## FOREWORD

In order to meet its mission objectives, the U.S. Navy performs a variety of operations, some requiring the use, handling, storage, or disposal of hazardous materials. Through accidental spills and leaks and conventional methods of past disposal, hazardous materials may have entered the environment in ways unacceptable by today's standards. With growing knowledge of the long-term effects of hazardous materials on the environment, the Department of Defense initiated various programs to investigate and remediate conditions related to suspected past releases of hazardous materials at their facilities.

One of these programs is the Installation Restoration (IR) program. This program complies with the Comprehensive Environmental Response, Compensation, and Liability Act, as amended by the Superfund Amendments and Reauthorization Act. The acts, passed by Congress in 1980 and 1986, respectively, established the means to assess and clean up hazardous waste sites for both private-sector and Federal facilities. These acts are the basis for what is commonly known as the Superfund program.

Originally, the Navy's part of this program was called the Navy Assessment and Control of Installation Pollutants (NACIP) program. Early reports reflect the NACIP process and terminology. The Navy eventually adapted the program structure and terminology of the standard IR program.

The IR program is conducted in several stages.

- The preliminary assessment (PA) identifies potential sites through record searches and interviews.
- A site inspection (SI) then confirms which areas contain contamination, constituting actual "sites." (Together, the PA and SI steps were called the initial assessment study under the Navy's old NACIP program.)

- Next, the remedial investigation and the feasibility study (RI/FS) together determine the type and extent of contamination, establish criteria for cleanup, and identify and evaluate any necessary remedial action alternatives and their costs. As part of the RI/FS, a risk assessment identifies potential effects on human health or the environment in order to help evaluate remedial action alternatives.
- The selected alternative is planned and conducted in the remedial design and remedial action stages. Monitoring then ensures the effectiveness of the effort.

A second program to address present hazardous material management is the Resource Conservation and Recovery Act (RCRA) Corrective Action program. This program is designed to identify and clean up releases of hazardous substances at RCRA-permitted facilities. RCRA is the law that ensures that solid and hazardous wastes are managed in an environmentally sound manner. The law applies primarily to facilities that generate or handle hazardous waste.

This program is conducted in three stages.

- The RCRA facility assessment identifies solid waste management units, evaluates the potential for releases of contaminants, and determines the need for future investigations.
- The RCRA facility investigation then determines the nature, extent, and fate of contaminant releases.
- The corrective measures study identifies and recommends measures to correct the release.

The hazardous waste investigations at Naval Station Mayport are presently being conducted under the RCRA Corrective Action program. Earlier preliminary investigations had been conducted at Naval Station Mayport under the Navy's old NACIP program and IR program following Superfund guidelines. In 1988, in coordination with the U.S. Environmental Protection Agency (USEPA) and the Florida Department of Environmental Protection (FDEP), the hazardous waste investigations were formalized under the RCRA program.

Naval Station Mayport is conducting the cleanup at their facility by working through the Southern Division, Naval Facilities Engineering Command. The USEPA and the FDEP oversee the Navy environmental program. All aspects of the program are conducted in compliance with State and Federal regulations, as ensured by the participation of these regulatory agencies.

Questions regarding the RCRA program at Naval Station Mayport should be addressed to Mr. David Driggers, Code 1852, at (803) 743-0501.

## EXECUTIVE SUMMARY

As part of the Navy Environmental Leadership Program (NELP), a technology demonstration for bioremediation of petroleum-contaminated soil and concrete surfaces was performed at Solid Waste Management Unit (SWMU) 14, the Mercury/Oil Waste Spill Area.

Through NELP, the Navy proposed to demonstrate *in situ* bioremediation of petroleum-related constituents from concrete surfaces and soil at and immediately adjacent to the SWMU 14 detention pond. The technology demonstration was conducted by RHS Technical Services, Inc. (RHS). ABB Environmental Services, Inc. (ABB-ES), observed the technology demonstration and collected baseline and performance evaluation samples to assess the effectiveness of the technology demonstration.

ABB-ES sampling events consisted of collecting surface water and surface and subsurface soil samples to evaluate the NELP technology demonstration. Baseline and performance evaluation samples were collected to assess whether or not the technologies achieved target treatment levels. The target treatment levels for the bioremediation of the concrete surface were evaluated by collecting surface water samples and comparing the analytical results to the State of Florida surface water quality criteria under Florida Administrative Code (FAC) 62-302. Target treatment levels for the bioremediation of soil were evaluated by collecting soil samples and comparing the analytical results (1) to criteria established under FAC 62-775 for thermal desorption of petroleum-contaminated soil and (2) to human health-based criteria to be established under FAC 62-770 for remediation of petroleum-contaminated sites.

The detention pond looked cleaner at the end of the technology demonstration. However, this may be more attributed to RHS using a 4,000-pounds-per-square-inch pressure washer to rinse the microbial solution from the concrete rather than the bioremediation.

Analytical results of surface water samples collected by ABB-ES suggest that the bioremediation was not effective in meeting the target cleanup levels. The analytical results from the baseline and performance evaluation surface water samples suggest that there was minimal difference prior to and after the technology demonstration at the detention pond. Concentrations of oil and grease detected in both the baseline and performance evaluation surface water samples were not in compliance with FAC 62-302.

Evaluation of the analytical results of performance evaluation soil samples suggests that the bioremediation of the petroleum hydrocarbons was successful in achieving the human health-based total recoverable petroleum hydrocarbons (TRPH) soil cleanup target levels but not the criteria for TRPH under State of Florida thermal treatment of petroleum-contaminated soil.

## 1.0 INTRODUCTION

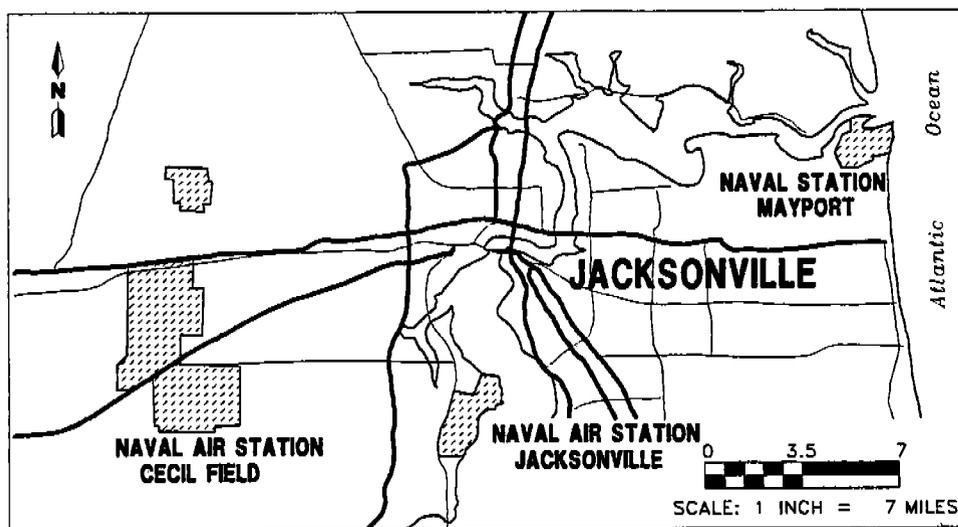

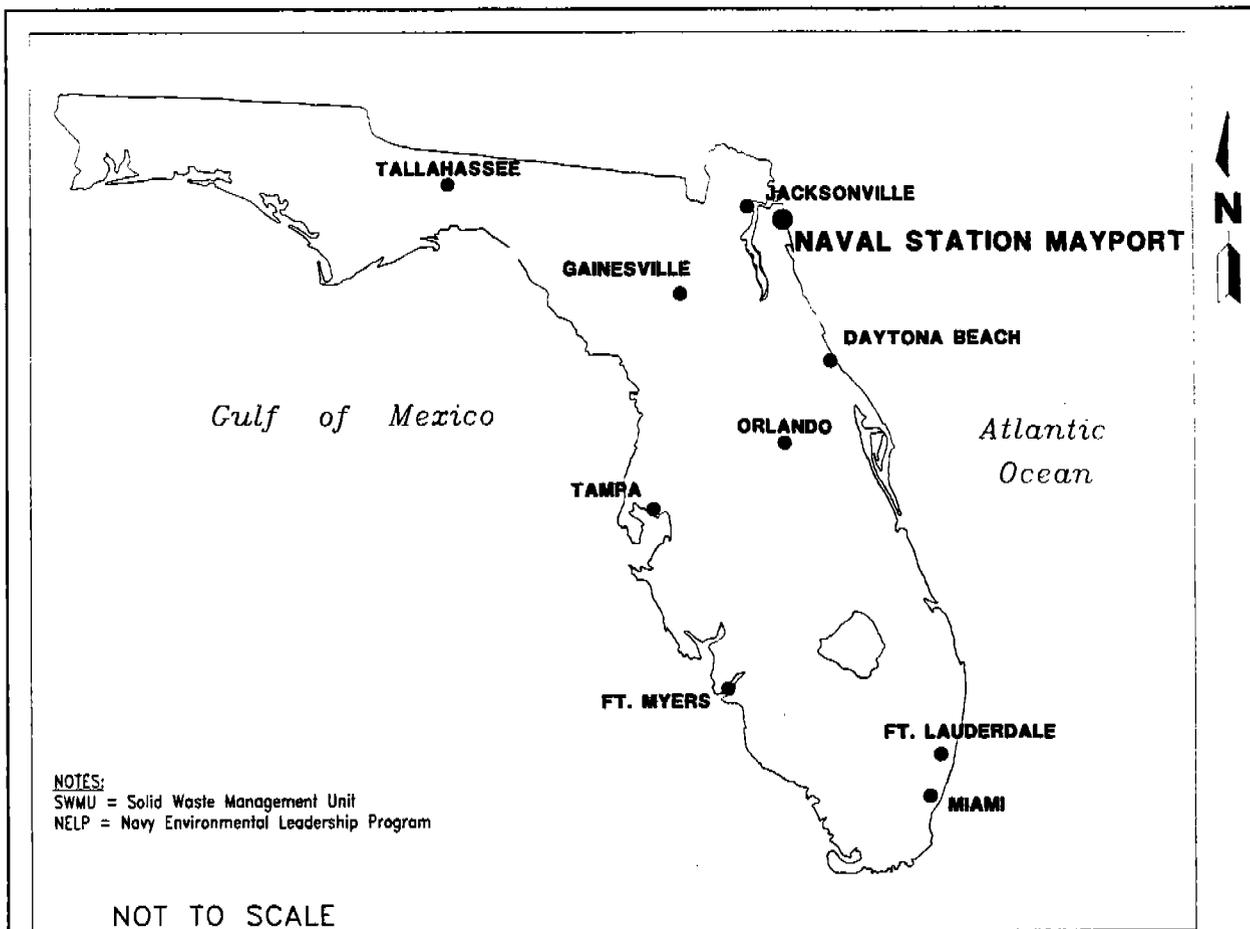

A technology demonstration was conducted under the Navy Environmental Leadership Program (NELP) for cleaning concrete containing petroleum residues and remediating soil containing petroleum-related constituents at Solid Waste Management Unit (SWMU) 14, Naval Station (NAVSTA) Mayport, Florida (Figures 1-1 and 1-2). NELP was created to promote the use of new and innovative technologies in the areas of compliance, conservation, cleanup, and pollution prevention within the Navy. NAVSTA Mayport was selected to participate in NELP because activities at this station are representative of similar activities at other naval stations.

ABB Environmental Services, Inc. (ABB-ES), was contracted by the Department of the Navy, Southern Division, Naval Facilities Engineering Command to provide technical oversight during the technology demonstration performed by others at SWMU 14. This technology evaluation report was prepared to describe and evaluate the effectiveness of activities carried out during the technology demonstration.

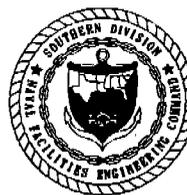

1.1 SITE DESCRIPTION AND BACKGROUND, SWMU 14. SWMU 14 includes a large concrete pad, adjacent to Buildings 1456 and 1388, that is used for firefighting training activities. The firefighting training activities conducted at SWMU 14 included the placing of used oil and other materials directly on the training pad within a bermed area and igniting the used oil (A.T. Kearney, 1989). Not all of the oil used in the training exercises was consumed in the fires. Much of the oil not consumed in the fire was washed from the pad by the water used to extinguish the fires. Since 1987, the oily-water runoff has been collected in an oil-water separator or a concrete detention basin prior to being pumped to the oily waste treatment plant (OWTP) (A.T. Kearney, 1989).

The concrete detention basin or pond was constructed in 1978 east of the firefighting training area. Stormwater drains from the firefighting training areas through a series of catch basins to an oil-water separator prior to treatment in the OWTP. The detention pond receives firefighting waste liquid when the oil-water separator is full. In addition, personnel who have worked at the NAVSTA Mayport firefighting training area in the past suggest that during the mid 1970s to early 1980s the piping from the oil-water separator to the OWTP would occasionally back up (A.T. Kearney, 1989). When this occurred, the manhole located southwest of Building 351 would overflow, allowing oily water from the firefighting training activities to flow into an open stormwater drainage ditch, eventually emptying into the detention pond. During periods of heavy rainfall, the detention pond often overflowed, resulting in a release of oily water from firefighting training and stormwater containing petroleum-related constituents onto the soils surrounding the detention pond.

The goal of the technology demonstration project is to demonstrate the applicability of bioremediation to reduce levels of petroleum residues on the concrete surface of the stormwater detention pond and the levels of petroleum-related constituents in the soils south of the detention pond. Petroleum staining of the concrete apron located in the firefighting training areas was not addressed as part of the technology demonstration. Figure 1-3 shows the location and general site features of SWMU 14, including areas treated during the technology demonstration.

1.2 TARGET TREATMENT LEVELS FOR CONCRETE AND SOIL CONTAINING PETROLEUM-RELATED CONSTITUENTS AT SWMU 14. The petroleum residue staining the concrete at SWMU 14 is most likely within the top layer of concrete in the detention pond. Because the concrete pad is a solidified mass, the likelihood of ingestion and inhalation of oil-containing dust from the pad is small. The most likely route of exposure for human or ecological receptors is either through dermal contact or ingestion of stormwater runoff from the detention pond.

The station presently is a group participant in the Navywide National Pollutant Discharge Elimination System (NPDES) stormwater discharge permit. That permit limits the amount of oil and grease in the discharge to 5.0 milligrams per liter (mg/l). Visual parameters are also regulated in the permit. These parameters include debris, foam, and any sheen that can be seen in the discharge. The runoff from the detention pond after treatment must comply with all conditions of the existing NPDES permit. In addition, the runoff must comply with the Florida Surface Water Quality Standards given in Chapter 62-302 of the *Florida Administrative Code* (FAC) (Florida Department of Environmental Protection [FDEP], 1995). Table 1-1 gives target treatment levels for chemicals applicable to petroleum-related constituents. These chemicals were chosen based on the site history of SWMU 14. FAC 62-302 gives a full listing of the standards for surface water for all chemicals. The runoff leaving the detention pond after the demonstration would have to meet the full requirements of FAC 62-302 as well as the existing NPDES permit.

Soil south of the detention pond may contain residual levels of petroleum constituents as a result of overflow from the detention pond. Ingestion of soil at SWMU 14 is unlikely as the area is an industrial site, and access is restricted. Inhalation of petroleum-containing dust and dermal contact with the surface soils are the most likely exposure pathways for humans.

At the time the technology demonstration was conducted, soil containing petroleum-related constituents were to be compared to clean soil requirements after treatment as described in FAC, Chapter 62-775, "Soil Thermal Treatment Facilities" as well as *Guidelines for Assessment and Remediation of Petroleum Contaminated Soil* (FDEP, 1994a, 1994b). Target treatment levels for surface soils at SWMU 14 are listed in Table 1-2 and are based on the above-referenced documents.

Since the technology evaluation was conducted, FDEP has been in the process of modifying the soil cleanup goals for petroleum sites to human health risk-based soil cleanup target levels (SCTLs) (Tonner-Navarro and Roberts, 1997). Human health-based target treatment levels for soil at SWMU 14 are listed in Table 1-3.

1.3 AREA OF CONCRETE AND VOLUME OF SOIL CONTAINING PETROLEUM-RELATED CONSTITUENTS AT SWMU 14. RHS Technical Services, Inc. (RHS), the remedial action contractor, proposed to treat approximately 1,000 square yards of concrete stained with petroleum residue (RHS, 1995a). The treated area (approximately 800 square yards) is the concrete area within the detention pond (Figure 1-3).

Concrete stained with petroleum residues at the firefighting training mockups was not addressed during this demonstration.

**Table 1-1  
Target Treatment Levels for Surface Water Runoff**

Navy Environmental Leadership Program  
Technology Evaluation Report for SWMU 14  
U.S. Naval Station  
Mayport, Florida

Constituent	Target Treatment Level <sup>1</sup>
Acenaphthene	Shall not exceed 2,700 $\mu\text{g}/\ell$ .
Anthracene	Shall not exceed 110,000 $\mu\text{g}/\ell$ .
Benzene	Shall not exceed 71.28 $\mu\text{g}/\ell$ annual average.
Dissolved oxygen	Shall not average less than 5 mg/ $\ell$ in a 24-hour period and shall never be less than 4 mg/ $\ell$ . Normal daily and seasonal fluctuations above these levels shall be maintained.
Fluoranthene	Shall not exceed 370 $\mu\text{g}/\ell$ .
Fluorene	Shall not exceed 14,000 $\mu\text{g}/\ell$ .
Lead	Shall not exceed 5.6 $\mu\text{g}/\ell$ .
Mercury	Shall not exceed 0.025 $\mu\text{g}/\ell$ .
Oils and greases	Dissolved or emulsified oils and greases shall not exceed 5.0 mg/ $\ell$ . No undissolved oil or visible oil shall be present so as to cause taste or odor or otherwise interfere with the beneficial use of the water.
PAHs <sup>2</sup>	Shall not exceed 0.031 $\mu\text{g}/\ell$ annual average <sup>3</sup> .
pH	Shall not vary more than one standard unit above or below natural background provided that the pH is not lower than 6 standard units or above 8.5 standard units.
Pyrene	Shall not exceed 11,000 $\mu\text{g}/\ell$ .

<sup>1</sup> Target treatment levels taken from the requirements of Florida Administrative Code 62-302, (Florida Department of Environmental Protection, 1995) for Class III marine waters.

<sup>2</sup> PAHs are the total of acenaphthylene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, and phenanthrene.

<sup>3</sup> Annual average means the maximum concentration at average annual flow conditions.

Notes: SWMU = solid waste management unit.

$\mu\text{g}/\ell$  = micrograms per liter.

mg/ $\ell$  = milligrams per liter.

PAH = polynuclear aromatic hydrocarbon.

**Table 1-2  
Target Treatment Levels for Soil Based on  
Thermal Treatment of Petroleum-Contaminated Soil**

Navy Environmental Leadership Program  
Technology Evaluation Report for SWMU 14  
U.S. Naval Station  
Mayport, Florida

Constituent	Target Treatment Level <sup>1</sup>
Total recoverable petroleum hydrocarbons	<sup>2</sup> 50
Volatile organic aromatics (BTEX)	<sup>3</sup> 100
Volatile organic halocarbons	<sup>3</sup> 50
Polynuclear aromatic hydrocarbons	<sup>3</sup> 1,000
Arsenic	10
Barium	4,940
Cadmium	37
Chromium	50
Lead	108
Mercury	23
Selenium	389
Silver	353

<sup>1</sup> Target treatment levels are specified in the Florida Administrative Code (FAC) 62-775. The values are in milligrams per kilogram (mg/kg) unless noted otherwise.

<sup>2</sup> If total recoverable petroleum hydrocarbons are below 10 mg/kg, polynuclear aromatic hydrocarbons and volatile organic halocarbons do not have to meet the target treatment levels listed in this table (FAC 62-775).

<sup>3</sup> Values are in mg/kg.

Notes: SWMU = Solid Waste Management Unit.  
BTEX = benzene, toluene, ethylbenzene, and xylene.

<b>Total Recoverable Petroleum Hydrocarbons (mg/kg)</b>			
TRPH	2,600	370	340

<sup>1</sup> Industrial and residential exposure values in  $\mu\text{g}/\text{kg}$  are from *Development of Soil Cleanup Target Levels for Chapter 62-770, Florida Administrative Code* (Tonner-Navarro and Roberts, 1997).

<sup>2</sup> The leachability to groundwater criteria are applicable where a chemical is detected in soil and groundwater samples and exceeds its groundwater guidance concentrations. Values are in  $\mu\text{g}/\text{kg}$  unless noted otherwise.

<sup>3</sup> Analysis by Toxicity Characteristic Leaching Procedure. Values are in  $\text{mg}/\text{kg}$ .

<sup>4</sup> Direct exposure values from U.S. Environmental Protection Agency (USEPA), Revised Interim Soil Lead Guidance for CERCLA and RCRA Corrective Action Facilities, OSWER Directive 9355.4-12 (1994). The residential value is in the middle of the USEPA suggested range of 400 to 600  $\text{mg}/\text{kg}$ .

Notes: SWMU = Solid Waste Management Unit.

$\mu\text{g}/\text{kg}$  = micrograms per kilogram.

$\text{mg}/\text{kg}$  = milligrams per kilogram.

TRPH = total recoverable petroleum hydrocarbons.

CERCLA = Comprehensive Environmental Response, Compensation, and Liability Act.

RCRA = Resource Conservation and Recovery Act.

OSWER = Office of Solid Waste and Emergency Response.

RHS proposed to treat approximately 100 cubic yards of soil containing petroleum-related constituents (RHS, 1995b). The treated area (approximately 55 feet by 25 feet, assuming a 2-foot depth) is shown on Figure 1-3 and is located south of the stormwater detention pond.

1.4 TECHNOLOGY EVALUATION REPORT. This technology evaluation report includes the following:

- a description of the technology demonstrated at SWMU 14;
- a summary of monitoring and sampling activities performed by RHS during the technology demonstration;
- a description of technical oversight activities performed by ABB-ES during the demonstration, including photographs, observations, and analytical results;
- an evaluation of the technology demonstration by comparison of analytical results to target treatment levels and cleanup goals;
- an assessment of the uncertainty associated with evaluating the technology demonstration's ability to meet the target treatment levels and cleanup goals, and
- conclusions based on findings from the technology demonstration.

## 2.0 SUMMARY OF TECHNOLOGY DEMONSTRATION ACTIVITIES AT SWMU 14

Through NELP, the Navy proposed to demonstrate *in situ* bioremediation of petroleum-related constituents from concrete and soil at SWMU 14. RHS was selected as the contractor, by the Navy, to demonstrate a technology to meet this goal.

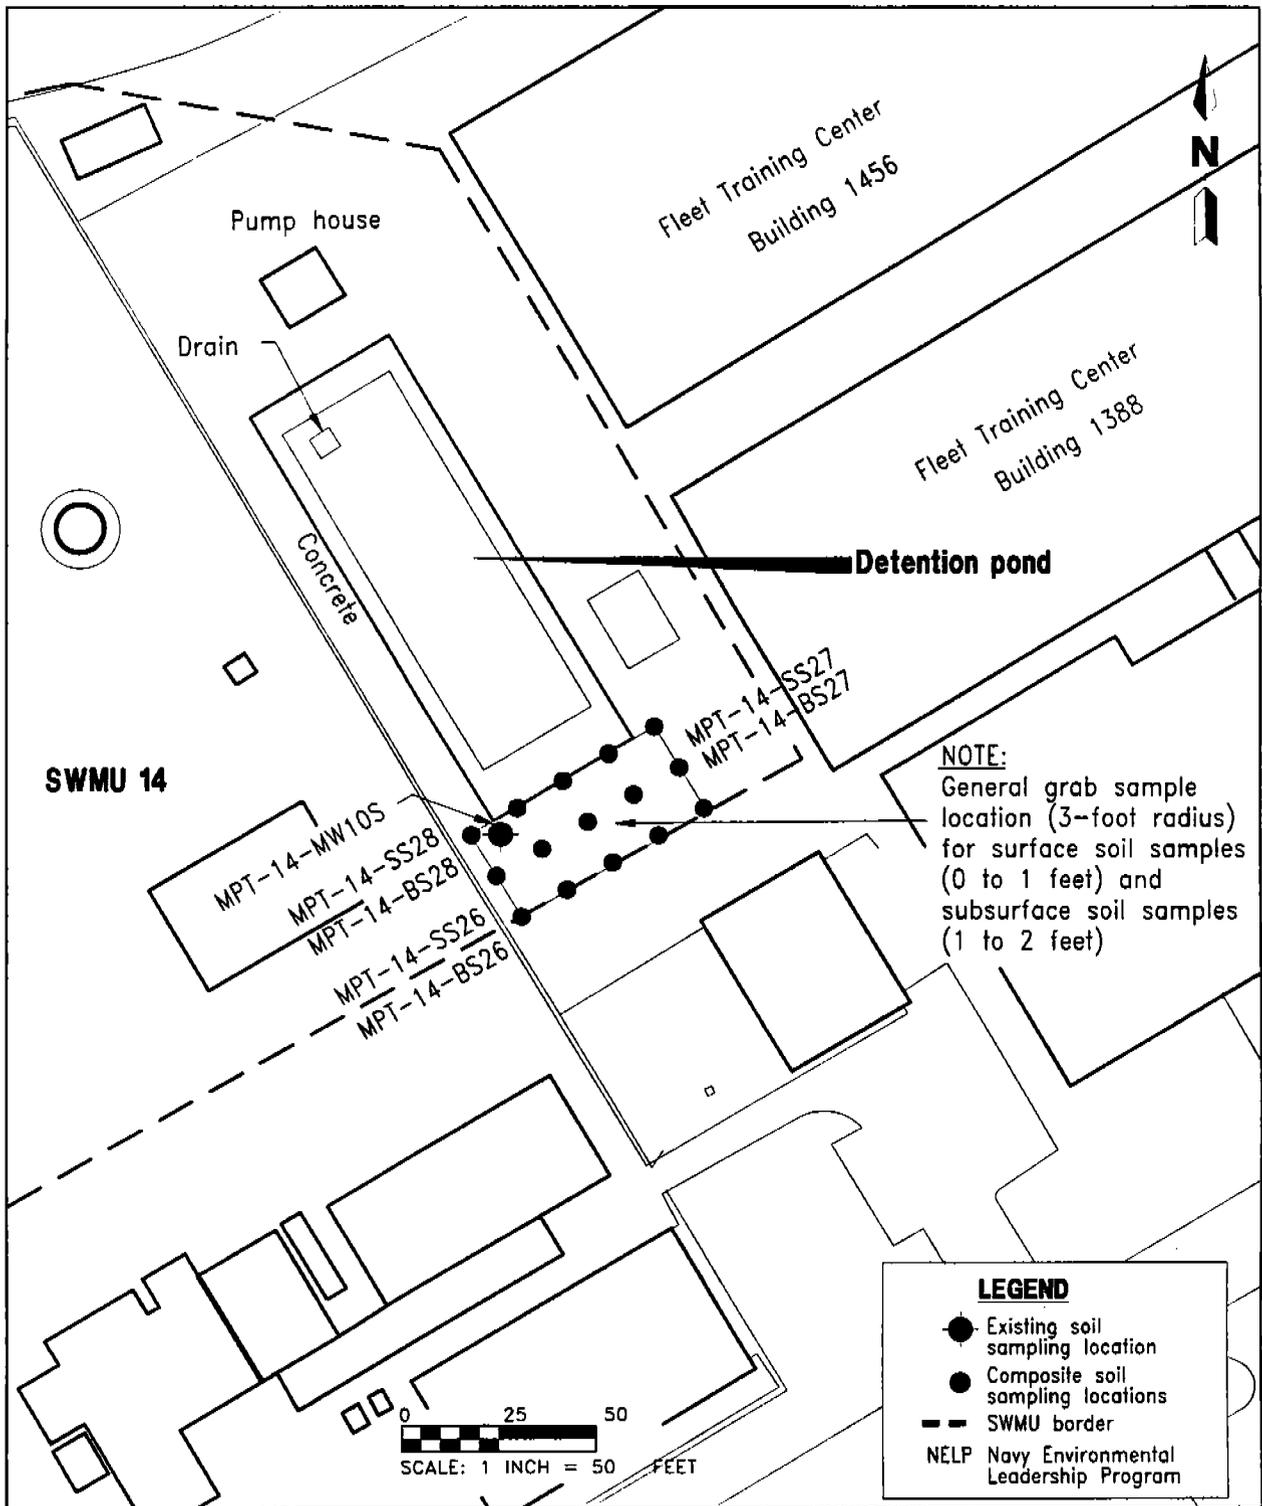

2.1 RHS TECHNOLOGY DEMONSTRATION ACTIVITIES. The contractor, RHS, conducted the technology demonstration from January to July 1996. The technology demonstration consisted of two areas: *in situ* bioremediation of a concrete surface stained with petroleum residues and *in situ* bioremediation of soil containing petroleum-related constituents. Photographs of activities conducted by RHS are provided in Appendix A. The bioremediation was conducted using a mixture of Earthwise Formula One, the bioremediation catalyst, and WinterBio RBC TPH/RBC 109 microbial bioremediation product (RHS, 1996).

