- Recycled steel disposal receipt
- Manifest for creosote material

TANK CLOSURE

1.0 SITE DESCRIPTION

The Chicora Tank Farm is located in North Charleston approximately ½ mile west of the Charleston Naval Complex. Tanks K, L, M, N, & O were on this site of approximately 24 acres. Tanks K, L, M, & N held 2.1 million gallons of diesel fuel each and tank O held 1.1 million gallons of sludge and water. Each tank had an attached adjacent pump room containing valves, piping and pumps. The tanks were interconnected by underground piping of various sizes. The piping connected the pump rooms to the transfer pipeline and the sludge pipeline through the underground distribution header manifold piping. These transfer pipelines connect the Chicora Tank Farm tank to the fuel oil distribution system at the Charleston Naval Complex. The 18 inch south transfer pipeline runs under Redwood Street from the underground distribution header manifold to south valve pit. The 18 inch north transfer pipeline runs under Token Street from the underground distribution header manifold to the north valve pit. The 12 inch sludge oil transfer pipeline runs under Redwood Street. Chicora Tank Farm is bounded by Carner Avenue on the west, Chicora Avenue on the east, Clements Ferry Road to the south, and a marshland area to the north. The Norman C. Toole Magnet School abuts the property to the northwest.

2.0 TANK, PUMP ROOM, AND PIPING DESCRIPTION

Chicora Tank Farm Tanks

The tanks were constructed in the mid 1940's as cut-and-cover underground storage tanks. Tanks K, L, M, & N were designed to contain Bunker C and were later switched to contain diesel fuel. The tanks K, L, M, and N contained residual diesel fuel which was removed by the Air National Guard and put into tank O. Tank O contained approximately 400,000 gallons of oil, sludge and oily water requiring processing, recycling and disposal. The tanks were approximately 138 feet in diameter and 20 foot inside height with 52 concrete roof supporting columns. Tank O was 102.5 feet in diameter, 20 foot inside height and had 38 concrete roof supporting columns. These tanks had four to five feet of soil covering over the top.

Chicora Tank Farm Pump Rooms

The tank pump rooms were 24 feet x 24 feet x 25 feet high and under seven feet of soil. There were three piping penetrations into the tanks from the pump rooms: a six inch sludge line, a 16 inch fuel oil fill line, and a 16 inch suction line. There were two penetrations into the pump rooms from the underground distribution header manifold piping: one 6 inch sludge and one 16 inch fuel oil pipeline. Each pump room housed a 1,000 GPM fuel pump, 50 GPM sludge pump, 150 horse power motor, connecting piping and valves, and steel pump foundations and supports.

18 inch Transfer Pipeline

There are two 18 inch transfer pipelines, the north and south transfer pipelines. The 18 inch south transfer pipeline at Chicora Tank Farm was excavated along the underground distribution header manifold and isolated from the Charleston Naval Complex by removing valve F-13. (See piping schematic photo on page 18.) Approximately 200 feet of the 18 inch south transfer pipeline at the Charleston Naval Complex was previously removed. The piping was removed and a recovery system was installed in Area of Concern - 626. The piping end that remained is 10' below grade and is up-piped with an 18 inch PVC elbow and standpipe to above ground level. The up-piping was used to pump out the south transfer pipeline.

The 18 inch north transfer pipeline at Chicora Tank Farm was excavated along the underground distribution header manifold and isolated from the Charleston Naval Complex by removing valve F-17. (See piping schematic photo page 18.) The Charleston Naval Complex end of the 18 inch north transfer pipeline runs into the valve pit north of Building 98 Booster Pump House. The end of the transfer pipeline was isolated by removing valve F-51. (See piping schematic photo page 18.)

