## 11 INTRODUCTION

This appendix presents the results of the screening-level ecological risk assessment (SLERA) and Step 3a risk refinement performed as part of the Remedial Investigation (RI) being conducted at Installation Restoration (IR) Site 34 at Alameda Point, Alameda, California (see Figure I-1). The SLERA and the Step 3a risk refinement assess potential risks to terrestrial receptors and aquatic life associated with exposure to chemicals of potential ecological concern (COPEC) in soil and groundwater at IR Site 34.

The SLERA and refined exposure estimation were prepared in accordance with guidance from the U.S. Environmental Protection Agency (EPA) (1997, 1998, 1999a, 1999b, 2000b), Department of Toxic Substances Control (DTSC) (1996a, 1996b), and the U.S. Department of the Navy (Navy) (1999, 2004). The Navy guidance follows a three-tiered approach for conducting ecological risk assessments (ERA).

The approach and organization of the SLERA and refined exposure estimation are presented in the following sections.

### 11.1 PURPOSE AND APPROACH OF THE SLERA AND STEP 3A RISK REFINEMENT

The purpose of this SLERA and the Step 3a risk refinement is to evaluate potential ecological risks associated with IR Site 34 using existing site data and site assessment reports. The SLERA evaluates potential ecological risks from chemicals present in soils and groundwater at IR Site 34 to terrestrial species potentially using the site, as well as aquatic life in the adjacent Oakland Inner Harbor. The results of this evaluation will guide future risk management decisions for IR Site 34. Further details on the SLERA and the Step3a risk refinement approach are provided below.

A SLERA uses conservative assumptions and available scientific literature to evaluate potential risk to ecological receptors in an approach consistent with Steps 1 and 2 of the eight-step process described in the EPA guidance (EPA 1997, 1998, 1999a, 1999b, 2000b). The methods and assumptions used to complete the SLERA were selected or developed to be consistent with RI work plan (Sultech 2006), Navy policy for conducting Ecological Risk Assessments (ERA) (Navy 1999, 2004), which is parallel to the EPA guidelines for the eight-step ERA process for Superfund sites (EPA 1997b), and EPA guidance. The first two components of the DTSC process (scoping assessment and Phase I predictive assessment) (DTSC 1996a, 1996b) are consistent with the EPA and Navy approaches. Substantive elements of the guidance provided by all three agencies were considered in the development of this SLERA.

Tier 1, composed of two steps, employs existing data and conservative assumptions to evaluate risk at a site (see Figure I-2). In Step 1, Exposure Evaluation, potentially complete exposure pathways are examined to determine if links between site chemicals and ecological receptors exist at IR Site 34. Step 2, Risk Characterization, estimates risk based on the hazard quotient (HQ) approach. Risk is estimated for chemicals with complete exposure pathways identified in

Step 1. Once the Tier 1 process is complete, a scientific management decision point is made on the site's status and whether further evaluation is necessary (EPA 1997, 2001). EPA guidance on conducting ERAs recommends that the list of COPECs be reevaluated in the problem formulation step of the baseline ERA to account for site-specific and regional conditions (EPA 2001). In addition, Navy guidance (1999) indicates that an intermediate refinement step may be conducted (Step 3a risk refinement) if the SLERA indicates unacceptable or uncertain risk (see Figure I-2). If the data evaluated in Steps 1 and 2 indicate risk to receptors at IR Site 34, then the Navy initiated the risk refinement step (Step 3a) of the baseline ERA.

## **12.0 EXPOSURE EVALUATION**

The exposure evaluation begins with a problem formulation step, which identifies an ecological conceptual site model (CSM) that addresses:

- Environmental setting and COPECs
- Chemical fate and transport mechanisms (operational)
- Mechanisms of ecotoxicity (broad classes of COPECs)
- Potentially complete exposure pathways

The ecological CSM for IR Site 34 is shown on Figure I-3.

An assessment of site characteristics and ecological habitats, representative organisms, and threatened and endangered species that exist or have to the potential to exist at IR Site 34 was conducted. COPECs were identified and the fate and transport mechanisms of the COPECs were evaluated to determine if the chemicals have the potential to reach ecological receptors. The ecotoxicity of the COPECs also was examined to understand the potential adverse effects to ecological receptors. Finally, the potential exposure pathways between COPECs and ecological receptors were evaluated.

### **12.1 SITE LOCATION AND DESCRIPTION**

Alameda Point is located at the west end of Alameda Island, which is positioned along the eastern margin of San Francisco Bay and the western edge of the City of Oakland (see Figure I-1). The island is bordered by the Oakland Inner Harbor to the north and San Francisco Bay to the south. IR Site 34 is located on the northwestern portion of Alameda Point.

Alameda Point historically consisted of submerged lands, tideland, and dry land. The area was filled using hydraulically placed dredge materials from San Francisco Bay, Seaplane Lagoon, and Oakland Inner Harbor. Most recently, the land was occupied by the former Naval Air Station Alameda, now known as Alameda Point, but other former land uses included a city-

owned airport and a railroad. The land is currently owned by the City of Alameda, and future potential land uses include a recreational area and a golf course.

Evaluation of soil borings at IR Site 34 indicated surface soils at the site are composed of artificial fill. The artificial fill extends from the ground surface to 6 to 14 feet below ground surface (bgs). The Bay Sediment Unit is located beneath the layer of artificial fill. The fill material is primarily poorly graded, fine- to medium-grained sand, with interbedded clay and sandy clay. An in-depth discussion of the geology of Alameda Point can be found in Section 2.3 of the IR Site 34 RI Report.

Groundwater at IR Site 34 exists in three hydrogeologic units: (1) first water-bearing zone (FWBZ), (2) second water-bearing zone (SWBZ), and (3) the deep water aquifer. Depth to groundwater in the FWBZ ranges from 4 to 6 feet bgs. Based on site investigations, groundwater is flowing in the direction of the Oakland Inner Harbor (see Figure 2-5 in IR Site 34 RI Report).

Current land use at IR Site 34 is open space, although at the time of the site visit, the site was being used for temporary dredging work and the land use was primarily industrial. All of the site buildings have been demolished, and most of the site is paved. IR Site 34 also contains a small amount of disturbed open space and one seasonal wetland area. Land use within a 1-mile radius of the site is mostly urban, with open space, wetlands, and the Oakland Inner Harbor comprising the remaining areas.

## **12.2 ECOLOGICAL SETTING**

This section describes the habitats; representative organisms; and rare, threatened, or endangered species within a 1-mile radius of IR Site 34. The descriptions of site habitats were based on a site visit and were supplemented by information from the California Wildlife Habitat Relationships System (California Department of Fish and Game [CDFG] 2005). The California Natural Diversity Database (CNDDB) (CDFG 2007) was consulted to verify whether special-status species have been reported at IR Site 34 or within the vicinity of the site.

### **12.2.1 Ecological Habitats at Installation Restoration Site 34**

Alameda Point contains the following six major terrestrial and aquatic wildlife habitats identified for an Environmental Impact Statement for the facility (Navy 1999a), and descriptions of the habitat are supplemented by a site visit and information from the California Wildlife Habitat Relationships System (California Department of Fish and Game [CDFG] 2005):

:

- Open Water Area
- Grassland
- Landscaped or Developed

- Intensively Developed
- Airfield (Paved) Area
- Rock Breakwaters and Rip Rap

IR Site 34 is considered an Intensively Developed area and is bordered by Open Water Area and RipRap to the north, Grassland to the south, and Intensively Developed areas to the east and west. Intensively Developed areas have little vegetation and typical urban wildlife, such as California ground squirrel, scrub jays, and American robins, may be observed in these areas but to a lesser extent than in the landscaped/developed areas, because less foraging habitat is available in these areas (Navy 1999a). Feral cats also are found in the intensively developed area.

Dominant plant species in the nonnative grassland habitat to the south include ryegrass (*Lolium perenne*), yellow sweet clover (*Melilotus officinalis*), and common plantain (*Plantago major*). Blacktailed jackrabbits (*Lepus californicus*), Canada geese (*Branta canadensis*); and European starlings (*Sturnus vulgaris*) are the dominant animal species in this habitat (Navy 1999a). Species composition and density vary depending on the amount and type of vegetation present. This habitat supports wildlife that have adapted to disturbed environments.

Riprap and a potential saline emergent wetland area line the northern boundary of IR Site 34 along the shoreline of the Oakland Inner Harbor, and an additional potential seasonal wetland occurs in the southwest corner of the site (see Figure I-5). These potential wetlands have not been formally delineated. In 2001, a wetland delineation was conducted on the northern edge of Site 15, which is located to the east of Site 34, and about 1 acre of the site is classified as wetlands (Tetra Tech 2001a). Dominant plant species in that wetland area include pickleweed (*Salicornia virginica*), Carolina geranium (*Geranium carolinum*), and prickly lettuce (*Lactuca serriola*). Feral cats have been observed in the riprap near the potential wetland. During the site visit, a small area of geraniums (*Geranium carolinum*) and prickly lettuce (*Lactuca serriola*), as well as other unidentified wetland plants, were observed in the potential seasonal wetland in the southwest corner of Site 34.

Although wetland habitat has the potential to support various species, it is unlikely that the wetlands located on or near IR Site 34 would support large populations of wildlife. The potential wetlands provide minimal habitat to support plant and invertebrate populations, and the potential wetland to the north is tidally inundated at such a frequency as to not provide suitable habitat for small mammals. In addition, because of high marine vessel activity in the Oakland Inner Harbor it is unlikely that this area will be used by nesting birds. The wetlands are also isolated by intensively developed area. The saline emergent wetland is subject to fast-moving currents and is adjacent to a deep, riprap-lined channel. This wetland is unlikely to meet the habitat requirements of much wetland wildlife because of the turbulent nature of the neighboring waters and the lack of refuge from flooding.

## 12.2.2 Rare, Threatened, or Endangered Species

Special-status species that have been reported at IR Site 34 or within the vicinity of the site were identified through the CNDDDB (CDFG 2007). Table I-1 lists the special-status species that have been reported at or within the vicinity of Alameda Point. The California Wildlife Habitat Relationships System (CDFG 2005) was consulted to assess the suitability of the habitats at IR Site 34 for each special-status species. Special-status species are unlikely to occur at IR Site 34 because of the dominance of barren or disturbed habitat. Although wetland habitat is present at the site and within a 1-mile radius of the site, these areas do not meet the habitat requirements of special-status species.

Several special-status plants have been reported in Alameda Point (CNDDDB 2007). Robust spineflower (*Chorizanthe robusta* var. *robusta*), Santa Cruz tarplant (*Holocarpha macradenia*), beach layia (*Layia carnosa*), and adobe sanicle (*Sanicula maritima*) are all extirpated or possibly extirpated from Alameda Point. Due to extirpation, as well as the lack of suitable habitat (CDFG 2007), these special-status plants are not expected to occur at IR Site 34.

The tidewater goby (*Eucyclogobius newberryi*), a federally listed endangered fish, occurs in brackish water habitats along the California coast. This species requires shallow lagoons and still water (CDFG 2007). Since the Oakland Inner Harbor is a deep, riprap-lined channel, the habitat requirements for the tidewater goby are not met. This species is not expected to occur at IR Site 34 because of the lack of suitable habitat.

The California tiger salamander (*Ambystoma californiense*) is primarily found in annual grassland habitats and lays eggs in vernal pools or other temporary water sources. This species requires underground mammal burrows for breeding (CDFG 2007). Grasslands do not exist at or within the vicinity of IR Site 34; therefore, the habitat requirements for tiger salamanders are not met. In addition, this species is extirpated at Alameda Point.

The special-status birds that have been reported at Alameda Point include the California black rail (*Laterallus jamaicensis coturniculus*), California clapper rail (*Rallus longirostris obsoletus*), and the California least tern (*Sterna antillarum browni*). The California black rail is associated with salt marshes bordering large bays, primarily in areas with dense pickleweed growth. Although an area of saline emergent wetlands exists at IR Site 34 (see Figure I-5), the area covers only approximately 700 square feet. The black rail prefers extensive tidal marshes (Spautz and Nur 2002), so the wetlands at IR Site 34 would not be large enough to support the black rail. One of the wetlands areas (approximately 5,000 square feet) located in the vicinity of IR Site 34 may be large enough to support the black rail, but this wetland is not tidally inundated. Therefore, this wetland does not meet the habitat requirements for black rails. The California clapper rail occurs in salt and brackish marshes traversed by tidal sloughs. No tidal sloughs are located along the Oakland Inner Harbor in the vicinity of IR Site 34 (see Figure I-5), thus IR Site 34 does not contain suitable habitat to support the clapper rail. As a result, the California black rail and the California clapper rail are not expected to occur at IR Site 34. The California least tern nests in a specific location at Alameda Point. IR Site 34 does not provide the nesting habitat

preferred by the least tern. The least tern has not been observed using the area known as IR Site 34.

The salt marsh harvest mouse (*Reithrodontomys raviventris*), federally and state-listed as endangered, resides only in saline emergent wetlands. Although the wetlands area north of IR Site 34 is classified as saline emergent wetlands, the salt marsh harvest mouse requires higher areas for flood escape (CDFG 2007). The wetlands within the vicinity of IR Site 34 do not fit these criteria, thus this species is not expected to occur at the site.

### **12.3 SELECTION OF CHEMICALS OF POTENTIAL ECOLOGICAL CONCERN**

Soil and groundwater investigations were conducted to characterize the nature and extent of contamination at IR Site 34. Results from these investigations indicated the presence of inorganic and organic chemicals in both media. Soil and groundwater samples were analyzed for metals, volatile organic compounds (VOC), semivolatile organic compounds (SVOC), polycyclic aromatic hydrocarbons (PAH), pesticides, polychlorinated biphenyls (PCB), and total petroleum hydrocarbons (TPH). This analytical data were used to select COPECs.

Soil COPECs were identified from analytical data collected from 0 to 4 feet bgs. Soil COPECs were identified from analytical data collected from 0 to 4 feet bgs. Although groundwater will undergo dilution upon entering the Bay, the SLERA uses the monitoring well concentration data as a conservative (protective) estimate. Groundwater COPECs were identified from analytical data collected from wells located at IR Site 34. COPECs include all chemicals detected above the detection limit at least once. Any chemical not detected above the quantitation limit was eliminated as a COPEC. Per EPA guidance (1989), essential nutrients (calcium, magnesium, potassium, and sodium) were excluded as COPECs. Although essential nutrients may be present at concentrations above naturally occurring levels, they are eliminated as COPECs because they are only toxic at levels higher than those found at the site. In accordance with Navy policy (2001b, 2004), data for IR Site 34 are not screened against background (ambient) concentrations until the COPEC refinement process in Step 3a of the baseline ERA, if Step 3a is necessary. As a result, 20 metals, 16 VOCs, 12 SVOCs, 17 PAHs, 20 pesticides, and 4 TPHs in soil were retained for further evaluation. For groundwater, 24 metals, 29 VOCs, 3 SVOCs, 20 PAHs, 15 pesticides, and 3 TPHs were retained. Descriptive statistics are provided for these initial COPECs for soil and groundwater and the 95UCLs were calculated (see Tables I-2 and I-3).

Retaining each chemical detected at least once as a COPEC likely leads to an overestimation of risk. Many of the chemicals detected at IR Site 34 were detected at relatively low concentrations, but were evaluated as COPECs to preserve the conservative nature of the SLERA. Additionally, the list of groundwater COPECs is conservatively developed, and does not take into account any attenuation or dilution which may occur between the point of detection and reaching ecological receptors at or near the point of entry to surface water. This approach likely overstates the risk to ecological receptors from groundwater.

## **12.4 CHEMICAL FATE AND TRANSPORT**

Residual soil contamination at IR Site 34 appears to be confined to several specific areas (see Section 4.1 of the IR Site 34 RI Report). Based on site-specific investigations, groundwater contamination is present throughout the site. The mechanisms of chemical fate and transport are evaluated to understand how a chemical may reach an ecological receptor. Fate and transport mechanisms of site chemicals determine how the chemicals degrade and where they travel through the environment. Site chemicals can move through environmental media, as well as change in the presence of other chemicals and particles.

Potential routes of migration differ for chemicals in soil and groundwater. Chemicals in soil may migrate via physical processes such as erosion. Migration routes for groundwater chemicals include flow of groundwater (advection) or movement of a chemical in groundwater from an area of greater concentration to a less concentrated area (diffusion). In addition, if groundwater discharges to surface water, chemicals in groundwater may migrate via surface water flow.

Chemicals may also undergo various chemical processes that affect fate and transport. Acid-base reactions, precipitation reactions, and oxidation-reduction reactions may affect the form of the chemical. Volatilization, hydrolysis, and photolysis can affect the persistence and properties of the site chemicals.

The fate and transport of site chemicals may be affected by biological processes. Chemicals that enter site receptors may undergo biotransformation. Bioaccumulation may aid the transfer of chemicals to biota from the air, soil, sediment, and water.

## **12.5 ECOTOXICITY OF CHEMICALS OF POTENTIAL ECOLOGICAL CONCERN**

Several classes of chemicals are included in the list of COPECs for IR Site 34. These classes may affect site receptors in different ways. Metals, VOCs, and SVOCs can adversely affect the central nervous system, as well as the lungs, hearts, livers, and kidneys of wildlife. PAHs may adversely affect several systems within an organism, including the cardiovascular, reproductive, and respiratory systems. Pesticides target several systems within an organism. They may negatively affect the liver, kidneys, and blood, as well as the cardiovascular, neurological, developmental, and reproductive systems. PCBs may have negative reproductive, developmental, and endocrine effects.

## **12.6 EXPOSURE PATHWAY ANALYSIS**

One of the primary tasks of the SLERA is the evaluation of potentially complete exposure pathways. Evaluation of exposure pathways identifies the potential for contact between site-related chemicals in soil and groundwater and the potential ecological receptors at IR Site 34. Identification of complete exposure pathways allows the SLERA to focus only on the chemicals that can reach the receptors.

### **12.6.1 Soil Pathways**

Site soils represent the primary source of chemicals. Chemicals leached into soil from site-related activities. Terrestrial flora and fauna are potential receptors of soil chemicals. A potential exposure route for plants is root uptake of soil chemicals. Potential exposure routes for animals include direct contact, inhalation, incidental soil ingestion, and ingestion of food that have absorbed site-related chemicals. Direct contact (such as dermal absorption) and inhalation are considered to be relatively insignificant pathways and are not easily evaluated. Therefore, these pathways were not assessed. Incidental ingestion of soils and ingestion of contaminated food represent likely exposure routes and were assessed in this SLERA.

No soil pathways for VOCs were quantitatively evaluated in this SLERA for several reasons. Toxicity reference values (TRV) are not typically available to evaluate the risk of dietary ingestion, so assessing risk related to VOCs is difficult. Since VOCs volatilize rapidly and do not bioaccumulate, risk from VOCs in soil is generally insignificant. Although inhalation modeling may be used to evaluate inhalation risk; VOCs were not considered to pose a significant threat since the detection frequency of these chemicals is low.

Future land use may make the soil pathways incomplete by changing the types and character of exposure.

### **12.6.2 Groundwater Pathways**

Groundwater represents a secondary source of chemicals. Chemicals most likely leached from site soils into the underlying groundwater. Terrestrial animals are not likely to burrow below the water table or otherwise come into contact with groundwater. Therefore, the groundwater-to-terrestrial animal pathway is incomplete. The only complete exposure pathway for groundwater is for groundwater to migrate to Oakland Inner Harbor and expose aquatic life to chemicals present in groundwater.

## **12.7 CONCEPTUAL SITE MODEL**

The ecological CSM for IR Site 34 was developed by evaluating receptor exposure pathways associated with site media known to be affected by site-related chemicals (see Figure I-3). The ecological CSM identifies sources of chemicals, fate and transport mechanisms, exposure pathways, and ecological receptors. Investigations at IR Site 34 indicated the presence of metals, VOCs, SVOCs, PAHs, pesticides, PCBs, and petroleum hydrocarbons. These chemicals have the potential to adversely affect the ecological habitats and receptors at and within the vicinity of IR Site 34.

Receptors were selected based on their ability to reside in the habitats at or within the vicinity of IR Site 34. Since barren and urban habitats dominate the area, receptors include species adapted to living in sparsely vegetated and disturbed environments. Exposure pathways evaluated above

were incorporated into the ecological CSM to demonstrate how COPECs may reach ecological receptors.

The selection of assessment endpoints helps to define the adverse effects of site-related chemicals on ecological receptors, including plant and animal populations and communities, habitats, and sensitive environments (EPA 1998). An assessment endpoint represents a specific ecosystem characteristic defined using an ecological entity and selected attributes. The selection of assessment endpoints for IR Site 34 considered the ecological relevance of the entity and attribute, as well as the sensitivity and susceptibility to site chemicals. Since there is relatively little information about adverse effects on specific ecological receptors, a generic assessment endpoint was formulated for the SLERA, as follows:

- Sufficient rates of survival, growth, and reproduction to sustain wildlife populations typical to the area

Although assessment endpoints are useful for identifying general population goals, they do not provide a means for direct measurement or quantification of effects. Therefore measurement endpoints, defined as measurable ecological characteristics that are related to the characteristic chosen as the assessment endpoint and that are measures of biological effects (such as mortality, reproduction, and growth) (EPA 1997), were developed for IR Site 34 as follows:

- Reproductive or physiological effects to the California ground squirrel
- Reproductive or physiological effects to the Alameda song sparrow
- Reproductive or physiological effects to the red-tailed hawk
- Reproductive or physiological effects to aquatic life within the Oakland Inner Harbor

Soil and groundwater models were developed to evaluate complete exposure pathways.

### **12.7.1 Soil Model**

Soil COPECs may migrate to groundwater, surface water, and sediments via leaching, runoff, and erosion processes. In addition, soil chemicals may be transferred directly to organisms via incidental soil ingestion or to plants via root uptake. Several of the site-related chemicals have the potential to bioconcentrate and/or bioaccumulate in plant and animal tissue. Bioaccumulation factors (BAF), expressed as the ratio of the chemical concentration in biota to the concentration of the chemical in soil, were used to estimate the transfer of soil COPECs to lower trophic levels (such as vegetation, invertebrates, and small mammals). Receptor-specific exposure factors were used to estimate transfer of soil COPECs to higher trophic levels (such as ingestion rate of invertebrates or small mammals for which BAFs were calculated).

Ecological receptors for IR Site 34 were selected based on current and future land use. Currently, IR Site 34 is used primarily for industrial work, such as dredge activity, and potential habitat at the site under current land use conditions is limited. The proposed future reuse of IR Site 34 includes construction of a golf course. This reuse would incorporate urban vegetation (grass and ornamental trees and shrubs), introducing potential habitat to the site. This SLERA considered the future reuse plans for Alameda Point to ensure that potential ecological risks were not overlooked.

Terrestrial receptors chosen as representative ecological receptors at IR Site 34 were selected to include the various feeding guilds potentially present at or within the vicinity of the site. Mammals include the deer mouse (omnivorous mammal) and the California ground squirrel (herbivorous mammal). Higher trophic level mammals were not included in the ecological CSM because they are not expected to inhabit IR Site 34. The American robin represents birds that feed primarily on terrestrial invertebrates, while the Alameda song sparrow represents birds that feed on a mix of invertebrates and plant material. The red-tailed hawk was selected to represent a higher trophic level bird predator that feeds on small mammals.

## **12.7.2 Groundwater Model**

Empirical evidence indicates that groundwater at IR Site 34 flows toward the Oakland Inner Harbor. The assessment of aquatic receptors is only addressed qualitatively in this SLERA. For the purposes of the SLERA, COPECs in groundwater were assumed to have no dilution, retardation, or degradation between the location where the COPEC was detected and the Oakland Inner Harbor. This is a conservative assumption that likely overestimates the risk from chemicals in groundwater at IR Site 34.

Ingestion of surface water by terrestrial receptors was not considered a complete exposure pathway since surface water at the site is saline and would not be used as a drinking water source. However, indirect exposure of aquatic life to groundwater through groundwater migration to the Oakland Inner Harbor was considered potentially complete and was addressed qualitatively. The direct contact pathway was considered insignificant for terrestrial mammals and birds.

Groundwater at IR Site 34 and surrounding sites generally flows from the center of the Alameda Point toward the shoreline. The low-flow velocities of groundwater, low concentrations of chemicals in groundwater, high potential for retardation along the groundwater flow path, and tidal action and surface water flow that create a mixing zone at the interface with the Oakland Inner Harbor suggest that chemicals will not discharge to the Inner Harbor at concentrations of concern. Even though chemicals are not expected to discharge into the Oakland Inner Harbor, groundwater COPECs were qualitatively evaluated to generate conservative estimates of the potential effects on aquatic life.

### 13.0 RISK CHARACTERIZATION

The second part of the SLERA is the preliminary risk characterization, Step 2. Effects of COPECs on aquatic life were qualitatively evaluated (see Section 13.4), and risk calculations for each terrestrial receptor were prepared, which allowed for a quantitative estimation of risk based on exposure assumptions for the individual receptor. Risk calculations for each terrestrial receptor and soil COPEC consisted of dividing the media-specific concentration by the appropriate estimated dose for birds and mammals. The risk is evaluated using a HQ. The HQ is calculated using the formula below:

$$HQ = Dose / TRV \quad (I-1)$$

If the HQ is greater than 1, then significant risk is assumed. However, if the HQ is less than or equal to 1, the risk is considered to be minimal. HQs are calculated using a dose assessment and a TRV. For this SLERA, both a low TRV and a high TRV were used wherever possible.

#### 13.1 TOXICITY REFERENCE VALUES FOR MAMMALS AND BIRDS

COPECs identified in soil and groundwater at IR Site 34 are known or suspected to have adverse effects on wildlife. TRVs, originally prepared by the Navy and EPA Biological Technical Assistance Group (BTAG) (Navy 1998), were used as guidelines in the evaluation of soil COPECs (DTSC 2000, 2002). TRVs are provided as both an upper estimate and a lower estimate of effects thresholds. The low TRV is based on no-observed-adverse-effects-level (NOAEL) data, while the high TRV is based on the approximate midpoint of the range of effects levels. Adverse effects are likely to occur at the high TRV. No adverse effects are expected to occur at the low TRV; therefore, the TRVs used in this SLERA represent low TRVs unless otherwise noted.

Navy-BTAG TRVs were used whenever available. If a Navy-BTAG TRV was unavailable for a COPEC, an appropriate TRV was selected from scientific literature. Data from chronic studies also were preferentially selected. If values selected from the literature did not represent chronic NOAELs, a factor of 0.1 was used to convert to a chronic value, and a value of 0.1 was used to convert to a NOAEL, where necessary. If a TRV for birds was unavailable for a COPEC, an adjustment factor of 0.1 was applied to a TRV for mammals. TRVs for mammals are provided in Tables I-4 and I-5, and TRVs for birds are provided in Tables I-6, I-7, and I-8.

Differences in body weight exceeding two orders of magnitude required an adjustment to account for differences in sensitivity between test species and the ecological receptors selected for IR Site 34 (see Tables I-4 through I-8). An allometric adjustment, based on the body weights of the test species described in the scientific literature, was used for both mammals and birds (Sample and Arenal 1999). Scaling factors indicate that mammalian sensitivity increases with increased body weight, whereas bird sensitivity increased with decreased body weight.

TRVs for mammals were calculated using the following formula:

$$TRV_{wildlife} = NOAEL_{test} * (BW_{test}/BW_{wildlife})^{[1-0.94]} \quad (I-2)$$

TRVs for birds were calculated using the following formula:

$$TRV_{wildlife} = NOAEL_{test} * (BW_{test}/BW_{wildlife})^{[1-1.2]} \quad (I-3)$$

where:

- $TRV_{wildlife}$  = Toxicity reference value for wildlife species
- $NOAEL_{test}$  = No-observed-adverse-effects level for test species
- $BW_{test}$  = Body weight for test species
- $BW_{wildlife}$  = Body weight for wildlife species

### 13.2 DOSE ESTIMATION

It is important that risk is conservatively estimated with a SLERA to ensure the assessment does not indicate insignificant risk when a significant risk exists. The following assumptions were used for the exposure assessment to calculate a conservative dose for each receptor. The dose of each COPEC that a receptor receives was calculated using several exposure factors. These exposure factors are discussed further below.

**Site Use Factors (SUF).** This factor measures how much time the receptor uses the site. All species considered in this SLERA were assumed to live and feed within the site at all times.

**Bioavailability.** This factor measures how available the COPECs are to the receptor. All ecological COPECs were assumed to be 100 percent bioavailable for all trophic levels and species.

**Body Weight and Food Ingestion.** The amount of food a receptor ingests relates to the potential uptake of COPECs. The body weight of a receptor influences the toxicity of a COPEC because many chemicals are toxic only once they reach a certain concentration relative to body weight. The average body weight indicated in the literature (EPA 1993, 2003; Office of Environmental Health Hazard Assessment 2003) was used to calculate an ingestion rate based on the formulas presented in Nagy 2001.

**Bioconcentration Factors (BCF) and BAFs.** Soil-to-plant and soil-to-soil invertebrate BAFs were obtained from various sources or calculated based on guidance from primary literature (RAIS 2007). Table I-10 through Table I-15 summarize the bioaccumulation models used for plants, invertebrates, and small mammals.

**Dietary Composition.** This factor is used to determine the source of COPECs in the diet. Some dietary sources may have low concentrations of chemicals, while other dietary sources may

contain high concentrations of chemicals. The diet of each of the receptors was based on the percentages of dietary items, as reported in the literature (Zeiner and others 1990; CDFG 2005).

**Ecological COPEC Concentration.** The EPC used in the evaluation was based on the maximum detection of each COPEC. Exposure was assessed in the context of the following linear food chains:

Soil→Invertebrates and Plants→California ground squirrel→Red-tailed hawk

Soil→Invertebrates and Plants→Alameda song sparrow or American robin

These food chains were used in this SLERA to evaluate potential ecological effects on small mammals, passerines, and raptors. The assumed food web for Alameda Point is presented in Figure I-3.

The model presented in the following equations is adequate to estimate daily doses to various receptors in a SLERA.