Concrete Surface Stained with Petroleum Residues. RHS proposed to treat 1,000 square yards of concrete stained with petroleum residues within the detention pond (RHS, 1995a). A microbial solution was applied to the concrete containing residual petroleum staining in several 10-square-foot areas. Once applied, the surface of the areas was periodically agitated using push brooms and a mechanical scrubber to emulsify and separate the oils from the concrete so the microbes could biodegrade the petroleum-related constituents (RHS, 1996). The remediated area was also sprayed with a fine mist of water to keep the surface wet throughout treatment and control temperature. RHS used visual inspection of the treatment area to determine when they considered the remediation process to be complete (RHS, 1996). After each iteration of solution application, RHS sprayed the area of treated concrete using a high-pressure washer to create runoff and mobilize any remaining petroleum-related constituents.

Runoff from the concrete remediation area flowed toward a drain at the northern end of the detention pond (Figure 2-1). Runoff from the treatment area was collected by RHS prior to the drain and placed in a temporary tank until the completion of the demonstration. Samples of the solution in the tank were collected by RHS at the completion of the demonstration to determine if the rinse water could be recycled and/or released to the OWTP.

The technology demonstration of the concrete surface was temporarily halted by RHS on February 5, 1996, because of cold temperatures. RHS indicated to the Navy that the daily temperatures were too cold for the microbial solution to be most effective. The technology demonstration was not continued until warmer temperatures occurred on May 1, 1996. Upon resuming the technology demonstration, RHS did not collect any surface water runoff samples from the detention pond before, during, or after this part of the demonstration.

Soil Containing Petroleum Constituents. RHS chose *in situ* bioremediation as the demonstration technology to treat the surface soils south of the detention pond. RHS sprayed a microbial solution on the land surface and rototilled the soil to ensure proper mixing and oxidation in the underlying soils (RHS, 1996). The soil was rototilled to a depth of 2 feet below land surface (bls). Soil samples were collected from various locations within the treatment area by RHS during and upon completion of the demonstration to assess the technology's effectiveness.

The first soil sampling event was conducted on February 2, 1996. Subsequently, because of cold temperatures, the technology demonstration for the petroleum-impacted soil was temporarily halted by RHS on February 5, 1996. RHS indicated to the Navy that the daily temperatures were too cold for the microbial solution to be most effective. The technology demonstration was not continued until warmer temperatures occurred on May 1, 1996.

Subsequently, RHS collected additional soil samples on May 1, 1996, May 15, 1996, and July 10, 1996. The final sampling event coincided with ABB-ES's final performance sampling event. During this sampling event, ABB-ES and RHS split the soil samples that were collected. Please refer to RHS's report entitled *NELP Technology Demonstration Bioremediation of Concrete Surfaces and Soil at SWMU 14, U.S. Naval Station, Mayport, Florida* (RHS, 1996), for details of their soil sampling events conducted during the technology demonstration.

**2.2 TECHNOLOGY DEMONSTRATION OVERSIGHT.** ABB-ES provided technical oversight of the NELP technology demonstration contractor, RHS. ABB-ES was on site during the technology demonstration to observe contractor activities, as follows:

- site preparation,
- application and treating activities, and
- sampling.

Site Preparation. Site preparation of the detention pond was conducted by the Navy and included using water to spray sand that had collected in the pond into the drain located on the north side of the pond. The Navy removed the sand that collected in the drain.

Site preparation of the soil treatment area at SWMU 14 was conducted by RHS on January 17, 1996. Their site preparation activities included layout of the site boundary. RHS personnel measured and staked out the area to be treated and then placed a yellow caution tape around the border of the area. RHS personnel then rototilled the soil treatment area to a depth of approximately 2 feet bls using a conventional garden-type rototiller.

Application and Treating Activities. Application and treating activities at the soil treatment area commenced on January 19, 1996. The treatment area was raked using a rake with 2-inch-long tines. Subsequently, RHS tested soil at the treatment area for temperature, pH, nitrogen, phosphorus, and potassium to determine an application concentration for the bioaugmentation. RHS mixed up 110-gallon batches of the microbial solution on January 22 and 23, 1997, and applied it to the treatment area using buckets. After application, RHS covered the treatment area with black polyethylene sheeting.

The treatment of the concrete surface was initially conducted on January 24, 1996. RHS mixed up a batch of the microbial solution and initially used brushes to scrub the concrete. The scrubbing of the concrete did not resume until January 30 and 31, 1996, at which time RHS used mechanical scrubbers. The drain located at the northern end of the detention pond was plugged to prevent the microbial solution from being released to the OWTP. The "used" microbial solution was pumped from the pond to a 1,000-gallon-capacity holding tank.

On February 5, 1996, RHS determined that the weather was too cold for the technology to work successfully and requested that the project be delayed until warmer weather. The technology demonstration project was resumed in April 1996.

In April 1996, RHS rototilled the soil, applied the microbial solution, and then rototilled the solution into the soil. RHS made several other treatments; however, the number of treatments is not known. At this time ABB-ES was not conducting full-time oversight and the number of treatments was not provided in the RHS report (RHS, 1996).

The bioremediation of the concrete surface was recommenced on May 9, 1996, and completed on May 21, 1996 (RHS, 1996). The Navy cleaned out sand that accumulated in the detention pond since the first treatment was suspended because of the cold weather. Activities by RHS involved the application of the microbial solution, scrubbing the solution into the concrete, and rinsing the concrete with a 4,000-pounds-per-square-inch (psi) sprayer (RHS, 1996). The microbial solution was applied by spraying. This application and cleaning method was applied up to six times on some of the 10-foot by 10-foot concrete squares in the detention pond. During the washing and rinsing phases of treatment, droplets of free-phase hydrocarbons were observed to be leaking from the construction joints between the 10-foot by 10-foot concrete pads of the detention pond. The free-phase hydrocarbon droplets were observed to be leaking from the construction joints prior to the beginning of the technology demonstration. However, the pressure rinsing may have resulted in the removal of some of the gasket material in the construction joints.

Application of the microbial solution included mixing the solution in the desired ratio and operating the sprayers and pumps. The desired ratio of the microbial solution varied from day to day and depended on whether the soil or concrete was being treated. Generally the microbial solution consisted of the bacteria and microbes (RBC 109), the biocatalyst (Earthwise Formula One), and water. The solution was mixed in 55-gallon plastic drums using a wooden oar or paddle. The solution was left to set up for approximately 1 hour and then was transferred (pumped) from the drums through a garden hose to hand sprayers. The hand sprayers were used to apply the microbial solution to the soil or concrete. When the transfer pump was nonoperational or not available, RHS personnel also applied the microbial solution by pouring it from 5-gallon buckets onto the soil or concrete. Please refer to RHS's report entitled *NELP Technology Demonstration Bioremediation of Concrete Surfaces and Soil at SWMU 14, U.S. Naval Station, Mayport, Florida* (RHS, 1996), for details on the content and application of the microbial solution used during the demonstration.

Sampling. RHS did not collect any water samples during the technology demonstration for the *in situ* bioremediation of the concrete surface. RHS used visual inspections of the treated area to determine when the bioremediation process was complete (RHS, 1996).

RHS collected soil samples to determine an appropriate mixture of microbial solution and to assess the performance of the microbial solution at the soil treatment area. Parameters measured to determine the appropriate mixture were pH for nitrogen, phosphorous, and potassium using the Rapidtest soil tester.

RHS personnel periodically collected soil samples to assess the progress of the bioremediation. The soil samples were analyzed for total recoverable petroleum

hydrocarbons (TRPH) using the PetroFlag analyzer kit manufactured by DEXIL®. RHS personnel periodically collected temperature and moisture data from the soil treatment area using a moisture meter and a needle-type thermometer.

Please refer to RHS's report entitled *NELP Technology Demonstration Bioremediation of Concrete Surfaces and Soil at SWMU 14, U.S. Naval Station, Mayport, Florida* (RHS, 1996), for details on the PetroFlag analyzer kit and other RHS soil monitoring activities conducted during the demonstration.

**2.3 TECHNOLOGY DEMONSTRATION CONFIRMATORY SAMPLING.** The ABB-ES sampling and analysis program consisted of collecting baseline and performance evaluation samples from the detention pond and the soil treatment area at SWMU 14. Surface water samples were collected from the detention pond, and surface and subsurface soil samples were collected from the soil treatment area located south of the detention pond (Figure 1-3). Baseline samples were used to characterize the media sampled prior to RHS conducting the technology demonstration. The performance evaluation samples were collected to assess whether or not the technology demonstration achieved the target treatment levels.

Quality assurance and quality control (QA/QC) samples were also collected during baseline and performance sampling events to assess the validity of the data obtained during sample analysis.

The baseline sampling event for the technology demonstration at the detention pond took place on January 11, 1996, and the performance evaluation sampling event was on May 21, 1996.

The first baseline sampling event for the technology demonstration at the soil treatment area took place on January 9, 1996, and January 18, 1996. The surface and subsurface soil samples collected on January 9, 1996, represent conditions prior to RHS rototilling the soil. The surface and subsurface soil samples collected on January 18, 1996, represent conditions after the rototilling, prior to the application of the microbial solution.

After the technology demonstration was restarted from the temporary suspension because of weather considerations, additional baseline samples were collected on April 19, 1996. The performance evaluation samples for the *in situ* soil bioremediation activities were collected on June 10, 1996.

Below is the rationale for collection and analysis of baseline and performance evaluation samples at SWMU 14 during the technology demonstration.

**2.3.1 Baseline Sampling** Below is a description of the baseline surface water sampling event at the detention pond and surface and subsurface soil samples from the soil treatment area.

**Surface Water Sampling at the Detention Pond.** Prior to RHS conducting the technology demonstration at the detention pond, sand and water that had collected in the bottom of the pond were removed. The accumulation of runoff from a precipitation event in the detention pond was simulated on January 11, 1996. Surface water samples were collected during the simulated runoff event. The detention pond outlet was plugged to collect water used during the baseline performance sampling event at the drain.

The petroleum-stained concrete surface of the detention pond was rinsed by ABB-ES prior to treatment, using two garden hoses. Two one-inch-diameter garden hoses were placed at the south end of the pond, one on each side of the concrete slope. The hoses were moved to the north along the sides of the pond approximately 10 feet every 10 minutes in order to direct the flow of runoff water to the drain at the north end and rinse the majority of the surface area of the detention pond. The hoses were moved in this manner throughout the duration of the runoff event, approximately 140 minutes. The surface water accumulated at the bottom of the detention pond with the majority at the detention pond drain.

Four surface water samples were collected: one sample at the beginning of the simulated runoff event, two in the middle, and one sample at the end of the simulated runoff event. The volume of water used was measured by flow rate and time so the same volume would be used to collect the performance evaluation samples. Below is the surface water sample location, sample number, corresponding duration (minutes) from the start of the test, and volume (gallons) for the baseline sampling event.

Sample Location	Sample Identifier	Time (minutes from start of test)	Volume (gallons)
MPT-14-SW09	14W009	20	10
MPT-14-SW10	14W010	60	330
MPT-14-SW11	14W011	100	660
MPT-14-SW12	14W012	140	1,000

Each of the samples was collected at the location of the drain at the northern end of the detention pond (Figure 2-1).

Surface and Subsurface Soil Sampling at the Soil Treatment Area. Surface and subsurface soil samples were collected on January 9 and January 18, 1996, in the soil treatment area located to the south of the detention pond (Figure 2-1). The requirements for soil sampling were based on the *Guidelines for the Assessment and Remediation of Petroleum Contaminated Soil* (FDEP, 1994). The guidelines specify that soil containing petroleum-related constituents, to be treated by a method other than thermal treatment, should use a pretreatment soil sampling frequency equivalent to the requirements of FAC 62-775.410.

Based on RHS treating 100 cubic yards of soil, FAC 62-775.410 stipulates the collection of at least three composite soil samples. A sampling grid size was calculated assuming a 90 percent probability of finding a hot spot 12 feet in radius using a geostatistical model developed by R.O. Gilbert (1987). Based on the above assumptions, the appropriate grid size was determined to be approximately 14 feet. The calculations for determining the grid size are provided in Appendix B.

Each composite surface and subsurface soil sample consisted of five grab sample aliquots. The grab samples were collected approximately 3 to 5 linear feet apart along lines parallel to the edge of the detention pond (Figure 2-1). The surface soil samples were collected from land surface to a depth of 1 foot, and the subsurface soil samples were collected from 1 to 2 feet bls. The actual grab sampling locations were biased by collecting the sample at an area of obvious staining or stressed vegetation.

The samples from locations MPT-14-SS26 and MPT-14-SS27 were collected on January 9, 1996. These samples are representative of conditions prior to RHS rototilling the soil. The samples from location MPT-14-SS28 were collected on January 18, 1996, after completion of the rototilling, prior to the application of the microbial solution.

ABB-ES collected an additional set of baseline surface and subsurface soil samples from locations MPT-14-SS26, MPT-14-SS27, and MPT-14-SS28 on April 19, 1996, after the temporary suspension by RHS of the technology demonstration because of weather considerations.

**2.3.2 Performance Evaluation Sampling** ABB-ES collected performance evaluation samples at the detention pond and soil treatment area after receiving notification from the Navy that RHS had determined that the technology demonstrations were complete.

Surface Water Sampling at the Detention Pond. ABB-ES conducted surface water sampling at the detention pond in the same manner as conducted previously during the baseline sampling event. The following table presents the surface water samples and the corresponding time and volume at which they were collected during the runoff event.

Below is the surface water sample location, sample number, corresponding duration (minutes) from the start of the test, and volume (gallons) for the baseline sampling event.

Sample Location	Sample Identifier	Time (minutes from start of test)	Volume (gallons)
MPT-14-SW13	14W013	20	10
MPT-14-SW14	14W014	60	330
MPT-14-SW15	14W015	100	660
MPT-14-SW16	14W016	140	1,000

Each of the samples was collected at the location of the drain at the northern end of the detention pond (Figure 2-1).

Surface and Subsurface Soil Sampling at the Soil Treatment Area. Surface and subsurface soil samples were collected from locations MPT-14-SS26, MPT-14-SS27, and MPT-14-SS28 on July 10, 1996, from the same general locations as sampled during the baseline sampling events (Figure 2-1).

**2.3.3 Sampling and Analytical Procedures.** The methods used for surface water and soil sample collection were consistent with standard operating procedures described in the NAVSTA Mayport Resource Conservation and Recovery Act (RCRA) Facility Investigation workplan (ABB-ES, 1991), the NAVSTA Mayport General Information report (ABB-ES, 1995), and U.S. Environmental Protection Agency (USEPA) Region IV standard operating procedures (USEPA, 1991).

Surface water samples were analyzed for petroleum-related constituents listed in FAC 62-302, using the appropriate testing method, and were based on the site history of SWMU 14 (Table 2-1). Surface water samples were also analyzed for TRPH, although not listed in FAC 62-302, to provide a baseline to assess the effectiveness of the technology demonstration.

**Table 2-1**  
**Surface Water Sample Analysis**

Navy Environmental Leadership Program

Anthracene	USEPA Method SW-846 8310
Benzene	USEPA Method SW-846 8020
Dissolved oxygen	USEPA Method 360.1 or 360.2
Fluoranthene	USEPA Method SW-846 8310
Fluorene	USEPA Method SW-846 8310
Lead	USEPA Method SW-846 7000
Mercury	USEPA Method SW-846 7470
Oils and greases	USEPA Method 413.1
Polynuclear aromatic hydrocarbons	USEPA Method SW-846 8310
Pyrene	USEPA Method SW-846 8310
Total recoverable petroleum hydrocarbons	USEPA Method 418.1

Notes: SWMU = Solid Waste Management Unit.  
USEPA = U.S. Environmental Protection Agency.

Surface and subsurface soil samples were analyzed for petroleum-related constituents derived from the clean soil requirements described in FAC 62-775, *Soil Thermal Treatment Facilities* (Table 2-2).

The analysis of the surface water and soil samples was conducted using appropriate USEPA methodology contained in the document *Test Methods for Evaluating Solid Waste, Physical and Chemical Methods, SW846* (USEPA, 1986). The analysis of surface water samples was also conducted using *Methods for Chemical Analysis of Water and Wastes, EPA-600/4-79-020* (USEPA, 1983) when appropriate. A summary of the analytical results is provided in Appendix C.

The groundwater and soil samples were placed in a cooler with ice and shipped by express-overnight delivery to a Naval Energy and Environment Support Activity (NEESA) approved laboratory under chain-of-custody protocol.

QA/QC Sampling. QA/QC samples were collected according to NEESA Level C requirements. QA/QC samples were collected during baseline and performance evaluation sampling. Trip, rinsate, and field blanks were collected and analyzed. Trip blanks were analyzed for only volatile organic compounds (VOCs). Environmental sample duplicates, matrix spike and matrix spike duplicate pairs, rinsate, and water source blanks were analyzed for the same constituents as the surface water and soil samples.

The analytical data package produced by the laboratory was NEESA Level C. The rationale for using NEESA Level C was to provide analytical data that could be validated substituting the SW846 method criteria for USEPA's Contract Laboratory Program method criteria according to *National Functional Guidelines for Organic Data Review* (USEPA, 1990). The data were validated so that the appropriate decision could be made as to whether or not SWMU 14 should be further evaluated through the RCRA Corrective Action Program. Data validation information is provided in Appendix D.

2.4 TEMPERATURE AND RAINFALL DATA. Maximum and minimum air temperature measurements and rainfall amounts were obtained for the period of January 15, 1996, to February 5, 1996, and May 1, 1996, to June 30, 1996, from the NAVSTA Mayport meteorology department. Periodic measurements were also made of the temperature of the soil at the treatment site. These data are presented in Section 3.2 along with the analytical results of the performance sampling.

A copy of the ABB-ES site logbook containing all oversight activities is provided in Appendix E.

### 3.0 RESULTS AND EVALUATION OF TECHNOLOGY DEMONSTRATION SAMPLING EVENTS

This chapter presents analytical results from the baseline and performance evaluation sampling events that were obtained during the technology demonstration at the detention pond and soil treatment area and a comparison of the analytical results to target cleanup goals.

3.1 BASELINE AND PERFORMANCE EVALUATION SAMPLING AT THE DETENTION POND. Below are analytical results of surface water samples collected during the baseline and performance evaluation sampling events and comparison of the analytical results to target cleanup goals (Table 1-1) for the Detention Pond.

Baseline Sampling Events. Below are field measurements made during the baseline sampling event for pH, temperature, and dissolved oxygen.

Sample Location	Ph (standard units)	Temperature (centigrade)	Dissolved Oxygen (milligrams per liter)
MPT-14-SW09	7.12	18	8.2
MPT-14-SW10	7.42	17.4	6.2
MPT-14-SW11	7.44	17.6	5.9
MPT-14-SW12	7.4	17.9	5.6

An average pH of approximately 7.5 standard units was measured while collecting background surface water samples from the St. Johns River in September 1994 (ABB-ES, 1995). The pH measurements made during the baseline sampling event appear to comply with the criterion specified for Class III marine waters under FAC 62-302 (Table 1-1).

Measured values for dissolved oxygen appear to comply with the criterion specified for Class III marine waters under FAC 62-302 (Table 1-1).

None of the target VOCs, polynuclear aromatic hydrocarbons (PAHs) or inorganic analytes (Table 2-1), if present, were detected at concentrations exceeding the detection limit in the baseline surface water samples collected on January 11, 1996 (Table 3-1).

Oil and grease were detected at concentrations ranging from 12.3 to 25.7 mg/l (Table 3-1). An arithmetic mean of 16.6 mg/l was calculated for oil and grease. Samples and duplicates are considered one sample when calculating the arithmetic mean. Therefore, the arithmetic mean includes the average value for a sample and associated duplicate. The concentrations of oil and grease detected in the surface water samples (Table 3-1) appear to not comply with the criterion specified for Class III marine waters under FAC 62-302 (Table 1-1).

TRPH was detected at concentrations ranging from 0.92 to 12.1 mg/l in baseline runoff samples collected from the detention pond (Table 3-1). An arithmetic mean of 6.5 was calculated for TRPH. Currently, there is no criterion under FAC 62-302 for TRPH.

**Table 3-1  
Analytes Detected in Baseline Surface Water Samples at SWMU 14**

Navy Environmental Leadership Program  
Technology Evaluation Report for SWMU 14  
U.S. Naval Station  
Mayport, Florida

Analytical Batch Number:	M9936	M9936	M9936	M9936	M9936
Sample Location:	MPT-14-SW09	MPT-14-SW10	MPT-14-SW10	MPT-14-SW11	MPT-14-SW12
Sample Number:	14W009	14W010	14W010D	14W011	14W012
Date Sampled:	11-JAN-96	11-JAN-96	11-JAN-96	11-JAN-96	11-JAN-96
<b><u>Volatile Organic Compounds (<math>\mu\text{g}/\ell</math>)</u></b>					
Target analytes not detected.	--	--	--	--	--
<b><u>Inorganic Analytes (<math>\mu\text{g}/\ell</math>)</u></b>					
Target analytes not detected.	--	--	--	--	--
<b><u>Polynuclear Aromatic Hydrocarbons (<math>\mu\text{g}/\ell</math>)</u></b>					
Target analytes not detected.	--	--	--	--	--
<b><u>General Parameters (mg/l)</u></b>					
Oil and grease	22.3	11.6	25.7	12.3	13.2
TRPH	0.92	8.75	12.1	7.07	7.45
Notes: SWMU = Solid Waste Management Unit. D = duplicate. $\mu\text{g}/\ell$ = micrograms per liter. -- = target analytes, if present, were less than the detection limit. mg/l = milligrams per liter. TRPH = total recoverable petroleum hydrocarbons.					

Performance Evaluation Sampling Event. Below are field measurements made during the performance evaluation sampling event for pH, temperature, and dissolved oxygen.

Sample Location	Ph (standard units)	Temperature (centigrade)	Dissolved Oxygen (milligrams per liter)
MPT-14-SW13	7.29	28.8	3.2
MPT-14-SW14	7.32	29.3	3.4
MPT-14-SW15	7.36	28.8	3.5
MPT-14-SW16	7.36	27.8	3.5

Comparison of the pH measurements made during the performance evaluation sampling event to the average value for the St. Johns River (ABB-ES, 1995), suggest that the measured values comply with the criterion specified for Class III marine waters under FAC 62-302 (Table 1-1).

Measured values for dissolved oxygen appear to not comply with the criterion specified for Class III marine waters under FAC 62-302 (Table 1-1).

None of the target VOCs, or inorganic analytes (Table 2-1), if present, were detected at concentrations exceeding the detection limit in the performance evaluation surface water samples collected on May 21, 1996 (Table 3-2). One PAH, phenanthrene, was detected at a concentration of 5 micrograms per liter in surface water sample 14W014. Currently, there is no individual criterion under FAC 62-302 for phenanthrene. Based on the detection of phenanthrene in the environmental sample and not in the associated duplicate, there is a low probability that this singular detection would result in noncompliance with the total PAH criterion specified for Class III marine waters under FAC 62-302 (Table 1-1).

Oil and grease were detected at concentrations ranging from 7.58 to 31.1 mg/l in performance evaluation samples collected from the detention pond (Table 3-2). An arithmetic mean of 15.8 mg/l was calculated for oil and grease. The concentrations of oil and grease detected in the surface water samples (Table 3-2) appear to not comply with the criterion specified for Class III marine waters under FAC 62-302 (Table 1-1). The average values for oil and grease in the baseline and performance evaluation surface water samples were relatively similar.

TRPH was detected at concentrations ranging from 1.51 to 18.8 mg/l in performance evaluation samples collected from the detention pond. An arithmetic mean of 6.7 was calculated for TRPH. The average values for TRPH in the baseline and performance evaluation surface water samples were relatively similar.

The analytical results from the baseline and performance evaluation surface water samples suggest that there was minimal difference prior to and after the technology demonstration at the detention pond. Concentrations of oil and grease detected in both the baseline and performance evaluation surface water samples were not in compliance with FAC 62-302.

**Table 3-2  
Analytes Detected in Performance Surface Water Samples at SWMU 14**

Navy Environmental Leadership Program  
Technology Evaluation Report for SWMU 14

Sample Number:	14W013	14W014	14W014D	14W015	14W015D	14W016	14W016
Date Sampled:	21-MAY-96						
<b><u>Volatile Organic Compounds (µg/l)</u></b>							
Target analytes not detected.							
<b><u>Inorganic Analytes (µg/l)</u></b>							
Target analytes not detected.							
<b><u>Polynuclear Aromatic Hydrocarbons (µg/l)</u></b>							
Phenanthrene							
	--	5	--	--	NA	NA	--
<b><u>General Parameters (mg/l)</u></b>							
Oil and grease	31.1	7.58	NA	12.4	15.3	10.9	10.9
TRPH	18.8	3.63	NA	2.96	2.75	1.51	1.51
Notes: SWMU = Solid Waste Management Unit. D = duplicate. µg/l = micrograms per liter. -- = target analytes, if present, were less than the detection limit. NA = not analyzed. mg/l = milligrams per liter. TRPH = total recoverable petroleum hydrocarbons.							

The leaking of free-phase hydrocarbon from beneath the detention pond likely contributes to the phenanthrene, oil and grease, and TRPH detected in the surface water samples. This release of free-phase hydrocarbons to water contained in the detention pond was observed prior to and after the technology demonstration. It is also possible that the rinsing of the detention pond with the high pressure washer (4,000 psi) may also have removed some of the gasket material that separates the 10-foot by 10-foot square concrete pads that make up the detention pond.

The detention pond looked cleaner at the end of the technology demonstration. However, this may be more attributed to RHS using a 4,000-psi pressure washer to rinse the microbial solution from the concrete rather than bioremediation and scrubbing. Additionally, a concrete core obtained from the detention pond suggested that petroleum-related compounds had migrated approximately 3/4 of an inch into the concrete. It is not likely that the microbial solution would remove the petroleum-related compounds that penetrated the concrete.

3.2 SOIL TREATMENT AREA. Below are analytical results of surface and subsurface soil samples collected during the baseline and performance evaluation sampling events and comparison of the analytical results to target cleanup goals (Tables 1-2 and 1-3) for the soil treatment area.