12 inch Sludge Oil Transfer Pipeline

The ends of the 12 inch sludge oil transfer pipeline at Chicora Tank Farm were excavated and isolated by cutting the pipeline and welding on two flanges with blanks. The 12 inch sludge oil transfer pipeline at Charleston Naval Complex was isolated previously by a contractor who removed two valves in the south valve pit. Therefore no pipeline cutting or welding of flanges was required. The contractor removed the two valves to clean other pipelines at Charleston Naval Complex.

Chicora Tank Farm Piping

The underground distribution header manifold piping is located east of tank sites K, L, M, and N and runs north to south along the length of the property. The header consists of two 18 inch fuel oil pipes and a 12 inch sludge oil pipe. This header is buried approximately 3-8 feet underground. The 12 inch sludge oil header piping was connected to each pump room via 6 inch underground pipelines. The 18 inch underground distribution header manifold piping had 16 inch underground pipelines connecting the underground distribution header manifold to each pump room. All piping at Chicora Tank Farm except 16 inch pipelines and pump room piping is covered with bitumastic enamel and tarred asbestos. The 16 inch pipelines are painted with red lead paint and asphalt. There was also a 3 inch pipeline connected to the 18 inch underground distribution header manifold piping from the UST at the steam building.

There were three piping penetrations into the tanks from the pump rooms: a six inch sludge line, a 16 inch fuel oil fill line, and a 16 inch suction line. There are two penetrations into the pump room from the underground distribution header manifold piping: one 6 inch and one 16 inch pipeline. Each pump room housed a 1,000 GPM fuel pump, 50 GPM sludge pump, 150 horse power motor, and 6, 12, and 16 inch schedule 80 steel welded seamless pipes connecting the pumps, valves, etc.

3.0 SCOPE OF WORK

The Environmental Detachment Charleston was tasked to pig the fuel and sludge pipelines at Chicora Tank Farm and between Chicora Tank Farm and the Charleston Naval Complex. The Environmental Detachment Charleston manned stations throughout the neighborhood during the pigging operations of the transfer pipelines to monitor for leaks. After pipeline pigging the ends were to be filled with an inert material such as expandable foam and then capped for abandonment in place. The tanks and pump rooms were to be cleaned of all petroleum products. Each pump room was opened, stripped of all pumps, motors, piping, and other equipment. The inside of the tanks and pump rooms were cleaned by high pressure washing. After cleaning, the pump rooms and tanks were inspected for cleanliness and damage.

4.0 SUMMARY OF WORK

Pipeline pigged and foamed

Nine excavations along the underground distribution header manifold pipeline at Chicora Tank Farm were required to open and isolate the tanks, manifold and transfer pipelines. Six areas were excavated along the underground distribution header manifold, one at each piping connection to the header. The other three excavations were dug at the north and south transfer pipeline connections and at the south end of the 12 inch sludge header.

The 16 inch fuel oil pipelines connected the pump rooms to the 18 inch manifold header. The pump rooms were also connected via a 6 inch sludge line to the 12 inch sludge header. The six and 16 inch lines from pump rooms O and P were left in place. The six and 16 inch pipelines from pump rooms K, L, M, and N were cleaned and removed.

The 12 inch sludge piping was continuous sections of piping welded together. There were no isolation valves or flanges in the 12 inch sludge line at Chicora Tank Farm. A three foot section of piping was cut out and removed. Then flanges were welded in place and modified blanks were installed. The blanks welded onto the north and south end of the 12 inch sludge header were cut off. Then flanges were welded to the ends and modified blanks were installed. The north and south transfer pipeline connections at Charleston Naval Complex were isolated,

pigged and filled with foam in the transfer line pipe vaults. No excavations of transfer piping was required for this work at the Charleston Naval Complex. These vaults were the north valve pit, north of Building 98, and the south valve pit, beside Bainbridge Avenue. The ends of the pipelines were filled with an inert expandable foam for a minimum of 200 feet. The following are the lengths and sizes of pipelines emptied, pigged cleaned and foamed:

- a) 18 inch underground distribution header manifold at Chicora Tank Farm - The piping was isolated into two sections by removing valves at the north and south end. Three thousand and two hundred feet of pipeline was pigged clean. Pigs were launched from the north end and received at the south end. Approximately 800 feet of piping was foamed. Foam was applied into four modified blanks of the header with two at each end.
- b) 18 inch north transfer line - Forty-one hundred feet of the piping was pigged clean. Approximately 400 feet was foamed. Two hundred feet at each end.
- c) 18 inch south transfer line - Twenty-nine hundred feet was pigged clean and 550 feet was inerted with foam. The transfer pipeline from Chicora Tank Farm to the south valve pit at Charleston Naval Complex is about 2,750 feet. Foam was applied to 200 feet in each end. The 18 inch transfer pipeline from the south valve pit to the up-pipe was 150 feet long and foamed the total length.
- d) 16 inch piping from the pump rooms P and O to the underground distribution header manifold at Chicora Tank Farm - The distance from each pump room to the manifold header was approximately 300 feet. The 16 inch pipelines were cleaned and foamed from end to end.
- e) 12 inch sludge header at Chicora Tank Farm - Sixteen hundred feet was cleaned by pigging and foam was to approximately 400 feet.
- f) 12 inch transfer sludge piping - The 12 inch pipeline connected Chicora Tank Farm to the Charleston Naval Complex and is approximately 2,750 feet long. The pipeline was cleaned by pigging and about 200 feet at each end was foamed.

- g) 6 inch piping from the pump rooms P and O to the header at Chicora Tank Farm - The distance from each pump room to the sludge header was approximately 300 feet. The six inch pipelines were cleaned and foamed from end to end.

Oil, water and sludge from Tank O

One hundred nine thousand seven hundred ten gallons of water were recovered from the oil water separator at Chicora Tank Farm and discharged into the sanitary sewer in accordance with North Charleston Sewer District guidelines. All the tanks were previously emptied into tank O by the Air National Guard. This resulted in approximately 440,000 gallons of oil, water and sludge in tank O. One hundred six thousand five hundred fifty one gallons of non hazardous used oil were pumped from the tank and recycled by a contractor. The remaining sludge in the tank, approximately 230,000 gallons, was removed for disposal by a contractor. See Appendix A for manifests.

Oil and water from cleaning tanks, pump rooms and pipelines

Fifty one thousand three hundred two gallons of oily water were processed through the separator facility at Building 1824. The water was separated and 28,637 gallons were discharged into the sanitary sewer. Twenty two thousand six hundred sixty five gallons of non hazardous used oil were pumped from the FRAC tank at Building 1824 and recycled by a contractor. (See Appendix A for manifests.)

Recycled steel

Approximately 106 tons of steel were removed and recycled by a recycling contractor. This included pipelines after removal and cleaning. Other examples of recycled steel were pumps, motors, valves, conduit, and foundations that were cleaned and removed from the pump rooms and vaults. (See Appendix A for disposal receipts.)

Creosote material

During the work at Chicora Tank Farm creosote telephone poles, fence post, and pipeline bunker supports were removed for disposal. Six and forty-three hundredth tons of this creosote material was disposed of at Oakridge landfill. (See Appendix A for manifests)

5.0 PHOTOGRAPHS*5.1 Stripping Pump Rooms*

Photo 1: The pump rooms were opened by removing the concrete slats

Photo 2: Pumps, piping, motors, and all the equipment was removed as scrap

Photo 3: The 16 inch piping was removed from the pump room for disposal

Photo 4: The components were removed from the pump room

Photo 5: The portable tanks transported oily water to the disposal facility

Photo 6: High pressure hot water washer and electric generator were used for tank cleaning

Photo 7: The venturi ventilation unit exhausted a tank during cleaning

Photo 8: The oil water separator system was set up in a berm area. The FRAC tanks held the oily water to be processed through the oil water separator