Deer mouse dose (milligrams per kilogram per day [mg/kg-day]) =

$$(SUF) \frac{[(C_{soil})(IR_{soil}) + (C_{invert})(IR_{invert}) + (C_{plant})(IR_{plant})]}{BW} \quad (I-4)$$

Ground squirrel dose (mg/kg-day) =

$$(SUF) \frac{[(C_{soil})(IR_{soil}) + (C_{invert})(IR_{invert}) + (C_{plant})(IR_{plant})]}{BW} \quad (I-5)$$

Alameda song sparrow dose (mg/kg-day) =

$$(SUF) \frac{[(C_{soil})(IR_{soil}) + (C_{invert})(IR_{invert}) + (C_{plant})(IR_{plant})]}{BW} \quad (I-6)$$

American robin dose (mg/kg-day) =

$$(SUF) \frac{[(C_{soil})(IR_{soil}) + (C_{invert})(IR_{invert}) + (C_{plant})(IR_{plant})]}{BW} \quad (I-7)$$

Red-tailed hawk dose (mg/kg-day) =

$$(SUF) \frac{[(C_{ground\ squirrel})(IR_{ground\ squirrel}) + (C_{soil})(IR_{soil})]}{BW} \quad (I-8)$$

where

BW	=	Body weight
$C_{\text{soil}}$	=	EPC of chemical in soil (milligram per kilogram [mg/kg])
$C_{\text{invert}}$	=	$(C_{\text{soil}})(\text{BAF}_{\text{soil-to-invert}})$ (mg/kg) (EPA 1999b)
$C_{\text{plant}}$	=	$(C_{\text{soil}})(\text{BAF}_{\text{soil-to-plant}})$ (0.12) (mg/kg) (EPA 1999b) (0.12 is a default value to convert the plant concentration from dry weight to fresh weight and is presented by EPA [1999b]. This value is an average based on 80 to 95 percent water content in herbaceous plants and nonwoody plant parts.)
$C_{\text{ground squirrel}}$	=	Concentrations in ground squirrels were estimated using uptake models using concentrations at the site or by multiplying concentrations in soil at the site by BAFs for small mammals.
SUF	=	Site use factor

Values for the exposure factors for each ecological receptor are presented in Tables I-16 through I-20. The following overall procedures and assumptions are associated with the exposure estimates for each receptor.

### Small Mammal and Passerine Receptors

Small mammals and passerines were assumed to have a diet consisting of a mixture of plants and invertebrates. For deer mice, diet consisted of 60 percent vegetation and 40 percent invertebrates; for ground squirrels, diet consisted of 100 percent plants; for the song sparrow, diet consisted of 50 percent vegetation and 50 percent invertebrates; and for robins, diet consisted of 25 percent vegetation and 75 percent invertebrates. The primary source of the dietary information was collected from CDFG (2005).

The EPC is the concentration of the COPEC in soil used in risk calculations. Multiplying the EPC by the appropriate plant and invertebrate BAF and natural history information on ingestion rates and body weights for the receptors derived the dose for each COPEC. The dose was calculated in mg/kg-day for each COPEC.

### Raptor Endpoints

Raptors at each site were assumed to have a diet consisting exclusively of the California ground squirrel, which is considered to be the most conservative diet for the raptor. This diet was selected based on the selection of the red-tailed hawk as a receptor. In general, passerines are not a significant component of the red-tailed hawk diet (EPA 1993).

The EPC is the concentrations of the COPEC in soil used in risk calculations. Multiplying the EPC by the soil and ground squirrel concentrations and natural history information on ingestion

rates and body weights for raptors derived the dose for each COPC (see Equation I-8). The dose was calculated in mg/kg-day for each COPEC.

Multiplying the EPC by the appropriate plant and invertebrate BCF and natural history information on ingestion rates and body weights for raptors derived the dose for each COPEC. The dose was calculated in mg/kg-day for each COPEC.

### 13.3 RISK ESTIMATION

Risk estimations were prepared for each terrestrial receptor based on exposure assumptions for the individual receptor (see Attachment I1 through I5). Risk estimations for terrestrial receptors consisted of dividing the calculated dose by the appropriate TRV for each receptor and COPEC, deriving a HQ.

$$HQ = DOSE/TRV \quad (I-9)$$

where

<i>HQ</i>	=	Hazard quotient
<i>DOSE</i>	=	Daily exposure dose for a COPEC (mg/kg-day)
<i>TRV</i>	=	Toxicity reference value (mg/kg-day)

HQs greater than 1 indicate potential risk to the assessment endpoint being evaluated. The risk estimations were made based on the following assumptions.

#### Small Mammal Endpoint

No specific TRV was identified for the metal iron; therefore, this chemical was qualitatively evaluated.

No specific TRVs were identified for the SVOCs 2,4-dimethylphenol, 4-methylphenol, 4-nitroaniline, 4-nitrophenol, butylbenzylphthalate, dibenzofuran, dimethylphthalate, isophorone, and phenol. Therefore, these chemicals were qualitatively evaluated.

Surrogate TRVs were used for pesticides. The TRV for benzene hexachloride (BHC) mixed isomers was used as a surrogate for alpha-, beta-, and delta-BHC. The TRV for chlordane was used as a surrogate for heptachlor and heptachlor epoxide because heptachlor and heptachlor epoxide are breakdown products of chlordane. The TRV for chlordane also was used for alpha-chlordane, gamma-chlordane, and technical chlordane. The TRV for endosulfan was used as a surrogate for endosulfan I, endosulfan II, and endosulfan sulfate. The TRV for endrin was used as a surrogate for endrin ketone and endrin aldehyde. The TRV for dieldrin was used as a

surrogate for aldrin because dieldrin is a metabolic breakdown product of aldrin. The TRV for PCBs was used for Aroclor-1248, Aroclor-1260, and Aroclor-1268.

### **Passerine and Raptor Endpoints**

No specific TRVs were identified for the metals antimony, beryllium, iron, or thallium; therefore, these chemicals were qualitatively evaluated.

No specific TRVs were identified for the SVOCs 2-4-dimethylphenol, 2-methylphenol, 4-methylphenol, 4-nitroaniline, 4-nitrophenol, butylbenzylphthalate, dibenzofuran, dimethylphthalate, isophorone, or phenol; therefore, these chemicals were qualitatively evaluated.

No specific TRVs were identified for the PAHs; therefore, these chemicals were qualitatively evaluated.

Surrogate TRVs were used for pesticides and PCBs were the same as those used for mammals.

Table I-21 lists the HQs for each soil COPEC and representative ecological receptor for IR Site 34. Most of the organic chemicals did not yield HQs greater than 1, indicating those COPECs are unlikely to represent ecological risk to receptors at IR Site 34. Metals, some SVOCs and PAHs, pesticides, and PCBs yielded HQs greater than 1, indicating the potential for unacceptable ecological risk. The COPECs with the highest HQ values are lead (61,000), Aroclor-1254 (4,780), Aroclor-1248 (1,200), and Aroclor-1260 (853).

Most of the COPECs only exceeded the low TRV. Seven metals, 2 SVOCs, 4 pesticides, and 4 PCBs exceeded both the low and high TRVs, but the exceedances of the high TRV were never more than 2 orders of magnitude. The only two chemicals to greatly exceed both the low and high TRVs were lead and Aroclor-1248.

If a TRV was unavailable for a soil COPEC, it was retained for qualitative evaluation in the Step 3a risk refinement. Groundwater COPECs were qualitatively addressed and are discussed in the Step 3a risk refinement (see Section I6.0).

### **13.4 QUALITATIVE EVALUATION OF AQUATIC LIFE**

Although the COPECs at IR Site 34 are not expected to reach ecological receptors, this SLERA qualitatively evaluated the effects of COPECs on aquatic life. This conservative approach was taken to address any potential effects on aquatic life from site-related chemicals.

Initially, the EPCs for groundwater COPECs at IR Site 34 (the lower of the maximum concentration and the 95 UCL), were compared to four sets of primary aquatic comparison criteria potentially applicable to the site (threshold criteria) (see Table I-9). Values were selected

from the California Toxics Rule (EPA 2003), the National Recommended Water Quality Criteria for Priority Toxic Pollutants (EPA 2006), the San Francisco Bay Water Quality Control Plan (Water Board 2006), and the "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater" (Water Board 2005). Because of the location of the site adjacent to Oakland Inner Harbor, comparisons were made to saltwater criteria. Where multiple criteria, such as CMC and CCC, or 1-hour; 24-hour; and 4-day criteria were available, the comparison was performed against all of the criteria. A summary of this comparison is presented in Table I-23.

Receptor-specific HQs were not calculated in this assessment. Aquatic threshold values are presented in Table I-9 and the results of the groundwater screening are presented in Table I-23.

## **14.0 UNCERTAINTY ANALYSIS**

Wherever possible, assumptions required to complete the SLERA were biased toward overestimating risk (that is, conservative assumptions). However, uncertainty is inherent to the SLERA process, and this leads to potential limitations in evaluating the accuracy and precision of estimated risks. It is important to identify both the sources and the effects of uncertainty in order to provide a thorough and valid assessment of the hazards presented by site-related chemicals. The major assumptions in this SLERA are discussed in the following sections.

### **14.1 SELECTION OF CHEMICALS OF POTENTIAL ECOLOGICAL CONCERN**

The selection of site-specific COPECs generates some uncertainty. Sampling procedures and analytical methods adhered to standard protocols, so the COPECs for IR Site 34 were likely reported appropriately. Data from 199 soil samples were included in this assessment. These data are adequate to estimate the number of COPECs in soil. Data from 31 groundwater samples were included in this assessment. Since several wells are located near the shoreline, it is likely the number of groundwater COPECs potentially discharging to the Oakland Inner Harbor are not underestimated. This SLERA assumed the maximum detected concentration of a chemical represented sitewide exposure. The representation of site exposure by a chemical or concentration detected only once most likely overestimates risk associated with site soils and groundwater. In addition, exposure to chemicals in groundwater is likely overestimated because concentrations would be reduced via dilution by surface water.

### **14.2 EXPOSURE PATHWAYS**

The exposure pathways included in this SLERA do not include all potential exposure pathways for the selected ecological receptors. Although dermal contact and inhalation both represent potentially complete exposure pathways, data for these pathways are not readily available. These pathways may be significant for the selected receptors at IR Site 34, so risk may have been underestimated. Soil exposure pathways may become incomplete because of future land uses.

### **14.3 ENDPOINT RECEPTOR SELECTION**

Selecting representative species as endpoint receptors leads to uncertainty in the risk assessment. Since it is not feasible to evaluate all species and communities potentially at risk, it is possible that risk may be underestimated for wildlife at IR Site 34. However, a wide range of ecological receptors were selected so it is unlikely that risk was underestimated.

### **14.4 EXPOSURE MODEL**

The exposure model included in this SLERA assumed that terrestrial receptors would only be in contact with soils at IR Site 34. Exposure to groundwater was not considered for terrestrial receptors because contact with groundwater is highly unlikely. Since groundwater at IR Site 34 discharges to San Francisco Bay and has the potential to reach organisms living in the bay, exposure to chemicals in groundwater was qualitatively evaluated in this SLERA. This comparison was completed to determine the need for further characterization of groundwater contamination, and its potential impacts on ecological receptors within Oakland Inner Harbor.

### **14.5 EXPOSURE ESTIMATES**

Estimating exposures generates a great deal of uncertainty because many assumptions must be made during the process. Wherever possible, the most conservative assumptions were made in order to overestimate risk.

In the initial risk estimation, EPCs were based on the maximum detection of each COPEC and were assumed to represent site-wide concentrations of COPECs. This approach likely overestimated risk at the site. Exposure parameters were selected from various sources. Receptor body weights, food composition, and ingestion rates were based on values from the *Wildlife Exposure Factors Handbook* (EPA 1993) and from primary literature. BAFs were taken from EPA guidance (EPA 1995), primary literature, or calculated using formulas from ORNL (RAIS 2007). Although these values may overestimate or underestimate the risk to wildlife at IR Site 34, they must be used in the absence of site-specific data. SUFs were set to 1 in the initial risk estimation. This conservative assumption likely overestimated risk because wildlife at the site may have home ranges larger than the area of IR Site 34.

In the refined risk estimation, the lower of the 95UCL and the maximum detected concentration was used as the EPC for each COPEC. Receptor-specific SUFs were generated for each of the selected receptors. The red-tailed hawk was the only receptor with a home range larger than the area of IR Site 34.

### **14.6 BIOAVAILABILITY**

Risks associated with the COPECs at IR Site 34 may have been overestimated since each COPEC was assumed to be 100 percent bioavailable.

## **14.7 TOXICITY REFERENCE VALUE EXTRAPOLATIONS**

Although a common practice in ERAs, extrapolation and scaling of available toxicity data is a major limitation of this analysis. Since most available wildlife toxicity data pertain to mammals, data must be extrapolated for birds. There is a great deal of uncertainty involved in this process because it is unknown whether the toxic mechanisms in birds and mammals are similar (Duke and Taggart 2000). Allometric scaling factors also generate uncertainty. The use of data generated in a laboratory setting also introduces uncertainty to the assessment. The bioavailability, assimilation, and relative toxicity of chemicals used in toxicity testing may differ from the chemical forms in nature. In general, the use of extrapolation and scaling factors leads to uncertainties in the estimation of exposure or dose.

## **14.8 UNCERTAINTY ANALYSES OF RISK CHARACTERIZATION**

The methodology of the SLERA tends to overestimate the risk at a site. It is likely that risk at IR Site 34 was overestimated because of the highly conservative nature of the assumptions used in both the SLERA and the Step 3a risk refinement. Uncertainty surrounds the risk estimation regardless of whether risk was under- or overestimated. Since uncertainty was introduced at several points throughout the SLERA, uncertainty is inevitably associated with the risk characterization.

COPECs with exposure estimates less than the toxicity benchmark values do not likely pose an ecological risk to wildlife at IR Site 34. Although COPECs with exposure estimates exceeding the toxicity benchmark values cannot be eliminated from consideration, marginal exceedances of the benchmark values suggest that risk to wildlife at the population or community level would be minimal.

Qualitative evaluation was necessary for soil COPECs when TRVs were unavailable. Groundwater COPECs were also qualitatively evaluated since the groundwater pathway was not considered fully complete. Qualitative evaluation introduces uncertainty to the risk characterization, since risk for these COPECs cannot be put into the form of an HQ.

## **15.0 SUMMARY AND CONCLUSIONS OF STEPS 1 AND 2**

Based on the evaluation of risk conducted in Steps 1 and 2 of this SLERA, chemicals in soil and groundwater at IR Site 34 may pose unacceptable risk to ecological receptors. At this point in the ERA process, COPECs may be further evaluated in a Step 3a risk refinement. The decision to proceed to a baseline ERA may also be made. Since this evaluation used extremely conservative measures, ecological risk was likely overestimated. In order to generate a slightly more realistic estimate of risk, while maintaining the conservative nature of the SLERA, a Step 3a risk refinement was conducted for any COPEC with an HQ greater than 1, soil COPECs without TRVs, and groundwater COPECs that exceeded the four sets of aquatic threshold criteria. Based on the results of the SLERA, the following chemicals were retained for further evaluation in the Step 3a risk refinement:

- Metals: Aluminum, antimony, arsenic, barium, cadmium, copper, chromium, iron, lead, manganese, molybdenum, nickel, selenium, thallium, vanadium, and zinc
- SVOCs: 2,4-Dimethylphenol, 4-methylphenol, 4-nitrophenol, butylbenzylphthalate, dimethylphthalate, 2-methylphenol, 4-nitroaniline, bis(2-ethylhexyl)phthalate, dibenzofuran, di-n-butylphthalate, isophorone, and phenol
- PAHs: 2-Methylnaphthalene, acenaphthene, acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene
- Pesticides: 4,4'-dichlorodiphenyldichloroethane [DDD], 4,4'-dichlorodiphenyldichloroethene [DDE], 4,4'-dichlorodiphenyltrichloroethane [DDT], aldrin, delta-BHC, dielrin, endosulfan II, endosulfan sulfate, endrin aldehyde, endrin ketone, methoxychlor, and technical chlordane
- PCBs: Aroclor-1248, Aroclor-1254, Aroclor-1260, and Aroclor-1268

## 16.0 STEP 3A RISK REFINEMENT

A Step 3a risk refinement was initiated to further evaluate the COPECs identified in the SLERA with HQs greater than 1 and a frequency of detection of 5 percent or greater, COPECs without TRVs, and groundwater COPECs that exceeded the four sets of aquatic threshold criteria.

### 16.1.1 Terrestrial Wildlife

Refined risk estimations were prepared for all soil COPECs yielding HQs greater than 1 and with a frequency of detection of 5 percent or greater. Refined risk estimates were not prepared for the following chemicals with HQs greater than 1 because their frequency of detection is less than 5 percent: pesticides (4,4'-DDD, aldrin, delta-BHC, dielrin, endosulfan II, endosulfan sulfate, endrin aldehyde, endrin ketone, and technical chlordane) and PCBs (Aroclor-1248). HQs were also not prepared for the following chemicals because there were no TRVs: metals (iron); SVOCs (2,4-dimethylphenol, 4-methylphenol, 4-nitrophenol, 4-nitroaniline, dibenzofuran, di-n-butylphthalate, isophorone, and phenol); and pesticides (methoxychlor). All but dibenzofuran, di-n-butylphthalate, isophorone, and phenol had a frequency of detection of less than 5 percent.

The EPC for each soil COPEC was estimated as the lower of the 95UCL and the maximum detected concentration. Exposure factors were modified to reflect more realistic values for each receptor. This process was completed for any COPEC that yielded an HQ greater than 1 in the SLERA. Changes in the SUF only affected the red-tailed hawk because the home ranges of all other receptors were smaller than the area of IR Site 34. All other exposure factors remained unchanged, maintaining the conservative nature of the screening-level exposure estimates.

Table I-22 lists the refined HQs for each soil COPEC and terrestrial receptor pair. Several chemicals yielded refined HQs less than 1 (4 metals, 4 PAHs), indicating that ecological risk for these chemicals is minimal.

Several chemicals yielded refined HQs greater than 1 (11 metals, 2 SVOCs, 2 PAHs, 2 pesticides, and 3 PCBs). Therefore, these chemicals may pose an unacceptable risk to ecological receptors at IR Site 34. The COPECs with the highest refined HQ values are cadmium (140), lead (8,590), di-n-butylphthalate (103), and Aroclor-1254 (174).

### ***Small Mammals***

Although HQs calculated for mammals indicated the potential for risk, only the low TRVs for eight metals (antimony, copper, lead, molybdenum, nickel, selenium, vanadium, and zinc) and two PAHs (fluoranthene and pyrene) yielded HQs greater than 1. Although the metals concentrations were greater than background levels at Alameda Point, only lead and nickel yielded HQs significantly greater than 1. The refined risk estimate for lead was based on the 95 UCL of 2,390 mg/kg, rather than the maximum concentration of 21,000 mg/kg used in Step 2. However, the arithmetic mean for lead is 520 mg/kg. Using the arithmetic mean, the refined deer mouse risk estimates for the high and low TRVs would be 1 and 417, respectively. Using the arithmetic mean, the refined ground squirrel risk estimates for the high and low TRVs would be 0.02 and 7, respectively.

Although fluoranthene and pyrene were detected at high concentrations, the mean detection of these COPECs is significantly lower. Therefore, it is likely that the HQs overestimated the risk associated with these COPECs. The pesticides that only yielded HQs greater than 1 for the low TRV were detected at low frequencies. Based on the frequency of detection and the concentrations, these COPECs were determined to pose limited potential for risk to small mammals.

Aluminum, cadmium, Aroclor-1254, and Aroclor-1260 yielded HQs greater than 1 for both the low and high TRV for the deer mouse. Aluminum was detected in all 82 samples collected at IR Site 34; 8 of the samples exhibited concentrations above background (13,960 mg/kg) (see Section 4.0, Table 4-1 in the RI Report). The average of detected concentrations and 95UCL (8,750 and 11,581 mg/kg, respectively) are both below background. The samples with exceedances were collected in the northern portion of the site near the former buildings and railroad tracks. The highest detected aluminum concentration was 37,000 mg/kg collected from DP15 at a depth of 7 feet bgs. As discussed in Section 4.1 of the RI Report, soil contaminated with cadmium appears to be limited to the northwest corner of IR Site 34 near the former railroad tracks.

PCB contamination is limited to the ground surface at individual locations or small clusters around the site, primarily along the western boundary and near former buildings in the northeast portion of the site (see Figures 4-13 and 4-14 of the RI Report).

No COPECs significantly exceeded the HQs for the California ground squirrel (see Table I-22).

### **Birds**

Only the low TRVs for four metals (aluminum, cadmium, copper, and nickel), 2 pesticides (4,4'-dichlorodiphenyldichloroethene [DDE], 4,4'-dichlorodiphenyltrichloroethane [DDT]) and 1 PCB (Aroclor-1268) yielded HQs greater than 1 for passerine receptors (see Table I-22). Concentrations of metals were greater than background, but the low TRV was not exceeded significantly for aluminum, copper, and nickel. Although the low TRV for cadmium was exceeded significantly, the HQs based on the high TRV were below 1. Therefore, risk from this chemical is expected to be minimal. The pesticides were detected infrequently (see Table 4-1 of the RI Report), so the HQs for these COPECs likely overestimated risk from pesticides. Based on the frequency of detection and the concentrations, these COPECs were determined to pose limited potential for risk to bird populations and were not considered risk drivers in soil.

Three metals (chromium, lead, and zinc), two SVOCs [bis(2-ethylhexyl)phthalate and di-n-butylphthalate], and two PCBs (Aroclor-1254 and Aroclor-1260) yielded HQs greater than 1 for both the low and high TRV (see Table I-19). The high HQs for chromium and zinc were only slightly higher than 1 (chromium HQ = 2.52; zinc high HQ = 12); therefore, these metals were not considered to be risk drivers for soil. The high HQ for lead exceeded 1 by an order of magnitude; therefore, lead was considered a risk driver for soil. The high HQs for SVOCs did not greatly exceed 1 (bis(2-ethylhexyl)phthalate high HQ = 2.00; di-n-butylphthalate high HQ = 10.3). Therefore, SVOCs were not considered to be risk drivers for birds in soil. The high HQs for PCBs did not greatly exceed 1 (Aroclor-1254 high HQ = 1.74; Aroclor-1260 high HQ = 3.54). Therefore, these PCBs were not considered to be risk drivers for birds for soil.

As discussed in Section 4.1 of the RI Report, chromium-contaminated soil appears to be limited to the northeast portion of the site near former Building 343 and the storm sewer and in an isolated location near the southwest corner of the site (see Figure 4-2 of the RI Report). Lead-contaminated soil appears to be present in several clusters near the former railroad track at the northwest corner of the site, around former Buildings 331, 343, 344, and 475, above the storm sewer, and isolated locations in the southwest corner of the site. Zinc was detected in 101 of 105 soil samples collected at IR Site 34 for the purposes of the nature and extent examination; 51 of these samples had concentrations above background (66.6 mg/kg), which were detected in the northern portion of the site near the former buildings and former railroad tracks and at an isolated location in the southwestern portion of the site. The highest detected concentration of zinc was 14,000 mg/kg in a surface soil sample collected from location PW18. Since zinc and chromium did not significantly exceed the high TRV, these chemicals were not considered to be risk drivers in soil. As mentioned above, lead was considered to be a risk driver in soil based on the significant exceedance of the high TRV.

Bis(2-ethylhexyl)phthalate was detected in 5 of 38 soil samples collected at IR Site 34 (see Section 4.0 and Table 4-1 in the RI Report). The highest detected concentration of bis(2-ethylhexyl)phthalate was 25 mg/kg in a sediment sample collected above the storm sewer line in the northern portion of the site. The next highest detected concentration was 14 mg/kg in

a surface soil sample collected from location 018-004-020, in the southwest portion of the site. The remaining detected concentrations of bis(2-ethylhexyl)phthalate ranged from 0.031 to 0.078 mg/kg from samples collected in the southwest corner of the site. Di-n-butylphthalate was detected in 4 of 38 soil samples collected at IR Site 34 (see Section 4.0 and Table 4-1 in the RI Report). The highest detected concentrations were 2.2 and 2.3 mg/kg (surface soil and 4 feet bgs, respectively) collected from location 018-007-035 in the central portion of the site. The remaining detected concentrations ranged from 0.15 to 0.51 mg/kg at two isolated samples at IR Site 34. Because SVOCs were detected infrequently in soil, they were not considered to be risk drivers in soil.

PCB contamination is limited to ground surface at individual locations or small clusters around the site, primarily along the western boundary and near former buildings in the northeast portion of the site (see Figures 4-12, 4-13, and 4-14 of the RI Report).

### ***Qualitative Evaluations***

A few metals were qualitatively evaluated for mammals and birds. Bioaccumulation of site-related metals is relatively insignificant, so the qualitative evaluation did not indicate a potential for risk.

When a TRV was unavailable for a COPEC/receptor pair, the COPEC was evaluated qualitatively. TRVs were unavailable for PAHs for all bird receptors. A review of the BAFs associated with PAHs reveals that this class of chemicals has a lower relative bioaccumulation potential than other site chemicals. Minor bioaccumulation of PAHs may occur from soil to invertebrates, so PAHs may be a concern for birds that consume invertebrates. Therefore, PAHs are a slight concern for the American robin and the Alameda song sparrow. TRVs were unavailable for several SVOCs. Bioaccumulation is only significant for the soil-to-invertebrate pathway, so risk for the herbivorous (California ground squirrel) and carnivorous (red-tailed hawk) receptors would be minimal. SVOCs may pose a risk for the American robin, the Alameda song sparrow, and the deer mouse.

TRVs were not available for all birds for the pesticide methoxychlor. Bioaccumulation for this pesticide is only significant for the soil-to-invertebrate pathway. Therefore, methoxychlor may pose a risk to the American robin and the Alameda song sparrow; risk to the red-tailed hawk is unlikely, since this receptor is carnivorous.

The qualitative evaluation of chemicals without readily available TRVs likely overstates the risk to ecological receptors at IR Site 34. In order to maintain the conservative nature of the SLERA, this assessment assumed that any chemical with a slightly significant bioaccumulation potential would pose a risk to ecological receptors. This most likely leads to an overestimation of risk because several other factors (such as variable dietary composition) may influence the risk. Also, the future land use (as a golf course and park) would most likely eliminate contact with site soils, thus the soil pathway would be incomplete.

## 16.1.2 Aquatic Life

This SLERA qualitatively evaluated the effects of COPECs on aquatic life. The qualitative evaluation included an initial groundwater screening using aquatic comparison criteria (Step 2), then further evaluation of those chemicals retained from the initial screening was conducted in Step 3a. This conservative approach was taken to address any potential effects on aquatic wildlife from site-related chemicals. Risk to ecological receptors at IR Site 34 from chemicals was likely overestimated because concentrations of chemicals would be significantly reduced following dilution at the groundwater-to-surface water interface. A total of 8 metals, 12 VOCs, 5 PAHs, and 7 pesticides were retained for further evaluation.

Groundwater COPECs retained for further evaluation in Step 3a were evaluated individually based upon the maximum and 95UCL concentrations compared to the four sets of threshold criteria; a supplemental literature search for additional criteria; the sample location and date; and the groundwater data set (see Table I-24). The results of the evaluation for each chemical are discussed below.

### **Aluminum**

Aluminum was detected in 17 of 19 samples (see Table I-3). The EPC for aluminum is 23.8 micrograms per liter ( $\mu\text{g/L}$ ). Aluminum was retained for further analysis because no primary comparison criterion was available from the four sources used. In 1988, EPA established NAWQC for aluminum of 87  $\mu\text{g/L}$  (4-day) and 750  $\mu\text{g/L}$  (1-hour). Because the EPC for aluminum is less than the 1988 NAWQC, aluminum is not considered to be a risk driver.

### **Arsenic**

Arsenic was detected in 19 of 19 samples (see Table I-3). The maximum concentration of arsenic (110  $\mu\text{g/L}$ ), which occurred in DP-15 (see Figure I-5), exceeded the California Toxics Rule, National Recommended Water Quality Criteria, and Water Board Bay Plan criteria. The maximum concentration is also an order of magnitude greater than any other arsenic concentration in groundwater at IR Site 34. The next highest concentration for arsenic was 15  $\mu\text{g/L}$ . Therefore, the maximum concentration appears to be an outlier. Additionally, the 95UCL value, including the maximum concentration, is 36.7  $\mu\text{g/L}$ , which is barely above the lowest of the criteria (the CCC from both CTR and National Recommended Water Quality Criteria) value of 36  $\mu\text{g/L}$ . Arsenic is therefore not considered to be a risk driver.

### **Copper**

Copper was detected in 13 of 19 samples (see Table I-3), with an average concentration of 3.29  $\mu\text{g/L}$  and a 95UCL of 5.5  $\mu\text{g/L}$ . The maximum concentration of copper detected was 12  $\mu\text{g/L}$ . All of these concentrations exceed the California Toxics Rule and NRWQC CCC criteria for copper. The background value for copper in groundwater at Alameda Point is 6.6  $\mu\text{g/l}$ . With

both the 95 UCL and average concentrations below the background concentration, copper is attributed to background. Therefore, copper is not retained as a risk driver.

### **Cobalt**

Cobalt was detected in 19 of 19 samples (see Table I-3), with an average concentration of 3.8 µg/L and a 95UCL of 24.3 µg/L. There are no California Toxics Rule, NRWQC, or Bay Plan values for cobalt. The comparison value used was 3.0 µg/L from the Water Board's Surface Water Screening Levels from the document "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater (Water Board, 2005). The 95UCL and average concentration values are driven by two detections, at DP17 and DP18. Both DP17 and DP18 were collected within the SWBZ. The cobalt results for DP17 and DP18 are representative of groundwater concentrations within the SWBZ, but not the FWBZ. Cobalt is not a risk driver in the FWBZ, and is not retained as a risk driver in the second water bearing zone because it is likely that a minimum dilution/attenuation factor of 10 will occur between the point of measurement and the ultimate discharge into the Oakland Inner Harbor, if such a discharge exists.