3.2.1 Surface Soil Samples Target analytes detected in baseline and performance evaluation surface soil samples are provided in Table 3-3. VOCs were not detected in the surface soil samples. Volatile organic halocarbons (VOHs) were detected as a single occurrence in the performance evaluation sample collected at location MPT-14-SS27. VOHs were not detected in the corresponding environmental sample. The concentration of VOHs detected (Table 3-3) was in compliance with the thermal treatment of petroleum-contaminated soil (Table 1-2).

Three PAHs, pyrene, benzo(a)anthracene, and chrysene, were detected in a surface soil sample collected at the location of monitoring well MPT-14-MW10S (Figure 2-1). Monitoring well MPT-14-MW10S was installed for the RCRA Facility Investigation conducted for the Group III SWMUs at NAVSTA Mayport (ABB-ES, 1996).

The sum of the three PAH concentrations (2,960 micrograms per kilogram [ $\mu\text{g}/\text{kg}$ ]) was not in compliance with the target treatment level (1,000  $\mu\text{g}/\text{kg}$ ) based on thermal treatment of petroleum-contaminated soil (Table 1-2). In addition, pyrene was detected (Table 3-3) at a concentration that was not in compliance with the residential SCTL (Table 1-3). However, the detection of the three PAHs was not confirmed during the technology demonstration. The PAHs were not detected in the baseline or performance evaluation surface soil samples.

The inorganic analytes (arsenic, barium, cadmium, chromium, lead, and mercury) were detected in the baseline and performance samples. Two inorganic chemicals, selenium and silver, that were target analytes of the baseline and performance evaluation samples, if present, were less than the detection limits.

Arsenic was detected in the baseline surface soil samples (Table 3-3) at a concentration that is not in compliance with the residential SCTL (Table 1-3).

Duplicate soil samples collected at location MPT-14-SS27 in January and April 1996 suggest that there was considerable variation between the concentrations of

ft bis = feet below land surface.  
µg/kg = micrograms per kilogram.  
-- = target analyte, if present, was less than the detection limit.

NA = not analyzed.  
mg/kg = milligrams per kilogram.  
J = estimated value.  
TRPH = total recoverable petroleum hydrocarbons.

arsenic detected in the environmental sample and its duplicate. This is based on the relative percent difference (RPD) between the environmental and duplicate samples. The RPD can be used to judge the precision of the analytical results for the sample pairs. An RPD of  $\pm 35$  percent for a sample and its duplicate is generally considered acceptable precision for arsenic (USEPA, 1988). The RPDs for sample pairs collected at MPT-14-SS27 were 72 percent for January 1996, 55 percent for April 1996, and 15 percent for July 1996. The variation could result from the lack of precision of the analytical method, a variation in concentration over short distances, or incomplete mixing (homogenization) of the sample.

Beryllium, copper, vanadium, and zinc were also detected in the surface soil sample collected at monitoring well MPT-14-MW10S. These four inorganic chemicals were not target analytes for the baseline and performance sampling events.

Measurements of TRPH suggest that the concentrations increased from the baseline to performance evaluation sampling events at locations MPT-14-SS26 and MPT-14-SS27 and decreased at location MPT-14-SS28.

Each of the surface soil samples collected from the three sampling locations exhibited a different temporal distribution for TRPH. TRPH appears to slightly increase from nondetect to 37.7 milligrams per kilogram (mg/kg) in the sample collected at sampling location MPT-14-SS26. The concentration of TRPH in the samples collected from location MPT-14-SS26 was in compliance with the thermal desorption criteria (Table 1-2) and the SCTLs (Table 1-3).

An environmental sample and duplicate were collected at sampling location MPT-14-SS27 during each sampling event. TRPH appears to increase from nondetect to 60.1 mg/kg in the samples collected during the two baseline sampling events and increased to 111 mg/kg in the performance evaluation sample. The RPDs calculated for the April 1996 and July 1996 sampling events were 33 and 35 percent. There is no RPD criterion to evaluate TRPH. One baseline sample result (14S02701, Table 3-3) was not in compliance with the thermal desorption criterion (Table 1-2). However, the RPD for the April 1996 sample results suggests that there is some uncertainty with this exceedance. The other baseline sample results for sampling location MPT-14-SS27 were in conformance with the thermal desorption criteria (Table 1-2) and the SCTLs (Table 1-3). The performance evaluation samples (14S02701 and 14S02701D, Table 3-3) were not in conformance with the thermal desorption criteria (Table 1-2), but were in conformance with the SCTLs (Table 1-3).

The baseline environmental sample and duplicate collected in January 1996 at sampling location MPT-14-SS28 were not in conformance with either the thermal desorption criteria (Table 1-2) or the SCTLs (Table 1-3). The subsequent baseline sample collected in April 1996 contained substantially less TRPH, but TRPH appears to increase in the sample collected for the performance evaluation event. The performance evaluation sample contained TRPH at concentrations that were not in conformance with the thermal desorption criteria (Table 1-2), but are in conformance with the SCTLs (Table 1-3).

**3.2.2 Subsurface Soil Samples** VOCs and PAHs, if present, were not detected at concentrations that exceeded the detection limit in the subsurface soil samples (Table 3-4).

 µg/kg = micrograms per kilogram.  
 -- = target analyte, if present, was less than the detection limit.  
 NA = not analyzed.  
 mg/kg = milligrams per kilogram.  
 J = estimated value.  
 TRPH = total recoverable petroleum hydrocarbons.

The inorganic analytes (arsenic, barium, chromium, and lead) were detected in the baseline and performance samples (Table 3-4). Four inorganic chemicals (cadmium, mercury, selenium, and silver) that were target analytes of the baseline and performance evaluation samples, if present, were less than the detection limits.

Beryllium, copper, vanadium, and zinc were also detected in the subsurface soil sample collected at monitoring well MPT-14-MW10S. These four inorganic chemicals were not target analytes for the baseline and performance sampling events.

None of the inorganic analytes (Table 3-4) were detected at concentrations that exceeded the thermal desorption criteria (Table 1-2) or the SCTLs (Table 1-3). TRPH, if present, was not detected at concentrations exceeding the detection limits in the baseline subsurface soil samples collected in January 1996, from locations MPT-14-SS26 and MPT-14-SS27. TRPH was detected in the baseline subsurface soil sample collected in January 1996, from location MPT-14-SS28 at a concentration that is not in conformance with the thermal desorption criterion (Table 1-2) or the SCTLs (Table 1-3).

TRPH, if present, was not detected in the baseline subsurface soil sample collected in April 1996, from location MPT-14-SS26. TRPH was detected in the baseline subsurface soil samples collected in April 1996, from locations MPT-14-SS27 and MPT-14-SS28 at concentrations that were in conformance with the thermal desorption criterion and the SCTLs.

TRPH was detected in the performance evaluation subsurface soil samples collected in July 1996, from locations MPT-14-SS26 and MPT-14-SS28 at concentrations that were in conformance with the thermal desorption criteria and the SCTLs. TRPH was detected in the performance evaluation subsurface soil sample collected in July 1996, from location MPT-14-SS27 at a concentration that was not in conformance with the thermal desorption criterion, but was in conformance with the SCTLs.

**3.3 RAINFALL AND TEMPERATURE.** Maximum and minimum air temperature measurements were obtained along with daily rainfall amounts and from the NAVSTA Mayport meteorology department. Temperature and rainfall measurements for the initial attempt to conduct the technology demonstration during winter months are provided in Table 3-5, and Table 3-6 includes temperature and rainfall measurements for May and June 1996 when the technology demonstration was resumed.

The technology demonstration was suspended by RHS on February 5, 1996, because of colder than normal temperatures. Biological degradation has been observed at soil temperatures ranging from 32 (0 degrees centigrade) to 77 degrees Fahrenheit (25 degrees centigrade), with a doubling in the microbial activity for every increase of 18 degrees Fahrenheit (10 degrees centigrade) (Sayles et al., 1992).

#### 4.0 EVALUATION OF RHS TECHNOLOGY DEMONSTRATION

Technology Demonstration at Detention Pond. RHS did not collect surface water samples during the technology demonstration at the detention pond.

Soil Treatment Area. RHS conducted field screening analysis for TRPH to assess whether or not the bioremediation activities appear to be working successfully. They also collected soil samples for laboratory confirmation. A summary of the RHS laboratory analytical results for TRPH is provided in Table 4-1. Sampling locations are provided in their report, *NELP Technology Demonstration Bio-remediation of Concrete Surfaces and Soil at SWMU 14* (RHS, 1996).

The baseline surface soil samples collected by RHS in February 1996 were not in conformance with the thermal desorption criteria (Table 1-2) and the SCTLs (Table 1-3). Analytical results of TRPH for surface soil samples collected in May 1966 by RHS suggest that each of the results exceeded the thermal desorption criteria and only one of the samples contained TRPH at a concentration that exceeded the TRPH SCTL. The soil samples collected in May and July 1966 by RHS did not contain TRPH at concentrations that exceeded the thermal desorption criteria or SCTL for TRPH.

<sup>1</sup> Sample locations are provided in the RHS report entitled *NELP Technology Demonstration Bioremediation of Concrete Surfaces and Soil at SWMU 14, Naval Air Station, Mayport, Florida* (RHS, 1996).

<sup>2</sup> RHS split samples with ABB Environmental Services, Inc., at locations MPT-14-SS26, MPT-14-SS27, and MPT-14-SS28 (Figure 2-1).

Notes: RHS = RHS Environmental Services, Inc.  
 SWMU = Solid Waste Management Unit.  
 in bls = inches below the land surface.  
 NS = sample for laboratory analysis not collected on this date.  
 - = total recoverable petroleum hydrocarbons, if present, were less than the detection limit.  
 NA = quality control sample; data not available.

**SAMPLING CALCULATIONS**

## PROJECT

NELP Implementation Plan 2001.14

sampling calculations

COMP. BY

UH

CHK. BY

JOB NO.

06034.33

DATE

2.1.95

Determine the number of samples and locations of samples necessary for Baseline soil sampling

- Given:
- length of detention basin adjacent to arc of soil contamination = 55 feet
  - 100 yd<sup>3</sup> of soil will be treated

- Assumptions:
- area of soil to be treated is 55 feet (width of detention basin) by 25 feet
  - Assume a hot spot radius of  $L = 12$  feet

Using the R.O. Gilbert model to determine grid spacing:

- Assume:
- $\beta = 0.1$  (assumes a 90% probability of finding a hotspot)
  - a square shaped grid
  - $S = 0.5$  (a conservative elliptical shape)

Using  $\beta$  and  $S$  look on Figure 10.3 and find  $\frac{L}{G} = 0.85$

$$\frac{L}{G} = 0.85 \quad \text{where } L = 12 \text{ feet}$$

$$G = \frac{12 \text{ feet}}{0.85} = 14.12 \text{ feet} \sim 14 \text{ feet}$$

Now plot the grid based on the grid spacing (see next page)

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA National Functional Guidelines for Organic Data Review, (12/90, Revised 6/91) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms and all necessary raw data were present in legible form in the data package.

Yes:  X  No:      

## III. Technical Holding Times

Technical holding times for all samples were verified from raw data and chain of custody forms.

1. Technical holding times were within the allowable limits shown below:

a. Preserved water samples analyzed  $\leq 14$  days from date of sample collection.

Yes:  X  No:       N/A:      

b. Unpreserved water samples, aromatic VOCs analyzed  $\leq 7$  days from date of sample collection; non-aromatic VOCs analyzed  $\leq 14$  days from date of sample collection.

Yes:       No:       N/A:  X

c. Soil samples analyzed  $\leq 14$  days from date of sample collection.

Yes:  X  No:       N/A:      

Comment: All samples were received at the laboratory with a temperature of 10°C. This exceeds the 4°C  $\pm$  2°C criteria, therefore, all associated sample results were qualified as estimated "J/UJ."

#### IV. Initial Calibration (ICAL)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. An initial 5-point calibration was run for each compound at concentrations of 5, 10, 20, 35, and 100 ug/L.

Yes:  X  No:

2. The RRF percent relative standard deviation (% RSD) results from the initial calibration met QC acceptance criteria for each compound.

Yes:   No:  X

Comment: Several compounds exceeded the 20% RSD QC criteria, however, all results were previously qualified as estimated "UJ" due to temperature problems, therefore, no further action was taken.

#### V. Continuing Calibration

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. A continuing calibration standard containing all target compounds was analyzed at the beginning of each 12-hour analysis period following the analysis of the instrument performance check and prior to the analysis of any blanks or samples.

Yes:  X  No:

2. The continuing calibration concentration for each compound was within the specified range.

Yes:  X  No:

3. The retention times (RT) for each compound was within the specified RT window.

Yes:  X  No:

4. Comments: The following calibration calculations were verified during the validation process.

MF001 VAR3600 DB624 1/16/96 Bromomethane Mean RT=(Sum RT)/5 (0.1689+0.2157+0.3311 +0.4202+0.6561)/5= 0.3584	MF001 VAR3600 DB624 1/16/96 Bromomethane % RSD=(Std.Deviation/Mean)* 100 % RSD=(0.1933/0.3584)*100 % RSD=53.93%	MF001 VAR3600 1/17/96 Bromomethane 20 ppb 12111/365734= =0.033114
---	---	---

## VI. Blanks

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

### A. Laboratory Blanks

- Laboratory method blanks were analyzed for each matrix type, concentration level, and for each 12 hour time period on each GC system used to analyze samples.

Yes:   X                        No:       

- All laboratory blanks were found to be free of contaminant target compounds at detectable concentrations.

Yes:   X                        No:       

Comment: The following table summarizes laboratory blank results:

Volatile Laboratory Blank Summary Table SDG No. MF001								
Blank ID/Date Analyzed	Affected Analyte	Conc. ug/l or ug/kg	Action Level ** ug/l or ug/kg	Affected Sample	Lab Conc ug/l or ug/kg	Lab Qual	EDS Conc ug/l or ug/kg	EDS Qual
VWB10117 1/17/96	None Found	--	--	--	--	--	--	--
VSB10117 1/17/96	None Found	--	--	--	--	--	--	--

## B. Field Blanks

1. The field blanks associated with samples in the SDG met the following conditions:

a. All field blanks were found to be free of target analytes at detectable concentrations.

Yes:  X  No:   N/A:

Comment: The following table summarizes field blank results:

Volatile Field Blank Summary Table SDG No. MF001								
Blank ID/Date Analyzed	Affected Analyte	Conc. ug/l	Action Level ** ug/l	Affected Sample	Lab Conc ug/l	Lab Qual	EDS Conc ug/l	EDS Qual
14T001 1/18/96	None Found	--	--	--	--	--	--	--
14Y001 1/18/96	None Found	--	--	--	--	--	--	--
14R001 1/18/96	None Found	--	--	--	--	--	--	--

## VII. System Monitoring Compounds (Surrogates)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. System monitoring compound recovery results met the QC acceptance criteria for fluorobenzene.

Yes:   No:  X

2. Sample reanalysis was performed if system monitoring results were outside of criteria.

Yes:  X  No:   N/A:

Comment: Samples 14S02701, 14S02701D and 14B02702 exhibited a high fluorobenzene % recovery. Sample 14B02702 was reanalyzed (14B02702R) with similar results. The laboratory did not reanalyze 14S02701 or

14S02701D, stating that since these were the duplicate pair no further action was necessary. All results for 14S02701, 14S02701D, 14B02702 and 14B02702R would be qualified as estimated "J" for positive results, however, there were no positive results reported for any of these samples, therefore, no qualifications were required.

### VIII. Matrix Spikes/Matrix Spike Duplicates

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one field sample of each type was spiked for MS/MSD analysis.

Yes:  X  No:      

2. MS/MSD sample I.D.: 14S02701

3. MS/MSD sample results met QC acceptance criteria.

Yes:  X  No:       NA:      

4. Comment: MS/MSD criteria have been met and no action has been taken.

### IX. Laboratory Control Samples (LCS)

Laboratory control charts were included in the data packages.

1. Laboratory control charts were provided for each surrogate for reagent blank analyses per batch.

Yes:  X  No:       N/A:      

2. The percent recoveries were within acceptable QC limits.

Yes:  X  No:       N/A:      

Comment: LCS criteria have been met and no action has been taken.

## X. Field Duplicates

1. The following duplicate set(s) was analyzed with this SDG:
  - a. 14S02701 and 14S02701D
2. Comment: There were no positive results for either duplicate sample.

## XI. Compound Quantitation and Reported CRQLS

Compound quantitation and reported CRQLs are not verified for Level C data validation.

1. All Form I sample results which were verified were correctly calculated and reported.  
Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X
2. All sample compounds had on-column concentrations within the upper calibration range of the method.  
Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_
3. All samples were analyzed only once (i.e., no samples required re-analysis or dilution).  
Yes: \_\_\_\_\_ No:  X  N/A: \_\_\_\_\_

## XII. System Performance

1. The instrumental and analytical systems used in the analysis of these samples maintained an acceptable level of performance.  
Yes:  X  No: \_\_\_\_\_

## XIII. Overall Assessment of Data

The final validated results represent the compilation of all quality control qualification. With the exception of the quality control anomalies presented in Section III (Holding Times) of this report and the resulting qualifiers, the analyses of environmental samples and quality control samples are valid within the constraints identified with the data quality flags.

## Organic Data Qualifiers

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA National Functional Guidelines for Organic Data Review, (12/90, Revised 6/91) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms and all necessary raw data were present in legible form in the data package.

Yes:  X  No:      

## III. Technical Holding Times

Technical holding times for all samples were verified from raw data and chain of custody forms.

1. Technical holding times were within the allowable limits shown below:

a. Water samples extracted < 7 days from date of sample collection; analyzed < 40 days from date of extraction.

Yes:  X  No:       N/A:      

b. Soil samples extracted < 14 days from date of sample collection; analyzed < 40 days from date of extraction.

Yes:  X  No:       N/A:      

Comment: Holding time criteria have been met and no action has been taken.

## IV. Calibration

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. Were initial calibration data reviewed and found to meet all method requirements?

Yes:  X  No:

Comment: Initial calibration criteria have been met and no action has been taken.

2. Were continuing calibration data reviewed and found to meet all method requirements?

Yes:  X  No:

Comment: Calibration criteria have been met and no action has been taken. All %D values were less than 15.0%.

3. Did the laboratory meet the linearity check criteria?

Yes:  X  No:

Comment: Linearity check criteria have been met and no action has been taken. The coefficient of determination for each calibration curve was greater than 0.995.

4. Were the retention times within specified limits?

Yes:  X  No:

Comment: Retention time criteria have been met and no action has been taken.

The following calculations were verified for this data package:

PNAs MF001 RTX-5 H8904 8/2/95 Anthracene mean RT= $20.56+20.55+20.55+20.55+$ $20.56/5 = 20.554$	PNAs MF001 RTX-5 H8904 1/19/96 Anthracene 0.5 Std = area ratio = $203373/605903 = 0.33565$	PNAs MF001 RTX-5 H8904 1/15/96 Naphthalene %D = $(19.32-19.76)/19.32 \times$ $100 = -2.3\%$
---	--	--

## V. Blanks

### A. Laboratory Blanks

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. A method blank analysis was performed for every 20 samples of a similar matrix type in each SDG.

Yes:  X  No:

2. Laboratory method blanks were found to be clean of target compound contamination at detectable concentrations.

Yes:  X  No:

3. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:   No:   NA:  X

Comment: Blank criteria have been met and no action has been taken. Laboratory blanks WBLK01 and SBLK01 were free of contamination.

### B. Field Blanks

1. Field blanks were found to be clean of target compound contamination at detectable concentrations.

Yes:  X  No:   N/A:

2. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:   No:   N/A:  X

Comment: Field blank 14Y001 and rinsate blank 14R001 were both free of contamination.

### VI. Surrogate Spike Compounds

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. The surrogate spike %R values were within the QC advisory limits for terphenyl-d14.

Yes:  X  No:

Comment: Surrogate criteria have been met and no action has been taken.

### VII. Matrix Spikes/Matrix Spike Duplicates (MS/MSD)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one field sample of each type was spiked for MS/MSD analysis.

Yes:  X  No: \_\_\_\_\_

2. MS/MSD sample I.D.: 14S02701

3. MS/MSD sample results were acceptable.

Yes:  X  No: \_\_\_\_\_

Comment: MS/MSD criteria have been met and no action has been taken.

### VIII. Blank Spikes

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one blank sample of each type was spiked for BS analysis.

Yes:  X  No: \_\_\_\_\_

2. Blank Spike sample I.D.: BS011161

3. Blank spike sample results were within acceptable QC limits.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

Comment: BS criteria have been met and no action has been taken.

### IX. Laboratory Control Samples (LCS)

Laboratory control charts were provided for each analysis.

1. For every batch, one LCS of each type was analyzed.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

2. LCS sample I.D.: W01116B1 and S01116B1

3. The percent recoveries for the LCS compound were within acceptable limits.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

Comment: The LCS' performed on 1/15/96 were acceptable.

#### X. Field Duplicates

1. The following duplicate set was analyzed with this SDG:
  - a. 14S02701 and 14S02701D
2. Comment: There were no positive results for either duplicate sample.

#### XI. Target Compound Identification

Target compound identification is not reviewed for Level C validation.

#### XII. Compound Quantitation and Reported CRQLS

Compound quantitation and reported CRQLS are not reviewed for Level C validation.

1. CRQL values were adjusted to reflect all sample volumes, sample dilutions, concentrations, cleanup activities, and dry weight factors not accounted for by the method.

Yes:  X                       No:                            N/A:     

2. Comments: The laboratory raised the reporting limits for phenanthrene in samples 14S02701 and 14B02702 due to chemical interferences during analysis. The laboratory qualified phenanthrene "UI" and the reviewer further qualified this compound as estimated "UJ."

#### XIII. Overall Assessment of Data

The final validated results represent the compilation of all quality control qualification. With the exception of the quality control anomalies presented in Section XII (Compound Quantitation) of this report and the resulting qualifiers, the analyses of environmental samples and quality control samples are valid within the constraints identified with the data quality flags.

## **Organic Data Qualifiers**

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA Functional Guidelines for Inorganic Analyses (7/88) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms are present and in legible form in the data package.

Yes:  X  No:      

2. Lab control charts were received and data points were within the control limit windows.

Yes:  X  No:       N/A:      

Note: If data points are outside of control limit windows, refer to the Laboratory Control Sample section VIII for any effect on data quality.

## III. Technical Holding Times

Chain of custody records and sample preparation logs (Form 13) were checked for all samples to verify that technical holding time, and preservation criteria were met.

1. Technical holding times were within the allowable limits shown below:
  - a. Analysis for all metals was completed within 180 days of sample collection; mercury was completed within 28 days.

Yes:  X  No:      

Comment: Holding time criteria have been met and no action has been taken.

#### IV. Instrument Calibration and Calibration Verification

One hundred percent of the calibration results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. Instrument calibration for metals determined by inductively coupled plasma spectroscopy (ICP) was performed using a blank and one standard for each analyte.

Yes:  X  No:      

2. Instrument calibration for metals determined by graphite furnace atomic absorption spectroscopy (GFAA) was performed using a blank and three standards (one of which was at the CRDL).

Yes:  X  No:      

3. Instrument calibration for mercury was performed using a blank and four standards.

Yes:  X  No:       N/A:      

4. Instrument calibration for cyanide was performed using a blank and three standards (one of which was at the CRDL).

Yes:       No:       N/A:  X

5. Calibration verification was performed for each analyte at a frequency of 10%.

Yes:  X  No:      

6. A continuing calibration verification (CCV) was performed after the last analytical sample in each run.

Yes:  X  No:      

7. Initial calibration verification (ICV) and CCV percent recovery (%R) values met the criteria specified below:

a. For all metals except cyanide and mercury, %R results were between 90% and 110%.

Note: Due to possible rounding errors, allow results to fall within 1% of the contract windows (e.g. 89-111%).

Yes:  X  No:

8. Correlation coefficients for GFAA analytes, mercury, and cyanide calibration curves were greater than or equal to 0.995.

Yes:   No:   N/A:  X

Comment: Raw data was not provided for this Level C SDG; therefore, calibration curves were not available.

9. Comments: The following calibration calculations were verified during the validation process.

ICV or CCV	Analyte	Calculation $\%R = (\text{Found}/\text{True}) \times 100$	% R
ICV	Barium	$2557/2500 \times 100$	102.3
CCV	Barium	$2566/2500 \times 100$	102.6
ICV	Arsenic	$27.25/25.0 \times 100$	109.0
CCV	Arsenic	$25.27/25.0 \times 100$	101.1
ICV	Mercury	$4.73/5.0 \times 100$	94.6
CCV	Mercury	$5.05/5.0 \times 100$	101.0

## V. Blanks

### A. Laboratory Blanks

One hundred percent of the laboratory blank results on the summary forms were checked to ensure that reported results were within required quality control limits.

1. Preparation blank analyses results have been reported for each matrix type for every extraction batch.

Yes:  X  No:

2. Calibration blanks were run at a frequency of 10%.

Yes:  X  No:

3. A calibration blank was analyzed immediately after every ICV and CCV, and after the last sample.

Yes:  X  No:

4. All reported blank analyte results had absolute values less than the corresponding IDL values.

Yes:   No:  X

The following sample results were qualified due to laboratory blanks that had target analytes where the absolute value of the reported results was greater than or equal to the corresponding IDL value; sample results were less than 5X the absolute value of the blank result.

Inorganic Laboratory Blank Summary Table SDG No. MF001								
Blank ID/ Date	Affected Analyte	Absolute Conc. ug/L	Action Level ug/L	Affected Sample	Lab Conc ug/L	Lab Qual	EDS Conc ug/L	EDS Qual
PBW 1/15/96	Cadmium	2.41B	NA	14Y001	2.2	U	2.4	UJ
				14R001	2.2	U	2.4	UJ

5. All reported blank analyte results had absolute values less than or equal to the corresponding CRDL values.

Yes:  X  No:

#### B. Field Blanks

1. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:   No:   N/A:  X

2. Analytes were detected, but associated sample aliquot concentrations were greater than 5X the blank concentration.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

Comment: Analytes were not detected in field blanks 14Y001 and 14R001.

## VI. Matrix Spike Sample Recovery

One hundred percent of the matrix spike (MS) sample results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. For SDG MF001, one field sample from each group of samples of a similar matrix and concentration level was spiked with each target analyte (except: Ca, Mg, K, Na on water samples and Al, Ca, Mg, K, and Na on soil/sediment samples) by the laboratory.

Yes:  X  No: \_\_\_\_\_

2. MS sample ID: 14S02701

3. For all target analytes, percent recovery (%R) results were within the limits of 75% - 125% (Note: MS %R limits do not apply when the sample concentration exceeded the spike concentration by a factor of 4 or more).

Yes: \_\_\_\_\_ No:  X

Sample	Analyte	% Recovery	Qualifier
14S02601	Lead	257	J
14B02602	Lead	257	J
14S02701	Lead	257	J
14S02701D	Lead	257	J
14B02701	Lead	257	J

4. The following spike calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation % R = (SSR-SR/SA)*100	% R
ICP	Barium	(430.6-6.46)/426.4 x 100	99.5
GFAA	Lead	(16.18-5.24)/4.26 x 100	256.8
CV	Mercury	(1.00-0.0)/1.04 x 100	96.2

## VII. Interference Check Samples

One hundred percent of the ICS results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

- ICP ICSs (solutions A and AB) were analyzed at the beginning and end of each sample analysis run (or a minimum of twice per 8-hour shift, whichever was more frequent).

Yes:  X  No:      

- Solution AB analyte recovery results were within the control limits of 80%-120%.

Yes:  X  No:      

- Concentrations of Ca, Fe, and Mg in the samples are less than or equal to their respective concentration in ICS solution A or AB.

Yes:       No:       N/A:  X

Comment: Ca, Fe and Mg were not requested analytes.

- Cr is present in a sample(s) at concentrations less than 10,000 ug/L.

Yes:  X  No:       N/A:      

- Comments: ICP ICSs criteria have been met and no action has been taken. The following ICS calculations were verified during the validation process.

