34, UST 1137-2 at Bldg 1137

Slug Data

See Appendix: Table: Figure: for a list of all data measurements.
 (water level logs, etc.) (Complete as appropriate.)

Water Level Recovery Data was measured by NA
 (Hermit Data Logger, Manually with Water Level Indicator, etc.) (List Method).

Complete the following table for each well tested.

COMPLETE A SECOND SHEET IF MORE THAN FOUR WELLS ARE TESTED

Slug Test Conducted in well(s) number	044001	044006	047001	047003
Initial Rise/ Drawdown in well (feet)	1.414	1.684	3.263	4.369
Radius of Well Casing (feet)	0.0833	0.0833	0.0833	0.0833
Effective Radius of Well (feet)	0.333	0.333	0.333	0.35
Static Saturated Aquifer Thickness (feet)	10.5	12.07	8.7	10.3
Length of Well Screen (feet)	10	10	8.7	10
Static Height of Water Column in Well (ft)	10.5	12.07	8.7	10.3

Calculations

See Appendix: Table: Figure: for calculations. (Complete as appropriate.)

The method for aquifer calculations was: Bouwer-Rice (i.e. Bouwer-Rice, Cooper, etc.)

Calculated values by well were as follows:

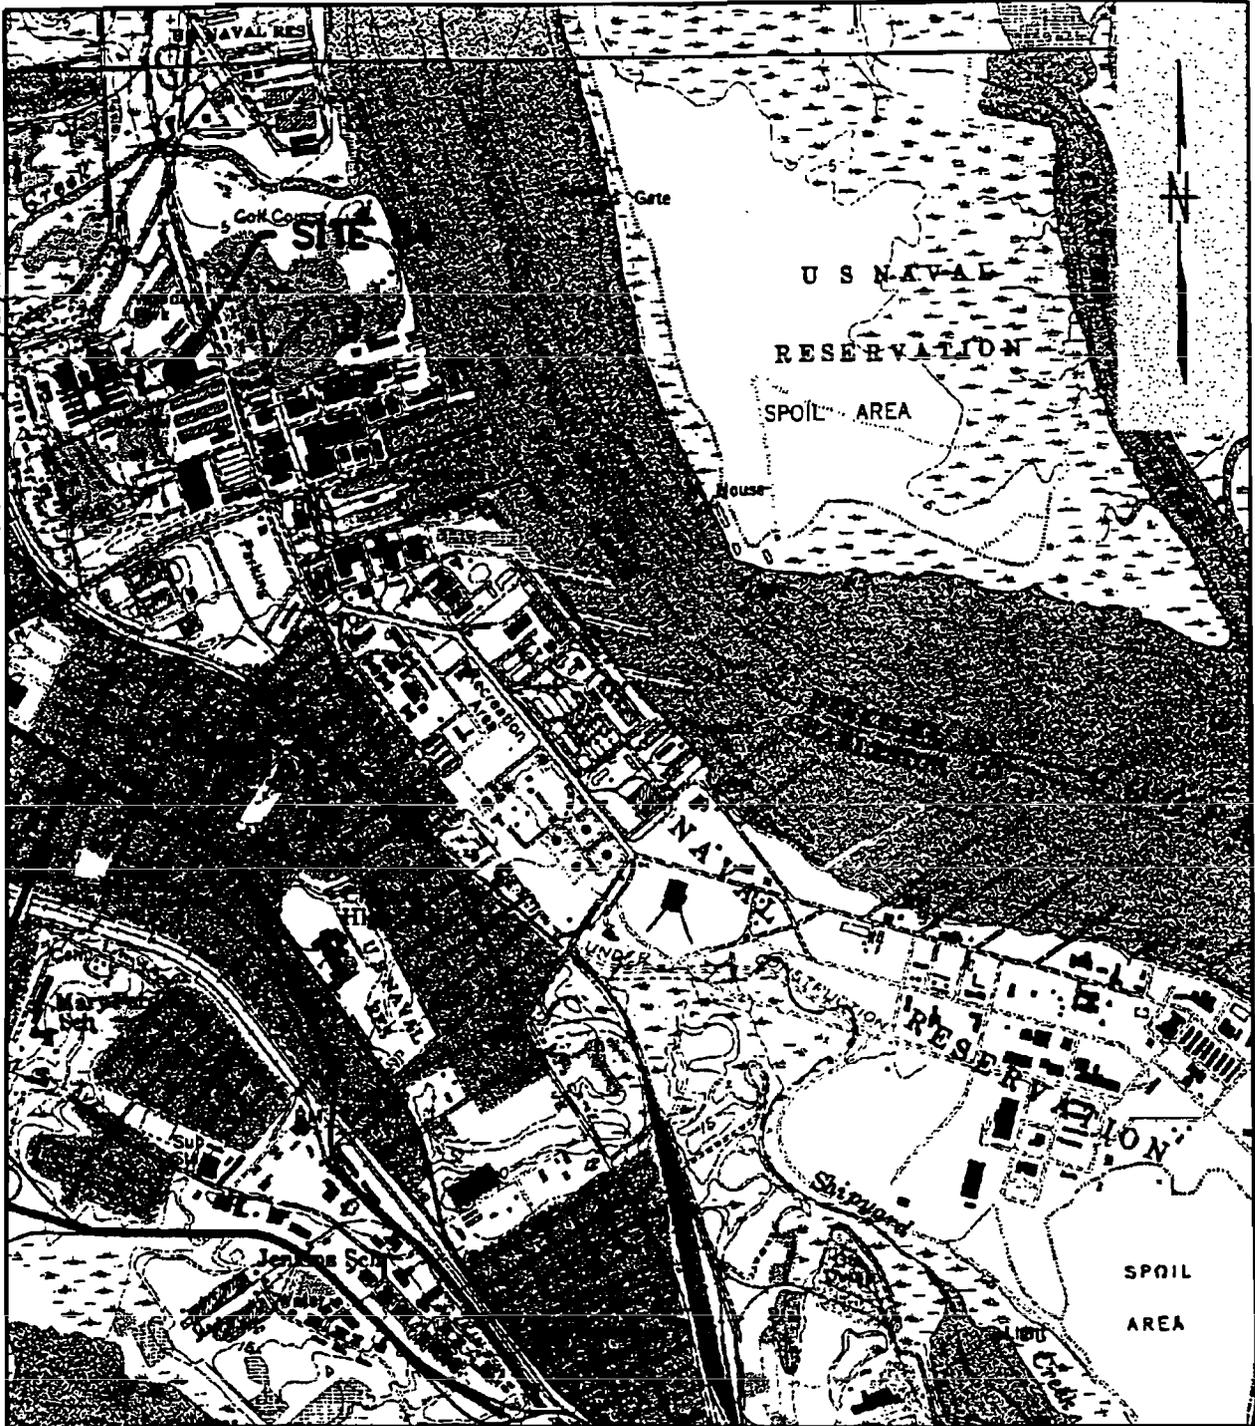

Slug Test Conducted in well(s) number	044001	044006	047001	047003
Hydraulic Conductivity (ft/min)	0.001908	0.0008453	0.009843	0.003599

Thickness of the aquifer used to calculate hydraulic conductivity was 10.05 feet.
 The aquifer is confined semi-confined X Water table (Check as appropriate.)

The estimated seepage velocity is 23 feet per year based on
 a hydraulic conductivity of 4.38 ft/d, a hydraulic gradient of 0.005, and
 a porosity of 34.5 per cent for sand Soil (list type i.e., silty sand, clay, etc).