Photo 9: The contractor's vacuum truck pumped sludge from tank O for disposal

Photo 10: The tank truck was used for transporting sludge from tank O for disposal

5.2 Cleaning Pipelines

Photo 1: The 18 inch north transfer pipeline in the north valve pit was drained

Photo 2: Valve F-20 was removed to isolate the 18 inch header pipeline

Photo 3: South valve pit at the Charleston Naval Complex

Photo 4: The 18 inch up-piping was ventilated during the pipeline flange welding operations in the south valve pit

Photo 5: A 3 foot section of 18 inch piping was cut out and the flanges were welded in place

Photo 6: The 18 inch north transfer line was pumped from the piping pit

Photo 7: Piping schematic for Chicora Tank Farm

Photo 8: Piping schematic for Charleston Naval Complex showing the 18 inch transfer pipelines

Photo 9: Blind flanges were modified to support the pigging and foaming operations

Photo 10: The 12 inch sludge header pipeline was pigged clean

Photo 11: The oversized foam pig is ready to be removed from the 18 inch upper header piping

Photo 12: The arrow and circle on Redwood Street denotes the location for the 18 inch piping air leak during pigging operations

Photo 13: The oversized foam pig was installed into the launching end of the 18 inch south transfer piping

Photo 14: The 18 inch south transfer pipeline was pigged. The pig was pushed through the pipeline with compressed air

Photo 15: Valve F-18 was removed in order to insert the foam pig into the upper header

Photo 16: The pig was stuffed into the 18 inch header piping

Photo 17: Once the pig was aligned, the flange was installed and the compressed air was applied behind the pig

Photo 18: Inside view of the 18 inch upper header clean pipeline

5.3 Foaming pipelines

Photo 1: The contractor mixed the solutions in preparation to foam the pipeline

Photo 2: The north end of the 18 inch header piping was foamed

Photo 3: The north transfer pipeline at Chicora Tank Farm was prepared for foaming

Photo 4: The six and 16 inch pipeline runs from near tank O to the header were foamed

Photo 5: The back pressure was bled off after foaming the 16 inch pipeline

Photo 6: The south end of the 18 inch upper header piping was foamed

Photo 7: The 18 inch piping back to the up-piping was foamed

Photo 8: The 18 inch south transfer piping at the Charleston Naval Complex was foamed from inside of the south valve pit

Photo 9: The south end of the 12 inch sludge line at Chicora Tank Farm was bled off

Photo 10: After foaming the piping and valve excavations were backfilled at Chicora Tank Farm

Photo 11: The up-piping at Charleston Naval Complex was cut off just below grade and covered with backfill

APPENDIX A

Disposal Manifests

**Manifests for oil, water
and sludge from Tank O**

DEPARTMENT OF THE NAVY
SUPERVISOR OF SHIPBUILDING, CONVERSION AND REPAIR, USN
PORTSMOUTH, VIRGINIA, ENVIRONMENTAL DETACHMENT CHARLESTON
1888 NORTH HOBSON AVENUE, BUILDING 30
NORTH CHARLESTON, SOUTH CAROLINA 29405-2106

IN REPLY REFER TO:

Ser. 955

MEMORANDUM

From: Director, Supervisor of Shipbuilding, Conversion and Repair, USN Portsmouth
Va., Environmental Detachment, Charleston, SC (SPORTENVDETCNASN)

To: North Charleston Sewer District
Attn: Kelly Singer

Subj: Chicora Tank Farm Project

1. The Environmental Detachment of Charleston has completed the waste water disposal project at Chicora Tank Farm. The Project completed on November 11, 1998. The total calculated volume of waste water discharged to the sewer was 109,710 gallons. Enclosed with this notification of completion are copies of the flow logs and the weekly sample results.

2. If there are any comments or questions concerning this notification please call Copes Wannamaker at 743-6777 extension 212.

Respectively,

E. R. Dearhart