Analyte	Calculation % R = (Found Soln AB/True Soln AB)*100	% R
Barium	474/500 x 100	94.8

### VIII. Laboratory Control Sample (LCS)

One hundred percent of the LCS results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. A laboratory control sample was analyzed for each SDG for each matrix type.

Yes:  X  No:      

2. Aqueous LCS recovery results were within the control limits of 80% to 120% (except for Sb and Ag which have no required limits).

Yes:  X  No:       N/A:      

3. Soil LCS recovery results were within the required control limits specified on the laboratory Form VII-IN and control charts.

Yes:  X  No:       N/A:      

Comment: LCS criteria have been met and no action has been taken.

4. The following LCS calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation %R = (Found/True)*100	%R
ICP	Barium	2744/2500 x 100	109.8
GFAA	Lead	51.94/50.0 x 100	103.9
CV	Mercury	5.05/5.0 x 100	101.0

### IX. Duplicate Sample Analysis

One hundred percent of the duplicate results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

**A. Laboratory Duplicates**

1. For each SDG, one duplicate sample was analyzed from each group of samples of a similar matrix type and concentration level.

Yes:  X  No:      

MSD ID: 14S02701, 14S02701D

2. For duplicate analyte concentrations greater than 5X the CRDL, the relative percent difference (RPD) between the two reported results was less than 20% for aqueous samples (35% for soil samples).

Yes:  X  No:      

Comment: Reported lead results were flagged with a "\*" by the laboratory because the RPD for duplicate lead analysis was 32.7. This is within the ± 35 allowed for soil samples.

3. For duplicate analyte concentrations less than 5X the CRDL, the difference between the two reported results was less than the CRDL value for aqueous samples, or less than 2X the CRDL value for soil samples. RPDs for samples with values less than the CRDL are not calculated.

Yes:  X  No:      

4. Comment: Laboratory duplicate criteria have been met and no action has been taken.

5. The following duplicate calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation $RPD = \frac{ S-D }{(S+D)/2} \times 100$ D = S - Dup	RPD or Difference
ICP	Barium	$[(6.46-6.81)/(6.46+6.81)]/2 \times 100$	5.1
GFAA	Lead	$[(5.24-7.29)/(5.24+7.29)]/2 \times 100$	32.7 (±35)
CV	Mercury	$[(0.0-0.0)/(0.0+0.0)]/2 \times 100$	NC

## B. Field Duplicates

1. The following duplicate sets were analyzed with this SDG:
  - a. 14S02701 and 14S02701D
2. Comment: Field duplicate criteria have not been met and no action has been taken.

## X. Furnace Atomic Absorption QC

One hundred percent of the AA summary data was checked to ensure that reported results were within required quality control limits.

1. Duplicate injections for AA analytes with concentrations greater than the CRDL had RSD results < 20%.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

Comment: RSD results are contained in the raw data which is not provided for Level C review.

2. For each sample, all AA analytical spike recovery results were between 85% and 115%.

Yes:  X  No: \_\_\_\_\_

3. For each sample, all AA results were within the appropriate calibration range, or were diluted to meet this criteria.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

4. Sample analyte results where the analytical spike recovery was <40% were diluted once and reanalyzed.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

5. Samples having analyte concentrations greater than or equal to 50% of the spike concentrations, and spike %R results <85% or >115% were quantitated by MSA.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

6. MSA analyses with correlation coefficients less than 0.995 were rerun once.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

7. MSA spike values met the criteria specified below:

- a. Spike 1 was approximately 50% of the sample concentration.
- b. Spike 2 was approximately 100% of the sample concentration.
- c. Spike 3 was approximately 150% of the sample concentration.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

#### XI. ICP Serial Dilution

1. ICP serial dilution analysis was performed on one sample from each SDG of a similar matrix type and concentration level.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

2. For each analyte in the serial dilution sample which was minimally a factor of 50 above the IDL in the original sample, the serial dilution result agreed within 10% of the original determination after correction for dilution.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

#### XII. Sample Result Verification

Ten percent of all reported sample results were not verified since the raw data is not provided for a Level C data package.

1. All sample results which were verified were correctly calculated and reported.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

Comment: Calculations and transcriptions can not be verified without the raw data.

2. All sample results fall within the linear range of the ICP (Form XIII) and within the calibrated range of the instrument for AA.

Yes:  X  No:      N/A:    

3. All reported concentrations were above the CRDL.

Yes:      No:  X  N/A:    

Comment: The "B" qualifier applied by the laboratory for results between the CRDL and the IDL were amended with a "J" qualifier.

4. Sample results on Form 1 were reported down to the IDL not CRDL for all analytes.

Yes:  X  No:      N/A:    

5. Reported sample results that were analyzed by ICP for As, Pb, Se, and Tl were at least 5X the ICP IDL.

Yes:      No:      N/A:  X

6. Sample weights, volumes and dilutions were taken into account when reporting detection limits on Form 1.

Yes:  X  No:      N/A:    

7. IDLs were present and found to be less than CRDL.

Yes:  X  No:      N/A:    

8. All CRDLs and IDLs were included on Form X.

Yes:  X  No:      N/A:

9. Raw data were free of anomalies (e.g. baseline shifts, negative absorbances/emissions, omissions, etc.). If no, please describe anomalies in the comments section below.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

Comment: Raw data is not provided for Level C review.

### **XIII. Additional Comments/Professional Judgment**

The final validated results represent the compilation of all quality control qualification. With the exception of the quality control anomalies presented in Sections V.A.4, VI.3 and XII.3 and the resulting qualifiers, the analyses of environmental samples and quality control samples are valid within the constraints identified with the data quality flags. All false positive/negative results are summarized on Table A-1.

## Inorganic Data Qualifiers

- U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
- J - The associated value is an estimated quantity.
- R - The data are unusable. (Note: Analyte may or may not be present.)
- UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

**APPENDIX A**

**Summary Tables and Work Sheets**

**Table A-1**  
**Review of False Positive/Negative Results**

Sample	Parameter	False Positive or Negative	Rationale	Reported		Validated	
				Conc. (ug/L)	Qual	Conc. (ug/L)	Qual
14Y001	Cadmium	N	3	2.2	U	2.4	UJ
14R001	Cadmium	N	3	2.2	U	2.4	UJ

**Rationale**

- 1 = Professional judgement
- 2 = Blank contamination (laboratory or field)
- 3 = Prep Blank - negative value > IDL

**Table A-3**  
**Matrix Interferences (Inorganics)**

Sample	Parameter	Initial	Re-analysis ID	Final	Was the Re-analysis Needed?	Most Appropriate Result	Comment
14S02601	Lead	%R=257	NA	NA	NO	4.1	J
14B02602	Lead	%R=257	NA	NA	NO	1.6	J
14S02701	Lead	%R=257	NA	NA	NO	5.2	J

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA National Functional Guidelines for Organic Data Review, (12/90, Revised 6/91) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms and all necessary raw data were present in legible form in the data package.

Yes:  X  No:

## III. Technical Holding Times

Technical holding times for all samples were verified from raw data and chain of custody forms.

1. Technical holding times were within the allowable limits shown below:

a. Preserved water samples analyzed  $\leq 14$  days from date of sample collection.

Yes:  X  No:   N/A:

b. Unpreserved water samples, aromatic VOCs analyzed  $\leq 7$  days from date of sample collection; non-aromatic VOCs analyzed  $\leq 14$  days from date of sample collection.

Yes:   No:   N/A:  X

c. Soil samples analyzed  $\leq 14$  days from date of sample collection.

Yes:   No:   N/A:  X

Comment: Holding time criteria have been met and no action has been taken.

#### IV. Initial Calibration (ICAL)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. An initial 5-point calibration was run for each compound at concentrations of 5, 10, 20, 50, and 100 ug/L.

Yes:   X              No:       

2. The RRF percent relative standard deviation (% RSD) results from the initial calibration met QC acceptance criteria for each compound.

Yes:   X              No:       

#### V. Continuing Calibration

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. A continuing calibration standard containing all target compounds was analyzed at the beginning of each 12-hour analysis period following the analysis of the instrument performance check and prior to the analysis of any blanks or samples.

Yes:   X              No:       

2. The continuing calibration concentration for each compound was within the specified range.

Yes:   X              No:       

3. The retention times (RT) for each compound was within the specified RT window.

Yes:   X              No:       

4. Comments: The following calibration calculations were verified during the validation process.

MF002 VAR3600 DB624 1/16/96 Chlorobenzene Mean RT=(Sum RT)/5 (1.0920+0.9960+0.9457 +0.9382+0.9597)/5= 0.9863	MF002 VAR3600 DB624 1/16/96 Chlorobenzene % RSD=(Std.Deviation/Mean)* 100 % RSD=(0.063/0.9863)*100 % RSD=6.38%	MF002 VAR3600 1/18/96 Benzene % Recovery = 21.39/20.00 = 107%
--	--	---

## VI. Blanks

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

### A. Laboratory Blanks

- Laboratory method blanks were analyzed for each matrix type, concentration level, and for each 12 hour time period on each GC system used to analyze samples.

Yes:  X  No:      

- All laboratory blanks were found to be free of contaminant target compounds at detectable concentrations.

Yes:  X  No:      

Comment: The following table summarizes laboratory blank results:

Volatile Laboratory Blank Summary Table SDG No. MF002								
Blank ID/Date Analyzed	Affected Analyte	Conc. ug/l	Action Level ** ug/l	Affected Sample	Lab Conc ug/l	Lab Qual	EDS Conc ug/l	EDS Qual
VWB10118 1/18/96	None Found	--	--	--	--	--	--	--

### B. Field Blanks

- The field blanks associated with samples in the SDG met the following conditions:

- All field blanks were found to be free of target analytes at detectable concentrations.

Yes:  X  No:   N/A:

Comment: The following table summarizes field blank results:

Volatile Field Blank Summary Table SDG No. MF002								
Blank ID/Date Analyzed	Affected Analyte	Conc. ug/l	Action Level ** ug/l	Affected Sample	Lab Conc ug/l	Lab Qual	EDS Conc ug/l	EDS Qual
14T002 1/18/96	None Found	--	--	--	--	--	--	--
14R002 1/18/96	None Found	--	--	--	--	--	--	--
14Y002 1/18/96	None Found	--	--	--	--	--	--	--

#### VII. System Monitoring Compounds (Surrogates)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. System monitoring compound recovery results met the QC acceptance criteria for fluorobenzene.

Yes:  X  No:

2. Sample reanalysis was performed if system monitoring results were outside of criteria.

Yes:   No:   N/A:  X

Comment: Surrogate criteria have been met and no action has been taken.

#### VIII. Matrix Spikes/Matrix Spike Duplicates

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one field sample of each type was spiked for MS/MSD analysis.

Yes:  X  No: \_\_\_\_\_

2. MS/MSD sample I.D.: 14W010

3. MS/MSD sample results met QC acceptance criteria.

Yes:  X  No: \_\_\_\_\_ NA: \_\_\_\_\_

4. Comment: MS/MSD criteria have been met and no action has been taken.

#### **IX. Laboratory Control Samples (LCS)**

Laboratory control charts were included in the data packages.

1. Laboratory control charts were provided for each surrogate for reagent blank analyses per batch.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

2. The percent recoveries were within acceptable QC limits.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

Comment: LCS criteria have been met and no action has been taken.

#### **X. Field Duplicates**

1. The following duplicate set(s) was analyzed with this SDG:

a. 14W010 and 14W010D

2. Comment: There were no positive results for either duplicate sample.

#### **XI. Compound Quantitation and Reported CRQLS**

Compound quantitation and reported CRQLs are not verified for Level C data validation.

1. All Form I sample results which were verified were correctly calculated and reported.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A: X

2. All sample compounds had on-column concentrations within the upper calibration range of the method.

Yes: X No: \_\_\_\_\_ N/A: \_\_\_\_\_

3. All samples were analyzed only once (i.e., no samples required re-analysis or dilution).

Yes: X No: \_\_\_\_\_ N/A: \_\_\_\_\_

## XII. System Performance

1. The instrumental and analytical systems used in the analysis of these samples maintained an acceptable level of performance.

Yes: X No: \_\_\_\_\_

## XIII. Overall Assessment of Data

The final validated results represent the compilation of all quality control qualification. The analyses of environmental samples and quality control samples are valid.

## Organic Data Qualifiers

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA National Functional Guidelines for Organic Data Review, (12/90, Revised 6/91) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms and all necessary raw data were present in legible form in the data package.

Yes:  X  No:

## III. Technical Holding Times

Technical holding times for all samples were verified from raw data and chain of custody forms.

1. Technical holding times were within the allowable limits shown below:

a. Water samples extracted <7 days from date of sample collection; analyzed <40 days from date of extraction.

Yes:  X  No:   N/A:

b. Soil samples extracted <14 days from date of sample collection; analyzed <40 days from date of extraction.

Yes:   No:   N/A:  X

Comment: Holding time criteria have been met and no action has been taken.

## IV. Calibration

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. Were initial calibration data reviewed and found to meet all method requirements?

Yes:  X  No:

Comment: Initial calibration criteria have been met and no action has been taken.

2. Were continuing calibration data reviewed and found to meet all method requirements?

Yes:  X  No: \_\_\_\_\_

Comment: Calibration criteria have been met and no action has been taken. All %D values were less than 15.0%.

3. Did the laboratory meet the linearity check criteria?

Yes:  X  No: \_\_\_\_\_

Comment: Linearity check criteria have been met and no action has been taken. The coefficient of determination for each calibration curve was greater than 0.995.

4. Were the retention times within specified limits?

Yes:  X  No: \_\_\_\_\_

Comment: Retention time criteria have been met and no action has been taken.

The following calculations were verified for this data package:

PNAs MF002 RTX-5 GC #4 8/2/95 Naphthalene mean RT= $10.55 + 10.52 + 10.52 + 10.52 +$ $10.52 / 5 = 10.526$	PNAs MF002 RTX-5 GC #4 1/19/96 Naphthalene 0.5 Std = area ratio = $174560 / 919526 = 0.18984$	PNAs MF002 RTX-5 1/17/96 Fluorene $\%D = (19.34 - 19.74) / 19.34 \times$ $100 = -2.1\%$
---	---	--

## V. Blanks

### A. Laboratory Blanks

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. A method blank analysis was performed for every 20 samples of a similar matrix type in each SDG.

Yes:  X  No: \_\_\_\_\_

2. Laboratory method blanks were found to be clean of target compound contamination at detectable concentrations.

Yes:  X  No:      

3. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:       No:       NA:  X

Comment: Blank criteria have been met and no action has been taken.  
Laboratory blank WBLK01 was free of contamination.

### B. Field Blanks

1. Field blanks were found to be clean of target compound contamination at detectable concentrations.

Yes:  X  No:       N/A:      

2. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:       No:       N/A:  X

Comment: Field blank 14Y002 and rinsate blank 14R002 were both free of contamination.

### VI. Surrogate Spike Compounds

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. The surrogate spike %R values were within the QC advisory limits for terphenyl-d14.

Yes:  X  No:      

Comment: Surrogate criteria have been met and no action has been taken.

### VII. Matrix Spikes/Matrix Spike Duplicates (MS/MSD)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one field sample of each type was spiked for MS/MSD analysis.

Yes:  X  No:      

2. MS/MSD sample I.D.: 14W010

3. MS/MSD sample results were acceptable.

Yes:  X  No:      

Comment: MS/MSD criteria have been met and no action has been taken. Due to the dilution requirements of 14W010, several of the spiking compounds recovered below the reporting limits. No action was taken by the reviewer on this basis.

### VIII. Blank Spikes

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one blank sample of each type was spiked for BS analysis.

Yes:  X  No:      

2. Blank Spike sample I.D.: BW011561

3. Blank spike sample results were within acceptable QC limits.

Yes:  X  No:       N/A:      

Comment: BS criteria have been met and no action has been taken.

### IX. Laboratory Control Samples (LCS)

Laboratory control charts were provided for each analysis.

1. For every batch, one LCS of each type was analyzed.

Yes:  X  No:       N/A:      

2. LCS sample I.D.: W01156B1

3. The percent recoveries for the LCS compound were within acceptable limits.

Yes:  X  No:       N/A:      

Comment: The LCS performed on 1/17/96 was acceptable.

#### X. Field Duplicates

1. The following duplicate set was analyzed with this SDG:
  - a. 14W010 and 14W010D
2. Comment: There were no positive results for either duplicate sample.

#### XI. Target Compound Identification

Target compound identification is not reviewed for Level C validation.

#### XII. Compound Quantitation and Reported CRQLS

Compound quantitation and reported CRQLS are not reviewed for Level C validation.

1. CRQL values were adjusted to reflect all sample volumes, sample dilutions, concentrations, cleanup activities, and dry weight factors not accounted for by the method.

Yes:  X  No:       N/A:      

2. Comments: Samples 14W009, 14W010, 14W010D, 14W011 and 14W012 were diluted due to chemical interferences. These samples also exhibited chromatographic interferences for phenanthrene and/or anthracene. The laboratory raised the reporting limits for these compounds and flagged them as "UI." The reviewer further qualified these compounds as estimated "UI."

#### XIII. Overall Assessment of Data

The final validated results represent the compilation of all quality control qualification. With the exception of the quality control anomalies presented in Section XII (Compound Quantitation) of this report and the resulting qualifiers, the analyses of environmental samples and quality control samples are valid within the constraints identified with the data quality flags.

## Organic Data Qualifiers

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA Functional Guidelines for Inorganic Analyses (7/88) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms are present and in legible form in the data package.

Yes:   X              No:       

2. Lab control charts were received and data points were within the control limit windows.

Yes:   X              No:                   N/A:       

Note: If data points are outside of control limit windows, refer to the Laboratory Control Sample section VIII for any effect on data quality.

## III. Technical Holding Times

Chain of custody records and sample preparation logs (Form 13) were checked for all samples to verify that technical holding time, and preservation criteria were met.

1. Technical holding times were within the allowable limits shown below:
  - a. Analysis for all metals was completed within 180 days of sample collection; mercury was completed within 28 days.

Yes:   X              No:       

Comment: Holding time criteria have been met and no action has been taken.

Note: Due to possible rounding errors, allow results to fall within 1% of the contract windows (e.g. 89-111%).

Yes:  X  No:

8. Correlation coefficients for GFAA analytes, mercury, and cyanide calibration curves were greater than or equal to 0.995.

Yes:   No:   N/A:  X

Comment: Raw data was not provided for this Level C SDG; therefore, calibration curves were not available.

9. Comments: The following calibration calculations were verified during the validation process.

ICV or CCV	Analyte	Calculation $\% R = (\text{Found}/\text{True}) * 100$	% R
ICV	Lead	$24.85/25.0 \times 100$	99.4
CCV	Lead	$23.97/25.0 \times 100$	95.9
ICV	Mercury	$4.98/5.0 \times 100$	99.6
CCV	Mercury	$5.12/5.0 \times 100$	102.4

## V. Blanks

### A. Laboratory Blanks

One hundred percent of the laboratory blank results on the summary forms were checked to ensure that reported results were within required quality control limits.

1. Preparation blank analyses results have been reported for each matrix type for every extraction batch.

Yes:  X  No:

2. Calibration blanks were run at a frequency of 10%.

Yes:  X  No:

3. A calibration blank was analyzed immediately after every ICV and CCV, and after the last sample.

Yes:  X  No:      

4. All reported blank analyte results had absolute values less than the corresponding IDL values.

Yes:  X  No:      

5. All reported blank analyte results had absolute values less than or equal to the corresponding CRDL values.

Yes:  X  No:      

**B. Field Blanks**

1. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:       No:  X  N/A:      

2. Analytes were detected, but associated sample aliquot concentrations were greater than 5X the blank concentration.

Yes:       No:  X  N/A:      

The following sample results were qualified due to field blanks that had target analytes where the absolute value of the reported results was greater than or equal to the corresponding IDL value; sample results were less than 5X the absolute value of the blank result.

Inorganic Field Blank Summary Table SDG No. MF002								
Blank ID	Affected Analyte	Absolute Conc. ug/L	Action Level ug/L	Affected Sample	Lab Conc ug/L	Lab Qual	EDS Conc ug/L	EDS Qual
14Y002	Lead	7.2	36.0	14W009	3.1	--	7.2	UJ
				14W010	2.8	B	7.2	UJ
				14W010D	1.8	B	7.2	UJ
				14W011	2.4	B	7.2	UJ
				14W012	2.7	B	7.2	UJ

## VI. Matrix Spike Sample Recovery

One hundred percent of the matrix spike (MS) sample results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. For SDG MF002, one field sample from each group of samples of a similar matrix and concentration level was spiked with each target analyte (except: Ca, Mg, K, Na on water samples and Al, Ca, Mg, K, and Na on soil/sediment samples) by the laboratory.

Yes:  X  No:

2. MS sample ID: 14W010

3. For all target analytes, percent recovery (%R) results were within the limits of 75% - 125% (Note: MS %R limits do not apply when the sample concentration exceeded the spike concentration by a factor of 4 or more).

Yes:  X  No:

4. The following spike calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation %R = (SSR-SR/SA)*100	%R
GFAA	Lead	$(22.8-2.83)/20.0 \times 100$	99.8
CV	Mercury	$(1.78-0.0)/2.0 \times 100$	89.0

## VII. Interference Check Samples

One hundred percent of the ICS results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. ICP ICSs (solutions A and AB) were analyzed at the beginning and end of each sample analysis run (or a minimum of twice per 8-hour shift, whichever was more frequent).

Yes:   No:   N/A:  X

2. Solution AB analyte recovery results were within the control limits of 80% - 120%.

Yes:  No:  N/A:

3. Concentrations of Ca, Fe, and Mg in the samples are less than or equal to their respective concentration in ICS solution A or AB.

Yes:  No:  N/A:

4. Cr, Cu, Ni, and V are present in a sample(s) at concentrations less than 10,000 ug/L.

Yes:  No:  N/A:

5. Comments: None.

### VIII. Laboratory Control Sample (LCS)

One hundred percent of the LCS results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. A laboratory control sample was analyzed for each SDG for each matrix type.

Yes:  No:

2. Aqueous LCS recovery results were within the control limits of 80% to 120% (except for Sb and Ag which have no required limits).

Yes:  No:  N/A:

3. Soil LCS recovery results were within the required control limits specified on the laboratory Form VII-IN and control charts.

Yes:  No:  N/A:

Comment: LCS criteria have been met and no action has been taken.

4. The following LCS calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation % R = (Found/True)*100	% R
GFAA	Lead	51.9/50.0 x 100	103.8
CV	Mercury	5.05/5.0 x 100	101.0

## IX. Duplicate Sample Analysis

One hundred percent of the duplicate results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

### A. Laboratory Duplicates

1. For each SDG, one duplicate sample was analyzed from each group of samples of a similar matrix type and concentration level.

Yes:  X  No:      

MSD ID: 14W010

2. For duplicate analyte concentrations greater than 5X the CRDL, the relative percent difference (RPD) between the two reported results was less than 20% for aqueous samples (35% for soil samples).

Yes:  X  No:      

3. For duplicate analyte concentrations less than 5X the CRDL, the difference between the two reported results was less than the CRDL value for aqueous samples, or less than 2X the CRDL value for soil samples. RPDs for samples with values less than the CRDL are not calculated.

Yes:  X  No:      

4. Comment: Laboratory duplicate criteria have been met and no action has been taken.

5. The following duplicate calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation $RPD = \frac{S-D}{(S+D/2)} \times 100$ $D = S - \text{Dup}$	RPD or Difference
GFAA	Lead	$[(2.83-2.61)/(2.83+2.61)]/2 \times 100$	8.1
CV	Mercury	$0.0-0.0/0+0/2 \times 100$	NC

### B. Field Duplicates

1. The following duplicate sets were analyzed with this SDG:
  - a. 14W010 and 14W010D
2. Comment: Field duplicate criteria have been met and no action has been taken.

### X. Furnace Atomic Absorption QC

One hundred percent of the AA summary data was checked to ensure that reported results were within required quality control limits.

1. Duplicate injections for AA analytes with concentrations greater than the CRDL had RSD results < 20%.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

Comment: RSD results are contained in the raw data which is not provided for Level C review.

2. For each sample, all AA analytical spike recovery results were between 85% and 115%.

Yes:  X  No: \_\_\_\_\_

3. For each sample, all AA results were within the appropriate calibration range, or were diluted to meet this criteria.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

4. Sample analyte results where the analytical spike recovery was <40% were diluted once and reanalyzed.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

5. Samples having analyte concentrations greater than or equal to 50% of the spike concentrations, and spike %R results <85% or >115% were quantitated by MSA.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

6. MSA analyses with correlation coefficients less than 0.995 were rerun once.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

7. MSA spike values met the criteria specified below:

- a. Spike 1 was approximately 50% of the sample concentration.
- b. Spike 2 was approximately 100% of the sample concentration.
- c. Spike 3 was approximately 150% of the sample concentration.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

## XI. ICP Serial Dilution

ICP serial dilution results were provided by the laboratory.

1. ICP serial dilution analysis was performed on one sample from each SDG of a similar matrix type and concentration level.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

2. For each analyte in the serial dilution sample which was minimally a factor of 50 above the IDL in the original sample, the serial dilution result agreed within 10% of the original determination after correction for dilution.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

## XII. Sample Result Verification

Ten percent of all reported sample results were not verified since the raw data is not provided for a Level C data package.

1. All sample results which were verified were correctly calculated and reported.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

Comment: Calculations and transcriptions can not be verified without the raw data.

2. All sample results fall within the calibrated range of the instrument for AA.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

3. All reported concentrations were above the CRDL.

Yes: \_\_\_\_\_ No:  X  N/A: \_\_\_\_\_

Comment: The "B" qualifier applied by the laboratory for results between the CRDL and the IDL were amended with a "J" qualifier.

4. Sample results on Form 1 were reported down to the IDL not CRDL for all analytes.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

5. Reported sample results that were analyzed by ICP for As, Pb, Se, and Tl were at least 5X the ICP IDL.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

6. Sample weights, volumes and dilutions were taken into account when reporting detection limits on Form 1.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

7. IDLs were present and found to be less than CRDL.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

8. All CRDLs and IDLs were included on Form X.

Yes:  X  No:   N/A:

9. Raw data were free of anomalies (e.g. baseline shifts, negative absorbances/emissions, omissions, etc.). If no, please describe anomalies in the comments section below.

Yes:   No:   N/A:  X

Comment: Raw data is not provided for Level C review.

### XIII. Additional Comments/Professional Judgment

The final validated results represent the compilation of all quality control qualification. With the exception of the quality control anomalies presented in Sections V.B.2 and XII.3 and the resulting qualifiers, the analyses of environmental samples and quality control samples are valid within the constraints identified with the data quality flags. All false positive/negative results are summarized on Table A-1.

## Inorganic Data Qualifiers

- U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
- J - The associated value is an estimated quantity.
- R - The data are unusable. (Note: Analyte may or may not be present.)
- UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

**APPENDIX A**

**Summary Tables and Work Sheets**

**Table A-1**  
**Review of False Positive/Negative Results**

Sample	Parameter	False Positive or Negative	Rationale	Reported		Validated	
				Conc. (ug/L)	Qual	Conc. (ug/L)	Qual
14W009	Lead	P	3	3.1	--	7.2	UJ
14W010	Lead	P	3	2.8	B	7.2	UJ
14W010D	Lead	P	3	1.8	B	7.2	UJ
14W011	Lead	P	3	2.4	B	7.2	UJ
14W012	Lead	P	3	2.7	B	7.2	UJ

**Rationale**

- 1 = Professional judgement
- 2 = Blank contamination (laboratory or field)
- 3 = Prep Blank - negative value > IDL

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA National Functional Guidelines for Organic Data Review, (12/90, Revised 6/91) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms and all necessary raw data were present in legible form in the data package.