### **Magnesium**

Magnesium was detected in 19 of 19 samples (see Table I-3). The EPC for magnesium was calculated to be 1,912,997 µg/L. Magnesium naturally occurs in seawater; therefore, it is not retained as a risk driver in groundwater at IR Site 34.

### **Manganese**

Manganese was detected in 19 of 19 samples (see Table I-3). The EPC for manganese was calculated to be 21,500 µg/L. Manganese naturally occurs in seawater; therefore, it is not retained as a risk driver in groundwater at IR Site 34.

### **Mercury**

Mercury was detected in 1 of 19 samples at an estimated concentration of 0.17 µg/L in a sample from location DP-5 (see Table I-3). Mercury was not detected in all of the other samples, with a reporting limit of 0.2 µg/L. Mercury has not been detected in any groundwater samples from monitoring wells; however, the one detection from a direct-push boring was above the comparison level. The lowest comparison criteria is 0.025; however, this is below commonly available reporting limits. Because of the low frequency of detection (< 5%) mercury is not retained as a risk driver.

### **Nickel**

Nickel was detected in 18 of 19 samples (see Table I-3). The average concentration of nickel was 7.27 µg/L, the 95UCL concentration was 17.6 µg/L, and the maximum concentration was 46

µg/L. The California Toxics Rule and NAWQC CCC value is 8.2 µg/L. Because nickel was detected in two different monitoring wells on two different dates at concentration above the comparison criteria (MW-20 in March 2007 and MW-24 in September 2006), and both of these wells have samples below the criteria, the detections of nickel are believed to be intermittent and not representative of a continuing discharge to surface water. Nickel is therefore not retained as a risk driver.

### **Zinc**

Zinc was detected in 18 of 19 samples (see Table I-3). The average concentration was 44.5 µg/L, the 95UCL was 292 µg/L, and the maximum concentration was 600 µg/L. The comparison criteria for both the California Toxics Rule and the NAWQC CCC is 81 µg/L. The two highest concentrations were from locations (DP-17 and DP-18) are samples from the SWBZ. Zinc is therefore not a risk driver within the FWBZ, and is not retained as a risk driver within the SWBZ because of the likelihood of an attenuation factor of at least 10 occurring before ultimate discharge to the Oakland inner harbor or San Francisco bay, if such a connection exists. The attenuation/dilution factor is based on guidance from the US Fish and Wildlife service.

### **VOCs**

Twelve VOCs were retained for further evaluation in the Step 3a risk refinement because no primary comparison criteria were available. An additional literature search was performed to identify other ecological comparison values for these VOCs. The literature search identified two supplemental sources of criteria; 1) the EPA Region 5 RCRA Ecological Screening Levels (EPA 2003) and 2) a document titled "Toxicological Benchmarks for Screening Potential Contaminants of Concern for Effects on Aquatic Biota, 1996; prepared for the Department of Energy / Oak Ridge National Laboratory (ORNL Criteria) (Suter and Tsao, 1996). Comparison values for four of the VOCs (2-hexanone, 4-methyl-2-pentanone, carbon disulfide, and trans-1,2-dichloroethene) were identified from the EPA Region 5 RCRA Ecological Screening Levels (EPA 2003) and Oak Ridge National Laboratory (Suter and Tsao, 1996). The EPCs for these four VOCs were below the comparison values; therefore, they are not considered to be risk drivers.

The remaining eight VOCs (1,2,4-trimethylbenzene; 1,3,5-trimethylbenzene, isopropylbenzene, tert-butylbenzene, n-butylbenzene, n-propylbenzene, p-Isopropyltoluene, and sec-butylbenzene) were all detected in only one or two samples. None of the detections were from adjacent sample locations. All of the detections were below the reporting limits for the chemical and were identified as estimated values. Residual VOCs were also detected in shallow soils near the facility fence lines in one or two samples but are unlikely to migrate from soil to groundwater because VOCs have a high tendency to volatilize if exposed to air. Thus, VOCs present in soils near the ground surface are expected to volatilize to the atmosphere. Because of the low frequency of detection, the low concentrations, and nonadjacent locations of detections, these eight VOCs are not considered to be risk drivers.

## **PAHs**

Five PAHs [benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, chrysene, and indeno(1,2,3-c,d)pyrene] were retained for further evaluation because they exceeded one of the comparison criteria. All five PAHs were detected in only 1 of 28 samples, with all of the detections occurring in DP-5. Because of the low frequency of detection, and recent samples from monitoring wells being non-detect for these five PAHs, these five PAHs are not retained as risk drivers.

## **Pesticides**

Six pesticides (4,4'-DDE, aldrin, alpha-BHC, alpha-chlordane, beta-BHC, and heptachlor epoxide) were retained for further evaluation as risk drivers. Four of the pesticides were retained because they exceeded at least one of the comparison criteria. These four pesticides (4,4'-DDE, aldrin, alpha-chlordane, and heptachlor epoxide) are retained for further evaluation because they exceeded one or more of the comparison criteria. However, because there are only one or two detections which exceed the Water Boards screening level, and no detections which exceed the CTR criteria, none of these is retained as a risk driver. The other two pesticides, alpha-BHC and beta-BHC, were retained because no criteria were available for comparison. A literature search identified two supplemental comparison criteria, the EPA Region 5 RCRA Ecological Screening Levels (EPA 2003) and ORNL criteria (Suter and Tsao, 1996). The EPCs and maximum concentrations for alpha-BHC and beta-BHC were below both the EPA Region 5 RCRA ESL and the ORNL screening level; therefore, alpha-BHC and beta-BHC are not retained as risk drivers.

## **16.2 CONCLUSIONS OF SCREENING-LEVEL ECOLOGICAL RISK ASSESSMENT AND STEP 3A RISK REFINEMENT**

The SLERA intentionally incorporates conservative assumptions in order to capture any potential risk from site-related chemicals to ecological receptors. Therefore, this assessment likely overestimates the risk associated with the risk drivers at IR Site 34. The Step 3a risk refinement conducted also likely overestimated risk because many of the assumptions used in the initial risk estimation remained unchanged in the refined risk estimation.

### **16.2.1 Conclusions of the Screening-Level Ecological Risk Assessment**

Based on the results of the SLERA, the following chemicals were identified as requiring further evaluation in the refined risk estimation:

- Metals: Aluminum, antimony, arsenic, barium, cadmium, copper, chromium, iron, lead, manganese, molybdenum, nickel, selenium, thallium, vanadium, and zinc

- SVOCs: 2,4-Dimethylphenol, 4-methylphenol, 4-nitrophenol, butylbenzylphthalate, dimethylphthalate, 2-methylphenol, 4-nitroaniline, bis(2-ethylhexyl)phthalate, dibenzofuran, di-n-butylphthalate, isophorone, and phenol
- PAHs: 2-Methylnaphthalene, acenaphthene, acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene
- Pesticides: 4,4'-dichlorodiphenyldichloroethane [DDD], 4,4'-dichlorodiphenyldichloroethene [DDE], 4,4'-dichlorodiphenyltrichloroethane [DDT], aldrin, delta-BHC, dieldrin, endosulfan II, endosulfan sulfate, endrin aldehyde, endrin ketone, methoxychlor, and technical chlordane
- PCBs: Aroclor-1248, Aroclor-1254, Aroclor-1260, and Aroclor-1268

## 16.2.2 Conclusions of the Step 3a Risk Refinement

Based on the results of the Step 3a risk refinement, the following chemical was identified as a risk driver in soil at IR Site 34:

- Lead

No risk drivers were identified in groundwater at Site 34.

Although lead may contribute to ecological risk at IR Site 34, based on the SLERA, a baseline ERA is not recommended because the SLERA likely overestimated risk, there is a lack of current suitable habitat, and future land use would not generate much ideal habitat for wildlife. IR Site 34 currently consists of predominantly Intensively Developed area and two potential wetland areas. Intensively Developed areas have little vegetation and typical urban wildlife, such as California ground squirrel, scrub jays, and American robins, may be observed in these areas but to a lesser extent than in the landscaped/developed areas, because less foraging habitat is available in these areas. The potential wetland areas provide minimal habitat to support plant and invertebrate populations and do not provide suitable habitat for small mammals. In addition, because of high marine vessel activity in the Oakland Inner Harbor it is unlikely that this area will be used by nesting birds.

Site-related chemicals in soil and groundwater at IR Site 34 are not expected to affect the potential wetland areas or the Oakland Inner Harbor for the following reasons. It is unlikely that groundwater or surface water runoff from IR Site 34 would affect the potential seasonal wetland located within the southwest corner of the site because the site topography would prevent it from reaching this potential wetland. Although surface water generally flows towards the wetland located to the north of the site, precipitation typically evaporates into the atmosphere, infiltrates to groundwater, or runs off into the storm drain system. The potential wetland is also not likely to be affected by site-related chemicals in groundwater because it lies between a series of parallel

rock riprap walls that together form a terrace of land that is the shoreline and is tidally inundated at such a frequency as to not present suitable habitat for small mammals, dilution would occur as groundwater mixes with surface water (Oakland Inner Harbor), and groundwater COPECs were identified based on the assumption that no dilution, retardation, or degradation will occur between the location where the groundwater risk drivers were detected and the Oakland Inner Harbor/wetland. In addition, the low-flow velocities of groundwater, low concentrations of VOCs in groundwater, high potential for retardation along the groundwater flow path, and tidal action and surface water flow that create a mixing zone at the interface with the Oakland Inner Harbor suggest that chemicals will not discharge to the Oakland Inner Harbor at concentrations of concern.

Future land use plans include a golf course and park; this plan would not generate much ideal habitat for wildlife. Therefore, the presence of terrestrial ecological receptors at IR Site 34 would be limited under future land use conditions. The creation of a golf course and park may diminish the risk from chemicals in soil.

Following further evaluation of the COPECs, this assessment was determined to likely overestimate risk to terrestrial and aquatic receptors (including the wetland); therefore, further investigation or assessment of ecological risk from soils and groundwater at IR Site 34 is not recommended.

Notes:

- 1 The derivation of TRVs is described in Navy (1998) and Sample and others (1996).
- 2 The following surrogate TRVs were used: The TRV for BHC mixed isomers was used as a surrogate for alpha- and delta-BHC. The TRV for heptachlor was used as a surrogate for heptachlor epoxide. The TRV for chlordane was used for alpha-chlordane, gamma-chlordane, and technical chlordane. The TRV for endosulfan was used as a surrogate for endosulfan I, endosulfan II, and endosulfan sulfate. The TRV for endrin was used as a surrogate for endrin ketone and endrin aldehyde. The TRV for PCBs was used for Aroclor-1260 and -1268. The TRV for benzo(a)pyrene was used as a surrogate for all high-molecular-weight PAHs including benzo(a)anthracene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, fluoranthene, indeno(1,2,3-cd)pyrene, and pyrene. The TRV for naphthalene was used as a surrogate for low-molecular-weight PAHs, including 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, fluorene, and phenanthrene.
- 3 Allometrically adjusted TRVs were calculated using the following equation: receptor species TRV = (test species TRV) x (test species body weight / receptor species body weight)<sup>(1-1.2)</sup>.

Definitions:

BAF	Bioaccumulation facto	kg/day	Kilogram per day

Notes

1 The derivation of TRVs is described in Navy (1998) and Sample (1996).  
 2

3 The following surrogate TRVs were used: The TRV for BHC mixed isomers was used as a surrogate for alpha- and delta-BHC. The TRV for heptachlor was used as a surrogate for heptachlor epoxide. The TRV for chlordane was used for alpha-chlordane, gamma-chlordane, and technical chlordane. The TRV for endosulfan was used as a surrogate for endosulfan I, endosulfan II, and endosulfan sulfate. The TRV for endrin was used as a surrogate for endrin ketone and endrin aldehyde. The TRV for PCBs was used for Aroclor-1260 and -1268. The TRV for benzo(a)pyrene was used as a surrogate for all high molecular weigh PAHs including benzo(a)anthracene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, fluoranthene, indeno(1,2,3-cd)pyrene, and pyrene. The TRV for naphthalene was used as a surrogate for low molecular weight PAHs, including 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, fluorene, and phenanthrene. Allometrically adjusted TRVs were calculated using the following equation: receptor species TRV = (test species TRV) x (test species body weight / receptor species body weight)<sup>(1-1.2)</sup>.

Definitions:

BAF	Bioaccumulation facto	kg/day	Kilogram per day

Dose/High TRV	1.27	1.72	0.55	Navy 1998
Dose/Low TRV	0.09	0.80	0.05	Navy 1998

Notes:

- 1 The derivation of TRVs is described in Navy (1998) and Sample (1996).
- 2 The following surrogate TRVs were used: The TRV for BHC mixed isomers was used as a surrogate for alpha-, beta-, and delta-BHC. The TRV for chlordane was used as a surrogate for heptachlor and heptachlor epoxide because heptachlor and heptachlor epoxide are breakdown products of chlordane. The TRV for chlordane was also used for alpha-chlordane, gamma-chlordane, and technical chlordane. The TRV for endosulfan was used as a surrogate for endosulfan I, endosulfan II, and endosulfan sulfate. The TRV for endrin was used as a surrogate for endrin ketone and endrin aldehyde. The TRV for dieldrin was used as a surrogate for aldrin because dieldrin is a metabolic breakdown product of aldrin. The TRV for PCBs was used for Aroclor-1248, -1260, and -1268.
- 3 Allometrically adjusted TRVs were calculated using the following equation: receptor species TRV = (test species TRV) x (test species body weight / receptor species body weight)<sup>(1-1.2)</sup>.

Definitions:

BAF	Bioaccumulation facto	kg/day	Kilogram per day
BHC	Benzene hexachloride	mg/day	Milligram per day
COPEC	Chemical of potential ecological concern	mg/kg	Milligram per kilogram
DDD	Dichlorodiphenyldichloroethane	mg/kg/day	Milligram per kilogram per day

<b>AROCLOR-1268</b>				
Dose/High TRV	1.27	1.72	0.68	Navy 1998
Dose/Low TRV	0.09	0.80	0.06	Navy 1998

Notes:

1

The derivation of TRVs is described in Navy (1998) and Sample (1996).

2

The following surrogate TRVs were used: The TRV for BHC mixed isomers was used as a surrogate for alpha-, beta-, and delta-BHC. The TRV for chlordane was used as a surrogate for heptachlor and heptachlor epoxide because heptachlor and heptachlor epoxide are breakdown products of chlordane. The TRV for chlordane was also used for alpha-chlordane, gamma-chlordane, and technical chlordane. The TRV for endosulfan was used as a surrogate for endosulfan I, endosulfan II, and endosulfan sulfate. The TRV for endrin was used as a surrogate for endrin ketone and endrin aldehyde. The TRV for dieldrin was used as a surrogate for aldrin because dieldrin is a metabolic breakdown product of aldrin. The TRV for PCBs was used for Aroclor-1248, -1260, and -1268.

3

Allometrically adjusted TRVs were calculated using the following equation: receptor species TRV = (test species TRV) x (test species body weight / receptor species body weight)<sup>(1-1.2)</sup>.

## TABLE I-11 SUMMARY OF BIOACCUMULATION MODELS FOR PLANTS -- ORGANIC CHEMICALS

Remedial Investigation Report for Installation Restoration Site 34, Alameda Point, Alameda, California

### Notes:

- 1 BAFs were calculated by ORNL and downloaded from RAIS database using the Kow and the following equation from (McKone 1994):  $BAF = 38 * Kow^{-0.58}$
- 2 Regression Formula:  $\ln(\text{tissue concentration}) = Y\text{-intercept} + \text{slope} * (\ln[\text{soil concentration}])$ . The BAF for chlordane was used as a surrogate for alpha- and gamma-chlordane. The BAF for endosulfan was used as a surrogate for endosulfan I, endosulfan II, and endosulfan sulfate. The BAF for endrin was used as a surrogate for endrin ketone and endrin aldehyde. The BAF for Aroclor-1260 was used as a surrogate for Aroclor-1268. A default BAF of 1 will be used for all chemical not listed above. Highlighted data represent recommended bioaccumulation data. BAFs reported in dry weight.
- 3 A default BAF of 1 will be used for all chemical not listed above. Highlighted data represent recommended bioaccumulation data. BAFs reported in dry weight.

### Definitions:

BAF	Bioaccumulation factor
BHC	Benzene hexachloride
DDD	Dichlorodiphenyldichloroethane
DDE	Dichlorodiphenyldichloroethylene
DDT	Dichlorodiphenyltrichloroethane
EPA	U.S. Environmental Protection Agency
<i>ln</i>	Natural log
$\log_{kw}$	Log octanol/water partition coefficient
N	Number of studies or observations
na	Not available
p	Probability

## TABLE I-13 SUMMARY OF BIOACCUMULATION MODELS FOR INVERTEBRATES – ORGANIC CHEMICALS

Remedial Investigation Report for Installation Restoration Site 34, Alameda Point, Alameda, California

### Notes:

- 1 Eco-SSL BAF modeled from Kow based on Jager (1998),  $BAF = K_{ow} (L/kg \text{ worm } dw) / K_d (L/kg \text{ soil } dw)$  (EPA 2003). Regression Formula:  $\ln(\text{tissue concentration}) = Y\text{-intercept} + \text{slope} * (\ln[\text{soil concentration}])$ .
- 2 When BAFs are unavailable, a BAF will be estimated based on the log Kow using the following equation from EPA 2003:  $BAF = 10^{(\log Kow - 0.6) / [foc \times 10^{(0.983 \log Kow + 0.00028)}]}$ ; foc will be set to 1% (0.01) per EPA 2005. Chemical specific log Kows are from RAIS on-line at <http://risk.lsd.ornl.gov/>. The BAF for chlordane was used as a surrogate for alpha- and gamma-chlordane. The BAF for endosulfan was used as a surrogate for endosulfan I, endosulfan II, and endosulfan sulfate. The BAF for endrin was used as a surrogate for endrin ketone and endrin aldehyde.
- 3 the BAF for Aroclor-1260 was used as a surrogate for Aroclor-1258.  
A default BAF of 1 will be used for all chemicals not listed above.  
Highlighted data represent recommended bioaccumulation data.  
BAFs reported in dry weight.

### Definitions:

BAF	Bioaccumulation factor
BHC	Benzene hexachloride
DDD	Dichlorodiphenyldichloroethane
DDE	Dichlorodiphenyldichloroethylene
DDT	Dichlorodiphenyltrichloroethane
dw	Dry weight
EPA	U.S. Environmental Protection Agency
foc	Fraction of organic carbon in soil
L/kg	Liter per kilogram
ln	Natural log
log <sub>kw</sub>	Log octanol water partition coefficient
N	Number of studies or observations
na	Not available
p	Probability

**TABLE I-16 DOSE PARAMETERS FOR THE DEER MOUSE (*Peromyscus maniculatus*)**

Remedial Investigation Report for Installation Restoration Site 34, Alameda Point, Alameda, California

Parameter	Average Adult	Units	Reference/Notes
Ingestion Rate <sub>food</sub>	0.003	kg/day	Calculated with body weight of 19.3 grams using the equation for the food requirement for intake of dry matter for rodents (food ingestion rate = $[0.332[BW(\text{grams})]^{0.774}]/1000$ ) (Nagy 2001).
Ingestion Rate <sub>plant</sub>	0.001	kg/day	Based on 40 percent of food ingestion rate.
Ingestion	0.002	kg/day	Based on 60 percent of food ingestion rate.
Ingestion Rate <sub>soil</sub>	0.00008	kg/day	2.4 percent of food ingestion rate from meadow vole (Beyer and others 1994).
Soil Concentrations	Maximum Concentration	mg/kg	Based on conservative use of the maximum concentration of each chemical in soil collected from the site (0-4 feet below ground surface) per EPA Screening Level ERA guidance (1997).
Food Concentrations	Food Chain Model	mg/kg	Food concentrations were estimated using uptake models using concentrations at the site or by multiplying concentrations in soil at the site by BAFs for plants and invertebrates.
Diet Composition	40%	Plant Tissue	Food will consist of 40 percent plant tissue and 60 percent invertebrate tissue because the deer mouse was selected as a surrogate species for omnivorous mammals.
	60%	Invertebrates	
Site Use Factor	1	Unitless	Based on conservative estimate of 100 percent site use as per EPA Screening Level ERA guidance
Body Weight	0.019	kg	Based on mean adult weight (EPA 1993).

**Notes:**

a Deer mice are omnivorous and highly opportunistic. The deer mouse consumes a wide variety of food items, including seeds, fruits, leaves, fungi, insects, and other animal matter (Zeiner 1990).

**TABLE I-17 DOSE PARAMETERS FOR THE CALIFORNIA GROUND SQUIRREL (*Spermophilus beecheyi*)**

Remedial Investigation Report for Installation Restoration Site 34, Alameda Point, Alameda, California

Parameter	Average Adult	Units	Reference/Notes
Ingestion Rate <sub>food</sub>	0.042	kg/day	Calculated with body weight of 516 grams using the equation for the food requirement for intake of dry matter for rodents (food ingestion rate = $[0.332[BW(\text{grams})]^{0.774}]/1000$ ) (Nagy 2001).
Ingestion Rate <sub>plant</sub>	0.042	kg/day	Based on 100 percent of food ingestion rate.
Ingestion Rate <sub>soil</sub>	0.001	kg/day	2.4 percent of food ingestion rate based on the meadow vole from EPA (1993).
Soil Concentrations	Maximum Concentration	mg/kg	Based on conservative use of the maximum concentration of each chemical in soil collected from the site (0-4 feet below ground surface) per EPA Screening Level ERA guidance (1997).
Food Concentrations	Food Chain Model	mg/kg	Food concentrations were estimated using uptake models using concentrations at the site or by multiplying concentrations in soil at the site by BAFs for plants.
Diet Composition <sup>a</sup>	100%	Plant Tissue	Food will consist of 100 percent plant tissue because the California ground squirrel was selected as representative species for herbivorous mammals.
Site Use Factor	1	Unitless	Based on conservative estimate of 100 percent site use as per EPA Screening Level ERA
Body Weight	0.52	kg	Lowest mean weight for adults from Cal/EPA 2003.

Notes:

a The California ground squirrel eats seeds, nuts, fruits, bulbs, fungi, and stems and leaves of greasses and forbs. They also eat some insects, bird eggs, and carrion. (DFG 2005).

**TABLE I-18: DOSE PARAMETERS FOR THE ALAMEDA SONG SPARROW (*Melospiza melodia pusilla*)**

Remedial Investigation Report for Installation Restoration Site 34, Alameda Point, Alameda, California

Parameter	Average Adult	Units	Reference/Notes
Ingestion Rate <sub>food</sub>	0.01	kg/day	Calculated with body weight of 25 grams using the equation for the food requirement for dry matter intake for passerines (food ingestion rate = $[0.630(BW[\text{grams}])^{0.683}]/1000$ ) (Nagy 2001).
Ingestion Rate <sub>plant</sub>	0.0028	kg/day	Based on 50 percent of food ingestion rate.
Ingestion Rate <sub>invertebrate</sub>	0.0028	kg/day	Based on 50 percent of food ingestion rate.
Ingestion Rate <sub>soil</sub>	0.0005	kg/day	8 percent of food ingestion rate for sparrows (dry weight), from Williams (1987).
Soil Concentrations	Maximum	mg/kg	Based on conservative use of the maximum concentration of each chemical in soil collected from the site (0-4 feet below ground surface) per EPA Screening Level ERA guidance (1997).
Food Concentrations	Food Chain Model	mg/kg	Food concentrations were estimated using uptake models using concentrations at the site or by multiplying concentrations in soil at the site by BAFs for plants and invertebrates.
Diet Composition <sup>a</sup>	50%	Plant Tissue	Food will consist of 50 percent plant tissue and 50 percent invertebrate tissue because the Alameda song sparrow was selected as a surrogate species for omnivorous birds.
	50%	Invertebrates	
Site Use Factor	1.00	Unitless	Based on conservative estimate of 100 percent site use as per EPA Screening Level ERA guidance (1997).
Body Weight	0.025	kg	Based on average of adult and juvenile male and female Song Sparrows at Mandarte Island, Canada, from Smith and others (1986), as cited in EPA 2003. No statistical differences in body weight were observed between hatching years or yearling and adult birds.

Notes:

- a Seeds are the most important foods in the annual diet of the Song Sparrow; however, during the nesting season, insects, spiders, and other small invertebrates make up almost half of the diet (Martin and others 1961, as cited in Zeiner and others 1990).

**TABLE I-19 DOSE PARAMETERS FOR THE AMERICAN ROBIN (*Turdus migratorius*)**  
 Remedial Investigation Report for Installation Restoration Site 34, Alameda Point, Alameda, California

Parameter	Average Adult	Units	Reference/Notes
Ingestion Rate <sub>food</sub>	0.012	kg/day	Calculated with body weight of 77.3 grams using the equation for the food requirement for intake of dry matter for passerines (food ingestion rate = $[0.630[BW(\text{grams})]^0.683]/1000$ ) (Nagy 2001).
Ingestion Rate <sub>plant</sub>	0.003	kg/day	Based on 25 percent of food ingestion rate.
Ingestion	0.009	kg/day	Based on 75 percent of food ingestion rate.
Ingestion Rate <sub>soil</sub>	0.001	kg/day	10% of total ingestion based on the turkey and woodcock (Beyer and others 1994).
Soil Concentrations	Maximum	mg/kg	Based on conservative use of the maximum concentration of each chemical in soil collected from the site (0-4 feet below ground surface) per EPA Screening Level ERA guidance (1997).
Food Concentrations	Food Chain Model	mg/kg	Food concentrations were estimated using uptake models using concentrations at the site or by multiplying concentrations in soil at the site by BAFs for plants and invertebrates.
Diet Composition <sup>a</sup>	25% 75%	Plant Tissue Invertebrates	Food will consist of 25 percent plant tissue and 75 percent invertebrate tissue because the American robin was selected as a surrogate species for omnivorous birds.
Site Use Factor	1	Unitless	Based on conservative estimate of 100 percent site use as per EPA Screening Level ERA guidance
Body Weight	0.08	kg	Mean body weight of adults throughout the United States (Clench and Leberman 1978 as cited in EPA

Notes:

a Animal matter predominates in the American robin's breeding season diet while in the nonbreeding season robins eat more berries and other fruits, seeds, seedlings and sprouts (Bent 1949 and Martin and others 1961, both as cited in Zeiner and others 1990).

**TABLE I-20 DOSE PARAMETERS FOR THE RED-TAILED HAWK (*Buteo jamaicensis*)**  
 Remedial Investigation Report for Installation Restoration Site 34, Alameda Point, Alameda, California

Parameter	Average Adult	Units	Reference/Notes
Ingestion Rate <sub>food</sub>	0.08	kg/day	Calculated with body weight of 957 grams using the equation for the food requirement for intake of dry matter for carnivorous birds (food ingestion rate = $[0.849[BW(\text{grams})]^{0.663}]/1000$ ) (Nagy 2001).
Ingestion Rate <sub>mammal</sub>	0.08	kg/day	Based on 100 percent food ingestion rate.
Ingestion Rate <sub>soil</sub>	0.0006	kg/day	0.7 percent of total ingestion rate, based on the bald eagle (Pascoe and others 1996).
Soil Concentrations	Maximum Concentration	mg/kg	Based on conservative use of the maximum concentration of each chemical in soil collected from the site (0-4 feet below ground surface) per EPA Screening Level ERA guidance (1997).
Food Concentrations	Food Chain Model	mg/kg	Food concentrations were estimated using uptake models using concentrations at the site or by multiplying concentrations in soil at the site by BAFs for small mammals.
Diet Composition <sup>a</sup>	100%	Small Mammals	Food will consist of 100 percent small mammal tissue because the red-tailed hawk was selected as representative species for carnivorous birds.
Site Use Factor	1	Unitless	Based on conservative estimate of 100 percent site use as per EPA screening-level ERA guidance
Body Weight	0.96	kg	Average of adult males throughout the United States (Steenhof 1983, as cited in EPA 1993).

Notes:

a Red-tailed hawks are swooping, pouncing carnivores with a diet that consists of small mammals, insects, earthworms, reptiles, and amphibians (Ehrlich and others 1988; Zeiner and others 1990).

**TABLE I-24: FINAL RISK DRIVER DETERMINATION FOR GROUNDWATER**

Remedial Investigation Report for Installation Restoration Site 34, Alameda Point, Alameda, California

Chemical Name	Identified as Risk Driver	Rationale
<b>Metals</b>		
Aluminum	No	EPC below 1988 NAWQC
Arsenic	No	EPC driven by outlier. Second highest concentration is below screening level. EPC is slightly above comparison value.
Copper	No	Attributed to background
Cobalt	No	Highest detections within the SWBZ. Likely that a minimum dilution/attenuation factor of 10 will occur between the point of measurement and the ultimate discharge into the Oakland Inner Harbor, if such a discharge exists.
Magnesium	No	Naturally occurring in sea water
Manganese	No	Naturally occurring in sea water
Mercury	No	Low frequency of detection. One estimated detection from a direct-push boring.
Nickel	Yes	High detection frequency. EPC exceeds comparison value.
Zinc	Yes	High detection frequency. EPC exceeds comparison value.
<b>Volatile Organic Compounds</b>		
1,2,4-Trimethylbenzene	No	Low detection frequency. Detection below reporting level. Low concentration.
1,3,5-Trimethylbenzene	No	Low detection frequency. Detection below reporting level. Low concentration.
2-Hexanone	No	Only 1 detection, detection below ORNL Ecological comparison value.
4-Methyl-2-pentanone	No	Only 1 detection; detection below EPA Region 5 RCRA Ecological Screening Level
Carbon disulfide	No	21 detections, all below the EPA Region 5 RCRA Ecological Screening Level
Isopropylbenzene	No	Low detection frequency. Detection below reporting level. Low concentration.
tert-Butylbenzene	No	Low detection frequency. Detection below reporting level. Low concentration.
n-Butylbenzene	No	Low detection frequency. Detection below reporting level. Low concentration.

