## Notes:

- 1 Default value from EPA 2002a and DTSC 2005.
- 2 Default values from the DTSC's 2003 Vapor Intrusion Model (DTSC 2003) for Sand.
- 3 The soil depth below grade to top of contamination is assumed to be directly under the asphalt because the shallowest detected concentration is 0-feet. The soil depth below grade to bottom of contamination is set to 122cm to assume the deepest detected soil concentration possible is at the soil-groundwater interface. The depth to groundwater is based on the average recorded depth to groundwater from the soil borings taken at Site 34.
- 4 Based on field logs for Site 34, the soil strata at Site 34 consisted of poorly graded sand. Sand (S) was used as the soil type input for modeling.
- 5 Average soil and groundwater temperature were determined from Figure A-1 of DTSC 2005.
- 6 The building foundation slab thickness for a residence was based upon the EPA 2002a and DTSC 2005 default value of 10 cm (approximately 4 inches); the default value for the building foundation thickness for a commercial/industrial building is 15 cm (approximately 6 inches) because commercial/industrial buildings have thicker foundation slabs.
- 7 Default value from DTSC 2005.
- 8 Default typical or mean value established in EPA 2002a for residential structures (see values in Appendix G - Table G-3 of EPA 2002). Default value of the hypothetical future commercial/industrial building is from the upper range of values for a residential structure (EPA 2002). Hypothetical future commercial/industrial structures is assumed to be a larger structure than the residential structure.
- 9 The default indoor air exchange rate is 0.5 hr-1 for residential structures and 1.0 hr-1 for industrial structures (DTSC 2005).