Yes:  X  No:      

## III. Technical Holding Times

Technical holding times for all samples were verified from raw data and chain of custody forms.

1. Technical holding times were within the allowable limits shown below:

a. Preserved water samples analyzed  $\leq 14$  days from date of sample collection.

Yes:  X  No:       N/A:      

b. Unpreserved water samples, aromatic VOCs analyzed  $\leq 7$  days from date of sample collection; non-aromatic VOCs analyzed  $\leq 14$  days from date of sample collection.

Yes:       No:       N/A:  X

c. Soil samples analyzed  $\leq 14$  days from date of sample collection.

Yes:  X  No:       N/A:      

Comment: Holding time criteria have been met and no action has been taken.

#### IV. Initial Calibration (ICAL)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. An initial 5-point calibration was run for each compound at concentrations of 5, 10, 20, 35, and 100 ug/L.

Yes:  X  No:      

2. The RRF percent relative standard deviation (% RSD) results from the initial calibration met QC acceptance criteria for each compound.

Yes:       No:  X

Comment: Several compounds exceeded the 20% RSD QC criteria, however, there were no positive results reported for these compounds, therefore, no qualifications were required.

#### V. Continuing Calibration

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. A continuing calibration standard containing all target compounds was analyzed at the beginning of each 12-hour analysis period following the analysis of the instrument performance check and prior to the analysis of any blanks or samples.

Yes:  X  No:      

2. The continuing calibration concentration for each compound was within the specified range.

Yes:       No:  X

Comment: The concentrations for vinyl chloride, chloroethane, trichlorofluoromethane, and 1,1-dichloroethane were below the concentration ranges. All of the listed compounds were qualified as estimated "UJ" for all associated samples.

3. The retention times (RT) for each compound was within the specified RT window.

Yes:  X  No:

4. Comments: The following calibration calculations were verified during the validation process.

MF003 VAR3600 DB624 1/16/96 1,1-DCE Mean RT=(Sum RT)/5 (2.0687+1.9258+2.0652 +2.0034+2.0258/5= 2.0177	MF003 VAR3600 DB624 1/16/96 1,1-DCE %RSD=(Std.Deviation/Mean)* 100 %RSD=(0.0582/2.0177)*100 %RSD=28.8%	MF003 VAR3600 1/17/96 Bromomethane 20 ppb 12111/365734= =0.033114
---	--	---

## VI. Blanks

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

### A. Laboratory Blanks

- Laboratory method blanks were analyzed for each matrix type, concentration level, and for each 12 hour time period on each GC system used to analyze samples.

Yes:  X  No:      

- All laboratory blanks were found to be free of contaminant target compounds at detectable concentrations.

Yes:  X  No:      

Comment: The following table summarizes laboratory blank results:

Volatile Laboratory Blank Summary Table SDG No. MF003								
Blank ID/Date Analyzed	Affected Analyte	Conc. ug/l or ug/kg	Action Level ** ug/l or ug/kg	Affected Sample	Lab Conc ug/l or ug/kg	Lab Qual	EDS Conc ug/l or ug/kg	EDS Qual
VWB10127 1/27/96	None Found	--	--	--	--	--	--	--
VSB10127 1/27/96	None Found	--	--	--	--	--	--	--

## B. Field Blanks

- The field blanks associated with samples in the SDG met the following conditions:

a. All field blanks were found to be free of target analytes at detectable concentrations.

Yes:  X                       No:                            N/A:     

Comment: The following table summarizes field blank results:

Volatile Field Blank Summary Table SDG No. MF003								
Blank ID/Date Analyzed	Affected Analyte	Conc. ug/l	Action Level ** ug/l	Affected Sample	Lab Conc ug/l	Lab Qual	EDS Conc ug/l	EDS Qual
14T003 1/27/96	None Found	--	--	--	--	--	--	--
14R003 1/27/96	None Found	--	--	--	--	--	--	--

## VII. System Monitoring Compounds (Surrogates)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

- System monitoring compound recovery results met the QC acceptance criteria for fluorobenzene.

Yes:                            No:  X

- Sample reanalysis was performed if system monitoring results were outside of criteria.

Yes:                            No:  X                       N/A:     

Comment: Samples 14S02801, 14S02801D and 14S02802DUP exhibited a high fluorobenzene % recovery. All results for these samples would be qualified as estimated "J" for positive results, however, there were no positive results reported for any of these samples, therefore, no qualifications were required.

### VIII. Matrix Spikes/Matrix Spike Duplicates

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one field sample of each type was spiked for MS/MSD analysis.

Yes:   X              No:       

2. MS/MSD sample I.D.: 14S02801

3. MS/MSD sample results met QC acceptance criteria.

Yes:                   No:   X              NA:       

4. Comment: Several of the MS/MSD compounds exhibited high percent recovery values. No action has been taken on this basis.

### IX. Laboratory Control Samples (LCS)

Laboratory control charts were included in the data packages.

1. Laboratory control charts were provided for each surrogate for reagent blank analyses per batch.

Yes:   X              No:                   N/A:       

2. The percent recoveries were within acceptable QC limits.

Yes:   X              No:                   N/A:       

Comment: LCS criteria have been met and no action has been taken.

### X. Field Duplicates

1. The following duplicate set(s) was analyzed with this SDG:

- a. 14S02801 and 14S02801D
- b. 14S02802 and 14S02802DUP

2. Comment: There were no positive results reported for either set of duplicate samples.

## XI. Compound Quantitation and Reported CRQLS

Compound quantitation and reported CRQLs are not verified for Level C data validation.

1. All Form I sample results which were verified were correctly calculated and reported.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A: X

2. All sample compounds had on-column concentrations within the upper calibration range of the method.

Yes: X No: \_\_\_\_\_ N/A: \_\_\_\_\_

3. All samples were analyzed only once (i.e., no samples required re-analysis or dilution).

Yes: X No: \_\_\_\_\_ N/A: \_\_\_\_\_

## XII. System Performance

1. The instrumental and analytical systems used in the analysis of these samples maintained an acceptable level of performance.

Yes: X No: \_\_\_\_\_

## XIII. Overall Assessment of Data

The final validated results represent the compilation of all quality control qualification. With the exception of the quality control anomalies presented in Section V (Continuing Calibration) of this report and the resulting qualifiers, the analyses of environmental samples and quality control samples are valid within the constraints identified with the data quality flags.

Additional Comments:

1. The chain of custody and sample tracking form identify sample M9986003 as 14B02802, however, the laboratory identifies this sample as 14S02802.

## Organic Data Qualifiers

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA National Functional Guidelines for Organic Data Review, (12/90, Revised 6/91) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms and all necessary raw data were present in legible form in the data package.

Yes:  X  No:      

## III. Technical Holding Times

Technical holding times for all samples were verified from raw data and chain of custody forms.

1. Technical holding times were within the allowable limits shown below:

a. Water samples extracted <7 days from date of sample collection; analyzed <40 days from date of extraction.

Yes:  X  No:       N/A:      

b. Soil samples extracted <14 days from date of sample collection; analyzed <40 days from date of extraction.

Yes:  X  No:       N/A:      

Comment: Holding time criteria have been met and no action has been taken.

## IV. Calibration

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. Were initial calibration data reviewed and found to meet all method requirements?

Yes:  X  No:

Comment: Initial calibration criteria have been met and no action has been taken.

2. Were continuing calibration data reviewed and found to meet all method requirements?

Yes:  X  No:

Comment: Calibration criteria have been met and no action has been taken. All %D values were less than 15.0%.

3. Did the laboratory meet the linearity check criteria?

Yes:  X  No:

Comment: Linearity check criteria have been met and no action has been taken. The coefficient of determination for each calibration curve was greater than 0.995.

4. Were the retention times within specified limits?

Yes:  X  No:

Comment: Retention time criteria have been met and no action has been taken.

The following calculations were verified for this data package:

PNAs MF003 RTX-5 GC#4 8/2/95 Fluorene mean RT= $18.02+18.01+18.01+18.01+18.01/5 = 18.012$	PNAs MF003 RTX-5 GC#4 1/19/96 Fluorene 0.5 Std = area ratio = $193314/605903 = 0.31905$	PNAs MF003 RTX-5 H8904 1/25/96 Acenaphthylene % D = $(19.34-19.89)/19.34 \times 100 = -2.9\%$
--	---	---

## V. Blanks

### A. Laboratory Blanks

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. A method blank analysis was performed for every 20 samples of a similar matrix type in each SDG.

Yes:  X  No:

2. Laboratory method blanks were found to be clean of target compound contamination at detectable concentrations.

Yes:  X  No:

3. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:   No:   NA:  X

Comment: Blank criteria have been met and no action has been taken. Laboratory blanks WBLK01 and SBLK01 were free of contamination.

### B. Field Blanks

1. Field blanks were found to be clean of target compound contamination at detectable concentrations.

Yes:  X  No:   N/A:

2. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:   No:   N/A:  X

Comment: Rinsate blank 14R003 was free of contamination.

### VI. Surrogate Spike Compounds

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. The surrogate spike %R values were within the QC advisory limits for terphenyl-d14.

Yes:   No:  X

Comment: Due to the dilution requirements of samples 14S02801 and 14S02801D, the surrogate did not recover and was reported as zero. No action was taken on this basis.

## VII. Matrix Spikes/Matrix Spike Duplicates (MS/MSD)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one field sample of each type was spiked for MS/MSD analysis.

Yes:  X  No:      

2. MS/MSD sample I.D.: 14S02801

3. MS/MSD sample results were acceptable.

Yes:       No:  X

Comment: Due to the dilution requirements of sample 14S02801, the MS/MSD compounds did not recover. No action has been taken on this basis.

## VIII. Blank Spikes

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one blank sample of each type was spiked for BS analysis.

Yes:  X  No:      

2. Blank Spike sample I.D.: BS012261

3. Blank spike sample results were within acceptable QC limits.

Yes:  X  No:       N/A:      

Comment: BS criteria have been met and no action has been taken.

## IX. Laboratory Control Samples (LCS)

Laboratory control charts were provided for each analysis.

1. For every batch, one LCS of each type was analyzed.

Yes:  X  No:       N/A:

2. LCS sample I.D.: W01226B1 and S01226B1
3. The percent recoveries for the LCS compound were within acceptable limits.

Yes:  X                       No:                            N/A:     

Comment: The LCS' performed on 1/25/96 and 1/26/96 were acceptable.

#### X. Field Duplicates

1. The following duplicate set was analyzed with this SDG:
  - a. 14S02801 and 14S02801D
2. Comment: There were no positive results for either duplicate sample.

#### XI. Target Compound Identification

Target compound identification is not reviewed for Level C validation.

#### XII. Compound Quantitation and Reported CRQLS

Compound quantitation and reported CRQLS are not reviewed for Level C validation.

1. CRQL values were adjusted to reflect all sample volumes, sample dilutions, concentrations, cleanup activities, and dry weight factors not accounted for by the method.

Yes:  X                       No:                            N/A:     

2. Comments: The laboratory raised the reporting limits for pyrene in sample 14S02801D due to chemical interferences during analysis. The laboratory qualified pyrene "UI" and the reviewer further qualified this compound as estimated "UJ."

### **XIII. Overall Assessment of Data**

The final validated results represent the compilation of all quality control qualification. With the exception of the quality control anomalies presented in Section XII (Compound Quantitation) of this report and the resulting qualifiers, the analyses of environmental samples and quality control samples are valid within the constraints identified with the data quality flags.

#### **Additional Comments:**

1. The chain of custody and sample tracking form identify sample M9986003 as 14B02802, however, the laboratory identifies this sample as 14S02802.

## Organic Data Qualifiers

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

## Summary of Inorganic Data Validation Metals

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA Functional Guidelines for Inorganic Analyses (7/88) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms are present and in legible form in the data package.

Yes:  X  No:      

2. Lab control charts were received and data points were within the control limit windows.

Yes:  X  No:       N/A:      

Note: If data points are outside of control limit windows, refer to the Laboratory Control Sample section VIII for any effect on data quality.

## III. Technical Holding Times

Chain of custody records and sample preparation logs (Form 13) were checked for all samples to verify that technical holding time, and preservation criteria were met.

1. Technical holding times were within the allowable limits shown below:
  - a. Analysis for all metals was completed within 180 days of sample collection; mercury was completed within 28 days.

Yes:  X  No:      

Comment: Holding time criteria have been met and no action has been taken.

#### IV. Instrument Calibration and Calibration Verification

One hundred percent of the calibration results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. Instrument calibration for metals determined by inductively coupled plasma spectroscopy (ICP) was performed using a blank and one standard for each analyte.

Yes:  X  No:

2. Instrument calibration for metals determined by graphite furnace atomic absorption spectroscopy (GFAA) was performed using a blank and three standards (one of which was at the CRDL).

Yes:  X  No:

3. Instrument calibration for mercury was performed using a blank and four standards.

Yes:  X  No:   N/A:

4. Instrument calibration for cyanide was performed using a blank and three standards (one of which was at the CRDL).

Yes:   No:   N/A:  X

5. Calibration verification was performed for each analyte at a frequency of 10%.

Yes:  X  No:

6. A continuing calibration verification (CCV) was performed after the last analytical sample in each run.

Yes:  X  No:

7. Initial calibration verification (ICV) and CCV percent recovery (%R) values met the criteria specified below:

a. For all metals except cyanide and mercury, %R results were between 90% and 110%.

Note: Due to possible rounding errors, allow results to fall within 1% of the contract windows (e.g. 89-111%).

Yes:  No:

8. Correlation coefficients for GFAA analytes, mercury, and cyanide calibration curves were greater than or equal to 0.995.

Yes:  No:  N/A:

Comment: Raw data was not provided for this Level C SDG; therefore, calibration curves were not available.

9. Comments: The following calibration calculations were verified during the validation process.

ICV or CCV	Analyte	Calculation $\% R = (\text{Found}/\text{True}) \times 100$	%R
ICV	Barium	$27.23/25.0 \times 100$	108.9
CCV	Barium	$26.44/25.0 \times 100$	105.8
ICV	Arsenic	$2451/2500 \times 100$	98.0
CCV	Arsenic	$2466/2500 \times 100$	98.6
ICV	Mercury	$5.03/5.0 \times 100$	100.6
CCV	Mercury	$4.21/5.0 \times 100$	84.2

## V. Blanks

### A. Laboratory Blanks

One hundred percent of the laboratory blank results on the summary forms were checked to ensure that reported results were within required quality control limits.

1. Preparation blank analyses results have been reported for each matrix type for every extraction batch.

Yes:  No:

2. Calibration blanks were run at a frequency of 10%.

Yes:  X  No:

3. A calibration blank was analyzed immediately after every ICV and CCV, and after the last sample.

Yes:  X  No:

4. All reported blank analyte results had absolute values less than the corresponding IDL values.

Yes:   No:  X

The following sample results were qualified due to laboratory blanks that had target analytes where the absolute value of the reported results was greater than or equal to the corresponding IDL value; sample results were less than 5X the absolute value of the blank result.

Inorganic Laboratory Blank Summary Table SDG No. MF003								
Blank ID/ Date	Affected Analyte	Absolute Conc. mg/kg	Action Level mg/kg	Affected Sample	Lab Conc mg/kg	Lab Qual	EDS Conc mg/kg	EDS Qual
PBS 1/23/96	Arsenic	0.236	1.18	14S02801	0.67	B	0.67	UJ
				14S02801D	0.43	B	0.43	UJ
				14S02802	0.41	B	0.41	UJ

5. All reported blank analyte results had absolute values less than or equal to the corresponding CRDL values.

Yes:  X  No:

#### B. Field Blanks

1. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:  X  No:   N/A:

2. Analytes were detected, but associated sample aliquot concentrations were greater than 5X the blank concentration.

Yes: \_\_\_\_\_ No: X N/A: \_\_\_\_\_

Comment: Mercury was detected in field blank 14R003, but the reported sample results are non-detected.

## VI. Matrix Spike Sample Recovery

One hundred percent of the matrix spike (MS) sample results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. For SDG MF003, one field sample from each group of samples of a similar matrix and concentration level was spiked with each target analyte (except: Ca, Mg, K, Na on water samples and Al, Ca, Mg, K, and Na on soil/sediment samples) by the laboratory.

Yes: X No: \_\_\_\_\_

2. MS sample ID: 14S02801

3. For all target analytes, percent recovery (%R) results were within the limits of 75% - 125% (Note: MS %R limits do not apply when the sample concentration exceeded the spike concentration by a factor of 4 or more).

Yes: \_\_\_\_\_ No: X

Sample	Analyte	% Recovery	Qualifier
14S02801	Silver	33.5	UJ
14S02801D	Silver	33.5	UJ
14S02802	Silver	33.5	UJ

Comment: Recovery of arsenic in the matrix spike was 144.9%. Arsenic results have been qualified for preparation blank contamination and no further action has been taken by the reviewer.

4. The following spike calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation $\%R = (SSR - SR / SA) * 100$	$\%R$
ICP	Barium	$(427.8 - 6.28) / 425.5 \times 100$	99.1
GFAA	Arsenic	$(13.0 - 0.67) / 8.51 \times 100$	144.9
CV	Mercury	$(0.992 - 0.0) / 1.06 \times 100$	93.6

## VII. Interference Check Samples

One hundred percent of the ICS results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. ICP ICSs (solutions A and AB) were analyzed at the beginning and end of each sample analysis run (or a minimum of twice per 8-hour shift, whichever was more frequent).

Yes:  X  No:

2. Solution AB analyte recovery results were within the control limits of 80% - 120%.

Yes:  X  No:

3. Concentrations of Ca, Fe, and Mg in the samples are less than or equal to their respective concentration in ICS solution A or AB.

Yes:   No:   N/A:  X

4. Cr and V are present in a sample(s) at concentrations less than 10,000 ug/L.

Yes:  X  No:   N/A:

5. Comments: ICP ICSs criteria have been met and no action has been taken. The following ICS calculations were verified during the validation process.

Analyte	Calculation $\%R = (\text{Found Soln AB} / \text{True Soln AB}) * 100$	$\%R$
Barium	$456 / 500 \times 100$	91.2

### VIII. Laboratory Control Sample (LCS)

One hundred percent of the LCS results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. A laboratory control sample was analyzed for each SDG for each matrix type.

Yes:  X  No:      

2. Aqueous LCS recovery results were within the control limits of 80% to 120% (except for Sb and Ag which have no required limits).

Yes:  X  No:       N/A:      

3. Soil LCS recovery results were within the required control limits specified on the laboratory Form VII-IN and control charts.

Yes:  X  No:       N/A:      

Comment: LCS criteria have been met and no action has been taken.

4. The following LCS calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation %R=(Found/True)*100	%R
ICP	Silver	440/500 x 100	88.0
GFAA	Arsenic	96.77/100 x 100	96.8
CV	Mercury	5.04/5.0 x 100	100.8

### IX. Duplicate Sample Analysis

One hundred percent of the duplicate results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

#### A. Laboratory Duplicates

1. For each SDG, one duplicate sample was analyzed from each group of samples of a similar matrix type and concentration level.

Yes:  X  No:

MSD ID: 14S02801

2. For duplicate analyte concentrations greater than 5X the CRDL, the relative percent difference (RPD) between the two reported results was less than 20% for aqueous samples (35% for soil samples).

Yes:  X  No:      

Comment: Reported lead results were flagged with a "\*" by the laboratory. The duplicate difference meets the 2X CRDL for soils and the "\*" has been removed by the reviewer.

3. For duplicate analyte concentrations less than 5X the CRDL, the difference between the two reported results was less than the CRDL value for aqueous samples, or less than 2X the CRDL value for soil samples. RPDs for samples with values less than the CRDL are not calculated.

Yes:  X  No:      

4. Comment: Laboratory duplicate criteria have been met and no action has been taken.

5. The following duplicate calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation $RPD = [S-D/(S+D/2)] * 100$ $D = S - Dup$	RPD or Difference
ICP	Chromium	2.5936-2.5596	0.03 ( $\pm 4.2$ )
GFAA	Lead	2.9383-3.9489	1.0 ( $\pm 1.2$ )
CV	Mercury	$[(0.0-0.0)/(0.0+0.0)]/2 \times 100$	NC

### B. Field Duplicates

1. The following duplicate sets were analyzed with this SDG:

a. 14S02801 and 14S02801D

2. Comment: Field duplicate criteria have not been met and no action has been taken.

**X. Furnace Atomic Absorption QC**

One hundred percent of the AA summary data was checked to ensure that reported results were within required quality control limits.

1. Duplicate injections for AA analytes with concentrations greater than the CRDL had RSD results < 20%.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

Comment: RSD results are contained in the raw data which is not provided for Level C review.

2. For each sample, all AA analytical spike recovery results were between 85% and 115%.

Yes:  X  No: \_\_\_\_\_

3. For each sample, all AA results were within the appropriate calibration range, or were diluted to meet this criteria.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

4. Sample analyte results where the analytical spike recovery was < 40% were diluted once and reanalyzed.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

5. Samples having analyte concentrations greater than or equal to 50% of the spike concentrations, and spike % R results < 85% or > 115% were quantitated by MSA.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

6. MSA analyses with correlation coefficients less than 0.995 were rerun once.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

7. MSA spike values met the criteria specified below:

- a. Spike 1 was approximately 50% of the sample concentration.
- b. Spike 2 was approximately 100% of the sample concentration.

c. Spike 3 was approximately 150% of the sample concentration.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

## XI. ICP Serial Dilution

1. ICP serial dilution analysis was performed on one sample from each SDG of a similar matrix type and concentration level.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

2. For each analyte in the serial dilution sample which was minimally a factor of 50 above the IDL in the original sample, the serial dilution result agreed within 10% of the original determination after correction for dilution.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

## XII. Sample Result Verification

Ten percent of all reported sample results were not verified since the raw data is not provided for a Level C data package.

1. All sample results which were verified were correctly calculated and reported.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

Comment: Calculations and transcriptions can not be verified without the raw data.

2. All sample results fall within the linear range of the ICP (Form XIII) and within the calibrated range of the instrument for AA.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

3. All reported concentrations were above the CRDL.

Yes: \_\_\_\_\_ No:  X  N/A: \_\_\_\_\_

Comment: The "B" qualifier applied by the laboratory for results between the CRDL and the IDL were amended with a "J" qualifier.

4. Sample results on Form 1 were reported down to the IDL not CRDL for all analytes.

Yes:  X  No:       N/A:      

5. Reported sample results that were analyzed by ICP for As, Pb, Se, and Tl were at least 5X the ICP IDL.

Yes:       No:       N/A:  X

6. Sample weights, volumes and dilutions were taken into account when reporting detection limits on Form 1.

Yes:  X  No:       N/A:      

7. IDLs were present and found to be less than CRDL.

Yes:  X  No:       N/A:      

8. All CRDLs and IDLs were included on Form X.

Yes:  X  No:       N/A:      

9. Raw data were free of anomalies (e.g. baseline shifts, negative absorbances/emissions, omissions, etc.). If no, please describe anomalies in the comments section below.

Yes:       No:       N/A:  X

Comment: Raw data is not provided for Level C review.

### XIII. Additional Comments/Professional Judgment

The final validated results represent the compilation of all quality control qualification. With the exception of the quality control anomalies presented in Sections V.A.4, VI.3 and XII.3 and the resulting qualifiers, the analyses of environmental samples and quality control samples are valid within the constraints identified with the data quality flags. All false positive/negative results and matrix interferences are summarized on Tables A-1 and A-3, respectively.

**Additional Comments:**

1. The chain of custody and sample tracking form identify sample M9986003 as 14B02802, however, the laboratory identifies this sample as 14S02802.

## Inorganic Data Qualifiers

- U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
- J - The associated value is an estimated quantity.
- R - The data are unusable. (Note: Analyte may or may not be present.)
- UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

**APPENDIX A**

**Summary Tables and Work Sheets**

**Table A-1**  
**Review of False Positive/Negative Results**

Sample	Parameter	False Positive or Negative	Rationale	Reported		Validated	
				Conc. (mg/kg)	Qual	Conc. (mg/kg)	Qual
14S02801	Arsenic	P	2	0.67	B	0.67	UJ
14S02801D	Arsenic	P	2	0.43	B	0.43	UJ
14S02802	Arsenic	P	2	0.41	B	0.41	UJ

**Rationale**

- 1 = Professional judgement
- 2 = Blank contamination (laboratory or field)
- 3 = Prep Blank - negative value > IDL

**Table A-3**  
**Matrix Interferences (Inorganics)**

Sample	Parameter	Initial	Re-analysis ID	Final	Was the Re-analysis Needed?	Most Appropriate Result	Comment
14S02801	Silver	%R=33.5	NA	NA	NO	0.49 UJ	VI.3
14S02801D	Silver	%R=33.5	NA	NA	NO	0.49 UJ	VI.3
14S02802	Silver	%R=33.5	NA	NA	NO	0.51 UJ	VI.3

**I. Validation Procedure Summary**

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA National Functional Guidelines for Organic Data Review, (12/90, Revised 6/91) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

**II. Data Deliverables**

1. All required deliverables including QA/QC summary forms and all necessary raw data were present in legible form in the data package.

Yes:  X  No:      

**III. Technical Holding Times**

Technical holding times for all samples were verified from raw data and chain of custody forms.

1. Technical holding times were within the allowable limits shown below:

a. Water samples extracted < 7 days from date of sample collection; analyzed < 40 days from date of extraction.

Yes:  X  No:       N/A:      

b. Soil samples extracted < 14 days from date of sample collection; analyzed < 40 days from date of extraction.

Yes:  X  No:       N/A:      

Comment: Holding time criteria have been met and no action has been taken.

**IV. Calibration**

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. Were initial calibration data reviewed and found to meet all method requirements?

Yes:  X  No:

Comment: Initial calibration criteria have been met and no action has been taken.

2. Were continuing calibration data reviewed and found to meet all method requirements?

Yes:  X  No:

Comment: Calibration criteria have been met and no action has been taken. All %D values were less than 15.0%.

3. Did the laboratory meet the linearity check criteria?

Yes:  X  No:

Comment: Linearity check criteria have been met and no action has been taken. The coefficient of determination for each calibration curve was greater than 0.995.

4. Were the retention times within specified limits?

Yes:  X  No:

Comment: Retention time criteria have been met and no action has been taken.

The following calculations were verified for this data package:

PNAs MF004 RTX-5 HP8904A 4/1/96 Fluorene mean RT= $18.02+18.01+18.01+18.01+18.01/5 = 18.01$	PNAs MF004 RTX-5 HP8904A 4/17/96 Naphthalene $0.5 \text{ Std} = \text{area ratio} = 204640/995417 = 0.20558$	PNAs MF004 HP8904A 4/25/96 Anthracene $\%D = (20.38-19.79)/20.38 \times 100 = 2.9\%$
--	---	---

## V. Blanks

### A. Laboratory Blanks

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. A method blank analysis was performed for every 20 samples of a similar matrix type in each SDG.

Yes:  X  No:

2. Laboratory method blanks were found to be clean of target compound contamination at detectable concentrations.

Yes:  X  No:

3. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:   No:   NA:  X

Comment: Blank criteria have been met and no action has been taken. Laboratory blanks NBLK22 and NBLK32 were free of contamination.

### B. Field Blanks

1. Field blanks were found to be clean of target compound contamination at detectable concentrations.

Yes:  X  No:   N/A:

2. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:   No:   N/A:  X

Comment: Field blank 14Y003 and rinsate blank 14R004 were free of contamination.

### VI. Surrogate Spike Compounds

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. The surrogate spike %R values were within the QC advisory limits for terphenyl-d14.

Yes:  X  No:

Comment: Surrogate criteria have been met and no action has been taken.