**TABLE I-24: FINAL RISK DRIVER DETERMINATION FOR GROUNDWATER**

Remedial Investigation Report for Installation Restoration Site 34, Alameda Point, Alameda, California

Chemical Name	Identified as Risk Driver	Rationale
n-Propylbenzene	No	Low detection frequency. Detection below reporting level. Low concentration.
p-Isopropylbenzene	No	Low detection frequency. Detection below reporting level. Low concentration.
sec-Butylbenzene	No	Low detection frequency. Detection below reporting level. Low concentration.
trans-1,2-Dichloroethene	No	Two detections, both below the ORNL Aquatic Screening Level
<b>Polycyclic Aromatic Hydrocarbons</b>		
Benzo(a)anthracene	No	Low detection frequency. Detection below reporting level. Low concentration.
Benzo(a)pyrene	No	Low detection frequency. Detection below reporting level. Low concentration.
Benzo(b)fluoranthene	No	Low detection frequency. Detection below reporting level. Low concentration.
Chrysene	No	Low detection frequency. Detection below reporting level. Low concentration.
Indeno(1,2,3-cd)pyrene	No	Low detection frequency. Detection below reporting level. Low concentration.
<b>Pesticides</b>		
4,4'-DDE	No	Only one or two detections which exceed the Water Boards screening level and no detections which exceed the CTR criteria.
Aldrin	No	Only one or two detections which exceed the Water Boards screening level and no detections which exceed the CTR criteria.
beta-BHC	No	Low frequency of detection and below EPA Region 5 RCRA ESL and ORNL screening level.
Heptachlor epoxide	No	Only one or two detections which exceed the Water Boards screening level and no detections which exceed the CTR criteria.
alpha-BHC	No	Moderate frequency of detection and below EPA Region 5 RCRA ESL and ORNL screening level.
alpha-Chlordane	No	Only one or two detections which exceed the Water Boards screening level and no detections which exceed the CTR criteria.
Endrin Aldehyde	No	Moderate frequency of detection with EPC exceeding comparison value.

**TABLE I-24: FINAL RISK DRIVER DETERMINATION FOR GROUNDWATER**

Remedial Investigation Report for Installation Restoration Site 34, Alameda Point, Alameda, California

Chemical Name	Identified as Risk Driver	Rationale
Notes:		
BHC	Benzene hexachloride	
COPEC	Chemical of potential ecological concern	
DDE	Dichlorodiphenyldichloroethylene	
EPA	U.S. Environmental Protection Agency	
EPC	Exposure point concentration	
ESL	Ecological screening level	
NAWQC	National Ambient Water Quality Criteria	
ORNL	Oak Ridge National Laboratory	
RCRA	Resource Conservation and Recovery Act

Notes:

- The formulas presented in Nagy (2001) were used to calculate ingestion rate.
- The plant ingestion rate is 100 percent of the total prey ingestion rate.
- BAFs were taken from EPA guidance (EPA 1995), primary literature, or calculated using formulas from ORNL (RAIS 2007). R = Regression equation used to generate tissue concentration.
- The plant concentration was calculated by multiplying the maximum soil concentration by the BAF or using a regression equation to generate a tissue concentration (see note 3).
- Plant daily doses were calculated by multiplying the ingestion rate (see note 2) by the tissue concentration (see note 4).
- Soil ingestion rate is 2.4 percent of prey ingestion rate.
- Maximum of all site-collected surface (0 to 4 feet) soil samples were used.
- Soil daily dose was calculated by multiplying the soil ingestion rate (see note 6) by soil concentration (see note 7).
- Body weight is taken from EPA (1993, 2003) and Office of Environmental Health Hazard Assessment (2003).
- Total daily dose is calculated using the following equation: total daily dose = ((plant daily dose + invertebrate daily dose + soil daily dose)\*SUF)/receptor species body weight.
- The derivation of TRVs is described in Navy (1998) and Sample (1996).
- The following surrogate TRVs were used: The TRV for BHC mixed isomers was used as a surrogate for alpha-, beta-, and delta-BHC. The TRV for chlordane was used as a surrogate for heptachlor and heptachlor epoxide because heptachlor and heptachlor epoxide are breakdown products of chlordane. The TRV for chlordane was also used for alpha-chlordane, gamma-chlordane, and technical chlordane. The TRV for endosulfan was used as a surrogate for endosulfan I, endosulfan II, and endosulfan sulfate. The TRV for endrin was used as a surrogate for endrin ketone and endrin aldehyde. The TRV for dieldrin was used as a surrogate for aldrin because dieldrin is a metabolic breakdown product of aldrin. The TRV for PCBs was used for Aroclor-1248, -1260, and -1268.
- Allometrically adjusted TRVs were calculated using the following equation: receptor species TRV = (test species TRV) x (test species body weight / receptor species body weight)<sup>1-1.2</sup>.
- HQs were calculated using the following equation: HQ = total daily dose/allometrically adjusted TRV.
- Sufficient data are not available to derive a TRV. This chemical was evaluated qualitatively.
- When only a low TRV was available from Sample and others (1996) or EPA (2007), it was multiplied by 10 to derive the high TRV.

BAF	Bioaccumulation factor	kg/day	Kilogram per day
BHC	Benzene hexachloride	mg/day	Milligram per day
COPEC	Chemical of potential ecological concern	mg/kg	Milligram per kilogram
DDD	Dichlorodiphenyldichloroethane	mg/kg/day	Milligram per kilogram per day
DDE	Dichlorodiphenyldichloroethylene	NA	Not applicable
DDT	Dichlorodiphenyltrichloroethane	Navy	U.S. Department of the Navy, Engineering Field Activity West
EPA	U.S. Environmental Protection Agency	R	Regression equation
HQ	Hazard Quotient	SUF	Site use factor
kg	kilogram	TRV	Toxicity reference value

Notes:

- The formulas presented in Nagy (2001) were used to calculate ingestion rate.
- The plant ingestion rate is 100 percent of the total prey ingestion rate.
- BAFs were taken from EPA guidance (EPA 1995), primary literature, or calculated using formulas from ORNL (RAIS 2007). R = Regression equation used to generate tissue concentration.
- The plant concentration was calculated by multiplying the maximum soil concentration by the BAF or using a regression equation to generate a tissue concentration (see note 3).
- Plant daily doses were calculated by multiplying the ingestion rate (see note 2) by the tissue concentration (see note 4).
- Soil ingestion rate is 2.4 percent of prey ingestion rate.
- Maximum of all site-collected surface (0 to 4 feet) soil samples were used.
- Soil daily dose was calculated by multiplying the soil ingestion rate (see note 6) by soil concentration (see note 7).
- Body weight is taken from EPA (1993, 2003) and Office of Environmental Health Hazard Assessment (2003).
- Total daily dose is calculated using the following equation: total daily dose = [(plant daily dose + invertebrate daily dose + soil daily dose)\*SUF]/receptor species body weight.
- The derivation of TRVs is described in Navy (1998) and Sample (1996).
- The following surrogate TRVs were used: The TRV for BHC mixed isomers was used as a surrogate for alpha-, beta-, and delta-BHC. The TRV for chlordane was used as a surrogate for heptachlor and heptachlor epoxide because heptachlor and heptachlor epoxide are breakdown products of chlordane. The TRV for chlordane was also used for alpha-chlordane, gamma-chlordane, and technical chlordane. The TRV for endosulfan was used as a surrogate for endosulfan I, endosulfan II, and endosulfan sulfate. The TRV for endrin was used as a surrogate for endrin ketone and endrin aldehyde. The TRV for dieldrin was used as a surrogate for aldrin because dieldrin is a metabolic breakdown product of aldrin. The TRV for PCBs was used for Aroclor-1248, -1260, and -1268.
- Allometrically adjusted TRVs were calculated using the following equation: receptor species TRV = (test species TRV) x (test species body weight / receptor species body weight)<sup>1-1.4</sup>.
- HQs were calculated using the following equation: HQ = total daily dose/allometrically adjusted TRV.
- Sufficient data are not available to derive a TRV. This chemical was evaluated qualitatively.
- When only a low TRV was available from Sample and others (1996) or EPA (2007), it was multiplied by 10 to derive the high TRV.

BAF	Bioaccumulation factor	kg/day	Kilogram per day
BHC	Benzene hexachloride	mg/day	Milligram per day
COPEC	Chemical of potential ecological concern	mg/kg	Milligram per kilogram
DDD	Dichlorodiphenyldichloroethane	mg/kg/day	Milligram per kilogram per day
DDE	Dichlorodiphenyldichloroethylene	NA	Not applicable
DDT	Dichlorodiphenyltrichloroethane	Navy	U.S. Department of the Navy, Engineering Field Activity West
EPA	U.S. Environmental Protection Agency	R	Regression equation
HQ	Hazard Quotient	SUF	Site use factor
kg	kilogram	TRV	Toxicity reference value

Notes:

- The formulas presented in Nagy (2001) were used to calculate ingestion rate.
- The plant ingestion rate is 100 percent of the total prey ingestion rate.
- BAFs were taken from EPA guidance (EPA 1995), primary literature, or calculated using formulas from ORNL (RAIS 2007). R = Regression equation used to generate tissue concentration.
- The plant concentration was calculated by multiplying the maximum soil concentration by the BAF or using a regression equation to generate a tissue concentration (see note 3).
- Plant daily doses were calculated by multiplying the ingestion rate (see note 2) by the tissue concentration (see note 4).
- Soil ingestion rate is 2.4 percent of prey ingestion rate.
- Maximum of all site-collected surface (0 to 4 feet) soil samples were used.
- Soil daily dose was calculated by multiplying the soil ingestion rate (see note 6) by soil concentration (see note 7).
- Body weight is taken from EPA (1993, 2003) and Office of Environmental Health Hazard Assessment (2003).
- Total daily dose is calculated using the following equation: total daily dose = ((plant daily dose + invertebrate daily dose + soil daily dose)\*SUF)/receptor species body weight.
- The derivation of TRVs is described in Navy (1998) and Sample (1996).
- The following surrogate TRVs were used: The TRV for BHC mixed isomers was used as a surrogate for alpha-, beta-, and delta-BHC. The TRV for chlordane was used as a surrogate for heptachlor and heptachlor epoxide because heptachlor and heptachlor epoxide are breakdown products of chlordane. The TRV for chlordane was also used for alpha-chlordane, gamma-chlordane, and technical chlordane. The TRV for endosulfan was used as a surrogate for endosulfan I, endosulfan II, and endosulfan sulfate. The TRV for endrin was used as a surrogate for endrin ketone and endrin aldehyde. The TRV for dieldrin was used as a surrogate for aldrin because dieldrin is a metabolic breakdown product of aldrin. The TRV for PCBs was used for Aroclor-1248, -1260, and -1268.
- Allometrically adjusted TRVs were calculated using the following equation: receptor species TRV = (test species TRV) x (test species body weight / receptor species body weight)<sup>1-1.2</sup>.
- HQs were calculated using the following equation: HQ = total daily dose/allometrically adjusted TRV.
- Sufficient data are not available to derive a TRV. This chemical was evaluated qualitatively.
- When only a low TRV was available from Sample and others (1996) or EPA (2007), it was multiplied by 10 to derive the high TRV.

BAF	Bioaccumulation factor	kg/day	Kilogram per day
BHC	Benzene hexachloride	mg/day	Milligram per day
COPEC	Chemical of potential ecological concern	mg/kg	Milligram per kilogram
DDD	Dichlorodiphenyldichloroethane	mg/kg/day	Milligram per kilogram per day
DDE	Dichlorodiphenyldichloroethylene	NA	Not applicable
DDT	Dichlorodiphenyltrichloroethane	Navy	U.S. Department of the Navy, Engineering Field Activity West
EPA	U.S. Environmental Protection Agency	R	Regression equation
HQ	Hazard Quotient	SUF	Site use factor
kg	kilogram	TRV	Toxicity reference value

Notes:

- The formulas presented in Nagy (2001) were used to calculate ingestion rate.
- The plant ingestion rate is 100 percent of the total prey ingestion rate.
- BAFs were taken from EPA guidance (EPA 1995), primary literature, or calculated using formulas from ORNL (RAIS 2007). R = Regression equation used to generate tissue concentration.
- The plant concentration was calculated by multiplying the maximum soil concentration by the BAF or using a regression equation to generate a tissue concentration (see note 3).
- Plant daily doses were calculated by multiplying the ingestion rate (see note 2) by the tissue concentration (see note 4).
- Soil ingestion rate is 2.4 percent of prey ingestion rate.
- Maximum of all site-collected surface (0 to 4 feet) soil samples were used.
- Soil daily dose was calculated by multiplying the soil ingestion rate (see note 6) by soil concentration (see note 7).
- Body weight is taken from EPA (1993, 2003) and Office of Environmental Health Hazard Assessment (2003).
- Total daily dose is calculated using the following equation: total daily dose = ((plant daily dose + invertebrate daily dose + soil daily dose) \* SUF) / receptor species body weight.
- The derivation of TRVs is described in Navy (1998) and Sample (1996).
- The following surrogate TRVs were used: The TRV for BHC mixed isomers was used as a surrogate for alpha-, beta-, and delta-BHC. The TRV for chlordane was used as a surrogate for heptachlor and heptachlor epoxide because heptachlor and heptachlor epoxide are breakdown products of chlordane. The TRV for chlordane was also used for alpha-chlordane, gamma-chlordane, and technical chlordane. The TRV for endosulfan was used as a surrogate for endosulfan I, endosulfan II, and endosulfan sulfate. The TRV for endrin was used as a surrogate for endrin ketone and endrin aldehyde. The TRV for dieldrin was used as a surrogate for aldrin because dieldrin is a metabolic breakdown product of aldrin. The TRV for PCBs was used for Aroclor-1248, -1260, and -1268.
- Allometrically adjusted TRVs were calculated using the following equation: receptor species TRV = (test species TRV) x (test species body weight / receptor species body weight)<sup>(1-1/2)</sup>.
- HQs were calculated using the following equation: HQ = total daily dose/allometrically adjusted TRV.
- Sufficient data are not available to derive a TRV. This chemical was evaluated qualitatively.
- When only a low TRV was available from Sample and others (1996) or EPA (2007), it was multiplied by 10 to derive the high TRV.

BAF	Bioaccumulation factor	kg/day	Kilogram per day
BHC	Benzene hexachloride	mg/day	Milligram per day
COPEC	Chemical of potential ecological concern	mg/kg	Milligram per kilogram
DDD	Dichlorodiphenyldichloroethane	mg/kg/day	Milligram per kilogram per day
DDE	Dichlorodiphenyldichloroethylene	NA	Not applicable
DDT	Dichlorodiphenyltrichloroethane	Navy	U.S. Department of the Navy, Engineering Field Activity West
EPA	U.S. Environmental Protection Agency	R	Regression equation
HQ	Hazard Quotient	SUF	Site use factor
kg	kilogram	TRV	Toxicity reference value

**ATTACHMENT I5 RED-TAILED HAWK DOSE CALCULATIONS AND HAZARD QUOTIENTS**  
 Remedial Investigation Report for Installation Restoration Site 34, Alameda Point, Alameda, California

COPEC	Total Prey Ingestion Rate <sup>1</sup> (kg/day)	Mammal Ingestion Rate <sup>2</sup> (kg/day)	Mammal BAF <sup>3</sup> (unitless)	Mammal Concentration <sup>4</sup> (mg/kg)	Mammal Daily Dose <sup>5</sup> (mg/day)	Soil Ingestion Rate <sup>6</sup> (kg/day)	Soil Concentration <sup>7</sup> (mg/kg)	Soil Daily Dose <sup>8</sup> (mg/day)	SUF	Body Weight <sup>9</sup> (kg)	Total Daily Dose <sup>10</sup> (mg/kg/day)	TRV <sup>11,12</sup> (mg/kg/day)	Test Species Body Weight <sup>11,12</sup> (kg)	Allometrically Adjusted TRV <sup>13</sup> (mg/kg/day)	HQ <sup>14</sup> (based on adjusted TRV)	Source of TRV
-------	--	--	---------------------------------------	--	--	--	--	--	-----	----------------------------------	---	-------------------------------------	---	--	---	---------------

Notes:

- The formulas presented in Nagy (2001) were used to calculate ingestion rate.
- The plant ingestion rate is 100 percent of the total prey ingestion rate.
- BAFs were taken from EPA guidance (EPA 1995), primary literature, or calculated using formulas from ORNL (RAIS 2007). R = Regression equation used to generate tissue concentration.
- The plant concentration was calculated by multiplying the maximum soil concentration by the BAF or using a regression equation to generate a tissue concentration (see note 3).
- Plant daily doses were calculated by multiplying the ingestion rate (see note 2) by the tissue concentration (see note 4).
- Soil ingestion rate is 2.4 percent of prey ingestion rate.
- Maximum of all site-collected surface (0 to 4 feet) soil samples were used.
- Soil daily dose was calculated by multiplying the soil ingestion rate (see note 6) by soil concentration (see note 7).
- Body weight is taken from EPA (1993, 2003) and Office of Environmental Health Hazard Assessment (2003).
- Total daily dose is calculated using the following equation: total daily dose = [(plant daily dose + invertebrate daily dose + soil daily dose)\*SUF]/receptor species body weight.
- The derivation of TRVs is described in Navy (1998) and Sample (1996).
- The following surrogate TRVs were used: The TRV for BHC mixed isomers was used as a surrogate for alpha-, beta-, and delta-BHC. The TRV for chlordane was used as a surrogate for heptachlor and heptachlor epoxide because heptachlor and heptachlor epoxide are breakdown products of chlordane. The TRV for chlordane was also used for alpha-chlordane, gamma-chlordane, and technical chlordane. The TRV for endosulfan was used as a surrogate for endosulfan I, endosulfan II, and endosulfan sulfate. The TRV for endrin was used as a surrogate for endrin ketone and endrin aldehyde. The TRV for dieldrin was used as a surrogate for aldrin because dieldrin is a metabolic breakdown product of aldrin. The TRV for PCBs was used for Aroclor-1248, -1260, and -1268.
- Allometrically adjusted TRVs were calculated using the following equation: receptor species TRV = (test species TRV) x (test species body weight / receptor species body weight)<sup>(1-1.4)</sup>.
- HQs were calculated using the following equation: HQ = total daily dose/allometrically adjusted TRV.
- Sufficient data are not available to derive a TRV. This chemical was evaluated qualitatively.
- When only a low TRV was available from Sample and others (1996) or EPA (2007), it was multiplied by 10 to derive the high TRV.

BAF	Bioaccumulation factor	kg/day	Kilogram per day
BHC	Benzene hexachloride	mg/day	Milligram per day
COPEC	Chemical of potential ecological concern	mg/kg	Milligram per kilogram
DDD	Dichlorodiphenyldichloroethane	mg/kg/day	Milligram per kilogram per day
DDE	Dichlorodiphenyldichloroethylene	NA	Not applicable
DDT	Dichlorodiphenyltrichloroethane	Navy	U.S. Department of the Navy, Engineering Field Activity West
EPA	U.S. Environmental Protection Agency	R	Regression equation
HQ	Hazard Quotient	SUF	Site use factor
kg	kilogram	TRV	Toxicity reference value

**REMEDIAL INVESTIGATION REPORT AND DRAFT FINAL REMEDIAL**  
**INVESTIGATION REPORT FOR INSTALLATION RESTORATION SITE 34**

---

**RESPONSES TO REGULATORY AGENCY COMMENTS ON THE  
DRAFT REMEDIAL INVESTIGATION REPORT FOR INSTALLATION RESTORATION  
SITE 34, FORMER NORTHWEST SHOP AREA, ALAMEDA POINT,  
ALAMEDA, CALIFORNIA**

---

This document presents the U.S. Department of the Navy's responses to comments from the regulatory agencies on the "Draft Remedial Investigation [RI] Report for Installation Restoration [IR] Site 34, Former Northwest Shop Area, Alameda Point, Alameda, California," dated September 6, 2007. The comments addressed below were received from the U.S. Environmental Protection Agency (EPA) on November 20, 2007, from the Department of Toxic Substances Control (DTSC) Geologic Services Unit (GSU) and the DTSC Human and Ecological Risk Division (HERD) on December 6, 2007, and from the California Department of Fish and Game, Office of Spill Prevention and Response (DFG-OSPR), on December 21, 2007.

**RESPONSES TO COMMENTS FROM EPA**

**General Comments**

- 1. Comment:** The future use of the site is a golf course and recreation area, but there is little discussion of how future land use will affect the fate and transport of contaminants. For example, a golf course needs frequent watering, which would increase the vertical flux of water through the soil. This could increase leaching of contaminants from soil into the groundwater. Please provide more information about future site use may impact contaminant fate and transport.

**Response:** It is not possible to forecast the potential effects of golf course management, including irrigation or pesticide application, on contamination that might be present at Site 34. Any such discussion would be speculative and conjectural at this point. The feasibility study (FS) will consider future land use in evaluating options to address contamination at Site 34.

- 2. Comment:** More sampling at Site 34 may be necessary to accurately define the lateral and vertical extent of soil contamination. In a few cases, the lateral extent of contamination has been established, but the vertical extent has not been delineated. For example, boring DP15 has samples from as deep as 7 feet below ground surface (ft bgs), and is the deepest boring in that area of Site 34. Some of the concentrations from DP15 at a depth of 7 ft exceed background and/or preliminary remediation goal (PRG) levels. Since samples were not collected from greater depths, the vertical extent of contamination remains uncertain. Similarly, Well MW-24, which has analytical results that exceed background and/or PRG levels, is fairly isolated in the

northwest corner of the site. Some of the same analytes exceeded screening criteria in samples collected from Boring DP06 but other nearby borings were not analyzed for the same suite of chemicals, so the lateral extent of contamination has not been delineated. Delineation of the extent of contamination appears to be necessary at the Feasibility Study or Remedial Design stage. Please consider more sampling in order to fully characterize the lateral and vertical extent of soil contamination at Site 34.

**Response:** It is the Navy's position that data are adequate to characterize the lateral and vertical extent of chemicals in soil and groundwater for the purposes of preparing the RI report and conducting risk assessments. The Navy also believes that the four areas of concern (AOC) presented in the draft RI report and an additional area north of Building 331, which will be added to the draft final report (see response to DTSC GSU specific comment 11), adequately represent potential risk to receptors, as defined by the risk assessments, and warrant further evaluation in an FS.

Additional samples in the area northeast of Building 331 (within the vicinity of DP16) and to the southwest (within the vicinity of DP02) (see response to EPA human health risk assessment [HHRA] general comment 2) will be collected in support of the FS; however, these results will not be available for the RI report. Sampling location DP15 is within the AOC along the former railroad and south of former Building 331. MW-24 and DP06 are within the AOC in the northwest corner of Site 34. These locations are already proposed for further investigation in the FS. If additional characterization of these other areas is needed, the Navy believes the information can be collected at the remedial design stage.

3. **Comment:** Additional sampling may be necessary to adequately characterize the groundwater at Site 34. There are only five wells present near Site 34, and only three of those are actually located within the site. There is a small section where the elevation data is supposedly more reliable (solid contours), but this area is located just to the west of Site 34. It appears from these two figures that more complete groundwater data from Site 34 and the surrounding areas is needed. Please consider collecting more groundwater data in order to provide more accurate fate and transport information for groundwater contaminants at Site 34.

**Response:** The Navy acknowledges that a reliable potentiometric surface contour cannot be drawn with the highest degree of accuracy using the available data. However, it is the Navy's position that the current level of accuracy is adequate to assess groundwater contamination for this RI report. In addition to the five monitoring wells mentioned by the reviewer, the

groundwater data from more than 25 direct-push samples were also used to evaluate groundwater contamination.

## SPECIFIC COMMENTS

1. **Comment:** Section 1.3.3, IR Site Description and Operations, Page 1-5; Table 1-1, Summary of Historical Uses, Investigations and Findings for IR Site 34 Buildings; and Figure 1-3, Site Features: The text of Section 1.3.3 says there are 15 transformers located within Site 34 and Table 1-1 indicates that 10 transformers were observed at IR Site 34, but Figure 1-3 shows only one transformer as indicated by the designated symbol from the legend. This transformer is also outside the site boundary line, just to the west. Please resolve the discrepancy in the number of reported transformers and include all transformers, whether currently present or not on Figure 1-3. Then, please evaluate whether samples for polychlorinated biphenyl (PCBs) analysis were collected from each of the current or former transformer locations and discuss this in Section 4.

**Response:** Fifteen transformers were located at Site 34. Six were located in Building 474, and one each were located in Buildings 330, 331, 343, 344, 472, 475, 476, 477, and 479. No transformers remain at Site 34. Section 1.3.3, Table 1-1, and Figure 1-3 will be edited to show the 15 transformers previously located on Site 34. There was no evidence of a release to the surface soils near the transformers during base operations or during the environmental baseline survey (EBS), and many of the transformers were located on concrete slabs that would prevent any releases to subsurface soils. Therefore, specific samples were not collected at previous transformer locations for analysis of polychlorinated biphenyls (PCBs). However, additional text will be added to the draft final RI report describing PCB concentrations in soil samples collected within the vicinity of the buildings formerly containing the transformers. PCBs are likely related to the use of oils at the site and the former temporary storage and treatment area (TSTA).

2. **Comment:** Figure 1-3, Site Features: All of the features listed in Table 1-1 should be shown and labeled on this figure. For example, the storm drain outlets and open space areas 1 and 2 are not labeled. In addition, total petroleum hydrocarbon (TPH) corrective action areas (CAA) 14 and CAA A should be included on this figure, since they are discussed in the text. Please label the storm drain outlets and open space areas 1 and 2 and review Table 1-1 to ensure that all features are included and labeled. Also, please include CAA 14 and CAA A on this figure.

**Response:** Figure 1-3 will be updated with all applicable site features.

3. **Comment:** Figure 1-4, IR Site 34 Soil Sampling Locations and Figure 1-5, Groundwater Sample Locations: Neither of these figures includes GB-14, but a log for this location is included in Appendix B. Please revise these figures to include location GB-14.

**Response:** Offshore geotechnical boring GB-14 was not part of the RI and was inadvertently included in Appendix B. Refer to Section 2.3 for site geology. Boring log GB-14 will be removed from the appendix.

4. **Comment:** Table 1-1, Summary of Historical Uses, Investigations, and Findings for IR Site 34 Buildings: For Buildings 472 and 474 as well as Open Space 1, the only item listed under Field Observations is “findings were not identified.” This statement is vague because it is unclear whether it means that no observations were made or observations were made but there were no significant findings. Please revise the statement in Table 1-1 so the meaning of the statement is clear.

**Response:** The statement will be revised to clarify that no observations were made about conditions at the building in the EBS report.

5. **Comment:** Section 2.4, Hydrogeology, Page 2-3: There are no approximate depths to aquifers and/or water-bearing zones included in the text. The hydrogeology descriptions would be more informative if information about depths to the various aquifers mentioned were included in the text. Please consider adding depth information to the hydrogeology sections.

**Response:** Depth to aquifers and water-bearing zones will be included in the text.

6. **Comment:** Section 2.4.1, Regional Hydrogeology, Page 2-3 and Section 2.4.2, Alameda Point and IR Site 34 Hydrogeology, Page 2-3: Section 2.4.1 states there are four primary aquifers found in the Eastern Bay Area, while Section 2.4.2 states there are two water-bearing zones and the Alameda Aquifer present at Alameda Point. There is no relationship drawn between these two hydrogeologic descriptions (i.e. the Newark Aquifer is equivalent to the Second Water-Bearing Zone). Please explain how the regional hydrogeology corresponds to the site hydrogeology.

**Response:** Additional text will be added to Sections 2.4.1 and 2.4.2 to describe the correlation between site hydrogeology and regional hydrogeology.

7. **Comment:** Section 2.6, Surface Water Drainage System and Tides, Page 2-6: The first paragraph of the section discusses the tidal influences on the

First Water-Bearing Zone (FWBZ), but does not discuss tidal influences on the Second Water-Bearing Zone (SWBZ). Please discuss tidal influence on the SWBZ.

**Response:** A description of the tidal influences on the second-water bearing zone (SWBZ) will be added to Section 2.6.

8. **Comment:** Section 2.7, Ecological Habitats, Page 2-7: The first sentence of the section states there are nine wildlife habitats present at Alameda Point. The bulleted section following the first paragraph only lists seven of these nine. Please include the two remaining habitat types or provide a reason for their exclusion.

**Response:** The text that describes ecological habitat in the executive summary, Section 2.7, Section 3.6, Section 7.0, and Appendix I of the draft RI report will be revised to be consistent with the following habitats:

- Open Water Area
- Grassland
- Landscaped or Developed
- Intensively Developed
- Airfield (Paved) Area
- Rock Breakwaters and Rip Rap

These habitats are described in the Final Environmental Impact Report for NAS Alameda dated December 2003 and are supplemented by a site visit and information from the California Wildlife Habitat Relationships System (CDFG 2005).

9. **Comment:** Figure 2-2, Schematic Geologic Cross Section A-A' and Figure 2-3, Schematic Geologic Cross Section B-B': It is unclear why these cross-sections only depict the top 10 feet of fill, since this is not sufficient for understanding the hydrogeology of IR 34. There are a number of borings and wells that were completed to depths between 15 and 241.5 feet. At a minimum, the cross-sections should include the units screened by the monitoring wells and the units sampled in the deeper direct push groundwater sample locations. Please relocate and revise the cross-sections to include the monitoring well borings and deeper direct push locations and to depict the units screened by the monitoring wells.

**Response:** The cross section figures will be revised to include the units screened by monitoring wells and the units sampled by deeper direct-push locations. The cross-sections were modified to include monitoring wells, and the shallow boring DP19 was not used in revised cross sections.

10. **Comment:** Figure 2-2, Schematic Geologic Cross Section A-A', Figure 2-3, Schematic Geologic Cross Section B-B' and Appendix B, Soil Boring Logs: Many of the water levels displayed on the cross sections were not measured; the values were estimated. According to the boring logs in Appendix B, the water levels at DP07, DP08 and DP10 were not measured. Please include a notation on the figures about estimated water levels or do not include inferred values on the cross sections.