### VII. Matrix Spikes/Matrix Spike Duplicates (MS/MSD)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one field sample of each type was spiked for MS/MSD analysis.

Yes:   X              No:       

2. MS/MSD sample I.D.: 14S02701

3. MS/MSD sample results were acceptable.

Yes:   X              No:       

Comment: MS/MSD criteria have been met and no action has been taken.

### VIII. Blank Spikes

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one blank sample of each type was spiked for BS analysis.

Yes:   X              No:       

2. Blank Spike sample I.D.: BS042261

3. Blank spike sample results were within acceptable QC limits.

Yes:   X              No:                   N/A:       

Comment: BS criteria have been met and no action has been taken.

### IX. Laboratory Control Samples (LCS)

Laboratory control charts were provided for each analysis.

1. For every batch, one LCS of each type was analyzed.

Yes:   X              No:                   N/A:       

2. LCS sample I.D.: S04226B1

3. The percent recoveries for the LCS compound were within acceptable limits.

Yes:   X              No:                   N/A:

Comment: The LCS performed on 4/26/96 was acceptable.

#### X. Field Duplicates

1. The following duplicate set was analyzed with this SDG:
  - a. 14S02701 and 14S02701D
2. Comment: There were no positive results reported for either duplicate sample.

#### XI. Target Compound Identification

Target compound identification is not reviewed for Level C validation.

#### XII. Compound Quantitation and Reported CRQLS

Compound quantitation and reported CRQLS are not reviewed for Level C validation.

1. CRQL values were adjusted to reflect all sample volumes, sample dilutions, concentrations, cleanup activities, and dry weight factors not accounted for by the method.

Yes:  X                       No:                            N/A:     

2. Comment: The laboratory raised the reporting limits for anthracene in sample 14S02801 due to chemical interferences during analysis. The laboratory qualified anthracene "UI" and the reviewer further qualified this compound as estimated "UJ."
3. Comment: Samples 14S02601, 14S02701, 14S02701D, and 14S02801 were analyzed at a dilution due to interferences. No action was taken on this basis.

#### XIII. Overall Assessment of Data

The final validated results represent the compilation of all quality control qualification. With the exception of the quality control anomalies presented in Section XII (Compound Quantitation) of this report and the resulting qualifiers, the analyses of environmental samples and quality control samples are valid within the constraints identified with the data quality flags.

## Organic Data Qualifiers

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA National Functional Guidelines for Organic Data Review, (12/90, Revised 6/91) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms and all necessary raw data were present in legible form in the data package.

Yes:  X  No:      

## III. Technical Holding Times

Technical holding times for all samples were verified from raw data and chain of custody forms.

1. Technical holding times were within the allowable limits shown below:

a. Preserved water samples analyzed  $\leq 14$  days from date of sample collection.

Yes:  X  No:       N/A:      

b. Unpreserved water samples, aromatic VOCs analyzed  $\leq 7$  days from date of sample collection; non-aromatic VOCs analyzed  $\leq 14$  days from date of sample collection.

Yes:       No:       N/A:  X

c. Soil samples analyzed  $\leq 14$  days from date of sample collection.

Yes:  X  No:       N/A:      

Comment: Holding time criteria have been met and no action has been taken.

#### IV. Initial Calibration (ICAL)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. An initial 5-point calibration was run for each compound.

Yes:  X  No:      

2. The correlation coefficient (r) results from the initial calibration met QC acceptance criteria for each compound.

Yes:  X  No:      

Comment: Initial calibration criteria have been met and no action has been taken.

#### V. Continuing Calibration

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. A continuing calibration standard containing all target compounds was analyzed.

Yes:  X  No:      

2. The % difference for each compound was within acceptance criteria.

Yes:  X  No:      

3. The retention times (RT) for each compound was within the specified RT window.

Yes:  X  No:      

4. Comments: The following calibration calculations were verified during the validation process.

MF004 GC9-VAR3400 5/2/96 Vinyl Chloride r = 0.9986384 r squared = 0.997278	MF004 GC9-VAR3400 5/2/96 Bromomethane $\%D = (100 - 108.08) / 100 \times 100 = 8.1\%$
---	---

## VI. Blanks

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

### A. Laboratory Blanks

1. Laboratory method blanks were analyzed for each matrix type, concentration level, and for each 12 hour time period on each GC system used to analyze samples.

Yes:   X              No:       

2. All laboratory blanks were found to be free of contaminant target compounds at detectable concentrations.

Yes:   X              No:       

Comment: The following table summarizes laboratory blank results:

Volatile Laboratory Blank Summary Table SDG No. MF004								
Blank ID/Date Analyzed	Affected Analyte	Conc. ug/l	Action Level ** ug/l	Affected Sample	Lab Conc ug/l	Lab Qual	EDS Conc ug/l	EDS Qual
VBLK001 5/3/96	None Found	--	--	--	--	--	--	--

### B. Field Blanks

1. The field blanks associated with samples in the SDG met the following conditions:

a. All field blanks were found to be free of target analytes at detectable concentrations.

Yes:   X              No:                   N/A:       

Comment: The following table summarizes field blank results:

**Volatile Field Blank Summary Table**  
SDG No. MF004

Blank ID/Date Analyzed	Affected Analyte	Conc. ug/l	Action Level ** ug/l	Affected Sample	Lab Conc ug/l	Lab Qual	EDS Conc ug/l	EDS Qual
14T004 5/3/96	None Found	--	--	--	--	--	--	--
14Y003 5/3/96	None Found	--	--	--	--	--	--	--
14R004 5/3/96	None Found	--	--	--	--	--	--	--

**VII. System Monitoring Compounds (Surrogates)**

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. System monitoring compound recovery results met the QC acceptance criteria for fluorobenzene.

Yes:   X                        No:       

2. Sample reanalysis was performed if system monitoring results were outside of criteria.

Yes:                             No:                             N/A:   X  

Comment: Surrogate criteria have been met and no action has been taken.

**VIII. Matrix Spikes/Matrix Spike Duplicates**

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one field sample of each type was spiked for MS/MSD analysis.

Yes:   X                        No:       

2. MS/MSD sample I.D.: 14S02701

3. MS/MSD sample results met QC acceptance criteria.

Yes: \_\_\_\_\_ No: X NA: \_\_\_\_\_

4. Comment: The RPD for bromomethane exceeded QC advisory limits. Bromomethane was not detected in any of the samples, therefore, no action was taken.

#### IX. Laboratory Control Samples (LCS)

Laboratory control charts were included in the data packages.

1. Laboratory control charts were provided for each surrogate recovery.

Yes: X No: \_\_\_\_\_ N/A: \_\_\_\_\_

2. The percent recoveries were within acceptable QC limits.

Yes: X No: \_\_\_\_\_ N/A: \_\_\_\_\_

Comment: LCS criteria have been met and no action has been taken.

#### X. Field Duplicates

1. The following duplicate set(s) was analyzed with this SDG:

a. 14S02701 and 14S02701D

2. Comment: There were no positive results reported for either duplicate sample.

#### XI. Compound Quantitation and Reported CRQLS

Compound quantitation and reported CRQLs are not verified for Level C data validation.

1. All Form I sample results which were verified were correctly calculated and reported.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A: X

2. All sample compounds had on-column concentrations within the upper calibration range of the method.

Yes:  X       No:           N/A:    

3. All samples were analyzed only once (i.e., no samples required re-analysis or dilution).

Yes:  X       No:           N/A:    

## **XII. System Performance**

1. The instrumental and analytical systems used in the analysis of these samples maintained an acceptable level of performance.

Yes:  X       No:    

## **XIII. Overall Assessment of Data**

The final validated results represent the compilation of all quality control qualification. The analyses of environmental samples and quality control samples are valid.

## Organic Data Qualifiers

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA Functional Guidelines for Inorganic Analyses (7/88) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms are present and in legible form in the data package.

Yes:  X  No:      

2. Lab control charts were received and data points were within the control limit windows.

Yes:  X  No:       N/A:      

Note: If data points are outside of control limit windows, refer to the Laboratory Control Sample section VIII for any effect on data quality.

## III. Technical Holding Times

Chain of custody records and sample preparation logs (Form 13) were checked for all samples to verify that technical holding time, and preservation criteria were met.

1. Technical holding times were within the allowable limits shown below:
  - a. Analysis for all metals was completed within 180 days of sample collection; mercury was completed within 28 days.

Yes:  X  No:      

Comment: Holding time criteria have been met and no action has been taken.

#### IV. Instrument Calibration and Calibration Verification

One hundred percent of the calibration results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. Instrument calibration for metals determined by inductively coupled plasma spectroscopy (ICP) was performed using a blank and one standard for each analyte.

Yes:   X              No:       

2. Instrument calibration for metals determined by graphite furnace atomic absorption spectroscopy (GFAA) was performed using a blank and three standards (one of which was at the CRDL).

Yes:   X              No:       

3. Instrument calibration for mercury was performed using a blank and four standards.

Yes:   X              No:                   N/A:       

4. Instrument calibration for cyanide was performed using a blank and three standards (one of which was at the CRDL).

Yes:                   No:                   N/A:   X  

5. Calibration verification was performed for each analyte at a frequency of 10%.

Yes:   X              No:       

6. A continuing calibration verification (CCV) was performed after the last analytical sample in each run.

Yes:   X              No:       

7. Initial calibration verification (ICV) and CCV percent recovery (%R) values met the criteria specified below:

a. For all metals except mercury, %R results were between 90% and 110%.

Note: Due to possible rounding errors, allow results to fall within 1% of the contract windows (e.g. 89-111%).

Yes:  X  No:

8. Correlation coefficients for GFAA analytes, mercury, and cyanide calibration curves were greater than or equal to 0.995.

Yes:   No:   N/A:  X

Comment: Raw data was not provided for this Level C SDG; therefore, calibration curves were not available.

9. Comments: The following calibration calculations were verified during the validation process.

ICV or CCV	Analyte	Calculation $\% R = (\text{Found}/\text{True}) \times 100$	% R
ICV	Arsenic	$25.54/25.0 \times 100$	102.2
CCV	Arsenic	$25.03/25.0 \times 100$	100.1
ICV	Barium	$2585/2500 \times 100$	103.4
CCV	Barium	$2587/2500 \times 100$	103.5
ICV	Mercury	$4.60/5.0 \times 100$	92.0
CCV	Mercury	$4.96/5.0 \times 100$	99.2

## V. Blanks

### A. Laboratory Blanks

One hundred percent of the laboratory blank results on the summary forms were checked to ensure that reported results were within required quality control limits.

1. Preparation blank analyses results have been reported for each matrix type for every extraction batch.

Yes:  X  No:

2. Calibration blanks were run at a frequency of 10%.

Yes:  X  No:

3. A calibration blank was analyzed immediately after every ICV and CCV, and after the last sample.

Yes:  X  No:

4. All reported blank analyte results had absolute values less than the corresponding IDL values.

Yes:   No:  X

The following sample results were qualified due to laboratory blanks that had target analytes where the absolute value of the reported results was greater than or equal to the corresponding IDL value; sample results were less than 5X the absolute value of the blank result.

Inorganic Laboratory Blank Summary Table SDG No. MF004								
Blank ID/ Date	Affected Analyte	Absolute Conc. ug/l or mg/kg	Action Level ug/l or mg/kg	Affected Sample	Lab Conc ug/l or mg/kg	Lab Qual	EDS Conc ug/l or mg/kg	EDS Qual
PBW 4/24/96	Barium	1.18	5.9	14Y003	0.72	B	1.18	UJ

Comment: Barium was detected in PBS 4/26/96 at a level of 0.63 mg/kg. Reported sample results for barium in soils were less than the action level but sample barium results will be qualified for barium contamination in the field rinsate blank, which is higher in barium concentration.

5. All reported blank analyte results had absolute values less than or equal to the corresponding CRDL values.

Yes:  X  No:

## B. Field Blanks

1. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes: \_\_\_\_\_ No:  X  N/A: \_\_\_\_\_

2. Analytes were detected, but associated sample aliquot concentrations were greater than 5X the blank concentration.

Yes: \_\_\_\_\_ No:  X  N/A: \_\_\_\_\_

The following sample results were qualified due to field blanks that had target analytes where the absolute value of the reported results was greater than or equal to the corresponding IDL value; sample results were less than 5X the absolute value of the blank result.

Inorganic Laboratory Blank Summary Table SDG No. MF004								
Blank ID/ Date	Affected Analyte	Absolute Conc. ug/l or mg/kg	Action Level ug/l or mg/kg	Affected Sample	Lab Conc ug/l or mg/kg	Lab Qual	EDS Conc ug/l or mg/kg	EDS Qual
14R004	Barium	2.5	12.5	14S02601	4.7	B	4.7	UJ
				14B02602	3.5	B	3.5	UJ
				14S02701	6.3	B	6.3	UJ
				14S02701D	7.1	B	7.1	UJ
				14B02702	3.8	B	3.8	UJ
				14S02801	2.8	B	2.8	UJ
				14B02802	3.1	B	3.1	UJ

## VI. Matrix Spike Sample Recovery

One hundred percent of the matrix spike (MS) sample results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

- For SDG MF004, one field sample from each group of samples of a similar matrix and concentration level was spiked with each target analyte (except: Ca, Mg, K, Na on water samples and Al, Ca, Mg, K, and Na on soil/sediment samples) by the laboratory.

Yes:  X  No:

- MS sample ID: 14S02701

- For all target analytes, percent recovery (%R) results were within the limits of 75% - 125% (Note: MS %R limits do not apply when the sample concentration exceeded the spike concentration by a factor of 4 or more).

Yes:   No:  X

Sample	Analyte	% Recovery	Qualifier
14S02601	Lead	52.5	J
14B02602	Lead	52.5	J
14S02701	Lead	52.5	J
14S02701D	Lead	52.5	J
14B02702	Lead	52.5	J
14S02801	Lead	52.5	J
14B02802	Lead	52.5	J

- The following spike calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation $\%R = (SSR - SR / SA) * 100$	% R
GFAA	Arsenic	$(8.86 - 0.97) / 8.47 \times 100$	93.2
ICP	Cadmium	$(9.91 - 0.0) / 10.59 \times 100$	93.6
CV	Mercury	$(0.956 - 0.129) / 1.03 \times 100$	80.3

## VII. Interference Check Samples

One hundred percent of the ICS results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. ICP ICSs (solutions A and AB) were analyzed at the beginning and end of each sample analysis run (or a minimum of twice per 8-hour shift, whichever was more frequent).

Yes:  X  No:

2. Solution AB analyte recovery results were within the control limits of 80%-120%.

Yes:  X  No:

3. Concentrations of Ca, Fe, and Mg in the samples are less than or equal to their respective concentration in ICS solution A or AB.

Yes:   No:   N/A:  X

4. Cr is present in a sample(s) at concentrations less than 10,000 ug/L.

Yes:  X  No:   N/A:

5. Comments: ICP ICSs criteria have been met and no action has been taken. The following ICS calculations were verified during the validation process.

Analyte	Calculation %R=(Found Soln AB/True Soln AB)*100	%R
Barium	483.6/500 x 100	96.6

**VIII. Laboratory Control Sample (LCS)**

One hundred percent of the LCS results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. A laboratory control sample was analyzed for each SDG for each matrix type.

Yes:  X  No:

2. Aqueous LCS recovery results were within the control limits of 80% to 120% (except for Sb and Ag which have no required limits).

Yes:  X  No:   N/A:

3. Soil LCS recovery results were within the required control limits specified on the laboratory Form VII-IN and control charts.

Yes:  X  No:       N/A:      

Comment: LCS criteria have been met and no action has been taken.

4. The following LCS calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation %R=(Found/True)*100	%R
ICP	Barium	2505/2500 x 100	100.2
GFAA	Arsenic	91.57/100 x 100	91.6
CV	Mercury	5.33/5.0 x 100	106.6

## IX. Duplicate Sample Analysis

One hundred percent of the duplicate results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

### A. Laboratory Duplicates

1. For each SDG, one duplicate sample was analyzed from each group of samples of a similar matrix type and concentration level.

Yes:  X  No:      

MSD ID: 14S02701

2. For duplicate analyte concentrations greater than 5X the CRDL, the relative percent difference (RPD) between the two reported results was less than 20% for aqueous samples (35% for soil samples).

Yes:  X  No:

3. For duplicate analyte concentrations less than 5X the CRDL, the difference between the two reported results was less than the CRDL value for aqueous samples, or less than 2X the CRDL value for soil samples. RPDs for samples with values less than the CRDL are not calculated.

Yes:  X  No:

4. Comment: Laboratory duplicate criteria have been met and no action has been taken.

5. The following duplicate calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation $RPD = [S-D/(S+D/2)] * 100$ $D = S - Dup$	RPD or Difference
ICP	Chromium	5.16-4.88	0.28 ( $\pm 4.2$ )
GFAA	Lead	$[(5.85-4.85)/(5.85+4.85/2)] * 100$	18.7 ( $\pm 35$ )

### B. Field Duplicates

1. The following duplicate sets were analyzed with this SDG:
- a. 14S02701 and 14S02701D
2. Comment: Field duplicate criteria have not been met and no action has been taken.

### X. Furnace Atomic Absorption QC

One hundred percent of the AA summary data was checked to ensure that reported results were within required quality control limits.

1. Duplicate injections for AA analytes with concentrations greater than the CRDL had RSD results < 20%.

Yes:   No:   N/A:  X

Comment: RSD results are contained in the raw data which is not provided for Level C review.

2. For each sample, all AA analytical spike recovery results were between 85% and 115%.

Yes:  No:

Comment: Analytical spike recovery of lead for sample 14Y003 was 122%. The above result has been qualified as estimated, UJ, due to possible interference.

3. For each sample, all AA results were within the appropriate calibration range, or were diluted to meet this criteria.

Yes:  No:  N/A:

4. Sample analyte results where the analytical spike recovery was <40% were diluted once and reanalyzed.

Yes:  No:  N/A:

5. Samples having analyte concentrations greater than or equal to 50% of the spike concentrations, and spike %R results <85% or >115% were quantitated by MSA.

Yes:  No:  N/A:

6. MSA analyses with correlation coefficients less than 0.995 were rerun once.

Yes:  No:  N/A:

7. MSA spike values met the criteria specified below:

- Spike 1 was approximately 50% of the sample concentration.
- Spike 2 was approximately 100% of the sample concentration.
- Spike 3 was approximately 150% of the sample concentration.

Yes:  No:  N/A:

## XI. ICP Serial Dilution

1. ICP serial dilution analysis was performed on one sample from each SDG of a similar matrix type and concentration level.

Yes:  No:  N/A:

2. For each analyte in the serial dilution sample which was minimally a factor of 50 above the IDL in the original sample, the serial dilution result agreed within 10% of the original determination after correction for dilution.

Yes:  No:  N/A:

## XII. Sample Result Verification

Ten percent of all reported sample results were not verified since the raw data is not provided for a Level C data package.

1. All sample results which were verified were correctly calculated and reported.

Yes:  No:  N/A:

Comment: Calculations and transcriptions can not be verified without the raw data.

2. All sample results fall within the linear range of the ICP (Form XIII) and within the calibrated range of the instrument for GFAA.

Yes:  No:  N/A:

3. All reported concentrations were above the CRDL.

Yes:  No:  N/A:

Comment: The "B" qualifier applied by the laboratory for results between the CRDL and the IDL were amended with a "J" qualifier.

4. Sample results on Form 1 were reported down to the IDL not CRDL for all analytes.

Yes:  No:  N/A:

5. Reported sample results that were analyzed by ICP for As, Pb, Se, and Tl were at least 5X the ICP IDL.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

6. Sample weights, volumes and dilutions were taken into account when reporting detection limits on Form 1.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

7. IDLs were present and found to be less than CRDL.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

8. All CRDLs and IDLs were included on Form X.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

9. Raw data were free of anomalies (e.g. baseline shifts, negative absorbances/emissions, omissions, etc.). If no, please describe anomalies in the comments section below.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

Comment: Raw data is not provided for Level C review.

### XIII. Additional Comments/Professional Judgment

The final validated results represent the compilation of all quality control qualification. With the exception of the quality control anomalies presented in Sections V.A.4, V.B.2, VI.3 and X.2 and the resulting qualifiers, the analyses of environmental samples and quality control samples are valid within the constraints identified with the data quality flags. All false positive/negative results and matrix interferences are summarized on Tables A-1 and A-3, respectively.

## **Inorganic Data Qualifiers**

- U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
- J - The associated value is an estimated quantity.
- R - The data are unusable. (Note: Analyte may or may not be present.)
- UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

**APPENDIX A**

**Summary Tables and Work Sheets**

**Table A-1**  
**Review of False Positive/Negative Results**

Sample	Parameter	False Positive or Negative	Rationale	Reported		Validated	
				Conc. (ug/l or mg/kg)	Qual	Conc. (ug/l or mg/kg)	Qual
14Y003	Barium	P	2	0.72	B	1.18	UJ
14S02601	Barium	P	2	4.7	B	4.7	UJ
14B02602	Barium	P	2	3.5	B	3.5	UJ
14S02701	Barium	P	2	6.3	B	6.3	UJ

**I. Validation Procedure Summary**

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA National Functional Guidelines for Organic Data Review, (12/90, Revised 6/91) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

**II. Data Deliverables**

1. All required deliverables including QA/QC summary forms and all necessary raw data were present in legible form in the data package.

Yes:  X  No:      

**III. Technical Holding Times**

Technical holding times for all samples were verified from raw data and chain of custody forms.

1. Technical holding times were within the allowable limits shown below:
- a. Preserved water samples were analyzed  $\leq 14$  days from date of sample collection.
  - b. Unpreserved water samples, aromatic VOCs analyzed  $\leq 7$  days from date of sample collection; non-aromatic VOCs analyzed  $\leq 14$  days from date of sample collection.

Yes:  X  No:       N/A:      

Yes:       No:       N/A:  X

- c. Soil samples analyzed  $\leq 14$  days from date of sample collection.

Yes:       No:       N/A:  X

Comment: Holding time criteria have been met and no action has been taken.

#### IV. Initial Calibration (ICAL)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. An initial 5-point calibration was run for each compound.

Yes:  X  No:      

2. The correlation coefficient (r) results from the initial calibration met QC acceptance criteria (>0.995) for each compound.

Yes:  X  No:      

Comment: Initial calibration criteria have been met and no action has been taken.

#### V. Continuing Calibration

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. A continuing calibration standard containing all target compounds was analyzed.

Yes:  X  No:      

2. The % difference for each compound was within acceptance criteria.

Yes:  X  No:      

3. The retention times (RT) for each compound was within the specified RT window.

Yes:  X  No:      

4. Comments: The following calibration calculations were verified during the validation process.

MF005 GC9-VAR3400 5/28/96 Benzene r = 0.9999480 r squared = 0.999896	MF005 GC9-VAR3400 5/28/96 Toluene % D = (100-98.80)/100 x 100 = 1.2%
---	--

## VI. Blanks

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

### A. Laboratory Blanks

1. Laboratory method blanks were analyzed for each matrix type, concentration level, and for each 12 hour time period on each GC system used to analyze samples.

Yes:  X                       No:      

2. All laboratory blanks were found to be free of contaminant target compounds at detectable concentrations.

Yes:  X                       No:      

Comment: The following table summarizes laboratory blank results:

Volatile Laboratory Blank Summary Table SDG No. MF005								
Blank ID/Date Analyzed	Affected Analyte	Conc. ug/l	Action Level ** ug/l	Affected Sample	Lab Conc ug/l	Lab Qual	EDS Conc ug/l	EDS Qual
VBLK001 5/28/96	None Found	--	--	--	--	--	--	--

### B. Field Blanks

1. The field blanks associated with samples in the SDG met the following conditions:

a. All field blanks were found to be free of target analytes at detectable concentrations.

Yes:  X                       No:                            N/A:      

Comment: The following table summarizes field blank results:

Volatile Field Blank Summary Table SDG No. MF005								
Blank ID/Date Analyzed	Affected Analyte	Conc. ug/l	Action Level ** ug/l	Affected Sample	Lab Conc ug/l	Lab Qual	EDS Conc ug/l	EDS Qual
14T005 5/28/96	None Found	--	--	--	--	--	--	--
14Y004 5/28/96	None Found	--	--	--	--	--	--	--
14R005 5/28/96	None Found	--	--	--	--	--	--	--

### VII. System Monitoring Compounds (Surrogates)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. System monitoring compound recovery results met the QC acceptance criteria for fluorobenzene.

Yes:  X  No:      

2. Sample reanalysis was performed if system monitoring results were outside of criteria.

Yes:       No:       N/A:  X

Comment: Surrogate criteria have been met and no action has been taken.

### VIII. Matrix Spikes/Matrix Spike Duplicates

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one field sample of each type was spiked for MS/MSD analysis.

Yes:  X  No:      

2. MS/MSD sample I.D.: 14W014

3. MS/MSD sample results met QC acceptance criteria.

Yes:  X  No:       NA:      

**IX. Laboratory Control Samples (LCS)**

Laboratory control charts were included in the data packages.

1. Laboratory control charts were provided for each surrogate recovery.

Yes:  X  No:       N/A:      

2. The percent recoveries were within acceptable QC limits.

Yes:  X  No:       N/A:      

Comment: LCS criteria have been met and no action has been taken.

**X. Field Duplicates**

1. The following duplicate set(s) was analyzed with this SDG:

a. 14W014 and 14W014D

2. Comment: There were no positive results reported for either duplicate sample.

**XI. Compound Quantitation and Reported CRQLS**

Compound quantitation and reported CRQLs are not verified for Level C data validation.

1. All Form I sample results which were verified were correctly calculated and reported.

Yes:       No:       N/A:  X

2. All sample compounds had on-column concentrations within the upper calibration range of the method.

Yes:  X  No:       N/A:

3. All samples were analyzed only once (i.e., no samples required re-analysis or dilution).

Yes:   X              No:                   N/A:       

## **XII. System Performance**

1. The instrumental and analytical systems used in the analysis of these samples maintained an acceptable level of performance.

Yes:   X              No:       

## **XIII. Overall Assessment of Data**

The final validated results represent the compilation of all quality control qualification. The analyses of environmental samples and quality control samples are valid.

## Organic Data Qualifiers

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA National Functional Guidelines for Organic Data Review, (12/90, Revised 6/91) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms and all necessary raw data were present in legible form in the data package.

Yes:  X  No:      

## III. Technical Holding Times

Technical holding times for all samples were verified from raw data and chain of custody forms.

1. Technical holding times were within the allowable limits shown below:

a. Water samples extracted < 7 days from date of sample collection; analyzed < 40 days from date of extraction.

Yes:  X  No:       N/A:      

b. Soil samples extracted < 14 days from date of sample collection; analyzed < 40 days from date of extraction.

Yes:       No:       N/A:  X

Comment: Holding time criteria have been met and no action has been taken.

## IV. Calibration

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. Were initial calibration data reviewed and found to meet all method requirements?

Yes:  X  No:

Comment: Initial calibration criteria have been met and no action has been taken.

2. Were continuing calibration data reviewed and found to meet all method requirements?

Yes:  X  No:      

Comment: Calibration criteria have been met and no action has been taken. All %D values were less than 15.0%.

3. Did the laboratory meet the linearity check criteria?

Yes:  X  No:      

Comment: Linearity check criteria have been met and no action has been taken. The coefficient of determination for each calibration curve was greater than 0.995.

4. Were the retention times within specified limits?

Yes:  X  No:      

Comment: Retention time criteria have been met and no action has been taken.

The following calculations were verified for this data package:

PNAs MF005 RTX-5 HP8904A 4/1/96 Fluorene mean RT= $18.02+18.01+18.01+18.01+18.01/5 = 18.01$	PNAs MF005 RTX-5 HP8904A 6/3/96 Naphthalene $0.5 \text{ Std} = \text{area ratio} = 204640/995417 = 0.20558$	PNAs MF005 HP8904A 5/31/96 Anthracene $\%D = (20.38-19.11)/20.38 \times 100 = 6.2\%$
--	--	---

## V. Blanks

### A. Laboratory Blanks

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. A method blank analysis was performed for every 20 samples of a similar matrix type in each SDG.