**Response:** The cross section figures will be revised to remove the inferred values for water levels.

11. **Comment:** Figure 2-3, Schematic Geologic Cross Section B-B' and Appendix B, Soil Boring Logs: According to the boring logs found in Appendix B, DP19 should have clayey sand extending from the surface to a depth of 0.5 ft. The cross section does not depict this portion of clayey sand. Please revise the cross section to display the clayey sand.

**Response:** The cross-sections were modified to include monitoring wells; therefore, shallow boring DP19 was not used in the revised cross sections. See response to EPA specific comment 9.

12. **Comment:** Figure 2-4, Groundwater Elevation Map First Water Bearing Zone (Basewide): The figure has no site boundaries for Site 34 on the map. Site 34 is the focus of the RI, so the site boundaries should be included on the map. Also, the map includes contours for the SWBZ, so this should be reflected in the title of the figure. Please alter the figure to include site boundaries for Site 34, and consider changing the title of the figure to indicate SWBZ data is also included.

**Response:** Site boundaries will be included on Figure 2-4. In addition, the title of the figure will be modified to indicate that the SWBZ has been included.

13. **Comment:** Section 4.1.1, Metals in Soil, Arsenic, Page 4-2: The text states that arsenic contamination at 1.5 and 2.5 ft bgs was not related to surface contamination and that a source for subsurface arsenic contamination was not apparent, but a soluble form of arsenic was used as an additive to anti-fouling paints (see *Marine Fouling and Its Prevention*, United States Naval Institute, 1952) so arsenic in the subsurface could

be related to dissolution of arsenic in paint chips and dust that is found in used sandblast abrasive. In addition, arsenic was used as a pesticide and for wood treatment. Please revise the text to include a discussion of the possible sources of arsenic.

**Response:** The text will be revised to state that, although a source of subsurface arsenic contamination at locations HS1N and DP12 was not apparent, some of the arsenic detected may have resulted from dissolution of paint chips, paint dust, pesticides, and treated wood that were generated during historical operations at the site. However, sources related to historical operations at Site 34 are no longer believed to remain on site.

14. **Comment:** Section 4.1.1, Metals in Soil, Vanadium, Page 4-4: It is unclear why the second to last sentence in the paragraph on vanadium refers to cadmium. Please revise the text to explain the relevance of an observation about cadmium to the discussion of vanadium in soil or delete the reference to cadmium.

**Response:** Cadmium in the referenced text will be revised to vanadium.

15. **Comment:** Section 4.1.6, Polychlorinated Biphenyls in Soil, Page 4-7, Figure 4-9, Analytical Results for Aroclor 1254 in Soil Samples, and Figure 4-10, Analytical Results for Aroclor 1260 in Soil Samples: It is unclear why the text states that all PCB concentrations exceeding PRGs were in samples within 0.5 ft of the surface, with the exception of HS1N. According to Figures 4-9 and 4-10, locations 004-Z03-004 and DP02 have samples collected from depths greater than 0.5 ft that exceed either residential or industrial PRG levels. Please revise the text to be consistent with the data displayed in Figures 4-9 and 4-10.

**Response:** The text in Section 4.1.6, Polychlorinated Biphenyls in Soil, will be revised to the following for consistency with the data displayed in Figures 4-9 and 4-10: "Most of the PCB concentrations detected above PRGs were in samples collected within 0.5 feet of the ground surface. PCB concentrations were detected above PRGs deeper than 0.5 feet bgs in the following samples: a sample from 0.5 to 0.9 feet bgs at DP02 (Aroclor-1254 and Aroclor-1260), a sample from 0.5 to 1.0 feet bgs at 004-Z03-004 (Aroclor-1260), and a sample from 2.0 to 2.5 feet bgs at HS1N (Aroclor-1260)."

16. **Comment:** Section 4.1.3, Summary of Contamination in Soil and Figure 4-14, Areas of Concern in Soil Based on Nature and Extent Evaluation and Section 8.1.1.1, Nature and Extent Soil Results, Page 8-2: The requirement that there have to be three adjacent points to identify an

area of concern (AOC) is too arbitrary because there are areas where there are only two sampling points, like the area northwest of Building 331 where only DP12 and DP17 were completed. Also, samples from areas with stained soils should not be dismissed (e.g., DP16) without considering whether groundwater has been impacted; in the case of DP16, numerous fuel-related constituents were detected in groundwater, so it appears that contaminants are being dissolved from the stained soil. In addition, many locations were not analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and pesticides, but there are areas where multiple contaminants were detected in one boring that should have been designated as AOCs. The areas northwest of Building 331 (DP12 and DP17 – arsenic, chromium, lead, and polynuclear aromatic hydrocarbons [PAHs]); southeast of Building 331 (HS3S – arsenic, lead), and north of Building 331 (DP16 – arsenic, lead, PCBs and 004-Z03-004 - PCBs) should be designated as AOCs. Similarly, DP02 should be included in the western AOC because chromium was detected above the industrial PRG and PCBs were detected above the residential PRG. Please designate these areas northwest, southeast, and south of Building 331 as AOCs on Figure 4-14 and expand the western AOC to include location DP02.

**Response:** The intent of Section 4.1.8, Summary of Contamination in Soil, and Figure 4-14 is not to dismiss areas with stained soils, locations where samples were not analyzed for specific analytical groups, or areas with fewer sampling locations. Rather, as the discussion of the nature and extent presented in Section 4.0 had focused only on chemical concentrations that exceed comparison criteria (preliminary remediation goals [PRG]; environmental screening levels [ESLs] for diesel, gasoline, and motor oil; and background), the intent of Section 4.1.8 and Figure 4-14 is to further highlight the nature and extent of chemicals likely to pose potential risk, based on the risk assessments, and to identify areas where residual soil contamination appears to be limited. Section 4.1.8 will be revised to more clearly indicate this, and references to the following will be removed from the text and figure: comparison criteria of a cluster of three or more adjacent sample points, chemicals that exceed industrial PRGs and ESLs, and metals that exceed two times the background comparison will be removed from the text and figure.

An additional AOC in soil (arsenic, lead, PCBs, naphthalene, and TPH) to the north of Building 331, which includes locations DP12, DP16, and DP17, will be added to the draft final RI report (see response to DTSC GSU specific comment 11) and identified as an AOC requiring further investigation in an FS.

An AOC in soil (PCBs) will be identified in Section 4.1.8 and Figure 4-14 near the southwest corner of former Building 343 and east of former Building 475, which includes PW13 and PW18. However, this area will not be recommended in Section 8.2 as an AOC requiring further investigation in an FS. See response to EPA specific comment 23.

The AOC located in the southwest corner of the site will be expanded to include location DP02 due to PCBs and VOCs. Although chromium was detected above the industrial PRG at DP02, chromium was not identified a risk driver in the risk assessments and further action is not proposed for this chemical.

Location HS3S was not included within an AOC because of the relatively low concentrations detected at this location. Lead was detected at a concentration equal to the Cal-modified PRG but did not exceed it. Although arsenic was detected above background in surface soil (0.5 feet below ground surface [bgs]) at location HS3S (one of 10 locations), the detected concentration of 17 milligrams per kilogram (mg/kg) is within an order of magnitude of the background concentration for the site. In addition, the three highest concentrations of arsenic were detected in soil between 1.5 and 2.5 feet bgs. These locations, HS1N (120 mg/kg), DP12 (62 mg/kg), and 018-007-034 (52.1 mg/kg), are already included within AOCs proposed for further evaluation in the FS (northwest corner, north of Building 331). Arsenic was only detected above background in surface soil within an order of magnitude of the background concentration for the site at the remaining locations; therefore, these locations were also not included within the AOCs.

17. **Comment:** Section 4.2.1, Metals in Groundwater, Page 4-10, Pages 4-10 through 4-12; Section 4.2.5, Pesticides in Groundwater, Page 4-15; and Section 4.3, Nature and Extent Conclusions, Page 4-17: It is unclear why data from wells and sampling points near the Oakland Inner Harbor (i.e., MW-23, MW-24, DP06, DP11, DP12, DP16, and DP17) were not compared to California Toxics Rule (CTR) Criteria for metals and pesticides since aquatic receptors could be impacted by contaminants in groundwater that is discharged to the Harbor. While these locations are 40 to 60 feet from the Harbor and CTR criteria apply to surface water, the CTR criteria should be used to evaluate whether there are potential impacts to aquatic life and whether groundwater needs to be considered in the Feasibility Study (FS). Please screen groundwater data from the points listed above using CTR criteria and revise the RI Report to include the results of this evaluation.

**Response:** The screening level ecological risk assessment (SLERA) compared all groundwater data with the California Toxics Rule (CTR) criteria. It was

not necessary to include this comparison in the Section 4 evaluations since the SLERA addresses potential effects of groundwater contamination on ecological receptors, as represented by the CTR.

18. **Comment:** Figure 4-18, Results for Cis-1, 2-Dichloroethene in Groundwater: The contour lines on this figure intersect. There are two areas where the 0.1 microgram per liter ( $\mu\text{g/L}$ ) contour intersects other contours with values of 0.2  $\mu\text{g/L}$  (e.g., DP09 and DP15). In the vicinity of DP12, the 0.1  $\mu\text{g/L}$  contour crosses the 0.7  $\mu\text{g/L}$  contour. Please revise the figure so the contour lines do not intersect.

**Response:** Figure 4-18 will be corrected using conventional contour methods, and plume data will be re-contoured.

19. **Comment:** Section 5.2.1.1, Arsenic, Page 5-5: The text should not conclude that the “arsenic mobility is low” if it was used in a pesticide formulation. Arsenic was used as a pesticide and as an antifouling additive to paint, so it must have been present in a soluble (i.e., bioavailable) form and has likely dissolved from spent sandblast abrasive materials. The fate and transport discussion should incorporate information on these uses of arsenic (for example, see *Marine Fouling and Its Prevention*, United States Naval Institute, 1952). Please revise the text to discuss the likely behavior of soluble arsenic at Site 34.

**Response:** The text will be revised, as requested, to state that, in addition to occurring naturally in soils and groundwater in California, arsenic in soil may be attributed to dissolution of arsenic in paint chips and dust, pesticide use, and wood treatment, which may have been present in a soluble form.

Please note, however, that the text in Section 5.2.1.1 does not conclude that the mobility of arsenic is low. Rather, the text states, as quoted below, that redox conditions control the ionic species of metals and that different ionic species of arsenic have differing aqueous solubilities. “In oxidizing conditions, the relatively insoluble arsenate species of arsenic predominates and arsenic mobility is low. In reducing conditions, the more soluble arsenite species predominates and is more likely to dissolve into the groundwater and mobilize arsenic (Van Deuren others 2002).”

20. **Comment:** Section 5.2.1.2, Iron, Page 5-5: The text states there are two common iron ions,  $\text{Fe}^{+2}$  and  $\text{Fe}^{+3}$ , present in groundwater and that sorption depends on the type of ion and the optimum pH range for that particular ion, but it is unclear how this applies to Site 34. Please discuss which ion is more prevalent and how this, along with pH levels, will affect the mobility/sorption of iron at Site 34.

**Response:** The text will be revised to include additional information about how this mechanism might apply at Site 34 and how site-specific conditions affect the mechanism.

21. **Comment:** Section 5.2.1.3, Lead, Page 5-5: The text states that lead sorption is pH dependent, but pH values for the groundwater at Site 34 are not given. Please include pH data for Site 34 and discuss how these pH levels will impact lead sorption at Site 34.

**Response:** The text will be revised to include additional site-specific information about pH and how it would influence lead sorption.

22. **Comment:** Section 5.4, Fate and Transport Summary, Page 5-13: The second to last bulleted point states chemicals are not migrating along storm sewer line pathways based on data collected. No information is given about the data and specific sample locations, nor is there discussion regarding which characteristics of the data indicate that no preferential migration is occurring. Please include specific information in the text to support the statement that no preferential migration is occurring along sewer lines.

**Response:** The text will be revised in the referenced section to include sampling results that show groundwater in samples collected from locations DP12 and DP17 along the storm sewer line are not contaminated; thus, there is no evidence that preferential migration is occurring. Locations DP12 and DP17 are only 10 and 5 feet, respectively, from the storm drain line.

23. **Comment:** Section 8.2, Recommendations, Page 8-7: It is unclear if the recommendation for addressing PCBs in locations PW13 and PW-18, where Aroclor 1248 was detected above the Industrial and Residential PRGs, respectively. PW13 also had Aroclor 1254, Aroclor 1260, and Aroclor 1268 above residential PRGs. Similarly, since Aroclor-1260 exceeded the Industrial PRG in DP06 and the Residential Goal in HS1n, FS5, and HS1E, this area should also be addressed. Please clarify if these areas are recommended for evaluation in the FS.

**Response:** Sample locations FS5, HS1N, HS1E, and DP06 are located within an AOC identified in the northwestern corner of the site (see Figure 4-14 in the draft RI report), which is recommended for further evaluation in an FS. Though PCBs were detected in samples collected at PW13 and PW18 at concentrations greater than the residential PRG (and, in one case, greater than the industrial PRG), these two locations will not be specifically identified for further evaluation in an FS. The highest cancer risk of an individual PCB is 5.6E-06 and is associated with future residential

exposure to Aroclor-1248 in soil from both 0 to 2 feet and 0 to 4 feet bgs. The corresponding noncancer hazard is 1.1. The cancer risk for the future resident is at the lower end of the risk management range of 1E-06 to 1E-04; the noncancer hazard is essentially equal to the noncancer hazard threshold of 1.0. The cancer risk for both Aroclor-1254 and Aroclor-1260 was 2.5E-06, and both noncancer hazards were less than 0.5. Aroclor-1268 did not exceed either the cancer risk or the noncancer hazard threshold. In addition, the PCB that posed the highest cancer risk (Aroclor-1248) is infrequently detected at the site (2 percent). The RI report will not recommend the area near sample locations PW13 and PW18 for further evaluation in the FS, based on the relatively low risk of PCBs and their infrequent detection. However, risk management decisions made during development of the FS could include these locations for further evaluation if necessary.

## MINOR COMMENTS

- Comment:** Acronyms should be defined in the text the first time each is used. Frequently, the full name will be given initially in the text of the Draft Remedial Investigation Report (the RI Report) for Installation Restoration Site 34, but no acronym is included. Later in the text only the acronym is used. Please define all acronyms the first time they are used.

**Response:** Acronyms in the text will be defined the first time they are used.

- Comment:** Figure 2-3, Schematic Geologic Cross Section B-B': The labels at the top of the cross section indicate that it extends south to north, but the inset figure depicts Cross Section B-B' as an East-West cross section. Please resolve this discrepancy.

**Response:** Figure 2-3 will be corrected with the appropriate east-west cross-section labels.

- Comment:** Figure 2-5, IR Site 34 Groundwater Elevation Map: Units for the groundwater elevation are not listed on the figure. Also, the dashed contours, which are areas where data are uncertain, are not defined in the legend. Please provide units for the groundwater elevation data and include a definition for the dashed contours in the legend.

**Response:** Figure 2-5 will be edited to include groundwater elevation units and a definition in the legend for the dashed contours.

4. **Comment:** Section 3.5.3, Toxicity Assessment, Page 3-10: In the paragraph following the first bulleted portion of the section, the third sentence discusses the OEHHA SF. The “C” was omitted, and “SF” should be “CSF.” Please correct this typographic error.

**Response:** The text will be corrected.

5. **Comment:** Section 4.1.1, Metals in Soil, Page 4-2 and Figure 4-2, Analytical Results for Chromium in Soil Samples: The paragraph discussing chromium states that 35 locations exceed residential PRG levels based on x-ray fluorescence (XRF) screening results, yet Figure 4-2 shows 36 locations exceeding residential PRG levels according to XRF screening. Please resolve this discrepancy.

**Response:** The text will be revised to reflect that X-ray fluorescence (XRF) results at 36 locations exceed residential PRGs. In addition, the following revisions will be made to Figure 4-2: (1) all sample locations will be labeled and (2) shading will be removed from location HS6A (was shown north of location HS6W-5W in the draft report). It should be noted that 37 locations were originally shown as exceeding residential PRGs in Figure 4-2; see location PW-7A that was obscured by the concentration labels in the draft figure. In addition, sample 105-S34-157, which was incorrectly associated with location PW2 in Table D-2 of the draft report, will be associated with PW1 in the draft final table. Samples associated with location HS6S will also be correctly identified with location HS6S-5W in Table D-2.

6. **Comment:** Section 4.1.1, Metals in Soil, Page 4-3 and Figure 4-4, Analytical Results for Lead in Soil Samples: The paragraph discussing lead states 17 locations exceed residential PRG levels based on XRF screening results, but Figure 4-4 shows only 16 locations exceeding residential PRG levels according to XRF screening. Also, the text states that 29 samples exceed residential PRG levels, but Figure 4-4 shows 30 samples exceeding residential PRG levels. Please resolve these discrepancies.

**Response:** The text regarding residential PRGs and XRF samples is correct in both Section 4.1.1 and Figure 4-4. The text states, “XRF screening results for 106 soil samples suggested lead concentrations in soil exceeded ... California-modified residential PRG (150 milligrams per kilogram [mg/kg]) in 17 samples. Lead exceeded the PRG in 17 samples at 16 locations (two at location HS1N, at depths of 0 to 0.5 and 2 to 2.5 foot bgs).

The text regarding the 29 samples that exceeded the California-modified residential PRG is correct in both Section 4.1.1 and Table 4-1. As stated in the text, "... lead *exceeded* the California-modified residential PRG (150 mg/kg) in 29 samples..." (emphasis added). Figure 4-4 reflects that lead concentrations *are equal to or exceed* the PRG in 30 samples. As shown on Figure 4-4, lead at location HS3S was detected at a concentration of 150 mg/kg, which is equal to the PRG.

However, text in Section 4.1.1 of the draft report will be revised to reflect that the background screening criteria for lead is 29.7 mg/kg, not 37.7 mg/kg, and was exceeded in 48 out of 105 samples, and not 45 samples as stated.

7. **Comment:** Section 4.1.4, Polycyclic Aromatic Hydrocarbons in Soil, Page 4-6 and Figure 4-6, Analytical Results for Benzo(a)pyrene Equivalent in Soil Samples: The chart included in this section lists a value of 1.28 milligrams per kilogram (mg/kg) as the benzo(a)pyrene equivalent for sample location 004-003-008 at a depth of 6 ft but on Figure 4-6, this same sample has a value of 1.26 mg/kg listed. Please resolve this discrepancy.

**Response:** The benzo(a)pyrene (B[a]P) equivalent for sample location 004-003-008 is 1.26 mg/kg. The chart in Section 4.1.4, Polycyclic Aromatic Hydrocarbons in Soil, will be revised to be consistent with Figure 4-6. A new table will be added to Section 4 to show the B(a)P equivalents for each of the 54 samples identified in Figure 4-6.

In addition, five revisions will be made to Figure 4-6: (1) the B(a)P equivalent for samples without any detections of PAHs that have been assigned toxicity equivalence factors (TEFs) will be changed to "NC" for not calculated, rather than the current designation of zero; (2) sample 018-004-020 (0 to 0.5 feet bgs) will be added to the figure; (3) the B(a)P equivalents for both samples listed for DP13 will be corrected to read "NC" because the analytical results identified them as non-detections; (4) the B(a)P equivalent for the sample collected at 1 foot at location DP15 will be corrected to read 0.000004 mg/kg rather than 0.001404 mg/kg; and (5) the depth of the B(a)P equivalent sample listed at 0 feet at DP05 will be corrected to read 7 feet.

8. **Comment:** Section 4.1.6, Polychlorinated Biphenyls in Soil, Page 4-7 and Figure 4-10, Analytical Results for Aroclor 1260 in Soil Samples: The section states 20 locations exceed residential PRG levels, but Figure 4-10 shows 22 locations exceeding residential PRG levels. Please resolve this discrepancy.

**Response:** Figure 4-10 displays the locations of 22 samples of Aroclor-1260 that equal or exceed the EPA residential PRG of 0.22 mg/kg. Of those 22 samples, two locations equal the PRG, and 20 locations exceed the PRG. The text will be revised to state that concentrations *equaled or* exceeded the EPA residential PRG in 22 samples for Aroclor-1260.

9. **Comment:** Section 4.2.1, Metals in Groundwater, Page 4-11: Figure 4-18 is referenced on the third line as depicting metals in groundwater exceeding background concentrations; however, Figure 4-18 is titled Results for cis-1,2-Dichloroethene in Groundwater and displays no metal concentrations. Please edit the text to reference the correct figure.

**Response:** The text identified in the comment was intended to reference Figure 4-15, which presents arsenic concentrations. This text will be revised accordingly.

10. **Comment:** Figure 4-2, Analytical Results for Chromium in Soil Samples: The symbol indicating the location of DP12 is incorrect. The blue dot is used, but because the first sample exceeds residential PRG levels, the orange dot should be used. Please change the symbol on Figure 4-2.

**Response:** The point location of DP12 will be corrected to “orange” on Figure 4-2.

## HUMAN HEALTH RISK ASSESSMENT

### GENERAL COMMENTS

1. **Comment:** In the Executive Summary, *Summary of Groundwater Nature and Extent*, of the RI Report, it is noted that the text indicates that groundwater at Site 34 is impacted with VOCs, metals and PAHs that were detected at concentrations exceeding USEPA Region 9 tap water PRGs. However, the RI Report indicates that the sources for the groundwater contamination have either been removed or are confined to several specific areas. Furthermore, according to Section 2.5, of the RI Report, groundwater beneath the central portions of Alameda Point (including Site 34) is not currently employed for drinking water, irrigation, or industrial supply. However, Section 2.5 advances on page 2-5 that “Based on the federal criteria for TDS [total dissolved solids] and yield, groundwater within the FWBZ [first water-bearing zone] was determined to be a potential source of drinking water (EPA Class II Aquifer)”. Future exposure scenarios applicable to potential domestic and industrial uses of groundwater have been deemed incomplete in Figure H-1, *Human Health Conceptual Site Model*

(CSM) for Site 34, and have been eliminated from quantitative evaluation in this RI. With that, there is concern that risks and hazards associated with future groundwater domestic and industrial uses have been eliminated without demonstrating sufficient evidence. In the human health risk assessment (HHRA), please consider including an assessment of the exposures potentially incurred via future domestic and industrial groundwater uses given that the first underlying water bearing unit's yield is suggested to be sufficiently high and of sufficient quality or provide further justification for the elimination of the aforesaid future groundwater exposure scenarios.

**Response:** It is the Navy's position that a quantitative evaluation of risk and hazards potentially associated with domestic and industrial use of groundwater is not necessary, as groundwater beneath the central portions of Alameda Point (including Site 34) is not currently used for drinking water, irrigation, or industrial supply, nor is it reasonably expected to serve as a public drinking water supply. Section 2.5 of the draft final RI report will be revised to clarify that this conclusion is based on the following justification: (1) drinking water is supplied to Alameda Point by the East Bay Municipal Utilities District; (2) the Regional Water Quality Control Board (Water Board) provided the Navy with a letter exempting groundwater west of Saratoga Street at Alameda Point, which includes groundwater beneath Site 34 from the beneficial use of drinking water, (3) although the FWBZ qualifies as a Class II aquifer under federal guidelines, the Base Realignment and Closure (BRAC) Cleanup Team (BCT) concluded that groundwater at the site is unlikely to be used as a source of drinking water, and (4) Alameda County well construction standards require that all wells be sealed and screened below the first confining layer in a shallow aquifer system and the FWBZ is a shallow unconfined aquifer.

2. **Comment:** It appears that bulk soil concentrations have been employed to assess the vapor intrusion (VI) pathway. According to USEPA's 2002 *OSWER Draft Guidance for Evaluating Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils (Subsurface Vapor Intrusion Guidance)*, soil gas is preferred to bulk soil concentrations in the assessment of the VI pathway. A more representative assessment of exposure to indoor air via the VI pathway may be ascertained if subslab soil gas samples are collected from underneath any existing on-site structures. However, since the RI Report indicates that all existing structures were removed between 1996 and 2000, shallow soil gas samples, targeted at maximally-impacted areas, may provide a reasonable surrogate for subslab soil gas. Hence, to provide a more plausible assessment of exposure to indoor air via the VI pathway,

please consider the collection of soil gas samples reflective of maximally-impacted areas.

**Response:** This issue was discussed at the 10 January BCT meeting. It was agreed that the Navy will collect additional samples in the vicinity of DP02 to verify previous results. The additional sampling will be targeted to include soil gas if site conditions (such as high water table) do not interfere. These results will not be available for the RI report, but will be included in the FS.

3. **Comment:** The justification provided for exclusion of quantitative evaluation of dermal contact with groundwater by a future construction worker does not appear to be sufficient (i.e., construction in saturated trench conditions is generally avoided and dewatering is quickly implemented for construction activities). Considering the depth to groundwater is within 10 ft bgs and direct contact with groundwater is a plausible exposure pathway for a construction worker receptor during trenching activities, a quantitative assessment of this exposure pathway is preferred as a component of the baseline assessment, even if this potential exposure will be addressed through the implementation of institutional controls (e.g., personal protective equipment and/or standard industrial practices like pumping and installation of sheet piling). Please, at a minimum, provide a quantitative evaluation of the aforesaid exposure pathway for a construction worker receptor or please include a discussion in Section H9.0, *Uncertainty Analysis*, to account for the exclusion of this relevant exposure pathway. Such a qualitative discussion should include an assessment of the relative risks posed by the complete exposure pathways to receptor populations at issue and the degree to which the exclusion of the dermal exposure pathway is likely to impact 1) the total quantitative point estimates of risk and hazard and 2) the ultimate risk management recommendations made to USEPA.

**Response:** Dermal exposure to groundwater by the future construction worker was excluded from further evaluation per the Final RI Work Plan, IR Site 34 (SulTech 2006). This approach is consistent with other Alameda Point HHRAs recently conducted for Sites 28 and 32, both of which excluded the dermal contact with groundwater exposure pathway for the future construction worker. The premise for excluding the dermal exposure to groundwater pathway at all of these sites (Site 28, 32, and 34) was that standard industrial practices would keep contact with groundwater within the excavations to a minimum; thus, the pathway was considered negligible, as it was an insignificant source of exposure for the construction worker. Exclusion of this exposure pathway is discussed in

Section H5.3.2, Construction Worker Exposure Pathways, of the Site 34 HHRA. Thus, the report will not be revised as a result of this comment.

4. **Comment:** The 1997 USEPA Exposure Factors Handbook was used as a primary guidance for deriving exposure factors, such as produce consumption rates and time attributed to leisure activities. Please note that for the evaluation of the child scenarios, exposure data should be obtained from USEPA's Child-Specific Exposure Factors Handbook (2006) (ChEFH). Please ensure that the child exposure factors applied in the risk assessment are consistent with those in ChEFH.

**Response:** The 1997 Exposure Factors Handbook (EPA 1997, as cited in the RI report) was used as a reference for the residential child homegrown produce intake rate (0.0174 gram per day) and the residential child inhalation rate (0.42 cubic meter per hour). These produce intake and inhalation rates were accepted in the Final RI Work Plan, IR Site 34 (SulTech 2006, as cited in the RI report) and are consistent with the exposure assumptions recently used at Alameda Point Sites 28 and 32. In addition, EPA's 2006 Child-Specific Exposure Factors Handbook is not yet finalized and is in an external review stage of development. However, a quantitative evaluation will be added to Section H9.0, Uncertainty Analysis, to discuss the values presented in the proposed guidance and their potential impact on the risk assessment.

In addition, Table H4.3, EPA Risk Assessment Guidance for superfund (RAGS) Part D Table 4, Values Used for Daily Intake, CTE Soil Exposures, will be revised to show the central tendency exposure (CTE) produce intake rates of 0.03 kilogram per day (kg/day) for the adult resident and 0.00642 kg/day for the child resident; the values currently shown in Table H4.3 are based on the reasonable maximum exposure (RME) scenario. These CTE values are currently reflected in the HHRA.

In addition, an error was noted in the intake calculations for the produce ingestion pathway. It was assumed that a certain percentage of the dietary intake was homegrown (40 percent for the RME scenario and 20 percent for the CTE scenario); however, the fraction ingested is already assumed in the produce ingestion rate provided by EPA 1997. Therefore, the HHRA will be revised to remove the additional adjustment for ingestion.

5. **Comment:** There is concern that some of the risk drivers not recommended for further evaluation in the feasibility study (FS) has been eliminated without sufficient justification. For example, while chromium is driving the risk for a construction worker receptor, the HHRA indicates that since chromium is only a risk driver for a single population receptor and is based on "total chromium" (which

accounts for the toxicity of the more toxic hexavalent form) that the RI Report is not recommending it for further consideration in the FS. However, such does not confer adequate justification for eliminating a chemical when chromium risk for a construction worker receptor falls within the risk management range of 1E-04 and 1E-06 (i.e., 1.3E-05). Please reevaluate the omission of chromium and other risk drivers presented in Section 8.1.4, *Risk Driver Evaluation*, in any subsequent revisions of the RI Report.

**Response:** Additional discussion will be provided in Section 8.1.4, Risk Driver Evaluation, on the omission of risk drivers identified in the draft RI report.

In addition, chromium was incorrectly identified as a risk driver. Please see DTSC HERD specific comment 6. Section 8.1.4, Risk Driver Evaluation, will be revised to remove chromium as a risk driver.

Furthermore, an error was found in the chemical-specific parameters worksheet (VLOOKUP) within the vapor intrusion (VI) model. The Henry's law constant (HLC) for heptachlor provided in the VI model is 1.48 atmospheres cubic meter per mole (atm-m<sup>3</sup>/mol). However, according to EPA's on-line database, "On-line Tools for Site Assessment Calculation" for Estimated HLCs (<http://www.epa.gov/athens/learn2model/part-two/onsite/esthenry.htm>), the HLC for heptachlor is 0.00109 atm-m<sup>3</sup>/mol. The HHRA will be revised to correct the HLC error, which will eliminate heptachlor as a risk driver.

## SPECIFIC COMMENTS

- Comment:** Section 6.4.1.4, Polycyclic Aromatic Hydrocarbons, Pages 6-6 to 6-7: Section 6.4.1.4 discusses how the evaluation of carcinogenic PAHs has been assessed employing a screening level of 0.62 mg/kg for an average benzo(a)pyrene [B(a)P]-equivalent concentration (and is a health-protective screening level agreed upon in previous discussions between the Navy and regulatory agencies). Although a potency equivalency factor (PEF) approach is an acceptable procedure to assess the potency of PAHs, the RI Report does not seem to comprise this particular quantitative evaluation. Considering a number of PAHs have been identified in the HHRA as risk drivers, yet are not recommended for further evaluation in the FS, please provide the quantitative basis of the exclusion of further consideration of the PAHs, such as benzo(a)pyrene and dibenzo(a,h)anthracene. That is, it does not appear that the weighting scheme for PAHs and their resulting cancer potency values have been provided as part of this HHRA.

**Response:** The B(a)P equivalent approach is first presented in Section 3.3, which includes a table of EPA TEFs used in the B(a)P equivalency evaluation. The table in Section 3.3 will be revised to also include the California EPA (Cal/EPA) TEFs. A new table (Table 4-3) will be added to Section 4, Nature and Extent of Contamination, to show the B(a)P equivalents for each of the 54 PAH samples identified in Figure 4-6. The new table will also present the site-wide average B(a)P equivalent concentrations based on the EPA and Cal/EPA TEFs. The HHRA in Appendix H provides the cancer risk and noncancer hazard estimates for individual PAHs. The draft final RI report will be revised to provide additional quantitative rationale for identifying the risk drivers as necessary.

2. **Comment:** Appendix H, Section 5.5.2.2, Exposure Parameters for Incidental Ingestion of Soil, Page H-16: Soil ingestion rates applicable to an adult and a child recreator have been adjusted downward from 100 mg/day to 5.6 mg/day and 200 mg/day to 12.5 mg/day, respectively. This adjustment is based on 16 walking hours and is not a typical adjustment. As a result of adjusting the soil ingestion rates downward for an adult and a child recreator, soil dermal contact appears to be driving the total risk for this receptor population. There is concern that adjustment to the ingestion rates for an adult and child recreator may underestimate ingestion risk and, in turn, the total point estimates of risk and hazard attributable to exposures incurred under a recreational land use condition. In any revisions to this deliverable, please consider the use of unadjusted ingestion rates (i.e., using 100 mg/day for an adult and 200 mg/day for a child) or potential account for this potential underestimation of total risk and hazard in the uncertainty section of the HHRA.

**Response:** The HHRA will be revised to assume ingestion rates of 100 mg/kg for the adult recreator and 200 mg/kg for the child recreator. However, the RME exposure duration will be adjusted from 350 days per year to 75 days per year. Both of these assumptions (ingestion rate and exposure duration) are consistent with the assumptions used at the adjacent Alameda Point Site 32, where a golf course is the planned reuse. Recreational use of the site as a golf course for 75 days a year is equivalent to approximately 6 to 7 rounds of golf per month.

3. **Comment:** Appendix H, Human Health Risk Assessment, Tables H-2.1 through H-2.3: The last couple columns of Tables H-2.1 through H-2.3 appear to have been truncated. Please revise these tables so that they contain the appropriate screening information.

**Response:** Tables H-2.1 through H-2.3 of Appendix H, Human Health Risk Assessment, will be revised to include all columns, specifically the last three columns that were truncated during document production.

## ECOLOGICAL RISK ASSESSMENT

### GENERAL COMMENTS

- 1. Comment:** 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, 1,2,4-trimethylbenzene, 1,2-dichlorobenzene, 1,4-dichlorobenzene, and naphthalene were detected at the facility fence lines so the risk characterization should discuss any spatial or temporal lines of evidence describing the nature and extent of these potentially mobile chemicals, even though the Screening Level Ecological Risk Assessment (SLERA) provides strong evidence that they are unlikely to be a risk issue to ecological receptors. The only potential future pathway of concern described in the document relates to site materials reaching the off-site bay area. These potentially mobile chemicals could represent a pending risk concern. The RI Report needs to provide more information on the groundwater pathway and the VOC chemical nature and extent (as related to temporal and spatial conditions) to bring this pathway to closure.

**Response:** As requested, additional text to describe the horizontal migration of groundwater will be added to Section 7.5 of the draft final RI report (conclusions of the SLERA) and Section I2.7.2 of the SLERA to clarify the groundwater exposure pathway. Text will be added to state that several factors suggest that chemicals will not discharge to the Oakland Inner Harbor at concentrations of concern. These factors include the low-flow velocities of groundwater, the low concentrations of chemicals in groundwater, the high potential for retardation along the groundwater flow path, and tidal action and surface water flow that create a mixing zone at the interface with the Oakland Inner Harbor.

Text will also be added to Section I6.1.2 of the SLERA (risk refinement, aquatic wildlife) stating that residual VOCs were also detected in shallow soils near the facility fence lines in one or two samples and are unlikely to migrate from soil to groundwater because VOCs have a high tendency to volatilize if exposed to air. Thus, VOCs present in soils near the ground surface are expected to volatilize to the atmosphere. This text is already provided in Section 5.2.2 (fate and transport of VOCs).

- 2. Comment:** The risk summaries for Lead and Aroclor-1248 in soil need to be better substantiated in the Executive Summary (page ES-9) and

several portions of the RI text (Section 7.5, page 7-9, subsection I6.2.2). The text states that 'barren habitat is unattractive to wildlife because of lack of shelter' and that soil is unlikely to cause contamination to the wetland. These statements are not supported and need further detail. Please cite biological survey information to support the statement about lack of habitat within barren areas, and describe why the transport of soils by storm water flow is not a concern for the wetland.

**Response:** As requested, the referenced text will be revised to state that Site 34 is considered an Intensively Developed area based on the Alameda Point Golf Course Environmental Impact Report (Alameda Reuse and Redevelopment Authority 2006), descriptions of the habitat supplemented by a site visit, and information from the California Wildlife Habitat Relationships System (California Department of Fish and Game [CDFG] 2005). Intensively Developed areas have little vegetation and typical urban wildlife, such as California ground squirrels, scrub jays, and American robins, may be observed in these areas, but to a lesser extent than in the landscaped/developed areas, because less foraging habitat is available in these areas. Although chemicals may contribute to ecological risk at IR Site 34, based on the SLERA, a baseline ERA is not recommended because the SLERA likely overestimated risk, there is a lack of current suitable habitat, and future land use would not generate significant ideal habitat for wildlife.

Regarding transport of soils by storm water flow to the two potential wetland areas, the following text will be added to Section 7.5 of the draft final RI report and Appendix I stating that it is unlikely that surface water runoff from IR Site 34 would affect the potential seasonal wetland located within the southwestern corner of the site because the site topography would prevent it from reaching this potential wetland. Although surface water generally flows towards the wetland located north of the site, precipitation typically evaporates into the atmosphere, infiltrates to groundwater, or runs off into the storm drain system. In addition, the wetland areas provide minimal habitat to support plant and invertebrate populations and is tidally inundated at such a frequency as to not present suitable habitat for small mammals.

3. **Comment:** The risk summaries for the groundwater Chemicals of Potential Ecological Concern (COPECs) need further supporting evidence. For instance, the text in the Executive Summary (ES-9) indicates that 'following further evaluation of the COPECs, no groundwater risk drivers were identified'. It is not clear in the RI what the 'further evaluation' steps for the groundwater COPECs entailed. In addition, the information in Section 7 (page 7-7) indicates that 'sampling

location and date, sample collection method' were incorporated in the groundwater COPEC screening process. It is not clear how these types of information were applied to the screening process. It appears that the soil removal efforts were used as part of the data evaluation process. Please summarize the steps by which groundwater COPECs were refined.

**Response:** No specific steps were used to refine the COPECs for groundwater, as a qualitative evaluation was conducted; Appendix I explains specifically how the supplemental literature search, and the sampling locations, dates, and methods, were used to evaluate each COPEC for groundwater. For example, cobalt was not retained as a COPEC because potentially significant concentrations of cobalt in groundwater were detected only within the SWBZ. Furthermore, these concentrations were determined to be insignificant given a dilution and attenuation factor of 10, which represents a reasonable minimum value between the point of measurement and the ultimate discharge into Oakland Inner Harbor. Mercury was not retained because it was detected in one direct-push sample but not detected in monitoring well samples.

Text in the executive summary and Section 7.0 will be revised to clarify that qualitative evaluations were conducted chemical by chemical to further evaluate each COPEC for groundwater. The evaluations included a comparison of each COPEC's 95<sup>th</sup> percentile of the upper confidence limit (95UCL) and maximum concentration to the threshold criteria and to additional criteria from literature searches. The evaluations further consider sampling locations (for example, FWBZ versus SWBZ, at locations with other elevated metals), sampling dates, sampling methods (for example, monitoring well versus direct push), and the groundwater data set (for example, exposure point concentration [EPC] driven by outlier). Additional details of this qualitative evaluation are discussed in Section I6.1.2 of Appendix I, and a summary of these evaluations is presented in Table I-24.

4. **Comment:** The SLERA uses a 95% Upper Confidence Level estimate (95UCL) for the Exposure Point Concentration (EPC). It is not clear if the maximum observed concentration is used in lieu of the 95UCL when the latter exceeds the former (e.g. page 3-14, page 7-1, Uncertainty analysis in Appendix I). In addition, it appears that the SLERA does not follow standard Navy SLERA procedures by applying the use of the 95UCL. Please revise the text to better describe when the maximum, or the 95 UCL, was selected as the EPC and why standard guidance procedures were not followed. In addition, it is recommended to use both the arithmetic mean and the 95UCL as EPCs for lead and Aroclor 1248 in the refined risk characterization.

**Please review the risk conclusions and discuss any additional supporting evidence that may result from using these alternative EPCs.**

**Response:** The text will be revised to be consistent. In the initial risk estimation for soil (Step 2), EPCs were based on the maximum detection of each COPEC and were assumed to represent site-wide concentrations of COPECs. However, the lower of the 95UCL and the maximum detected concentration was used as the EPC for each COPEC in the refined risk estimation for soil (Step 3a). The EPC in the qualitative evaluation for groundwater was the lower of the maximum concentration and the 95UCL. The 95UCL concentration was calculated only for the chemicals that were associated with more than three detections. This approach is consistent with the RI work plan for Site 34 (Tetra Tech 2006, as cited in the RI report), which states that the EPC will be based on the maximum detected concentration for each medium (soil and groundwater) and will be refined if the ERA is to proceed to a baseline ERA.

As suggested, the SLERA will also be revised to include the arithmetic mean for lead in the refined risk characterization. Consistent with the response to EPA: ERA general comment 6, a refined HQ will not be presented for Aroclor 1248 in the draft final SLERA because it has a frequency of detection of less than 5 percent. In addition, the HQs for aluminum will be recalculated using the correct maximum soil concentration of 37,000 mg/kg rather than the incorrect concentration of 33,000 mg/kg presented in the draft RI report.

**5. Comment:** The wildlife exposure calculations were based on a “mixed” diet (plant + inverts) for the deer mouse, song sparrow, and American robin (see p. I-13, and Tables I-16, I-18, and I-19). This approach contradicts the Navy’s ERA guidance which states that the diet will be considered to consist of whichever type of food is most contaminated. Please revise the document to include food chain modeling that incorporates the standard guidance approaches. These new risk calculations can then be compared to the mixed diet food chain results as a comparative risk analysis tool.

**Response:** The approach used in the SLERA is consistent with the RI work plan for Site 34 (Tetra Tech 2006, as cited in the RI report) and Navy guidance. Navy guidance states, “the diet will be considered to consist of whichever type of food is most contaminated, ... To derive an exposure estimate, the preliminary CSM should be used to identify all potential complete pathways to the receptor. Once these pathways are identified, individual dose models ... should be developed for each pathway. A dose is

calculated for each COPEC exposure pathway, and a total dose is estimated by summing the doses for all appropriate pathways.”

6. **Comment:** The use of ‘frequency of detection’ as a COPEC screening tool is inconsistently used within this SLERA. EPA guidance allows for a further refinement of COPECs in Step 3.A based on frequency of detection, assuming that the data sets used in the screening evaluation meet the criteria for completeness, comparability, representativeness, precision, and accuracy. If so, then COPECs detected in less than 5% of the samples are typically eliminated from further consideration. That would remove most of the VOCs, SVOCs (except PAHs), and pesticides (see Table I-1). This topic is alluded to in the last paragraph of section I2.3 on p. I-6. However, this variable (i.e., <5% detection) was included in the ground water data summary table (see I-23), but doesn’t appear to have been used in decision-making. Please revise the document to consistently present the use of frequency of detection as a COPEC screening tool for both soil and groundwater.

**Response:** Frequency of detection was not used as a COPEC screening tool in the draft SLERA. As stated in Section I2.3, “The initial list of soil COPECs includes all chemicals detected above the detection limit at least once.” The text continued, “Retaining each chemical detected at least once as a COPEC likely leads to an overestimation of risk. Although frequency of detection was included in Table I-23, summary of the groundwater qualitative evaluation, no chemicals were excluded from further evaluation because of frequency of detection.”

As suggested, COPECs with HQs greater than 1 will be further evaluated in Step 3a using a frequency of detection criterion of less than 5 percent. In the draft final RI report, refined HQs will only be prepared for those soil COPECs with a detection frequency of 5 percent or greater and a hazard quotient (HQ) greater than 1.

## SPECIFIC COMMENTS

1. **Comment:** Executive Summary, Screening-Level Ecological Risk Assessment and Step 3A Risk Refinement, page ES-8 bottom paragraph: ‘Direct soil ingestion’ should be added to the suite of exposure pathways listed as being evaluated in the second sentence of this paragraph. Please make this change.

**Response:** The text will be revised to state that direct soil ingestion, ingestion via the food chain, and horizontal migration of groundwater to surface water were

identified as potentially complete exposure pathways for ecological receptors.

2. **Comment:** Section 7.1, Problem Formulation, Page 7-2, third paragraph: The statement that the physical and chemical characteristics of the COPECs provide evidence that these chemicals will not migrate is unsupported. It is recommended to support this claim based on site-related data. Please describe the spatial trends that may exist between soil and groundwater COPEC concentrations and any temporal change observed between the two rounds of groundwater sampling.

**Response:** As requested, additional information on the spatial trends of chemicals of interest between soil and groundwater will be added to the fate and transport section of the draft final RI report (Section 5.0). Please note that the referenced text in Section 7.1 does not state that COPECs will not migrate. Rather, as quoted below, the text states that COPECs will bind preferentially to soil and lists potential pathways for movement of chemicals. "As part of the fate and transport evaluation, the physical and chemical properties of the COPECs were evaluated. Based on these properties, all of the COPECs, except for VOCs, could bind preferentially to the soil and are relatively insoluble in water. The major movement of COPECs would be through erosion processes (such as wind and surface water runoff); infiltration to subsurface soil and groundwater; and groundwater discharge to surface water."

3. **Comment:** Section 7.1, Problem Formulation, Page 7-2, fourth paragraph: It appears that frequency of detection was used as a line of evidence for the risk characterization, but specific details are not provided. Please describe any 'cut-off' thresholds or rationale behind this line of evidence.

**Response:** The reference text in Section 7.1 refers only to one of several reasons that risk from VOCs in soil was not quantitatively evaluated. The text will be revised to state that no soil pathways for VOCs were quantitatively evaluated in this SLERA, for several reasons, as follows. First, toxicity reference values (TRV) are not typically available to evaluate the risk of dietary ingestion, so assessing risk related to VOCs is tenuous at best. Furthermore, since VOCs volatilize rapidly and do not bioaccumulate, risk from VOCs in soil is generally insignificant. Finally, although inhalation modeling may be used to evaluate inhalation risk; VOCs were not considered to pose a significant threat since the detection frequency of these chemicals is low.

However, as suggested in ERA general comment 6 above, COPECs with HQs greater than 1 will be further evaluated in Step 3a using a frequency

of detection criterion of less than 5 percent. In the draft final RI report, refined HQs will be prepared only for the soil COPECs with a detection frequency of 5 percent or greater and a HQ greater than 1.

4. **Comment:** Subsection 7.3.1, SLERA and Step 3a Risk Refinement Results for Soil, Page 7-4: Please separate out the chemicals that yielded hazard quotients (HQs) greater than 1 vs those where no toxicity reference values (TRVs) were available (second sentence).

**Response:** As requested, the referenced text will be revised to differentiate between the chemicals with HQs greater than 1 and those with no TRV available.

5. **Comment:** Table 7-1, Chemicals of Potential Ecological Concern in Soil at IR Site 34 and Table 7-2, Chemicals of Potential Ecological Concern in Groundwater at IR Site 34: The frequency of detection should be included in these tables. Please make this change.

**Response:** As requested, the frequency of detection will be added to Tables 7-1 and 7-2 in the draft final RI report.

6. **Comment:** Table 7-3, Bird and Mammal Hazard Quotients (Step 2) and Table 7-4, Bird and Mammal Hazard Quotients (Step 3A): These tables highlight significant HQ results that are not mentioned in Section 7.0 (e.g., cadmium). Please summarize the risk characterizations for these chemicals with highlighted HQs in order to bring the risk conclusions to closure.

**Response:** Section 7.0 is designed only as a summary of the SLERA results; therefore, the Navy believes it reflects an appropriate level of detail, which includes a summary of the Step 2 and Step 3a results in the text, a presentation of HQs in Tables 7-3 and 7-4, and references to a more detailed review of the HQs in Appendix I.

7. **Comment:** Appendix I, Section I2.3, Selection of Chemicals of Potential Ecological Concern, Page I-6, first paragraph. The text does not provide a transparent description of COPEC elimination. There appears to be a disconnect in the logic used in this paragraph. Removing common elements of calcium, potassium, magnesium and sodium as COPECs dropped the number of COPECs from 97 to 82. However, additional COPECs appear to have been eliminated, or retained since the sum total is shown to be 90. Please revise this information to clearly describe the COPEC list and the steps taken to eliminate certain COPECs from the evaluation.

**Response:** Chemicals in soil were eliminated as COPECs if they were not detected above the quantitation limit or if they were identified as essential nutrients (such as calcium, magnesium, potassium, and sodium). The reference text in Section I2.3 will be revised to state that COPECs for soil were identified from analytical data collected from 0 to 4 feet bgs. Any chemical that was not detected above the quantitation limit was eliminated as a COPEC. Of the remaining chemicals, calcium, magnesium, potassium, and sodium also were eliminated as COPECs because they are essential nutrients, which are toxic only at levels higher than were found at the site. As a result, 20 metals, 16 VOCs, 12 SVOCs, 17 PAHs, 20 pesticides, 4 PCBs, and 4 TPHs were retained for further evaluation. Table I-2 provides descriptive statistics for these initial COPECs, including the 95UCL.

Groundwater COPECs were identified from analytical data collected from wells located at IR Site 34. Any chemical that was not detected above the quantitation limit was eliminated as a COPEC, retaining all chemicals detected above the detection limit at least once. As a result, 24 metals, 29 VOCs, 3 SVOCs, 20 PAHs, 15 pesticides, and 3 TPHs were retained for further evaluation. Descriptive statistics are provided for these initial COPECs, and the 95UCL was calculated (see Table I-3).

8. **Comment:** Appendix I, Section I2.3, Selection of Chemicals of Potential Ecological Concern, Page I-6, first paragraph: This paragraph should mention which soil benchmark sources were used to select soil COPECs. It is unclear whether the standard EcoSSL benchmarks were relied upon as part of this process. Please revise this text to clarify the soil benchmarks used for the SLERA and be sure to accommodate the use of the standard EcoSSL values.

**Response:** Soil benchmark sources were not used in the selection process for COPECs in soil. See response to EPA ERA specific comment 7 above. Only chemicals that were not detected above the quantitation limit and essential nutrients were eliminated as COPECs for soil.

9. **Comments:** Appendix I, Section I2.3, Selection of Chemicals of Potential Ecological Concern, Page I-6, second paragraph: It appears that acute benchmarks were used as part of the SLERA as screening benchmarks for selecting COPECs. Screening benchmarks are supposed to be conservative as per both EPA and Navy guidance. It is therefore incorrect to include the acute effects surface water benchmarks as part of the screening process. Please remove these values from the screening process.

**Response:** The benchmarks referenced in the comment were not used for selecting COPECs. Therefore, the text in Section I2.3 will be revised accordingly. See response to EPA ERA specific comment 7 above.

The qualitative evaluation of the effects of COPECs on aquatic wildlife included an initial groundwater screening using aquatic comparison values (threshold criteria or benchmarks, as referred to in the comment) and further evaluation of those chemicals retained from this initial screening. Text on this qualitative evaluation will be included only in Section I6.1.2 of the draft final SLERA.

10. **Comment:** Appendix I: This Appendix includes a summary of the surface water screening criteria (Table I-9), however there is no equivalent table for soils screening criteria. In addition, it is unclear what the order of preference was used to select the soil and groundwater screening criteria. Please revise the RI Report to provide summary lists of the screening criteria for each media, and the rationale behind the selection of preferred criteria.

**Response:** As explained in responses to EPA ERA specific comments 7 through 9, above, COPECs were not selected using screening criteria. The values in Table I-9, Groundwater Threshold Criteria, are aquatic comparison values used in the qualitative evaluation of the effects of COPECs on aquatic wildlife. As a quantitative evaluation of soil was conducted, toxicity reference values for soil were used and are provided in Tables I-4 through I-8.

## RESPONSES TO COMMENTS FROM DTSC GSU

### GENERAL COMMENTS AND RECOMMENDATIONS

**A: Comment:** GSU questions the source and extent of the volatile organic compounds (VOCs) detected in the shallow soil sample from boring DP02. While the levels of VOCs in this sample are below the residential screening criteria (with the exception of 1,4-dichlorobenzene at a concentration of 6.8 milligrams per kilogram [mg/kg]), several of these compounds were found to be human health risk drivers under the residential scenario. Sufficient sampling has not been performed to determine the source and extent of VOCs in soil and groundwater in this area. It is possible that their presence is related to the former fuel lines (CAA A) and/or storm sewer lines that traverse this area and additional investigation of these features may be warranted. In addition, chromium was found at an elevated

concentration (550 J mg/kg) in shallow soil at this location, and the extent has not been delineated.

**Recommendation**

**GSU recommends that the Navy consider performing additional sampling for VOCs and metals in the vicinity of boring DP02 to determine the source, distribution, and significance of contamination in soil and groundwater at this location.**

**Response:** As discussed at the 10 January 2008 BCT meeting, the Navy will collect additional samples in the vicinity of DP02 to verify the levels of VOCs. Chromium at 550 mg/kg is not a chemical of interest since it has been demonstrated that the chromium is present as trivalent chromium rather than hexavalent chromium (see also response to DTSC HERD specific comment 6).

**B. Comment:** **GSU disagrees that the lateral extent of arsenic (at location DP12) and lead (at locations DP12, DP16, and DP17) have been adequately delineated. Further investigation of the extent of these metals in soil, and possible impacts to groundwater, is needed to support the FS.**

**Recommendation**

**GSU recommends that the Navy collect additional metals data to delineate the extent of arsenic and lead contamination north and northwest of Building 331.**

**Response:** It is the Navy's position that data are adequate to characterize the lateral and vertical extent of chemicals in soil and groundwater for the purposes of the RI report and conducting risk assessments. Additional samples within the vicinity of DP16 near the northeastern corner of Building 331 (see response to DTSC specific comment 11 and DTSC GSU comment C) and within the vicinity of DP02 (see response to EPA HHRA general comment 2) will be collected in support of the FS; however, these results will not be available for the RI report. If additional characterization of other areas is needed, the Navy believes the information can be collected at the remedial design stage.

**C. Comment:** **A black, fine sand (SP) layer with a strong diesel odor was encountered at the groundwater interface in boring DP16 located near the northeast corner of Building 331. Soil samples were not collected from this layer for chemical analysis, but samples collected above this layer were found to contain elevated lead and several polynuclear aromatic hydrocarbons (PAHs) including benzo(a)pyrene**

and naphthalene. In addition, several fuel-related VOCs were detected in the groundwater sample collected at this location, as well as SVOCs, PAHs, and pesticides. Sufficient sampling has not been performed to determine the source or extent of contamination that may be associated with the residual fuel layer in this area.

**Recommendation**

GSU recommends that the Navy collect additional data to delineate the source and extent of contamination that may be related to residual fuel contamination in the vicinity of Building 331.

**Response:** The Navy will collect additional samples near the northeastern corner of Building 331 to further characterize the fine sand (SP) layer with a strong diesel odor that was encountered at the groundwater interface in boring DP16.

**D. Comment:** It is not clear what criteria were used to determine the locations of the five monitoring wells installed during the second mobilization phase of the RI. The RI Work Plan stated that groundwater data from the first mobilization would be compared to Environmental Protection Agency (EPA) vapor intrusion criteria (2002) and aquatic criteria (California Toxics Rule [CTR], National Ambient Water Quality Criteria [NAWQC], etc.) to determine the need for and locations of new monitoring wells. However, the Draft RI Report has modified the comparison criteria as indicated in Section 3.3 – *Methods and Approach for Nature and Extent Evaluation* (see Specific Comment 7). It appears that aquatic criteria have not been used to screen groundwater in the nature and extent evaluations presented in the Draft RI Report.

**Recommendation**

Please clarify the comparison criteria that were used to screen groundwater data to determine the locations of the five monitoring wells that were installed during the second mobilization. GSU recommends that further justification be provided in the Draft Final RI Report for the use of the modified screening values and that appropriate aquatic criteria are also used to screen groundwater data.

**Response:** The text will be revised to clarify the criteria used to select the locations of the five monitoring wells. It should be noted that appropriate aquatic criteria were used to evaluate groundwater data in the SLERA. It should not be necessary to duplicate that effort in the nature and extent section.

## SPECIFIC COMMENTS AND RECOMMENDATIONS

1. **Comment:** Section 1.3.3.1 – Historical Ownership and Operations. The storm sewer line description in the second full paragraph on page 1-6 and shown on Figure 1-3 is not consistent with the depiction shown on other figures in the Draft RI Report (see Figure 1-5 and figures in Section 4). Please confirm the location of the storm sewer lines at IR Site 34 and provide an accurate description and depiction of these features throughout the Draft Final RI Report.

**Response:** Figures and feature descriptions will be edited for consistency throughout the RI report.

2. **Comment:** Section 1.3.4.1 – 1994-1998 EBS Investigation, Phase 2A EBS Investigation. The first paragraph of this section states that samples were analyzed for TPH and metals, only, but the results indicated that Aroclor-1260 was detected in one sample. Please resolve this apparent discrepancy.

**Response:** The text in Section 1.3.4.1, Phase 2A EBS Investigation, will be revised to state that samples were analyzed for metals, TPH as extractables, TPH as purgeables, and/or pesticides/PCBs.

In addition, the text will be revised to reflect that surface soil samples were collected from four locations (004-001-001, 004-001-002, 004-002-003, and 004-Z03-004).

3. **Comment:** Section 1.3.4.2 – TPH CAA Investigations. Please indicate the locations of the CAAs discussed in this section on a map.

**Response:** The locations of CAA 14 and CAA A will be added to Figure 1-3.

4. **Comment:** Section 2.3.2 – IR Site 34 Geology. Please indicate on the cross-sections (Figures 2-2 and 2-3) whether water levels were estimated or measured.

**Response:** The figures will be modified to show measured water levels. Estimated water levels will be identified as such.

5. **Comment:** Section 2.4.2 – Alameda Point and IR Site 34 Hydrogeology.

a. Water level data from monitoring well MW-24 should not be used to contour the potentiometric surface of the first water-bearing zone (FWBZ) because this well

is screened in the second water-bearing zone (SWBZ) from approximately 45 to 60 feet below ground surface (bgs). Please do not use water level data from this well to contour the potentiometric surface of the FWBZ.

- b. Please include the monitoring well construction details for all monitoring wells at IR Site 34 in a table in the Draft Final RI Report.
- c. Please provide all available water level depth and elevation data in a table in the Draft Final RI Report.
- d. Please indicate the date of groundwater level measurements presented on Figure 2-5.
- e. It is recommended that the dashed lines extending across the eastern half of IR Site 34 be removed from Figure 2-5 because there is no groundwater elevation data in this area upon which to base this interpretation. Any dashed lines that remain on the figure should be defined in the legend.
- f. Please include estimates of the average linear groundwater flow velocities at IR Site 34 using the available site-specific data for hydraulic gradient and hydraulic conductivity. Professional judgment can be used to estimate the effective porosity. This information can be used to support conclusions about the rate of groundwater movement for the conceptual site model (CSM) presented in Section 5.3.
- g. Please update Table 2-1 with site-specific information obtained during the RI.

- Response:**
- a. Comment noted, water levels from well MW-24 will not be used to contour the potentiometric surface of the first water-bearing zone.
  - b. Well construction details will be included in a table as requested.
  - c. Water level and monitoring well elevation data will be included in a table as requested.
  - d. The date of groundwater level measurements will be included.
  - e. The dashed lines noted in the comment will be removed from the figure. If any dashed lines remain in the figure, the legend will be revised to define their meaning.
  - f. Average groundwater velocities will be included in the draft final RI Report.

g. Table 2-1 will be revised to include site-specific information obtained during the RI.

6. **Comment:** Section 3.0 – Investigation Approach and Scope. The Draft Final RI Report should include a subsection that discusses implementation of the RI field work and any deviations from the RI Work Plan. For example,

- The number of step-out samples that were required to be analyzed based on the step-out criteria specified in the RI Work Plan should be indicated.
- Any proposed locations that were unable to be sampled should be identified.
- Any sample locations that were moved from the locations specified in the RI Work Plan should be discussed.

Actual locations and depths of borings and wells should be compared to proposed locations and depths if significant deviations occurred, along with an explanation as to why the deviation was necessary. For example, the locations of DP06, DP12, and DP16 were moved from the north side of the fence line as indicated in the RI Work Plan (Figure 5-2) to the south side of the fence line as indicated in the Draft RI Report (Figure 4-1). According to the responses to comments on the Draft RI Work Plan, DP16 was specifically moved to the location north of the fence line to address a concern by EPA regarding potential surface runoff and transport to the Oakland Inner Harbor from Building 331.