Yes:  X  No:

2. Laboratory method blanks were found to be clean of target compound contamination at detectable concentrations.

Yes:  X  No:      

3. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:       No:       NA:  X

Comment: Blank criteria have been met and no action has been taken.  
Laboratory blank NBLK22 was free of contamination.

### B. Field Blanks

1. Field blanks were found to be clean of target compound contamination at detectable concentrations.

Yes:  X  No:       N/A:      

2. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:       No:       N/A:  X

Comment: Field blank 14Y004 and rinsate blank 14R005 were free of contamination.

### VI. Surrogate Spike Compounds

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. The surrogate spike %R values were within the QC advisory limits for terphenyl-d14.

Yes:  X  No:      

Comment: Surrogate criteria have been met and no action has been taken.

### VII. Matrix Spikes/Matrix Spike Duplicates (MS/MSD)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one field sample of each type was spiked for MS/MSD analysis.

Yes:  X  No:      

2. MS/MSD sample I.D.: 14W014

3. MS/MSD sample results were acceptable.

Yes:  X  No:      

Comment: MS/MSD criteria have been met and no action has been taken.

### VIII. Blank Spikes

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one blank sample of each type was spiked for BS analysis.

Yes:  X  No:      

2. Blank Spike sample I.D.: BC052361

3. Blank spike sample results were within acceptable QC limits.

Yes:  X  No:       N/A:      

Comment: BS criteria have been met and no action has been taken.

### IX. Laboratory Control Samples (LCS)

Laboratory control charts were provided for each analysis.

1. For every batch, one LCS of each type was analyzed.

Yes:  X  No:       N/A:      

2. LCS sample I.D.: C05226B1

3. The percent recoveries for the LCS compound were within acceptable limits.

Yes:  X  No:       N/A:

Comment: The LCS performed on 5/31/96 was acceptable.

#### X. Field Duplicates

1. The following duplicate set was analyzed with this SDG:
  - a. 14W014 and 14W014D
2. Comment: Phenanthrene was reported in sample 14W014 at 5 ug/l and 4UJ in sample 14W014D. The RPD was not calculated since one result is positive and the other result is a non-detect. No action was taken.

#### XI. Target Compound Identification

Target compound identification is not reviewed for Level C validation.

#### XII. Compound Quantitation and Reported CRQLS

Compound quantitation and reported CRQLS are not reviewed for Level C validation.

1. CRQL values were adjusted to reflect all sample volumes, sample dilutions, concentrations, cleanup activities, and dry weight factors not accounted for by the method.

Yes:  X                       No:                            N/A:     

2. Comment: Sample 14W013 was diluted and analyzed at 10X due to chemical interferences. The reporting limits were raised in samples 14W013, 14W014D, 14W015, and 14W016 for phenanthrene and anthracene, also due to chemical interferences. The laboratory flagged these results as "UI" and the reviewer further qualified these results as estimated "UJ." Sample 14W014 was flagged "UJ" for anthracene only.

#### XIII. Overall Assessment of Data

The final validated results represent the compilation of all quality control qualification. With the exception of the quality control anomalies presented in Section XII (Compound Quantitation) of this report and the resulting qualifiers, the analyses of environmental samples and quality control samples are valid within the constraints identified with the data quality flags.

### Organic Data Qualifiers

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA Functional Guidelines for Inorganic Analyses (7/88) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms are present and in legible form in the data package.

Yes:  X  No:      

2. Lab control charts were received and data points were within the control limit windows.

Yes:  X  No:       N/A:      

Note: If data points are outside of control limit windows, refer to the Laboratory Control Sample section VIII for any effect on data quality.

## III. Technical Holding Times

Chain of custody records and sample preparation logs (Form 13) were checked for all samples to verify that technical holding time, and preservation criteria were met.

1. Technical holding times were within the allowable limits shown below:
  - a. Analysis for all metals was completed within 180 days of sample collection; mercury was completed within 28 days.

Yes:  X  No:      

Comment: Holding time criteria have been met and no action has been taken.

#### IV. Instrument Calibration and Calibration Verification

One hundred percent of the calibration results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. Instrument calibration for metals determined by inductively coupled plasma spectroscopy (ICP) was performed using a blank and one standard for each analyte.

Yes:  No:  N/A:

Comment: ICP analysis was not performed for this SDG.

2. Instrument calibration for metals determined by graphite furnace atomic absorption spectroscopy (GFAA) was performed using a blank and three standards (one of which was at the CRDL).

Yes:  No:

3. Instrument calibration for mercury was performed using a blank and four standards.

Yes:  No:  N/A:

4. Instrument calibration for cyanide was performed using a blank and three standards (one of which was at the CRDL).

Yes:  No:  N/A:

5. Calibration verification was performed for each analyte at a frequency of 10%.

Yes:  No:

6. A continuing calibration verification (CCV) was performed after the last analytical sample in each run.

Yes:  No:

7. Initial calibration verification (ICV) and CCV percent recovery (%R) values met the criteria specified below:

a. For all metals except mercury, %R results were between 90% and 110%.

Note: Due to possible rounding errors, allow results to fall within 1% of the contract windows (e.g. 89-111%).

Yes:  X  No:

8. Correlation coefficients for GFAA analytes, mercury, and cyanide calibration curves were greater than or equal to 0.995.

Yes:   No:   N/A:  X

Comment: Raw data was not provided for this Level C SDG; therefore, calibration curves were not available.

9. Comments: The following calibration calculations were verified during the validation process.

ICV or CCV	Analyte	Calculation %R=(Found/True)*100	%R
ICV	Lead	45.94/50.0 x 100	91.9
CCV	Lead	53.82/50.0 x 100	107.6
ICV	Mercury	4.37/5.0 x 100	87.4
CCV	Mercury	4.74/5.0 x 100	94.8

## V. Blanks

### A. Laboratory Blanks

One hundred percent of the laboratory blank results on the summary forms were checked to ensure that reported results were within required quality control limits.

1. Preparation blank analyses results have been reported for each matrix type for every extraction batch.

Yes:  X  No:

2. Calibration blanks were run at a frequency of 10%.

Yes:  X  No:

3. A calibration blank was analyzed immediately after every ICV and CCV, and after the last sample.

Yes:  X  No:      

4. All reported blank analyte results had absolute values less than the corresponding IDL values.

Yes:       No:  X

The following sample results were qualified due to laboratory blanks that had target analytes where the absolute value of the reported results was greater than or equal to the corresponding IDL value; sample results were less than 5X the absolute value of the blank result.

Inorganic Laboratory Blank Summary Table SDG No. MF005								
Blank ID/ Date	Affected Analyte	Absolute Conc. ug/l	Action Level ug/l	Affected Sample	Lab Conc ug/l	Lab Qual	EDS Conc ug/l	EDS Qual
PBW 5/28/96	Lead	2.76	13.8	14W013	4.9	-	4.9	UJ
				14W014	3.6	-	3.6	UJ
				14W014D	12.5	-	12.5	UJ
				14W015	1.5	B	2.76	UJ
				14W016	2.4	B	2.76	UJ
				14Y004	3.5	-	3.5	UJ

5. All reported blank analyte results had absolute values less than or equal to the corresponding CRDL values.

Yes:  X  No:      

#### B. Field Blanks

1. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:       No:  X  N/A:

2. Analytes were detected, but associated sample aliquot concentrations were greater than 5X the blank concentration.

Yes: \_\_\_\_\_ No:  X  N/A: \_\_\_\_\_

The following sample results were qualified due to field blanks that had target analytes where the absolute value of the reported results was greater than or equal to the corresponding IDL value; sample results were less than 5X the absolute value of the blank result.

Inorganic Laboratory Blank Summary Table SDG No. MF005								
Blank ID	Affected Analyte	Absolute Conc. ug/l	Action Level ug/l	Affected Sample	Lab Conc ug/l	Lab Qual	EDS Conc ug/l	EDS Qual
14R005	Mercury	0.19	0.95	14W014	0.15	B	0.19	UJ
				14W015	0.10	B	0.19	UJ

Comment: Water source blank 14Y004 exhibited lead at a level of 3.5 ug/l. This is probably a reflection of the prep blank contamination.

## VI. Matrix Spike Sample Recovery

One hundred percent of the matrix spike (MS) sample results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. For SDG MF005, one field sample from each group of samples of a similar matrix and concentration level was spiked with each target analyte (except: Ca, Mg, K, Na on water samples and Al, Ca, Mg, K, and Na on soil/sediment samples) by the laboratory.

Yes:  X  No: \_\_\_\_\_

2. MS sample ID: 14W014

3. For all target analytes, percent recovery (%R) results were within the limits of 75% - 125% (Note: MS %R limits do not apply when the sample concentration exceeded the spike concentration by a factor of 4 or more).

Yes:  X  No:

4. The following spike calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation %R=(SSR-SR/SA)*100	%R
GFAA	Lead	(18.8-3.58)/20.0 x 100	76.1
CV	Mercury	(1.92-0.15)/2.0 x 100	88.5

## VII. Interference Check Samples

Since no ICP analysis was performed for this SDG, an ICS was not necessary.

1. ICP ICSs (solutions A and AB) were analyzed at the beginning and end of each sample analysis run (or a minimum of twice per 8-hour shift, whichever was more frequent).

Yes:   No:   N/A:  X

2. Solution AB analyte recovery results were within the control limits of 80% - 120%.

Yes:   No:   N/A:  X

3. Concentrations of Ca, Fe, and Mg in the samples are less than or equal to their respective concentration in ICS solution A or AB.

Yes:   No:   N/A:  X

4. Cr is present in a sample(s) at concentrations less than 10,000 ug/L.

Yes:   No:   N/A:  X

### VIII. Laboratory Control Sample (LCS)

One hundred percent of the LCS results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. A laboratory control sample was analyzed for each SDG for each matrix type.

Yes:  X  No:      

2. Aqueous LCS recovery results were within the control limits of 80% to 120% (except for Sb and Ag which have no required limits).

Yes:  X  No:       N/A:      

3. Soil LCS recovery results were within the required control limits specified on the laboratory Form VII-IN and control charts.

Yes:       No:       N/A:  X

Comment: LCS criteria have been met and no action has been taken.

4. The following LCS calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation %R = (Found/True)*100	%R
GFAA	Lead	50.77/50 x 100	101.5
CV	Mercury	4.93/5.0 x 100	98.6

### IX. Duplicate Sample Analysis

One hundred percent of the duplicate results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

#### A. Laboratory Duplicates

1. For each SDG, one duplicate sample was analyzed from each group of samples of a similar matrix type and concentration level.

Yes:  X  No:

MSD ID: 14W014, 14W014D

2. For duplicate analyte concentrations greater than 5X the CRDL, the relative percent difference (RPD) between the two reported results was less than 20% for aqueous samples (35% for soil samples).

Yes:  X  No:

3. For duplicate analyte concentrations less than 5X the CRDL, the difference between the two reported results was less than the CRDL value for aqueous samples, or less than 2X the CRDL value for soil samples. RPDs for samples with values less than the CRDL are not calculated.

Yes:  X  No:

4. Comment: Laboratory duplicate criteria have been met and no action has been taken.

5. The following duplicate calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation $RPD = [S-D/(S+D/2)] * 100$ $D = S - Dup$	RPD or Difference
GFAA	Lead	3.58-5.39	1.81 ( $\pm 3.0$ )
CV	Mercury	0.15-0.32	0.17 ( $\pm 0.2$ )

### B. Field Duplicates

1. The following duplicate sets were analyzed with this SDG:
- a. 14W014 and 14W014D
2. Comment: Field duplicate analysis of lead resulted in a difference of 8.9 ( $\pm 3$ ). Lead results have been qualified for prep blank contamination and no further action has been taken.

### X. Furnace Atomic Absorption QC

One hundred percent of the AA summary data was checked to ensure that reported results were within required quality control limits.

1. Duplicate injections for AA analytes with concentrations greater than the CRDL had RSD results < 20%.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A: X

Comment: RSD results are contained in the raw data which is not provided for Level C review.

2. For each sample, all AA analytical spike recovery results were between 85% and 115%.

Yes: \_\_\_\_\_ No: X

Comment: Lead analysis of sample 14W015 resulted in an analytical spike recovery of 83%. The lead result for the above sample has already been qualified for prep blank contamination and no further action has been taken.

3. For each sample, all AA results were within the appropriate calibration range, or were diluted to meet this criteria.

Yes: X No: \_\_\_\_\_ N/A: \_\_\_\_\_

4. Sample analyte results where the analytical spike recovery was <40% were diluted once and reanalyzed.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A: X

5. Samples having analyte concentrations greater than or equal to 50% of the spike concentrations, and spike %R results <85% or >115% were quantitated by MSA.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A: X

6. MSA analyses with correlation coefficients less than 0.995 were rerun once.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A: X

7. MSA spike values met the criteria specified below:

- a. Spike 1 was approximately 50% of the sample concentration.
- b. Spike 2 was approximately 100% of the sample concentration.
- c. Spike 3 was approximately 150% of the sample concentration.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

## XI. ICP Serial Dilution

1. ICP serial dilution analysis was performed on one sample from each SDG of a similar matrix type and concentration level.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

2. For each analyte in the serial dilution sample which was minimally a factor of 50 above the IDL in the original sample, the serial dilution result agreed within 10% of the original determination after correction for dilution.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

## XII. Sample Result Verification

Ten percent of all reported sample results were not verified since the raw data is not provided for a Level C data package.

1. All sample results which were verified were correctly calculated and reported.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

Comment: Calculations and transcriptions can not be verified without the raw data.

2. All sample results fall within the calibrated range of the instrument for GFAA and mercury.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

3. All reported concentrations were above the CRDL.

Yes: \_\_\_\_\_ No: X N/A: \_\_\_\_\_

Comment: The "B" qualifier applied by the laboratory for results between the CRDL and the IDL were amended with a "J" qualifier.

4. Sample results on Form 1 were reported down to the IDL not CRDL for all analytes.

Yes: X No: \_\_\_\_\_ N/A: \_\_\_\_\_

5. Reported sample results that were analyzed by ICP for As, Pb, Se, and Tl were at least 5X the ICP IDL.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A: X

6. Sample weights, volumes and dilutions were taken into account when reporting detection limits on Form 1.

Yes: X No: \_\_\_\_\_ N/A: \_\_\_\_\_

7. IDLs were present and found to be less than CRDL.

Yes: X No: \_\_\_\_\_ N/A: \_\_\_\_\_

8. All CRDLs and IDLs were included on Form X.

Yes: X No: \_\_\_\_\_ N/A: \_\_\_\_\_

9. Raw data were free of anomalies (e.g. baseline shifts, negative absorbances/emissions, omissions, etc.). If no, please describe anomalies in the comments section below.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A: X

Comment: Raw data is not provided for Level C review.

### **XIII. Additional Comments/Professional Judgment**

The final validated results represent the compilation of all quality control qualification. With the exception of the quality control anomalies presented in Sections V.A.4, V.B.2, and XII.3 and the resulting qualifiers, the analyses of environmental samples and quality control samples are valid within the constraints identified with the data quality flags. All false positive/negative results are summarized on Table A-1.

## Inorganic Data Qualifiers

- U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
- J - The associated value is an estimated quantity.
- R - The data are unusable. (Note: Analyte may or may not be present.)
- UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

## APPENDIX A

### Summary Tables and Work Sheets

**Table A-1**  
**Review of False Positive/Negative Results**

Sample	Parameter	False Positive or Negative	Rationale	Reported		Validated	
				Conc. (ug/l)	Qual	Conc. (ug/l)	Qual
14W013	Lead	P	2	4.9	-	4.9	UJ
14W014	Lead	P	2	3.6	-	3.6	UJ
14W014D	Lead	P	2	12.5	-	12.5	UJ
14W015	Lead	P	2	1.5	B	2.76	UJ
14W016	Lead	P	2	2.4	B	2.76	UJ
14Y004	Lead	P	2	3.5	-	3.5	UJ
14W014	Mercury	P	2	0.15	B	0.19	UJ
14W015	Mercury	P	2	0.10	B	0.19	UJ

**Rationale**

- 1 = Professional judgement
- 2 = Blank contamination (laboratory or field)
- 3 = Prep blank

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA National Functional Guidelines for Organic Data Review, (12/90, Revised 6/91) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms and all necessary raw data were present in legible form in the data package.

Yes:  X  No:      

## III. Technical Holding Times

Technical holding times for all samples were verified from raw data and chain of custody forms.

1. Technical holding times were within the allowable limits shown below:

a. Preserved water samples analyzed  $\leq 14$  days from date of sample collection.

Yes:  X  No:       N/A:      

b. Unpreserved water samples, aromatic VOCs analyzed  $\leq 7$  days from date of sample collection; non-aromatic VOCs analyzed  $\leq 14$  days from date of sample collection.

Yes:       No:       N/A:  X

c. Soil samples analyzed  $\leq 14$  days from date of sample collection.

Yes:  X  No:       N/A:      

Comment: Holding time criteria have been met and no action has been taken.

#### IV. Initial Calibration (ICAL)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. An initial 5-point calibration was run for each compound.

Yes:  X  No:      

2. The correlation coefficient (r) results from the initial calibration met QC acceptance criteria for each compound.

Yes:  X  No:      

Comment: Initial calibration criteria have been met and no action has been taken.

#### V. Continuing Calibration

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. A continuing calibration standard containing all target compounds was analyzed.

Yes:  X  No:      

2. The % difference for each compound was within acceptance criteria.

Yes:  X  No:      

3. The retention times (RT) for each compound was within the specified RT window.

Yes:  X  No:      

4. Comments: The following calibration calculations were verified during the validation process.

MF006 GC10 VAR3400 7/18/96 Vinyl Chloride r = 0.999507 r squared = 0.999014	MF006 GC9 VAR3400 7/15/96 Chloroethane % D = (100-96.67)/100 x 100 = -3.3%
--	--

## VI. Blanks

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

### A. Laboratory Blanks

1. Laboratory method blanks were analyzed for each matrix type, concentration level, and for each 12 hour time period on each GC system used to analyze samples.

Yes:   X              No:       

2. All laboratory blanks were found to be free of contaminant target compounds at detectable concentrations.

Yes:   X              No:       

Comment: The following table summarizes laboratory blank results:

Volatile Laboratory Blank Summary Table SDG No. MF006								
Blank ID/Date Analyzed	Affected Analyte	Conc. ug/l	Action Level ** ug/l	Affected Sample	Lab Conc ug/l	Lab Qual	EDS Conc ug/l	EDS Qual
VBLK001 7/15/96	None Found	--	--	--	--	--	--	--
VBLK002 7/18/96	None Found	--	--	--	--	--	--	--

### B. Field Blanks

1. The field blanks associated with samples in the SDG met the following conditions:

a. All field blanks were found to be free of target analytes at detectable concentrations.

Yes:   X              No:                   N/A:       

Comment: The following table summarizes field blank results:

Volatile Field Blank Summary Table SDG No. MF006								
Blank ID/Date Analyzed	Affected Analyte	Conc. ug/l	Action Level ** ug/l	Affected Sample	Lab Conc ug/l	Lab Qual	EDS Conc ug/l	EDS Qual
14T006 7/15/96	None Found	--	--	--	--	--	--	--
14Y005 7/15/96	None Found	--	--	--	--	--	--	--
14R006 7/15/96	None Found	--	--	--	--	--	--	--

### VII. System Monitoring Compounds (Surrogates)

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

- System monitoring compound recovery results met the QC acceptance criteria for fluorobenzene.

Yes:  X  No:

- Sample reanalysis was performed if system monitoring results were outside of criteria.

Yes:   No:   N/A:  X

Comment: Surrogate criteria have been met and no action has been taken.

### VIII. Matrix Spikes/Matrix Spike Duplicates

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

- For every 20 samples in an SDG, one field sample of each type was spiked for MS/MSD analysis.

Yes:  X  No:

- MS/MSD sample I.D.: 14S02701

3. MS/MSD sample results met QC acceptance criteria.

Yes:  X  No:       NA:      

4. Comment: MS/MSD criteria have been met and no action has been taken.

#### IX. Laboratory Control Samples (LCS)

Laboratory control charts were included in the data packages.

1. Laboratory control charts were provided for each surrogate recovery.

Yes:  X  No:       N/A:      

2. The percent recoveries were within acceptable QC limits.

Yes:  X  No:       N/A:      

Comment: LCS criteria have been met and no action has been taken.

#### X. Field Duplicates

1. The following duplicate set(s) was analyzed with this SDG:

a. 14S02701 and 14S02701D

2. Comment: There were no positive results reported for either duplicate sample.

#### XI. Compound Quantitation and Reported CRQLS

Compound quantitation and reported CRQLs are not verified for Level C data validation.

1. All Form I sample results which were verified were correctly calculated and reported.

Yes:       No:       N/A:  X

2. All sample compounds had on-column concentrations within the upper calibration range of the method.

Yes:  X  No:       N/A:

3. All samples were analyzed only once (i.e., no samples required re-analysis or dilution).

Yes:  X                       No:                            N/A:     

## **XII. System Performance**

1. The instrumental and analytical systems used in the analysis of these samples maintained an acceptable level of performance.

Yes:  X                       No:     

## **XIII. Overall Assessment of Data**

The final validated results represent the compilation of all quality control qualification. The analyses of environmental samples and quality control samples are valid.

## Organic Data Qualifiers

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA National Functional Guidelines for Organic Data Review, (12/90, Revised 6/91) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms and all necessary raw data were present in legible form in the data package.

Yes:  X  No:      

## III. Technical Holding Times

Technical holding times for all samples were verified from raw data and chain of custody forms.

1. Technical holding times were within the allowable limits shown below:

a. Water samples extracted <7 days from date of sample collection; analyzed <40 days from date of extraction.

Yes:  X  No:       N/A:      

b. Soil samples extracted <14 days from date of sample collection; analyzed <40 days from date of extraction.

Yes:  X  No:       N/A:      

Comment: Holding time criteria have been met and no action has been taken.

## IV. Calibration

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. Were initial calibration data reviewed and found to meet all method requirements?

Yes:  X  No:

Comment: Initial calibration criteria have been met and no action has been taken.

2. Were continuing calibration data reviewed and found to meet all method requirements?

Yes:  X  No:

Comment: Calibration criteria have been met and no action has been taken. All %D values were less than 15.0%.

3. Did the laboratory meet the linearity check criteria?

Yes:  X  No:

Comment: The coefficient of determination was not calculated for any of the compounds. Insufficient data was printed in the coefficient of determination space. The curves all appeared to meet linearity criteria. No action was taken.

4. Were the retention times within specified limits?

Yes:  X  No:

Comment: Retention time criteria have been met and no action has been taken.

The following calculations were verified for this data package:

PNAs MF006 RTX-5 HP8904A 7/19/96 Fluorene mean RT= $17.97+17.96+17.96+17.96+17.97/5 = 17.964$	PNAs MF006 RTX-5 HP8904A 7/22/96 Naphthalene $0.5 \text{ Std} = \text{area ratio} = 156839/929950 = 0.16865$	PNAs MF006 HP8904A 7/25/96 Anthracene $\%D = (19.32-19.71)/19.32 \times 100 = -2.0\%$
--	---	--

## V. Blanks

### A. Laboratory Blanks

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. A method blank analysis was performed for every 20 samples of a similar matrix type in each SDG.

Yes:  X  No:

2. Laboratory method blanks were found to be clean of target compound contamination at detectable concentrations.

Yes:  X  No:

3. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:   No:   NA:  X

Comment: Blank criteria have been met and no action has been taken. Laboratory blanks NBLK08 and NBLK09 were free of contamination.

#### B. Field Blanks

1. Field blanks were found to be clean of target compound contamination at detectable concentrations.

Yes:  X  No:   N/A:

2. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:   No:   N/A:  X

Comment: Field blank 14Y005 and rinsate blank 14R006 were free of contamination.

#### VI. Surrogate Spike Compounds

One hundred percent of the results on summary forms were checked to ensure that reported results met required quality control criteria.

1. The surrogate spike %R values were within the QC advisory limits for terphenyl-d14.

Yes:  X  No:

Comment: Surrogate criteria have been met and no action has been taken.

**VII. Matrix Spikes/Matrix Spike Duplicates (MS/MSD)**

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one field sample of each type was spiked for MS/MSD analysis.

Yes:  X  No:      

2. MS/MSD sample I.D.: 14S02701

3. MS/MSD sample results were acceptable.

Yes:  X  No:      

Comment: MS/MSD criteria have been met and no action has been taken.

**VIII. Blank Spikes**

One hundred percent of the results on the summary forms were checked to ensure that reported results met required quality control criteria.

1. For every 20 samples in an SDG, one blank sample of each type was spiked for BS analysis.

Yes:  X  No:      

2. Blank Spike sample I.D.: BS071561

3. Blank spike sample results were within acceptable QC limits.

Yes:  X  No:       N/A:      

Comment: BS criteria have been met and no action has been taken.

**IX. Laboratory Control Samples (LCS)**

Laboratory control charts were provided for each analysis.

1. For every batch, one LCS of each type was analyzed.

Yes:  X  No:       N/A:

2. LCS sample I.D.: W07126B1 and S07156B1
3. The percent recoveries for the LCS compound were within acceptable limits.

Yes:  X                       No:                            N/A:     

Comment: The LCS' performed on 7/25/96 and 7/29/96 were acceptable.

#### **X. Field Duplicates**

1. The following duplicate set was analyzed with this SDG:
  - a. 14S02701 and 14S02701D
2. Comment: There were no positive results reported for either duplicate sample.

#### **XI. Target Compound Identification**

Target compound identification is not reviewed for Level C validation.

#### **XII. Compound Quantitation and Reported CRQLS**

Compound quantitation and reported CRQLS are not reviewed for Level C validation.

1. CRQL values were adjusted to reflect all sample volumes, sample dilutions, concentrations, cleanup activities, and dry weight factors not accounted for by the method.

Yes:  X                       No:                            N/A:     

2. Comment: Several samples were analyzed at a dilution due to chemical interferences. No action was taken on this basis.

#### **XIII. Overall Assessment of Data**

The final validated results represent the compilation of all quality control qualification. The analyses of environmental samples and quality control samples are valid.

## Organic Data Qualifiers

- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- N - The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
- NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

## Summary of Inorganic Data Validation Metals

## I. Validation Procedure Summary

Data review and validation were performed in accordance with Naval Energy and Environmental Support Activity (NEESA) 20.2-047B (June 1988) using the USEPA Functional Guidelines for Inorganic Analyses (7/88) and criteria specified in the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 3rd Edition (1986).

## II. Data Deliverables

1. All required deliverables including QA/QC summary forms are present and in legible form in the data package.

Yes:  X  No:      

2. Lab control charts were received and data points were within the control limit windows.

Yes:  X  No:       N/A:      

Note: If data points are outside of control limit windows, refer to the Laboratory Control Sample section VIII for any effect on data quality.

## III. Technical Holding Times

Chain of custody records and sample preparation logs (Form 13) were checked for all samples to verify that technical holding time, and preservation criteria were met.

1. Technical holding times were within the allowable limits shown below:
  - a. Analysis for all metals was completed within 180 days of sample collection; mercury was completed within 28 days.

Yes:  X  No:      

Comment: Holding time criteria have been met and no action has been taken.

#### IV. Instrument Calibration and Calibration Verification

One hundred percent of the calibration results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. Instrument calibration for metals determined by inductively coupled plasma spectroscopy (ICP) was performed using a blank and one standard for each analyte.