Please discuss field implementation and RI Work Plan deviations in the Draft Final RI Report.

**Response:** A subsection will be included in Section 1.3.4.4 of the draft final RI report to address the reviewer's concerns. That subsection will discuss field implementation of the RI work plan and any deviations from the work plan.

7. **Comment:** Section 3.3 – Methods and Approach for Nature and Extent Evaluation. The RI Work Plan specified that groundwater data would be compared to screening levels from the EPA guidance on vapor intrusion (2002) and aquatic screening values (CTR, NAWQC, etc.). In the Draft RI Report, however, the screening criteria were modified to use EPA tap water Preliminary Remediation Goals (PRGs), Water Board groundwater environmental screening levels for vapor intrusion concerns (ESLs), and Alameda Point background values for metals in groundwater. It should be noted that Alameda Point background groundwater values have never been approved by

the regulatory agencies. Secondly, it is unclear why aquatic criteria were not used as comparison criteria for the nature and extent discussions since IR Site 34 is adjacent to Oakland Inner Harbor.

GSU recommends that further justification be provided in the Draft Final RI Report for the use of the modified screening values and that appropriate aquatic criteria also be used to screen groundwater data.

**Response:** The vapor intrusion and aquatic screening criteria identified within the nature and extent approach section of the RI work plan were intended to guide collection of data in an iterative fashion at Site 34. Vapor intrusion and aquatic criteria were not used as comparison criteria for the nature and extent discussions in the RI report, as these pathways were evaluated as a part of the human health and ecological risk assessments. Risk from the vapor intrusion pathway was modeled in the HHRA, and the SLERA evaluated risk to aquatic life from groundwater using the aquatic screening values.

At this time, the Navy cannot provide a response to HERD's concerns regarding the groundwater data set, as the HERD memorandum of 12 June 2006 addresses soil and not the background groundwater data set. The Navy is preparing a separate response to the HERD comments on the background soil data set. In general, the Navy does not agree with the HERD analysis and does not believe the methods used are adequate to warrant removal of data from the data set.

8. **Comment:** Section 4.1.1 – Metals in Soil. Please include a figure showing the distribution of cadmium in soil at IR Site 34.

**Response:** A figure will be prepared to show the distribution of cadmium in soil.

9. **Comment:** Section 4.1.3 – Polycyclic Aromatic Hydrocarbons in Soil. This section states that the black clayey sand layer with a strong diesel odor encountered in boring DP16 (approximately 2.75 to 3.75 feet bgs) was not noted in other borings and does not appear to represent site-wide conditions or a large mass of contaminated media. However, it should be noted that the nearest borings drilled to this depth are 80 to 100 feet away and cross-gradient from the location of boring DP16. There does not appear to be sufficient information to determine the extent or mass of this layer, or contamination associated with this layer.

Please remove statements regarding the mass of this layer from the Draft Final RI Report. Please also discuss the fate and transport of

**residual contamination that may be associated with this layer in Section 5 of the Draft Final RI Report.**

**Response:** The Navy agrees that additional characterization of the fine sand (SP) layer with a strong diesel odor near the northeast corner of Building is necessary (see response to DTSC GSU specific comment 11); however, it does not view this issue as site-wide. Sufficient samples have been collected across the site to conclude that this location represents an anomalous situation from a site-wide perspective. In addition, the extent of the contamination is defined by samples below the gross contamination and by samples collected to the south and west. The statements about mass are related to the presence of PAHs across the site and are pertinent in that context.

**10. Comment:** **Section 4.1.6 – Polychlorinated Biphenyls in Soil.** GSU requests that the analytical results for PCBs in soil be discussed in relation to the locations of former transformers at IR Site 34. The locations of former transformers should be identified, and the Draft Final RI Report should describe the sufficiency of the investigation to characterize potential releases from these features. GSU cannot concur with the adequacy of the investigation for PCBs without this information.

**Response:** The draft final RI report will be revised to include former transformer locations on figures that detail PCB results at the site. Additional text will be added to the draft final RI report describing PCB concentrations in soil samples collected within the vicinity of the buildings formerly containing the transformers. However, there was no evidence of a release to the surface soils near the transformers during base operations or during the EBS, and many of the transformers were located on concrete slabs that would prevent any releases to subsurface soils. See response to EPA specific comment 2. PCBs are likely related to the use of oils at the site and the former TSTA.

**11. Comment:** **Section 4.1.8 – Summary of Contamination in Soil.** This section identifies areas where elevated chemical concentrations were found “in a cluster of three or more adjacent sample points.” However, the criterion used to define a cluster of adjacent points is not clear. Some isolated locations were found to have elevated concentrations of one or more chemicals, but nearby samples were not collected to form a “cluster.” For example, on the north and northwest side of Building 331, lead and arsenic were found above industrial PRGs, and the extent of these metals was not delineated. It appears that metals in these samples were not determined to form a “cluster” because nearby samples were not collected. In addition, Aroclor-1260 and

PAHs were found above industrial screening levels north of Building 331, and the extent of these chemicals was not delineated. This area was also found to contain a layer of black sand with a strong diesel odor at approximately 2.5 to 3.5 feet bgs. The source of this residual fuel layer and the extent of contamination that may be associated with it have not been evaluated.

Based on these factors, GSU recommends that the area north and northwest of Building 331 be considered an area of concern for soil and possible groundwater impacts. Additional investigation is recommended to determine the extent of contamination and to support the FS.

**Response:** Section 4.1.8 will be revised as described in the response to EPA specific comment 16.

Additional soil and groundwater sampling will also be proposed for the area northeast of Building 331. However, based on results for samples collected in the area, there is no evidence of impacts to groundwater.

12. **Comment:** Section 4.2.2 – Volatile Organic Compounds in Groundwater, TCE and cis-1,2-DCE. The method used to contour variable concentrations within the trichloroethylene and cis-1,2-dichloroethylene (cis-1,2-DCE) “plumes” shown on Figures 4-17 and 4-18, respectively, is unconventional. In addition, contour intervals should not overlap as shown on the eastern side of the cis-1,2-DCE plume on Figure 4-18. GSU suggests that the Navy consider re-contouring the data using contour intervals of 0.1 micrograms per liter ( $\mu\text{g/L}$ ), 0.5  $\mu\text{g/L}$ , and 1  $\mu\text{g/L}$ .

**Response:** The plumes on Figures 4-17 and 4-18 will be redrawn. The contour intervals will be selected to more closely reflect the data. Please note that the detection limit for VOCs in groundwater is 0.5 micrograms per liter ( $\mu\text{g/L}$ ); therefore, the outermost contour on the plume map should be 0.5  $\mu\text{g/L}$ . Contours for lower concentrations cannot be supported by the data because the concentrations reported as “estimated” are below the detection limit and by definition are uncertain.

13. **Comment:** Section 4.2 – Nature and Extent of Groundwater Contamination. Due to the proximity of IR Site 34 to Oakland Inner Harbor, GSU requests that appropriate aquatic criteria be used to screen groundwater data for the nature and extent evaluations in addition to EPA tap water PRGs and Water Board ESLs. Furthermore, the subsequent subsections of Section 4.2 focus on comparisons to EPA tap water

PRGs and do not discuss vapor intrusion criteria. Please include a discussion of the analytical results for groundwater relative to aquatic criteria and screening criteria for vapor intrusion concerns.

**Response:** Analytical results for groundwater are evaluated against aquatic criteria and screening criteria for vapor intrusion in the ecological and human health risk assessments (Sections 6.0 and 7.0). A reference to these evaluations will be added to Section 4.2.

14. **Comment:** Section 5.1.3 – Infiltrating Precipitation or Fluctuating Groundwater Table. This section states that the potential for chemicals to leach from soil to groundwater depends on the concentration and solubility of the chemicals present in the soil, precipitation infiltration rate and volume, and frequency and duration of tidal inundation and seasonal variations. The text goes on to discuss the site specific seasonal and tidal conditions at IR Site 34. However, the text does not elaborate on the role of solubility, concentration, and precipitation infiltration on leaching potential. Please elaborate on the role of solubility and concentration as well as infiltration in this section in the Draft Final RI Report.

**Response:** The text will be revised to clarify the roles of infiltration and the fluctuating groundwater table. The intent is not to address all factors that affect groundwater concentrations, but instead to focus on migration pathways.

15. **Comment:** Section 5.1.4 – Groundwater Migration. This section states that based on the single deep boring (MW-24) drilled at the site, an 18-foot thick clay layer separates the shallow and deep aquifers. However, the lithologic log for boring MW-24 indicates the presence of silty clay and clay extending from 22 feet bgs to 51 feet bgs, or approximately 29 vertical feet. Please clarify the interpretation of the clay layer thickness.

Also, please include information for DP17 and DP18 which were deep borings drilled to 44 feet bgs during the RI field work. A fine-grained lithology that would serve as an aquitard was not encountered in boring DP17 located along the north-central property fence line adjacent to the storm sewer. A clay aquitard between the FWBZ and deeper sand units was encountered in boring DP18 located adjacent to former GAP 78. Please revise the discussion in this section to include lithologic data from borings DP17 and DP18.

**Response:** Text will be revised to clarify the lithologic composition and the location or absence of the aquitard between the first and second water-bearing zones.

16. **Comment:** Section 5.1.5 – Subsurface Conduits. It is stated that borings DP12 and DP13 were drilled to evaluate the potential for the storm sewer line to act as a preferential flow pathway but according to Figure 1-5, DP13 was drilled approximately 30 feet west of the storm sewer line and approximately 30 feet north of the nearest catch basin. It is not clear how this location would serve to provide information on the possibility that preferential migration is occurring through the storm sewer lines. Please clarify and/or revise this discussion.

**Response:** The intent was to evaluate whether the storm bedding material was acting as a preferential flow path. Text will be revised to clarify that locations DP12 and DP17 are located 10 and 5 feet, respectively, from the storm drain line. See response to EPA Specific Comment 22.

17. **Comment:** Section 8.2 – Recommendations.

- a. GSU requests that the limits of the areas recommended for further consideration in an FS be indicated on a figure in the Draft Final RI Report.
- b. GSU requests that the Navy include recommendations for additional investigation of the VOCs and chromium found at boring DP02, and the arsenic and lead in soil north and northwest of Building 331 (See General Comments A and B).
- c. Section 4.1.7 of the Draft RI Report indicates that TPH-diesel and TPH-motor oil contamination at DP06, DP16 and MW-24 has not been delineated. Soil data from MW-24 indicate that TPH-diesel concentrations increase with depth, and groundwater samples were not collected from the FWBZ at this location. Soil data from DP06 indicate that TPH-diesel and TPH-motor oil concentrations increase with depth. DP16 contained a black sand layer with a strong diesel odor at the groundwater interface (see General Comment C). GSU requests that the Navy include recommendations for further investigation of fuel-related contamination in soil and groundwater at these locations.

- Response:**
- a. A figure indicating the limits of the areas recommended for further consideration in an FS will be created.
  - b. The Navy intends to conduct additional investigation at DP02 and in the area north of Building 331.

c. The RI report will be revised to include a recommendation for additional investigation of fuel-related contamination in soil and groundwater at DP16. DP06 and MW24 are located within AOCs; therefore, if additional characterization of these areas is needed, the Navy believes the information can be collected at the remedial design stage.

## RESPONSES TO COMMENTS FROM DTSC HERD

### GENERAL COMMENTS

1. **Comment:** In review of the RI Report work plan dated January 13, 2006, HERD recommended that the human health risk assessment be dual-tracked with one human health risk and/or hazard estimate result based solely on the U.S. EPA Region 9 toxicity values and exposure parameters and the other result based on California EPA (CalEPA) toxicity values and exposure parameters. With the exception of the Toxicity Equivalency Factors (TEFs) used for PAHs this recommendation was followed. The CalEPA estimate of PAH carcinogenic risk, based on OEHHA TEFs, must be presented in the CalEPA summary. This will increase the PAH contribution to carcinogenic risk.

Aroclor 1268 was detected at, and enters into the HHRA, for IR Site 34. Some explanation should be provided for the presence of this Aroclor, which does not occur at other NASA IR sites, or at a minimum is extremely rare at NASA.

Terrestrial plant and soil invertebrate communities must be included in the ERA for IR Site 34.

- Response:** Conclusions and decisions in the RI report are based on nature and extent and results of the EPA human health risk assessment (Method 1). However, for comparison and dual-tracking purposes, the RI report will be revised to present the Cal/EPA B(a)P equivalent concentrations. The table and text in Section 3.3, Methods and Approach for Nature and Extent Evaluation, will be revised to list the OEHHA TEFs. Furthermore, the chart in Section 4.1.4, Polycyclic Aromatic Hydrocarbons in Soil, will be revised to show both EPA and Cal/EPA B(a)P equivalents for comparison; no additional samples are expected to exceed the screening level of 0.62 mg/kg. In addition, a new table (Table 4-3) will be added to Section 4 to show the EPA and Cal/EPA B(a)P equivalents for each of the 54 samples identified in Figure 4-6. The site-wide average B(a)P equivalent based on EPA and OEHHA TEFs will also be presented in the new table for comparison. The draft final RI report will be revised to present comparisons to the Cal/EPA B(a)P equivalents where necessary.

Based on the Agency for Toxic Substances and Disease Registry's (ATSDR's) toxicological profile for PCBs (ATSDR 2000), 99 percent of PCBs used in the U.S. were manufactured by Monsanto Chemical Company in Illinois. Until 1971, Aroclor-1268 was one of many Aroclors manufactured and used in the U.S. After 1971, manufacturing was limited to only a few Aroclors. According to Table 5-1 of ATSDR (2000), the typical end uses of Aroclor-1268 were as a plasticizer (in rubbers and synthetic resins) and as a wax extender. It is unknown why Aroclor-1268 was detected at Site 34; PCBs at the site are attributed to historical railroad and sandblasting activities, including the potential release of oils from sand blasting equipment, and temporary storage of PCB- and lead-contaminated soil excavated from Site 15.

Site 34 is within an Intensively Developed area and provides little vegetation and minimal habitat to support plant and invertebrate populations (see response to EPA ERA general comment 2). It is the Navy's position that an evaluation of terrestrial plant and soil invertebrate communities in the SLERA for IR Site 34 is not necessary as these pathways should be considered incomplete based on the type of habitat present at the site. This approach is also consistent with the SLERA's prepared for Sites 14 and 15, which are adjacent to Site 34 and are also located within the Intensively Developed area (see Figure I-4 in Appendix I).

### SPECIFIC COMMENTS

- 1. Comment:** Future use of IR Site 34 is 'designated' as part of a golf course area (Executive Summary, page ES-1). Incremental cancer risk and non-cancer hazard estimates (Section 6.0; Appendix H) for some exposure scenarios indicate that a deed restriction, or some legal instrument of equivalent strength, should be put in place if future use is the basis for no-further action.

**Response:** The FS will assess the need for or appropriate use of institutional controls.

- 2. Comment:** HERD previously commented on specific issues with the 'pink' fill data base in a June 12, 2006 memorandum to the DTSC Project Manager. The 'pink' background data set (Executive Summary, Page ES-2) for mercury and silver contains outliers which should be removed prior to use in statistical tests for background concentration. Please see Specific Comment number 18 below.

**Response:** The Navy is formulating a separate response to the HERD memorandum of June 12, 2006. At this time, the Navy does not intend to make any changes to the methods or data sets used to evaluate background.

3. **Comment:** There is no risk assessment significance to the presence of 'metals' at concentrations 'at least two times background comparison value' (Executive Summary, page ES-3). The sentence should be amended to indicate simply that metals are present above background concentrations.

**Response:** The statement will be revised as requested.

4. **Comment:** The four areas of IR 34 identified as areas of concern (Executive Summary, page ES-3) should be carefully evaluated when considering remedial alternatives.

**Response:** Comment noted. The intent of identifying the AOCs was to ensure they are comprehensively evaluated in the FS.

5. **Comment:** Future residential use is indicated as 'unlikely' (Executive Summary, page ES-5). Development plans at closing or closed Department of Defense (DoD) facilities frequently change. Unless, future residential use is prohibited, the residential use scenario be carried forward into any Feasibility Study (FS) for IR 34.

**Response:** The text was included to ensure the FS will acknowledge that limitations to the future use are likely at this site. The residential use scenario will be included in the FS.

6. **Comment:** Soil Contaminants of Concern (COCs), summarized in the Executive Summary, are not recommended to be carried forward to the FS without sufficient justification. Chromium is excluded because 'risk from chromium may have been slightly overestimated depending on the actual levels of hexavalent and trivalent chromium at IR Site 34' (Executive Summary, page ES-7). The results of the samples submitted for analysis of hexavalent chromium should be presented or referenced. Geographic distribution of the five of 105 soil samples where chromium exceeded the EPA residential Preliminary Remedial Goal (PRG) should also be presented in support of the proposal to not carry chromium forward into the FS.

**Response:** The HHRA evaluated chromium detected in soil as total chromium (one-to-six ratio of hexavalent chromium to trivalent chromium). A total of 105 soil samples were submitted to a fixed laboratory for analysis of

metals; total chromium was detected in 100 percent of the samples. In addition, 22 of the 105 soil samples plus two additional soil samples were submitted to a fixed laboratory for analysis of hexavalent chromium. Analytical results for the 24 samples show that hexavalent chromium is not detected in soil at Site 34. Therefore, the HHRA will be revised to evaluate chromium as trivalent chromium rather than total chromium. In the draft RI report, chromium was identified as a risk driver only for the future construction worker exposure scenario. A cancer risk would not be calculated since trivalent chromium is not carcinogenic. The noncancer hazard for the future construction worker would be unchanged from the values presented in the draft RI report: 0.00024 for exposure to soil from 0 to 2 feet bgs and 0.00022 for exposure to soil from 0 to 4 feet bgs. Both of the noncancer hazards are less than the noncancer threshold of 1.0; therefore, chromium will no longer be considered a risk driver in the draft final RI report.

7. **Comment:** HERD would concur with the proposal to not carry Polycyclic Aromatic Hydrocarbons (PAHs) forward into the FS based on an average Benzo(a)pyrene [B(a)P] equivalent concentration less than the agreed-upon 0.62 mg/kg (Executive Summary, page ES-7) as long as the CalEPA B(a)P equivalent concentration based on OEHHA TEFs is less than this risk management criterion. The two conditions on not carrying PAHs forward are: 1) an estimate of the carcinogenic risk, which includes the risk associated with PAHs, must be supplied in the risk assessment; and, 2) localized areas of elevated PAH concentration (i.e., 'hot spots') may require retention of PAHs regardless of average concentration.

**Response:** Please see the response to DTSC HERD general comment 1.

8. **Comment:** The un-used portion of EBS Parcel 16 and the unnamed portion of land between IR Site 34 and the OIH are excluded from this RI Report 'because no activity occurred in these areas (Section 1.3.3.1, page 1-6). The 1994 EBS Report discusses all areas within IR Site 34. HERD defers to the DTSC Project Manager for concurrence on this decision.

**Response:** Section 1.3.3.1 states, "The portion of EBS Parcel 16 that lies within IR Site 34 and the unnamed portion of land between the EBS parcels and the Oakland Inner Harbor are not discussed further because no activity occurred in these areas. The EBS Report discusses all areas within the IR Site 34 boundaries (ERM-West 1994)." The text will be revised to state that no activity occurred within the portion of EBS Parcel 16 that lies within IR Site 34 and that no activity occurred within the unnamed portion

of land between the EBS parcels and the Oakland Inner Harbor (ERM-West 1994, as cited in the RI report).

9. **Comment:** Please indicate in the text (Section 1.3.4.4, page 1-14) the rationale for selecting the locations where soil samples were collected deeper (i.e., 'subsurface') than 2 feet below ground surface (bgs).

**Response:** The text will be revised to include the rationale for selecting locations where samples were collected deeper than 2 feet bgs.

10. **Comment:** The construction worker scenario must include dermal exposure. Dermal exposure is typically included in the construction worker scenario and is included in the construction worker scenario at the adjacent Alameda Annex. If desired, an additional calculation which does not include dermal exposure based on common construction practices for dewatering below grade excavations (Section 3.5.2.1, page 3-8) can be included in the HHRA.

**Response:** Please see the response to EPA HHRA general comment 3.

11. **Comment:** Hexavalent chromium is listed as an IR Site 34 analytical method (Section 3.1, page 3-1). The results of these hexavalent chromium analyses should be the basis for any conclusion regarding the over- or under-estimation of carcinogenic risk associated with hexavalent chromium analyses in 24 soil samples (Section 4.1.1, page 4-2). Please see Specific Comment number 6 above.

**Response:** Please see response to DTSC HERD specific comment 6.

12. **Comment:** IR Site 34 groundwater concentrations were compared to the NASA groundwater background data set (Tetra Tech, 1998) to determine which inorganic elements were elevated above background (Section 3.2, page 3-3; Table 3-3). HERD completed an internal review of the proposed NASA groundwater background data set in 2006 as part of the review of the 'pink', 'yellow' and 'blue' NASA soil background data sets contained in a June 12, 2006 memorandum to the DTSC Project Manager. The groundwater background data set for the following elements were determined to be deficient or require revision:

aluminum	Potentially two populations with the upper population beginning at about 410 µg/L to 440 µg/L.
antimony	n=194 with only 3 Detected; 13 Detected and Estimated (J-qualified).

beryllium	1 Detected and 17 Estimated (J-qualified). Insufficient detected concentrations.
cadmium	n=194 total; 22 Estimated (J-qualified). Insufficient detected concentrations.
chromium	One outlier at 82.4 µg/L should be removed. Remainder acceptable.
cobalt	n=194 total; 1 Detected; 11 Estimated (J-qualified). Insufficient detected concentrations.
iron	One outlier at 24,400 µg/L should be removed.
lead	One outlier at 28.4 µg/L should be removed. Remainder acceptable.
manganese	Concentrations above 1500 µg/L may be separate population.
mercury	n=198 total; 2 Detected; 2 Estimated (J-qualified). Insufficient detected concentrations.
nickel	Two obvious outliers with concentrations of 138 µg/L and 151 µg/L should be removed. Remainder of data set insufficient given shape of probability plots.
selenium	[n=193 total; 0 Detected; 1 Estimated (J-qualified). Insufficient detected concentrations.
silver	n=188; 1 Detected; 3 Estimated (J-qualified). Insufficient detected concentrations.
thallium	n=193 total; 0 Detected; 3 Estimated (J-qualified). Insufficient detected concentrations.
zinc	One obvious outlier at 46,800 µg/L and seven additional outliers at concentrations ranging from 226 µg/L to 90.7 µg/L should be removed.

**Given these deficiencies in the NASA groundwater background data set HERD recommends that any conclusion based on comparison to groundwater background be carefully evaluated.**

**Response:** The HERD memorandum of 12 June 2006 addresses soil and not the background groundwater data set. At this time, the Navy cannot provide an evaluation of the analysis HERD completed on the groundwater data set. The Navy is preparing a separate response to the HERD comments on the background soil data set. In general, the Navy does not agree with the HERD analysis and does not believe the methods used are adequate to warrant removal of data from the data set.

**13. Comment:** The Toxicity Equivalency Factors (TEFs) used to normalize the concentration of carcinogenic PAHs to a B(a)P-equivalent concentration (Section 3.3, page 3-5) are not those recommended by HERD. The TEF for benzo(k)fluoranthene should be 0.1 rather than 0.01 and the TEF for chrysene should be 0.01 rather than 0.001. These differences will increase the estimate of B(a)P soil concentration for comparison to the NASA-specific risk management agreed-upon concentration of 0.62 mg/kg.

**Response:** Please see the response to DTSC HERD general comment 1.

**14. Comment:** The TEFs listed (Section 3.3, page 3-5) for PAHs and those recommended by CalEPA are:

Polycyclic Aromatic Hydrocarbon	CalEPA TEF	TEF Listed
Benz(a)pyrene	1.0	1.0
Benzo(a)anthracene	0.1	0.1
Benzo(b)fluoranthene	0.1	0.1

<b>Benzo(k)fluoranthene</b>	<b>0.1</b>	<b>0.01</b>
Dibenz(a,h)anthracene	0.34	1.0
Indeno(1,2,3-c,d)perylene	0.1	0.1
<b>Chrysene</b>	<b>0.01</b>	<b>0.001</b>

All the remedial alternative comparisons to B(a)P-equivalent cancer risk soil concentrations are incorrect to some unknown degree dependent on the concentration of benzo(k)fluoranthene and chrysene. The CalEPA estimate of B(a)P soil concentration (Method 2) should be made with the most protective TEF.

**Response:** Please see the response to DTSC HERD general comment 1. In addition, note that the Cal/EPA TEF listed above for dibenzo(a,h)anthracene should be 1.1 (based on the inhalation pathway) rather than the listed 0.34 (based on the oral pathway) (OEHHA 2001).

15. **Comment:** HERD reviewed the following components of the HHRA and has no recommendations on the methodology used. Rather than providing specific comments for each, the HHRA component for which HERD has no recommendations or additional requirements are:

- a. HHRA Exposure Scenarios (Section 3.5.2.1, page 3-8) except the construction worker scenario;
- b. HHRA Exposure Point Concentrations (EPCs) for Soil (Section 3.5.2.2, page 3-9);
- c. HHRA Indoor Air Vapor Intrusion Methodology (Section 3.5.2.2, page 3-9);
- d. HHRA Toxicity Value Hierarchy (Section 3.5.3, page 3-10), and;
- e. Lead Evaluation (Section 3.5.3, page 3-11).

This comment is meant for the DTSC Project Manager and no response is required from the Navy or Navy contractors.

**Response:** Comment noted.

16. **Comment:** There is no discussion for the exclusion of plants and/or the soil invertebrate community as representative components of the IR Site 34 to be evaluated in the Ecological Risk Assessment (ERA) (Section 3.6.2, page 3-15). Development of risk characterization for these biological components is a data gap which must be addressed.

**Response:** Text that describes the habitat will be revised (see response to EPA specific comment 8 and EPA ERA general comment 2) to further support this exclusion. As Site 34 is within the Intensively Developed area and

supports little vegetation, it is the Navy's position that this pathway is incomplete and that an evaluation of terrestrial plant and soil invertebrate communities in the SLERA for IR Site 34 is not necessary.

17. **Comment:** HERD reviewed the following components of the ERA and has no recommendations on the methodology used. Rather than providing specific comments for each, the HHRA component for which HERD has no recommendations or additional requirements are:
- a. ERA Vertebrate Representative Species (Measurement Endpoints) (Section 3.6.2, page 3-15);
  - b. ERA Groundwater Toxicity Evaluation Criteria (Section 3.6.2, page 3-16);
  - c. ERA Vertebrate Exposure Factors (e.g., Site Use Factor) (Section 3.6.4, page 3-17), and;
  - d. ERA Vertebrate Toxicity Reference Values (Section 3.6.2, page 3-19).

This comment is meant for the DTSC Project Manager and no response is required from the Navy or Navy contractors.

**Response:** Comment noted.

18. **Comment:** All inorganic elements except beryllium, mercury and silver are greater than the pink soil background concentrations selected as representative of IR Site 34 soil (Section 6.1, page 6-1). This is an indication that inorganic elements representative of increased risk and/or hazard should be given special consideration when evaluating remedial alternatives.

**Response:** Comment noted; inorganic elements determined to be chemicals of concern that are greater than background will be considered in evaluating remedial alternatives.

19. **Comment:** Please include a table displaying the total risk and/or hazard for the CalEPA methodology (Method 2), similar to that presented for the EPA methodology (Method 1) (Table 6-1).

**Response:** A table similar to Table 6-1 will be added to Section 6, Baseline Human Health Risk Assessment, to present the total, incremental, and background risks based on the Cal/EPA methodology (Method 2).

20. **Comment:** All five of the Volatile Organic Compounds (VOCs) identified as risk drivers for soil were found at the same sample location (Section

6.4.1.2, page 6-5). Soil sampling location DP2 should be re-sampled should further soil sampling be performed in this area.

**Response:** The Navy intends to collect additional samples at this location.

21. **Comment:** HERD does not necessarily agree that COCs may be dropped from detailed consideration where the Hazard Quotient (HQ) based on the low TRV (TRV<sub>low</sub>) exceeds one but the HQ based on the high TRV (TRV<sub>high</sub>) does not exceed one. However, HERD does not object to the site-specific reduction in COCs made here after review of the ratio of these two HQs and the specific COCs removed and retained (Tables 7-3 and 7-4).

**Response:** Comment noted.

22. **Comment:** No evidence is provided in support of the conclusion that the wetland to the north of IR Site 34 is 'not likely' to be affected by site related chemicals (Section 7.5, page 7-9; Section 8.1.5, page 8-6). Groundwater is described as discharging at a depth deeper than the wetland, even though IR Site 34 soil sampling depth was limited to 4 feet bgs due to the presence of groundwater. If the wetland to the north of IR Site 34 is less than 4 feet below IR Site 34 ground surface it should be clearly stated.

**Response:** Text that describes groundwater as discharging at a depth deeper than the wetland will be removed from the report. Additional text in support of the conclusion that the wetland north of IR Site 34 does not require further investigation or assessment of ecological risk will be added to Sections 7.5 and 8.1.5. Although site-related chemicals in soil may contribute to ecological risk at Site 34 based on the SLERA, results of soil samples collected from the potential wetland area north of the site indicate the wetland is not contaminated. Therefore, it is not identified as an AOC. In addition, further investigation or assessment of ecological risk is not recommended based on the SLERA because the SLERA likely overestimated risk, there is a lack of current suitable habitat, and future land use would not generate much ideal habitat for wildlife. The potential wetland areas provide minimal habitat to support plant and invertebrate populations and do not include suitable habitat for small mammals. In addition, it is unlikely that this area will be used by nesting birds because of high marine vessel activity in the Oakland Inner Harbor.