Yes:  X                       No:                            N/A:     

2. Instrument calibration for metals determined by graphite furnace atomic absorption spectroscopy (GFAA) was performed using a blank and three standards (one of which was at the CRDL).

Yes:  X                       No:     

3. Instrument calibration for mercury was performed using a blank and four standards.

Yes:  X                       No:                            N/A:     

4. Instrument calibration for cyanide was performed using a blank and three standards (one of which was at the CRDL).

Yes:                            No:                            N/A:  X

5. Calibration verification was performed for each analyte at a frequency of 10%.

Yes:  X                       No:     

6. A continuing calibration verification (CCV) was performed after the last analytical sample in each run.

Yes:  X                       No:     

7. Initial calibration verification (ICV) and CCV percent recovery (%R) values met the criteria specified below:

a. For all metals except mercury, %R results were between 90% and 110%.

Note: Due to possible rounding errors, allow results to fall within 1% of the contract windows (e.g. 89-111%).

Yes:  X  No: \_\_\_\_\_

8. Correlation coefficients for GFAA analytes and mercury calibration curves were greater than or equal to 0.995.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

Comment: Raw data was not provided for this Level C SDG; therefore, calibration curves were not available.

9. Comments: The following calibration calculations were verified during the validation process.

ICV or CCV	Analyte	Calculation % R = (Found/True)*100	% R
ICV	Barium	2436/2500 x 100	97.4
CCV	Barium	2438/2500 x 100	97.5
ICV	Arsenic	26.5/25.0 x 100	106.0
CCV	Arsenic	25.7/25.0 x 100	102.8
ICV	Mercury	5.10/5.0 x 100	102.0
CCV	Mercury	4.76/5.0 x 100	95.2

## V. Blanks

### A. Laboratory Blanks

One hundred percent of the laboratory blank results on the summary forms were checked to ensure that reported results were within required quality control limits.

1. Preparation blank analyses results have been reported for each matrix type for every extraction batch.

Yes:  X  No: \_\_\_\_\_

2. Calibration blanks were run at a frequency of 10%.

Yes:  X  No:

3. A calibration blank was analyzed immediately after every ICV and CCV, and after the last sample.

Yes:  X  No:

4. All reported blank analyte results had absolute values less than the corresponding IDL values.

Yes:   No:  X

The following sample results were qualified due to laboratory blanks that had target analytes where the absolute value of the reported results was greater than or equal to the corresponding IDL value; sample results were less than 5X the absolute value of the blank result.

Inorganic Laboratory Blank Summary Table SDG No. MF006								
Blank ID/ Date	Affected Analyte	Absolute Conc. mg/kg or ug/l	Action Level mg/kg or ug/l	Affected Sample	Lab Conc mg/kg or ug/l	Lab Qual	EDS Conc mg/kg or ug/l	EDS Qual
PBW 7/15/96	Barium	1.16	5.8	14Y005	2.0	B	2.0	UJ
PBW 7/15/96	Lead	0.85	4.25	14R006	1.0	B	1.0	UJ

5. All reported blank analyte results had absolute values less than or equal to the corresponding CRDL values.

Yes:  X  No:

#### B. Field Blanks

1. If analytes were detected in the blanks, the associated samples were found to be free of those analytes at detectable concentrations.

Yes:   No:  X  N/A:

2. Analytes were detected, but associated sample aliquot concentrations were greater than 5X the blank concentration.

Yes: \_\_\_\_\_ No:  X  N/A: \_\_\_\_\_

The following sample results were qualified due to field blanks that had target analytes where the absolute value of the reported results was greater than or equal to the corresponding IDL value; sample results were less than 5X the absolute value of the blank result.

Inorganic Laboratory Blank Summary Table SDG No. MF006								
Blank ID	Affected Analyte	Absolute Conc. mg/kg or ug/l	Action Level mg/kg or ug/l	Affected Sample	Lab Conc mg/kg or ug/l	Lab Qual	EDS Conc mg/kg or ug/l	EDS Qual
14R006	Barium	1.74	8.7	14S02601	4.8	B	4.8	UJ
				14B02602	3.4	B	3.4	UJ
				14S02701	6.6	B	6.6	UJ
				14S02701D	6.1	B	6.1	UJ
				14B02702	4.3	B	4.3	UJ
				14S02801	5.3	B	5.3	UJ
				14B02802	3.6	B	3.6	UJ

#### VI. Matrix Spike Sample Recovery

One hundred percent of the matrix spike (MS) sample results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. For SDG MF006, one field sample from each group of samples of a similar matrix and concentration level was spiked with each target analyte (except: Ca, Mg, K, Na on water samples and Al, Ca, Mg, K, and Na on soil/sediment samples) by the laboratory.

Yes:  X  No: \_\_\_\_\_

2. MS sample ID: 14S02701

3. For all target analytes, percent recovery (% R) results were within the limits of 75% - 125% (Note: MS % R limits do not apply when the sample concentration exceeded the spike concentration by a factor of 4 or more).

Yes: \_\_\_\_\_ No:  X

The following samples were qualified due to matrix spike sample recovery deficiencies:

Sample	Analyte	% Recovery	Qualifier
14S02601	Selenium	72.4	UJ
14B02602	Selenium	72.4	UJ
14S02701	Selenium	72.4	UJ
14S02701D	Selenium	72.4	UJ
14B02702	Selenium	72.4	UJ
14S02801	Selenium	72.4	UJ
14B02802	Selenium	72.4	UJ

4. The following spike calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation % R = (SSR-SR/SA)*100	% R
ICP	Barium	$(377-6.62)/422 \times 100$	87.8
GFAA	Selenium	$(1.53-0.0)/2.11 \times 100$	72.5
CV	Mercury	$(0.88-0.0)/1.0 \times 100$	88.0

## VII. Interference Check Samples

One hundred percent of the ICS results on the quality control summary forms were checked to ensure that reported results were within quality control limits.

1. ICP ICSs (solutions A and AB) were analyzed at the beginning and end of each sample analysis run (or a minimum of twice per 8-hour shift, whichever was more frequent).

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

2. Solution AB analyte recovery results were within the control limits of 80%-120%.

Yes:  X  No:       N/A:      

3. Concentrations of Ca, Fe, and Mg in the samples are less than or equal to their respective concentration in ICS solution A or AB.

Yes:       No:       N/A:  X

4. Cr is present in a sample(s) at concentrations less than 10,000 ug/L.

Yes:  X  No:       N/A:      

5. ICP ICSs criteria have been met and no action has been taken.

### VIII. Laboratory Control Sample (LCS)

One hundred percent of the LCS results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

1. A laboratory control sample was analyzed for each SDG for each matrix type.

Yes:  X  No:      

2. Aqueous LCS recovery results were within the control limits of 80% to 120% (except for Sb and Ag which have no required limits).

Yes:  X  No:       N/A:      

3. Soil LCS recovery results were within the required control limits specified on the laboratory Form VII-IN and control charts.

Yes:  X  No:       N/A:      

Comment: LCS criteria have been met and no action has been taken.

4. The following LCS calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation % R = (Found/True)*100	% R
ICP	Barium	2368/2500 x 100	94.7
GFAA	Arsenic	100.6/100.0 x 100	100.6
CV	Mercury	5.2/5.0 x 100	104.0

## IX. Duplicate Sample Analysis

One hundred percent of the duplicate results on the quality control summary forms were checked to ensure that reported results were within required quality control limits.

### A. Laboratory Duplicates

- For each SDG, one duplicate sample was analyzed from each group of samples of a similar matrix type and concentration level.

Yes:  X  No:

MSD ID: 14S02701

- For duplicate analyte concentrations greater than 5X the CRDL, the relative percent difference (RPD) between the two reported results was less than 20% for aqueous samples (35% for soil samples).

Yes:  X  No:

- For duplicate analyte concentrations less than 5X the CRDL, the difference between the two reported results was less than the CRDL value for aqueous samples, or less than 2X the CRDL value for soil samples. RPDs for samples with values less than the CRDL are not calculated.

Yes:  X  No:

- Comment: Laboratory duplicate criteria have been met and no action has been taken.

- The following duplicate calculations were verified during the validation process.

Instrument or Method	Analyte	Calculation $RPD = \frac{S-D}{(S+D/2)} * 100$ D = S - Dup	RPD or Difference
ICP	Chromium	4.58-3.79	0.79 (±4.2)
GFAA	Arsenic	NA	NC
CV	Mercury	NA	NC

### B. Field Duplicates

1. The following duplicate sets were analyzed with this SDG:
  - a. 14S02701 and 14S02701D
2. Comment: Field duplicate criteria have been met and no action has been taken.

### X. Furnace Atomic Absorption QC

One hundred percent of the AA summary data was checked to ensure that reported results were within required quality control limits.

1. Duplicate injections for AA analytes with concentrations greater than the CRDL had RSD results < 20%.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

Comment: RSD results are contained in the raw data which is not provided for Level C review.

2. For each sample, all AA analytical spike recovery results were between 85% and 115%.

Yes:  X  No: \_\_\_\_\_

3. For each sample, all AA results were within the appropriate calibration range, or were diluted to meet this criteria.

Yes:  X  No: \_\_\_\_\_ N/A: \_\_\_\_\_

4. Sample analyte results where the analytical spike recovery was <40% were diluted once and reanalyzed.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

5. Samples having analyte concentrations greater than or equal to 50% of the spike concentrations, and spike %R results <85% or >115% were quantitated by MSA.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

6. MSA analyses with correlation coefficients less than 0.995 were rerun once.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

7. MSA spike values met the criteria specified below:

- a. Spike 1 was approximately 50% of the sample concentration.
- b. Spike 2 was approximately 100% of the sample concentration.
- c. Spike 3 was approximately 150% of the sample concentration.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

## XI. ICP Serial Dilution

1. ICP serial dilution analysis was performed on one sample from each SDG of a similar matrix type and concentration level.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

2. For each analyte in the serial dilution sample which was minimally a factor of 50 above the IDL in the original sample, the serial dilution result agreed within 10% of the original determination after correction for dilution.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

## XII. Sample Result Verification

Ten percent of all reported sample results were not verified since the raw data is not provided for a Level C data package.

1. All sample results which were verified were correctly calculated and reported.

Yes:  No:  N/A:

Comment: Calculations and transcriptions can not be verified without the raw data.

2. All sample results fall within the calibrated range of the instrument for GFAA and mercury.

Yes:  No:  N/A:

3. All reported concentrations were above the CRDL.

Yes:  No:  N/A:

Comment: The "B" qualifier applied by the laboratory for results between the CRDL and the IDL were amended with a "J" qualifier.

4. Sample results on Form 1 were reported down to the IDL not CRDL for all analytes.

Yes:  No:  N/A:

5. Reported sample results that were analyzed by ICP for As, Pb, Se, and Tl were at least 5X the ICP IDL.

Yes:  No:  N/A:

6. Sample weights, volumes and dilutions were taken into account when reporting detection limits on Form 1.

Yes:  No:  N/A:

7. IDLs were present and found to be less than CRDL.

Yes:  No:  N/A:

8. All CRDLs and IDLs were included on Form X.

Yes:  No:  N/A:

9. Raw data were free of anomalies (e.g. baseline shifts, negative absorbances/emissions, omissions, etc.). If no, please describe anomalies in the comments section below.

Yes: \_\_\_\_\_ No: \_\_\_\_\_ N/A:  X

Comment: Raw data is not provided for Level C review.

### **XIII. Additional Comments/Professional Judgment**

The final validated results represent the compilation of all quality control qualification. With the exception of the quality control anomalies presented in Sections V.A.4, V.B.2, VI.3 and XII.3 and the resulting qualifiers, the analyses of environmental samples and quality control samples are valid within the constraints identified with the data quality flags. All false positive/negative results and matrix interferences are summarized on Tables A-1 and A-3, respectively.

### **Inorganic Data Qualifiers**

- U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
- J - The associated value is an estimated quantity.
- R - The data are unusable. (Note: Analyte may or may not be present.)
- UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

**APPENDIX A**

**Summary Tables and Work Sheets**

**Table A-1**  
**Review of False Positive/Negative Results**

Sample	Parameter	False Positive or Negative	Rationale	Reported		Validated	
				Conc. (mg/kg or ug/l)	Qual	Conc. (mg/kg or ug/l)	Qual
14Y005	Barium	P	2	2.0	B	2.0	UJ
14R006	Lead	P	2	1.0	B	1.0	UJ
14S02601	Barium	P	2	4.8	B	4.8	UJ
14B02602	Barium	P	2	3.4	B	3.4	UJ
14S02701	Barium	P	2	6.6	B	6.6	UJ
14S02701D	Barium	P	2	6.1	B	6.1	UJ
14B02702	Barium	P	2	4.3	B	4.3	UJ
14S02801	Barium	P	2	5.3	B	5.3	UJ
14B02802	Barium	P	2	3.6	B	3.6	UJ

Rationale

- 1 = Professional judgement
- 2 = Blank contamination (laboratory or field)
- 3 = Prep Blank - negative value > IDL

**Table A-3  
Matrix Interferences (Inorganics)**

Sample	Parameter	Initial	Re-analysis ID	Final	Was the Re-analysis Needed?	Most Appropriate Result	Comment
14S02601	Selenium	% R = 72.4	NA	NA	NO	0.27 UJ	VI.3
14B02602	Selenium	% R = 72.4	NA	NA	NO	0.27 UJ	VI.3
14S02701	Selenium	% R = 72.4	NA	NA	NO	0.26 UJ	VI.3

①

1/8/96 SNMU 14 Cloudy 30°F  
 Objective: Observe bioremediation at SNMU14  
 Personnel: Svin, Kuchibotla, ABE-ES  
 Mike Jaynes, ABB-ES

0900 Arrival at trailer. Personnel (Svin and Mike) working on setting up equipment to collect soil and surface water samples at SNMU14.

1400 Arrival at SNMU14. Meeting with RHS at site. Precon meeting attended by NAS/Magport personnel, South Dir Nav Fac/Engcom personnel, FTC personnel, RHS person, ROICC person, Cole/Jon personnel, ABB-ES personnel.

RHS person indicates that he is mobilizing this week and intends to begin bioremediation at the site next week. Cheryl Mitchell has got the plugs for the piping through Cole/Jon personnel. Cole/Jon personnel intend to install the plugs for the piping in the sump at the middle of the detention pond on Wednesday.

1530 Arrival at wastewater treatment plant. Cole/Jon personnel show us the

②

pipe plugs Cheryl mentions that may attach additional piping to the plugs to prevent them from going into the piping due to backpressure from water in the sump and pond. Also, Cheryl mentioned that the bugs may not act on the plugs because of the material the plugs are made of.

Cheryl also mentioned that they had researched <sup>(50)</sup> 1/8 she was concerned about the bugs reaching the Oily Waste Treatment Plant. RHS personnel could not promise that none of <sup>(20)</sup> 1/8 no bugs would reach the DWTP. Cheryl wanted to prevent the bugs from reaching the DWTP because the oil at the <sup>(20)</sup> 1/8 reaching the DWTP is separated from the water and the water is reused in the ships, and she was concerned that the bugs may hinder reuse of the oil. RHS personnel will wash the water into the sump. The water is runoff from the concrete pad. This water will

1600

be transferred into a 1000 gallon tank. Cheryl mentioned that they intend to reuse the water in the 1000 gallon on the pad. She said she would check with the regulatory agencies on reuse of the water on the concrete since soil may be a concern. ~~at 1/8~~ 1/8 due to the potential of the bags reaching the groundwater. Return to trailer.

1615 Meeting with South Div personnel at trailer. Harold and Harry Doo brief Sin and Mike about our involvement in the construction oversight.

1645 Mike and Sin working on sampling for next day.

1830 Completing bottle sets for soil sampling. End of day.

②

1/11/96  
 Objective: Collect surface water samples at  
 site.

Personnel: Srin Kuchibotta, ABB-ES  
 0810 Arrival at trailer. Working on  
 redox probe to observe if it  
 could be used for Dissolved

Oxygen measurement.  
 0905 Arrival at site. Unloading of  
 equipment in progress. Crayl

Mitchell of HAUSA/Mayport and Cole/Jon  
 (two) personnel at site. The pipes  
 have been blocked at the sump.  
 The concrete pad was cleaned by  
 the FIC personnel this morning.

Small puddles of water were  
 observed on the pad

1015 Garden hose connected. Mike and  
 Srin check the flow of water. Water  
 flowing at 9 gallons/minute from  
 the two hoses. Two hoses used one along  
 east edge and one along the west edge.

1030 Simulation of the storm event begins.  
 Simulation begins at the south end  
 of the detention pond. Setup includes  
 Dissolved oxygen meter from Cole/Jon.

1500 Feder collects samples

1530 Arrival at site to remove @ 1/11 clean up our equipment.

1600 Depart site. Return to trailer to complete other items. End of day

1/12/96

Objective:

Summary  
Wrap up stormwater sampling events at site.

Personnel: Srin Kuchibotta, ARB-ES

1300 Arrival at site. No personnel at site.

Cheryl called at 1200 and mentioned that the RTHS personnel would expedite ARB-ES soil and stormwater samples if they needed flow results.

However, David Driggers mentioned that RTHS may have to pay the cost difference associated with expediting the results. Cheryl requested me to convey to RTHS person (Ted) to call her about the above detail. Message conveyed to Terry Hansen. Also Cheryl requested that the garden hose be transferred to RTHS personnel. RTHS to return hose after their use. This message also conveyed to Terry and Frank at Tallahassee Depart site.

1430

Arrival again at site. No personnel at site. Talked to Dec Meland about vac. @ 1/12. Talked to

13

Lt. Eimer M. Navaran of FTC about leaving garden hose at FTC  
Lt. Navaran said that it was not a concern and that the hose would be safe at the site.  
1500 Depart site for folder. End of day

Cloudy 65°F

Objective: Observe bioremediation at site

Personnel: Srin Kuchibhotla, Bob ES

1230 Arrival at site. Ted and Jim start of R&S at site. Setting up of work zone and decon pad in progress. Retobill at site.

1300 Retobilling begins. Ted mentioned that they would be wearing a face mask for the not grassed areas. Isopropanol and deionized water being used for decontamination. Ted also mentioned that their microbes and nutrient had arrived at the site. They were planning on applying the bacteria next week. Ted also mentioned that they would be using Petrolog to analyze soil samples that they collect during the course of bioremediation. They also have a pH tester at site. The type of number being used on the concrete pad is called the Rotary Baseline from Africa.

 1/19/96

1/19/96  
 Objective: SWMU 14  
 Observe bioaugmentation (SR) 1/19  
 bioremediation at SWMU 14

Personnel: Srin Kuchibotla, ABB-ES  
 0900 Arrival at site. Personnel not at site.  
 Awaiting arrival of personnel.  
 1030 Called Ted from trailer. Ted  
 mentioned that they were arriving  
 at site late today.

1130 Ted calls at trailer and informs  
 Srin that they were at site and  
 performing some soil tests for TPH  
 using Petrolog. Collection of soil  
 samples not observed. However, observed  
 test in progress. Test involves  
 mixing of engine with soil, and  
 collecting filtered solution from  
 mixture and finally applying iodine  
 engine to it. The Petrolog  
 indicator is used to determine  
 results.

1330 Results from tests available. Soil  
 sample collected from near dump  
 indicating high levels of petroleum.

1/19/96

24

1/22/96 Sunny 65°F  
Objective observe bioremediation at  
Summit

Personnel: Srin Kuchibotla, ABS-ES

0900 Arrival at site. Two RHS personnel on site. RHS personnel testing soil temperature and probing water on tap. water temperature 46°F Summit  
Temp nature: 42°F @ d head  
Temp nature checked at 0949.  
Tap water 60°F

1100 Tony Matani of RHS is other person on site. Tony involved in making of seal at site. Decontamination procedure currently does not involve Ethanol wash. Decon pad setup has been dismantled because it is not viable.

1115 Decon pad maybe set up later by Ted. Ted using Kaptest by Sartester to determine free pH, Nitrogen, phosphorus and potassium content in the soil. Collection of soil sample in progress

Soil sample collected at edge of the work zone. For testing ~~for~~ 1/19 for nitrogen, phosphorus and nitro mix 1 cup of soil with 5 cups of water. Empty a capsule ~~with~~ 1/19 of material into the water and shake well ~~and~~ for 10 minutes. ~~1/19~~ After 10 minutes compare color against color ~~1/19~~ 1/19 chart. Color chart indicated that Nitrogen was low (17 ppm) Phosphorus was at 6 ppm (low) pH is neutral at 7.0.

1140 Ted mentioned that he needed 50 ppm for ~~1/19~~ 1/19 Nitrogen for the bacteria to function. Ted to use air sprayer used for spraying paint for spraying nutrients and bacteria on the concrete and a submersible utility pump for pumping bacteria and nutrients on the soil in the work zone. ~~1/19~~

0830 Arrival onsite. Depart site.

0920 Arrival at site. Ted of R+IS at site.

Ted mentioned that he had spoken with Cheryl about the weather. He mentioned that he was having trouble applying the bacteria because they would not be able to perform well in this cool weather. He also mentioned that the concrete and soil were badly saturated with petroleum and he may not be able to clean up the site ~~1/21~~ 1/21. He mentioned that the bacteria needed atleast 6-8 hours to work on the concrete and that it was very cold in the morning ~~1/28/96~~ 1/28 ~~10:00 hrs~~ and they ~~1/28~~ 1/28 from 0700 to 1100 hrs and he had to stop at 1500 and

(58)

he sees that as a potential concern. 1000 Soil temperature 58°F. Outside temperature 60°F. Ted mentioned that they may ~~1/26~~ 1/26 he may not do any bioremediation today. He plans to start again on Monday. Ted informed him that Mike would be reburied me up to Thursday next week. Depart site. End of day.

SUM 14

Objective Meet with Ted Borkowski of RAS to learn what RAS' plans are regarding the second attempt at the SUM 14 clean-up.

Personnel: Cheryl Mitchell, Larry Smith and Mike Jayna onsite @ 9:00 AM for meeting. Ted arrived @ 9:12. Stated that he would be working on finding accommodations, acquisition of a new se-rubber that worked better, and a different laboratory for their analytical testing.

- During this event the soil will be rototilled and shoveled to homogenize to reduce hot spots.
- In the following week additional people will be employed in the clean up.
- Laboratory results will be analyzed to determine what mix to apply in two weeks.
- Ted suggested that plugging the system was not necessary because the bugs die in water with > 1,000 ppm oil concentration.

9:45 Departed to Trailer

10:05 Called Frank Leszawa reported that no significant work would be done this week.

Will try to - take wells, determine process at NB. Talk with they waste about future materials to be turned in, study Incinerator.

Larry M Smith 4/16/96

**APPENDIX F**  
**RESPONSE TO REGULATORY COMMENTS**

## 1.0 INTRODUCTION

As part of the Navy Environmental Leadership Program (NELP), a technology demonstration for bioremediation of petroleum-contaminated soil and concrete surfaces was performed at Solid Waste Management Unit (SWMU) 14, the Mercury/Oil Waste Spill Area.

Through NELP, the Navy proposed to demonstrate *in situ* bioremediation of petroleum-related constituents from concrete surfaces and soil at and immediately adjacent to the SWMU 14 detention pond. The technology demonstration was conducted by RHS Technical Services, Inc. ABB Environmental Services, Inc. (ABB-ES), observed the technology demonstration and collected baseline and performance evaluation samples to assess the effectiveness of the technology demonstration.

The purpose of this document is to respond to comments by the Florida Department of Environmental Protection (FDEP) concerning the draft report (June 1997) entitled *NELP Program Technology Evaluation Report for SWMU 14, U.S. Naval Station, Mayport, Florida* (ABB-ES, 1997a). The U.S. Environmental Protection Agency declined to comment on the report.

The following correspondence was received from FDEP:

- October 2, 1997, Correspondence from James H. Cason, P.G., Remedial Project Manager, FDEP, to Mr. David Driggers, Department of the Navy, Southern Division Naval Facilities Engineering Command, Subject: Draft Technology Evaluation Report: Naval Environmental Leadership Program Technology Evaluation Report for SWMU 14.

The following chapter provides point-by-point responses to FDEP's comments.

## 2.0 RESPONSE TO FDEP COMMENTS

2.1 Comment 1. The technology demonstration occurred during the colder winter months; as such, I am unsure as to the value of any conclusions regarding the efficacy of the technology type. For this reason, I recommend that the Navy consider conducting any/all bioremediation demonstration projects only in the warmer months of the year. It appears that the demonstration did not adequately establish that the bioremediation of the concrete surface was responsible for the observed effects at SWMU 14.

Comment acknowledged.

2.2 Comment 2. One of the underlying reasons for the consideration of this site as a NELP project was due to the fact that the storm water runoff from the detention pond often failed criteria for petroleum constituents prior to discharge into the St. Johns River. In the conclusions, ABB noted little difference in the surface water baseline and performance evaluation samples from this area. In this respect the technology did not appear to yield beneficial results. This technology should therefore not be utilized for remediation of petroleum-contaminated concrete surfaces and certainly not for those instances where the petroleum has penetrated into the material.

Comment acknowledged. It should be noted that free-phase hydrocarbons were observed to emanate between construction joints in the concrete pads prior to and after the demonstration. The free-phase hydrocarbons may have contributed to the concentrations of petroleum-related chemicals detected in the surface water samples.

2.3 Comment 3. The technology may have had a beneficial effect on the petroleum-contaminated soil; however, an adequate evaluation which accounted for the effects of rototilling was not available. Future projects of this nature should include this aspect.

Baseline soil samples were collected before and after the rototilling occurred. However, the variations in concentrations observed in the soil samples may be related to the rototilling, poor mixing of the soil samples, and/or the precision of the analytical method. It is likely that the rototilling of the soil provided oxygen required for the bioremediation to occur.

2.4 Comment 4. How does the Navy intend to utilize the data from this demonstration in the evaluation of the present status of these portions of SWMU 14.

Petroleum-impacted soil at the southern end of the detention pond appears to have been adequately treated during the technology demonstration to concentrations less than the human health risk-based soil cleanup target levels. The human health-based target treatment levels were promulgated under Florida Administrative Code 62-772 by the State of Florida in September 1997.

The petroleum-related constituents were not compared to ecological screening criteria. However, this is currently not a concern under the assumption that ecological receptors will not utilize the site because of the industrial setting (i.e., firefighting training). Should future use of the site change from

industrial, the ecological criteria may need to be assessed. It should be noted that it is likely that bioremediation will continue to naturally occur and that the concentration of petroleum-related chemicals will likely reduce over time.

Because the detention pond was in use at the time the Resource Conservation and Recovery Act Facility Investigations were being conducted, soil and groundwater directly beneath the detention pond were not evaluated, which was considered a data gap (ABB-ES, 1996). Additional soil and groundwater samples were collected since the NELP technology demonstration was conducted at SWMU 14 and reported in the Interim Measures (IM) Performance Specifications report for SWMU 14 (ABB-ES, 1997b).

Remediation of the soil beneath the detention pond was not recommended in the IM Performance Specifications report because land use at the site is currently industrial, the volatile and semivolatile organic compounds were detected in soil samples at concentrations less than the FDEP soil cleanup criteria (Tonner-Navarro and Roberts, 1997), and the existing concrete surface is an engineering control that prevents exposure to the chemicals (ABB-ES, 1997b). The soil beneath the detention pond should be reassessed if the detention pond (engineering control) is removed.

Natural attenuation was recommended as the interim measure for petroleum-impacted groundwater beneath the site (ABB-ES, 1997b). Monitoring of the natural attenuation should be conducted to document the success of the remedial measure, and to assess whether or not other remedial options should be considered.

The Navy is planning to make improvements to the former firefighting training areas and detention pond including cleaning the stormwater drain system, slip lining the drain pipe, resealing construction joints, and sealing the concrete surfaces of the training areas and detention pond with an epoxy (KJB Architects, 1997).