Although groundwater generally flows toward the potential wetland located north of the site, the potential wetland is not likely to be affected by site-related chemicals because it lies between a series of parallel rock

riprap walls. These walls together form a terrace of land that is the shoreline and is tidally inundated at such a frequency so that it would not present suitable habitat for small mammals. Dilution would occur as groundwater mixes with surface water (Oakland Inner Harbor), and COPECs for groundwater were identified based on the assumption that no dilution, retardation, or degradation will occur between the location where the groundwater COPECs were detected and the Oakland Inner Harbor and wetland.

As the SLERA likely overestimated risk to the wetland, further investigation or assessment of ecological risk is also not recommended for the wetland. The SLERA likely overestimated risk to the wetland because chemicals will not discharge to the potential wetland at concentrations of concern and the wetland provides minimal habitat to support plant, invertebrate, or small mammal populations.

Furthermore, it is unlikely that groundwater or surface water runoff from Site 34 would affect the potential seasonal wetland located within the southwestern corner of the site because the site topography would prevent it from reaching this potential wetland.

**23. Comment:** HERD agrees with the four areas identified for further consideration (Section 8.1.1.1, page 8-2; Section 8.2, page 8-7) based on the soil concentrations present.

**Response:** Comment noted.

**24. Comment:** HERD defers to the Regional Water Quality Control Board San Francisco Region (SFRWQCB) for evaluation of Total Petroleum Hydrocarbon (TPH)-affected groundwater with frequency of detection for diesel and motor oil petroleum hydrocarbons greater than 50 percent (Section 8.1.1.2, page 8-3) and for TPH-affected soils (Section 8.2, page 8-7) even though the primary sources appear to have been removed.

**Response:** Comment noted.

**25. Comment:** The methods for calculating Exposure Point Concentrations (EPCs) were reviewed and use the most recent U.S. EPA ProUCL software application (Appendix G) as recommended by HERD. This comment is meant for the DTSC Project Manager and no response is required by the Navy or the Navy contractor.

**Response:** Comment noted.

26. **Comment:** The methodology for conducting the screening of inorganic elements to the soil background data set (i.e., 'pink' background data set) and the groundwater background data set were reviewed (Appendix G) and conform to the current HERD recommendations. This comment is meant for the DTSC Project Manager and no response is required by the Navy or the Navy contractor.

**Response:** Comment noted.

#### SPECIFIC COMMENTS HUMAN HEALTH RISK ASSESSMENT (APPENDIX H)

1. **Comment:** Screening of the IR Site 34 concentration of inorganic elements against the 'pink' soil background data set (PRC, 1997) indicate that all inorganic elements tested, with the exception of beryllium, mercury and silver, were greater than 'pink' background soil concentrations (Section H4.4, page H-5). The background comparison for mercury and silver may be in error. HERD identified, in a June 12, 2006 memorandum containing the review of the 'pink' data set, an outlier in the mercury 'pink' background data set of 2.71 mg/kg and an outlier in the silver 'pink' background data set of 5.64 mg/kg which should be removed prior to statistical testing. One possible conclusion from this result is that IR Site 34 soils are contaminated by past Navy activities for all inorganic elements other than beryllium.

**Response:** The Navy is providing a response to the general issue of background soil in a separate document. The Navy does not agree with the HERD memorandum of June 12, 2006. The data set will not be adjusted at this time.

2. **Comment:** The construction worker scenario must include dermal exposure. Dermal exposure is typically included in the construction worker scenario and is included in the construction worker scenario at the adjacent Alameda Annex. If desired, an additional calculation which does not include dermal exposure based on common construction practices for dewatering below grade excavations (Section H5.3.2, page H-7) can be included in the HHRA.

**Response:** Please see the response to EPA HHRA general comment 3.

3. **Comment:** Indoor air exposure model parameters (Section H5.4.2, page H-10 through H-13; Table H1-1) for the Johnson and Ettinger (J&E) model were checked and are acceptable EPA and DTSC recommendations.

This comment is meant for the DTSC Project Manager and no response is required by the Navy or the Navy contractor.

**Response:** Comment noted

4. **Comment:** General exposure parameters for the residential, industrial, construction worker, and recreational user scenarios (Section H5.5.1, page H-15 through H-18; Table H-4.1 through H-4.4) were reviewed and are acceptable EPA and/or DTSC recommendations or reasonable values based on best professional judgment. This comment is meant for the DTSC Project Manager and no response is required by the Navy or the Navy contractor.

**Response:** Comment noted.

5. **Comment:** The hierarchy presented for the selection of cancers slope factors (CSFs) (Section H6.2, page H-21) and non-cancer Reference Doses (RfDs) (Section H6.1, page H-19) including the route-to-route extrapolation methodology (Section H6.3, page H-22) were reviewed and are acceptable to HERD. This comment is meant for the DTSC Project Manager and no response is required by the Navy or the Navy contractor.

**Response:** Comment noted.

6. **Comment:** There appears to be no outline of the TEF values proposed for PAHs, as presented in the main text (Section 3.3, page 3-5). The TEFs used to normalize the concentration of carcinogenic PAHs to a B(a)P-equivalent concentration are not those recommended by HERD. The TEF for benzo(k)fluoranthene should be 0.1 rather than 0.01 and the TEF for chrysene should be 0.01 rather than 0.001. These differences will increase the estimate of B(a)P soil concentration for comparison to the NASA-specific risk management agreed-upon concentration of 0.62 mg/kg. The CalEPA estimate of B(a)P soil concentration (Method 2) should be made with the most protective TEF.

**Response:** Please see the response to DTSC HERD general comment 1.

7. **Comment:** HERD concurs with the methodology and parameters used to evaluate the potential human health effects associated with lead exposure (Section H7.3, page H-25; Section H8.3, page H-35; Tables H-10.1 and H-10.2). This comment is meant for the DTSC Project Manager and no response is required by the Navy or the Navy contractor.

**Response:** Comment noted.

8. **Comment:** The evaluation of naphthalene as a carcinogen in the CalEPA (Method 2) HHRA commercial/industrial worker scenario (Section H8.1.1, page H-27) is the primary cause of the difference between the EPA (Method 1) and CalEPA (Method 2) estimate of cancer risk. This comment is meant for the DTSC Project Manager and no response is required by the Navy or the Navy contractor.

**Response:** Comment noted.

9. **Comment:** The attribution of an oral CSF for trichloroethene (TCE) to DTSC is incorrect (Section H8.1.3, page H-30). The CalEPA Office of Environmental Health Hazard Assessment (OEHHA) is the CalEPA entity responsible for setting CalEPA toxicity values. Please amend this sentence in the text to indicate that 'OEHHA has established an oral SF..' or 'DTSC requires an oral SF..'.

**Response:** The fifth paragraph of Section H8.1.3 will be revised to state: "OEHHA has established an oral SF ..."

10. **Comment:** Essentially, three of the four corners of IR Site 34 are recommended as areas for further consideration along with the area of the former railroad track (Section 8.1.1.1, page 8-2). HERD concurs with this identification in the HHRA.

**Response:** Comment noted.

11. **Comment;** HERD recommends that some risk management evaluation of remedial alternatives be performed for unrestricted use based on the residential exposure scenario cancer risk estimates (Section H8.1.3, page H-29) and non-cancer Hazard Index (HI) (Section H8.2.3, page H-34). The average soil lead concentration of 520 mg/kg (Section H8.3, page H-36) should enter into the risk management evaluation.

**Response:** The risk management evaluation will be conducted as part of the FS in considering remedial alternative.

## SPECIFIC COMMENTS

### ECOLOGICAL RISK ASSESSMENT (APPENDIX I)

- Comment:** The figure (Figure I-3) presenting the Conceptual Site Model (CSM) (Section I2.0, page I-2) contains both dotted lines and dashed lines while the footnote indicates that solid lines are complete exposure pathway, dashes indicate incomplete exposure pathways. Some of the lines, whether dashed or dotted, appear to be transport pathways (e.g., soil to sediment or soil to air) rather than exposure pathways. Please amend the figure or the footnotes.

**Response:** The footnote will be revised to state that the solid lines refer to complete exposure or transport pathways, and that the dashes indicate incomplete pathways.

- Comment:** Wetlands exist along the fence line to the north of the site and to the south of the site (Section I2.2.1, page I-3). The wetland to the south appears to be approximately 150 feet from a larger wetland indicated as '23D' (Figure I-5). These wetlands have not been formally delineated (Section I2.2.A, page I-4). The California Department of Fish and Game should be consulted to determine whether a formal wetland delineation is required for the seasonal wetland to the south or the saline emergent wetland to the north.

**Response:** The draft RI report was provided to CDFG. Based on the recent Environmental Impact Report prepared for the proposed Alameda Point Golf Course, there are no delineated wetlands within IR Site 34 except for the emergent wetlands located along the Oakland Inner Harbor (Alameda Reuse and Redevelopment Authority 2006). The Navy would also note that formal wetland delineations are required for CERCLA actions only if remedial action is proposed for the wetland. VOCs, pesticides, and PCBs in soil within the southwestern corner of the site are recommended for further consideration in the FS. A formal wetland delineation will be conducted should remedial action be proposed in the areas near the potential seasonal wetlands.

- Comment:** The two sentences attempting to distinguish the toxic effects of inorganic elements from those attributable to Volatile Organic Compounds (VOCs) and Semi-Volatile Organic Compounds (SVOCs) (Section I2.5, page I-7) should be amended or removed. Whether an inorganic element toxic effect is restricted to developmental and reproductive effects is affected by many factors (e.g., concentration and/or length of exposure).

**Response:** The referenced text in Section I2.5 will be removed from the draft final RI report.

4. **Comment:** Please correct the third sentence in the discussion of the CSM (Section I2.7, page I-8) which contains a typographic error that repeats a partial list of Contaminants of Potential Ecological Concern (COPECs).

**Response:** The third sentence in Section I2.6, Conceptual Site Model, will be revised to state that investigations at IR Site 34 indicated the presence of metals, VOCs, SVOCs, PAHs, pesticides, PCBs, and petroleum hydrocarbons.

5. **Comment:** The terrestrial plant and soil invertebrate communities are not included in the proposed assessment endpoints for IR Site 34 (Section I2.7, page I-9). Assessment endpoints and measurement endpoints for these two significant ecological components must be included in the ERA.

**Response:** It is the Navy's position that an evaluation of terrestrial plant and soil invertebrate communities in the SLERA for Site 34 is not necessary as Site 34 is within the Intensively Developed area and has little vegetation and minimal habitat to support plant and invertebrate populations. Therefore, this pathway was considered incomplete.

6. **Comment:** HERD agrees to the source hierarchy for terrestrial receptors (Section I3.1, page I-11) and aquatic receptors (Section I3.2, page I-11). Additional sources will be necessary for evaluation of the terrestrial plant and soil invertebrate communities.

**Response:** It is the Navy's position that an evaluation of terrestrial plant and soil invertebrate communities in the ERA for Site 34 is not necessary as Site 34 is within the Intensively Developed area and has little vegetation and minimal habitat to support plant and invertebrate populations.

7. **Comment:** The generic exposure factors (e.g., site use factor and bioavailability) used for the Screening Level ERA (SLERA) (Section I3.3, page I-12; Table I-10 through I-15) are acceptable. The species-specific exposure factors (e.g., body weight) were reviewed (Tables I-16 through I-20) are acceptable. This comment is meant for the DTSC Project Manager and no response is required by the Navy or the Navy contractor.

**Response:** Comment noted.

8. **Comment:** Aroclor 1268 is one of the Polychlorinated Biphenyl (PCB) mixtures retained for further analysis based on the results of the SLERA (Section I5.0, page I-19). This Aroclor mixture has not been detected or at least evaluated in any other ERA for NASA. A more detailed description of the source of Aroclor 1268 at IR Site 34 should be included in the IR Site 34 Site Description (Section 1.3, page 1-3 and/or Section 1.3.3, page 1-5).

**Response:** The intent of Sections 1.3, Background, and 1.3.3, IR Site 34 Description and Operations, is to provide general introductory descriptions of the activities conducted at Site 34 rather than a detailed description of potential sources of chemicals that are later identified in the risk assessments. What is known about activities conducted at the site is provided in these sections of the draft RI report. More detailed descriptions of the nature and extent and potential sources of PCBs in soil were provided in Section 4.1.6, Polychlorinated Biphenyls in Soil, and Section 4.1.8, Summary of Contamination in Soil, of the draft RI report. As stated in the text, PCBs appear to be limited to the ground surface, and were clustered along the western site boundary, between former Buildings 343 and 344, and on the north and south sides of former Building 331, with isolated elevated levels identified at former Building 604 and in off-site step-out samples near former Building 345.

9. **Comment:** HERD accepts the areas identified as posing potential ecological hazard for terrestrial vertebrate receptors in the refined ERA (Section I6.0, pages I-19 through I-23). These areas are essentially the four corners of IR Site 34. This comment is meant for the DTSC Project Manager and no response is required by the Navy or the Navy contractor.

**Response:** Comment noted.

10. **Comment:** The comparison of groundwater concentrations to aquatic hazard criteria is indicated as Table I-20 in the text (Section I6.1.2, page I-24). A qualitative yes/no listing of the groundwater COPECs against available aquatic criteria is presented in Table I-23. The identification of the groundwater COPECs exceeding specific aquatic criteria is actually Table I-24. Please amend the text.

**Response:** The text will be amended to reference Table I-24.

11. **Comment:** Groundwater sample location DP-5 is the source of sample results exceeding criteria for multiple groundwater COPECs (e.g., mercury, PAHs) (Section I6.1.2, pages I-23 through I-27). Soil at sample

location of DP-5 should be considered as a candidate for any further soil actions.

**Response:** The FS will consider the need for further actions at all locations where there are chemicals of concern.

12. **Comment:** HERD is unwilling to consider the proposal that either IR Site 34 wetland is not affected (Section I6.2.2, page I-28) until the California Department of Fish and Game determines whether a formal wetland delineation is required and/or the southern wetland serves as an extension of habitat for the more extensive wetland location indicated at 23D (Figure I-5).

**Response:** The draft RI report has been provided to CDFG. The biological survey conducted during the field investigation did not show that the wetland south of the site is connected to the possible wetland area on site.

13. **Comment:** Please clearly describe, or reference, the monitoring well information for monitoring wells along OIH which indicates that groundwater discharges to OIH at depths greater than the wetland to the north of IR Site 34 (Section I6.2.2, page I-28). Soil samples were collected at IR Site 34 only to depths of 4 feet bgs due to the presence of groundwater. As the wetland to the north of IR Site 34 has been described as an 'emergent saline wetland' a groundwater discharge to OIH at approximate depths of 4 feet bgs would seem within the bounding depths of this wetland.

**Response:** Text that describes groundwater as discharging at a depth deeper than the wetland will be removed from the report. Additional text in support of the conclusion that the wetland north of IR Site 34 does not require further investigation or assessment of ecological risk will be added to Sections 7.5 and 8.1.5. See response to DTSC HERD specific comment 22.

14. **Comment:** While some of the soil COPECs are present at concentrations which pose potential ecological hazard, lack of current significant terrestrial habitat and potential future use as part of a golf course (Section I6.2.2, page I-28) are the basis for concluding that there is currently minimal terrestrial habitat. Any changes in land use which lead to the development of significant terrestrial habitat will require re-evaluation of the potential ecological hazard.

**Response:** Comment noted.

## DTSC CONCLUSIONS

The majority of HERD recommendations and requirements outlined in the January 13, 2006, HERD review of the Draft Final Work Plan for IR Site 34 have been incorporated into this draft Remedial Investigation Report. However, there remain several outstanding issues such as use of the OEHHA Toxicity Equivalency Factors (TEFs) for the CalEPA estimate (Method 2) of PAH risk in the Human Health Risk Assessment (HHRA).

Evaluation of potential hazard to the terrestrial plant community and the soil invertebrate community must be added to the Ecological Risk Assessment (ERA).

The presence of Aroclor 1268 at IR Site 34, when this Aroclor mixture has not been reported for other Naval Station Alameda sites must be explained or at least further discussed.

Essentially, three of the four corners of IR Site 34 are identified as areas for further consideration along with an area of the former railroad track. HERD accepts this conclusion of the HHRA.

The California Department of Fish and Game (DFG) should be consulted to determine whether a formal wetland delineation is required for the two small wetlands associated with IR Site 34. The DFG should also be asked to determine whether the small seasonal wetland in IR Site 34 serves as a significant extension of the larger wetland indicated to the south in area 23D.

**Response:** The RI report will be revised to present the Cal/EPA B(a)P equivalent concentrations. (See response to DTSC HERD general comment 1.)

The Navy has determined that an evaluation of terrestrial plant and soil invertebrate communities in the SLERA for Site 34 is not necessary as Site 34 is within the Intensively Developed area and has little vegetation and minimal habitat to support plant and invertebrate populations.

PCBs are likely from the temporary storage of PCB- and lead-contaminated soil excavated from IR Site 15. Potential sources of PCBs in soil were provided in Section 4.1.6, Polychlorinated Biphenyls in Soil, and Section 4.1.8, Summary of Contamination in Soil, of the draft RI report.

Comment noted regarding the four AOCs identified in the draft RI report for further consideration in the FS. In addition, it should be noted that the area north and northwest of Building 331 will also be identified as an AOC in the draft final RI report. (See response to DTSC GSU specific comment 11.)

A formal wetland delineation is required only if remedial action is proposed for the wetlands. VOCs, pesticides, and PCBs in soil within the southwestern corner of the site are recommended for further consideration in the FS. A formal wetland delineation will be conducted should remedial action be proposed in this area near the potential seasonal wetland.

## RESPONSE TO COMMENTS BY DFG-OSPR

### GENERAL COMMENTS

- 1. Comment:** DFG-OSPR appreciates this opportunity to provide guidance on the planned cleanup at Alameda Point, Alameda. This memo will serve to inform the Navy of our continuing interest in coordinating any natural resource issues, as one of the designated State natural resource trustees. This may be necessary should release(s) of any hazardous materials at the subject site affect State natural resources.

**Response:** Comment noted.

- 2. Comment:** DFG-OSPR is in general concurrence with the detailed review provided by Dr. James Polisini of the Department of Toxic Substances Control (DTSC) on November 28, 2007. The DFG has only a few new comments on the above document beyond those expressed by DTSC.

**Response:** Comment noted.

### SPECIFIC COMMENTS

- 1. Comment:** Page 3-19, Section 3.6.4: Please add statements or paragraphs as follows: Chemicals of potential ecological concern (COPECs) with hazard quotient (HQ) below one with the low toxicity reference values (TRVs) would not be expected to pose unacceptable risks to ecological receptors, while those with HQ in excess of one with the high TRVs would pose unacceptable level of risks and would require remediation. For COPEC concentrations that are between the low and high TRVs, a management decision will be required to determine if the level of risk is acceptable or if site-specific bioavailability and exposure data need to be incorporated to refine the risk assessment.

**Response:** The Navy believes it is not appropriate to incorporate the requested text. Consistent with EPA and Navy guidance, the purpose of a SLERA is to use conservative assumptions and existing data to make a decision

whether to continue or not to continue the assessment of ecological risk (the baseline ERA). It is not to determine if the level of risk is unacceptable and would require remediation. Hazard quotients were calculated as preliminary risk estimates, and refined exposure estimates were developed in accordance with Step 3a of Navy policy and EPA guidance if the HQ was greater than 1. If the SLERA had concluded that further assessment was necessary, a baseline ERA would have been conducted.

2. **Comment:** Page 7-8, Section 7.4: A number of factors that contribute to uncertainty were not adequately addressed in this section. For example, no attempt is made to account for the potential additive or synergistic effects of multiple contaminants.

**Response:** The SLERA approach is consistent with the RI work plan for Site 34 (Tetra Tech 2006, as cited in the RI report) that is based on EPA and Navy guidance. It is not intended to reduce all uncertainty; rather, it is a screening process intended to use conservative assumptions and existing data to make a decision whether to continue or not to continue the assessment of ecological risk (the baseline ERA). If it had been determined that further assessment was necessary, a baseline ERA would have addressed which, if any, of the chemicals truly pose an unacceptable risk by using a more site-specific and technically rigorous process. However, the SLERA has concluded that a baseline ERA is not necessary at Site 34.

3. **Comment:** Page 7-8, Section 7.4: Since groundwater in Site 34 is hydrologically connected to surface water in San Francisco Bay and is tidally influenced, there is potential for migration of contaminants from Site 34 to the aquatic environment and selected aquatic receptors, either by surface runoff or subsurface flow. Please address this concern in Section 7.4.

**Response:** Potential risk from groundwater is addressed in Section 7.3.2 of the RI report. Exposure of aquatic life to COPECs through groundwater migration to the Oakland Inner Harbor is evaluated as a complete pathway, and the exposure point concentrations for groundwater COPECs were compared with three sets of aquatic comparison criteria. Surface water runoff from the site generally infiltrates to groundwater before it reaches San Francisco Bay, with smaller amounts entering the storm drain system; therefore, this pathway was considered essentially incomplete.

4. **Comment:** Page 1-28, Section 16.2.2: For wetland delineation, DTSC deferred to DFG's consultation. DFG-OSPR reiterates that the Navy should recognize that DFG consistently uses the U.S. Fish and Wildlife

Service (USFWS) definition of wetland in its wetland policy (<http://www.fgc.ca.gov/html/p4misc.html>). The DFG wetland policy is a To-Be-Considered guideline which recommends that wetland characterization utilize USFWS definition of wetlands (USFWS, 1979). The USFWS definition utilizes hydric soils, saturation or inundation, and vegetative criteria, and requires the presence of at least one of these criteria (rather than all three) in order to classify an area as a wetland. Therefore, the USFWS criteria for wetland characterization is more stringent than the U.S. Army Corp of Engineers (COE) criteria. In order to uphold the DFG policy, we must utilize USFWS criteria for wetland delineation at Alameda Point and other BRAC sites. The new wetland delineation report would be unacceptable if only COE criteria for wetland delineation were applied at Alameda Point.

**Response:** Potential wetland areas identified in the remedial investigation report were evaluated in the Alameda Point Golf Course Final Environmental Impact Report (Alameda Reuse and Redevelopment Authority (2006). The Navy does not believe that wetland delineation is necessary at this time. Furthermore, It is the Navy's position that a formal wetland delineation would be required, and in accordance with U.S. Army Corp of Engineers (COE) criteria, only if remedial action is proposed for the wetland. VOCs, pesticides, and PCBs in soil in the southwestern corner of the site are recommended for further consideration in the FS. A formal wetland delineation will be conducted using COE criteria should remedial action be proposed in this area near the potential seasonal wetland.

**5. Comment:** Page 1-28, Section 16.2.2: Before the seasonal wetland is delineated, DFG-OSPR cannot accept the statement that "wetlands identified both on and around IR Site 34 may provide minimal suitable habitat for ecological receptors." It is not clear from the discussion on this page how the wetland was characterized. DFG-OSPR strongly recommends that the wetland delineation be made by a qualified biologist. The biologist utilizes site information and background materials to prepare what is commonly referred to as a Wetland Delineation Report. DFG-OSPR recommends the following outline to present the project information in a report format.

- I. Summary**
- II. Introduction**
  - A. Description of Project
  - B. Purpose of Assessment
- III. Project Setting**
  - A. Vegetation community
  - B. Hydrology

- C. Soils
- IV. Methodology**
  - A. Pre-survey investigations
  - B. Field survey
- V. Results**
  - A. Summary table of wetland impacts
  - B. Wetland functions and values
    - 1. Description of existing functions and values
    - 2. Potential impacts
- VI. Discussion**
  - A. Avoidance and minimization recommendations
  - B. Mitigation recommendations
- VII. References Cited**
- VIII. Personal Communications Cited**
- IX. Appendices**
  - A. Project maps showing proposed USFWS and COE jurisdictional areas (1:100 scale map preferred)
  - B. Data Forms - Wetland Delineation
  - C. National Wetlands Inventory map, where available

**Response:** It is the Navy's position that a formal wetland delineation is not necessary to assess risk at Site 34 and would be required only if remedial action is proposed for the wetland. Additional text will be added to the report stating that Site 34 is within an Intensively Developed area, which has little vegetation and less foraging habitat than is available in surrounding areas. In addition, the wetlands provide minimal habitat to support plant and invertebrate populations and is tidally inundated at such a frequency that it would not present suitable habitat for small mammals. This characterization is based on an environmental impact report prepared by the City of Alameda and a biological surveys conducted by the Navy. Furthermore, based on a review of the California Natural Diversity Database (2007), special-status plant and animal species are not expected to occur at Site 34.

### **DFG-OSPR CONCLUSIONS**

As detailed above, the report has several areas of concern to DFG-OSPR that should be addressed. DFG-OSPR recommends that the Navy provide a revised report that clearly addresses these concerns.

Before this RI report is acceptable with respect to ecological risk, the seasonal wetland should be delineated. We request additional time to evaluate the response to a request for the wetland delineation. In the meantime, the Navy may proceed with Site 34, with the clear understanding that additional action may be required after DFG reviews the Response to Comments for the formal wetland delineation.

**RESPONSE TO REGULATORY AGENCY COMMENTS ON THE DRAFT FINAL  
REMEDIAL INVESTIGATION REPORT FOR INSTALLATION RESTORATION SITE  
34, FORMER NORTHWEST SHOP AREA, ALAMEDA POINT, ALAMEDA,  
CALIFORNIA**

---

This document presents the U.S. Department of the Navy's response to regulatory agency comments on the "Draft Final Remedial Investigation [RI] Report for Installation Restoration [IR] Site 34, Former Northwest Shop Area, Alameda Point, Alameda, California," dated March 6, 2008. The comments addressed below were received from the U.S. Environmental Protection Agency (EPA) on April 7, 2008 and from the Department of Toxic Substances Control (DTSC) Geologic Services Unit (GSU) and the DTSC Human and Ecological Risk Division (HERD) on April 4, 2008.

**RESPONSES TO COMMENTS FROM EPA**

**General Comments**

1. **Comment:** Response to Specific Comment 16: It is unclear why the request to designate HS3S as an area for further delineation during the remedial design was dismissed. This location is along a former railroad track, so additional samples east-southeast and west-northwest of this location (i.e., along the railroad) are needed to evaluate whether there is additional contamination along the rail line. The extent of contamination to the south of this location has not been delineated. In addition, the X-ray fluorescence (XRF) results indicate higher concentrations for lead and chromium than the laboratory results; given the heterogeneity of soil this data should be considered when evaluating the need for further sampling. Also, analyses for polynuclear aromatic hydrocarbons (PAHs) were not done for the HS3S samples; since this location is along a former railroad analyses should include PAHs and semi-volatile constituents of creosote. Please recommend HS3S for delineation during the remedial design to evaluate the extent of arsenic, chromium, lead, PAHs, and creosote in the vicinity of HS3S.

**Response:** The Navy reviewed the sampling data within the vicinity of HS3S and along the former rail line. The Navy believes that sufficient sampling has been conducted to evaluate the contamination within these areas. There are at least 12 other samples located along the rail line. Although HS3S was not analyzed for PAHs and SVOCs, this location was analyzed for metals, and there are other samples collected along the rail line that were analyzed for PAHs and SVOCs. Furthermore, the remedial investigations at IR Site 14 and IR Site 15 (west and east of IR Site 34, respectively) did

not show significant contamination of soils by PAHs or SVOCs. There has not been any impact on soil contamination by the rail line observed at other IR Sites.

Based on the analysis of these samples and other IR Sites, there is no consistent pattern to conclude that the rail line has been a significant source of contamination at IR Site 34. Accordingly, the Navy intends to remove text in the Executive Summary and in Section 8 that attributes soil contamination to use and subsequent fill of the historical railroad.

The XRF results were used during the remedial investigation site characterization to determine which samples would be analyzed by the analytical laboratory. XRF analyses are known to be biased high and there was no intent for the XRF results to be used other than as a screening tool. In addition, the heterogeneity of the soil is not relevant to the XRF results. Rather the heterogeneity is important in determining if sampling is sufficient to conduct the necessary evaluations.

The Navy is satisfied that sufficient samples were collected to support the risk evaluations for the site. The Navy does not believe there is sufficient uncertainty to warrant additional sampling around HS3S.

2. **Comment:** Response to Specific Comment 23: **Since the highest risk associated with the polychlorinated biphenyls (PCBs) in PW13 and PW18 was 5.7E-06 (Table 6-6) for a potential future residential receptor and the total risk associated with PCBs is 1.2E-05 (Table 6-6), institutional controls are needed to ensure that the area is not used for residences in the future. Also, please note that the risk cited in the response does not agree with Table 6-6. Please recommend all locations with PCBs for inclusion in the Feasibility Study.**

**Response:** The feasibility study will evaluate PCBs for appropriate remedial action. The Navy acknowledges that the risks cited in the response were incorrect. The values presented in Table 6-6 are the values from the human health risk assessment.

RESPONSES TO COMMENTS FROM DTSC CAL CENTER CLEANUP PROGRAM

**General Comments**

1. **Comment:** In our previous letter regarding this Site (Review of the draft Remedial Investigation Report for Site 34, dated December, 6, 2007) DTSC stated,

Of particular note is Dr. Polisini's... comment ...which references the detailed memorandum that DTSC submitted to the Navy reading HERD's evaluation of the Alameda Point soil background data set. In your response to Dr. Polsini's ...comment ... please indicate 1) whether the Navy is going to adjust the background data set in response to the HERD memorandum of July 12, 2006, and 2) when DTSC can expect that adjustment.

Subsequently the Navy responded,

The Navy is preparing a separate response to the HERD comments on the background soil data set. In general, the Navy does not agree with the HERD analysis and does not believe the methods used are adequate to warrant removal of data from the data set.

DTSC is looking forward to receiving the Navy's analysis and resolving this outstanding issue.

**Response:** The Navy will submit its analysis in the near future. The Navy would like to reiterate HERD's conclusion in Specific Comment 3 below that implementing the requested changes in the data set would not affect the conclusions of the IR Site 34 SLERA.

2. **Comment:** Dr. Polisini's Comment 3 (attached) references Comment 12 from the HERD review of the draft Remedial Investigation Report. Please note Dr. Polisini's recommendation that the Alameda Point groundwater background data set should be revised to account for HERD comments.

**Response:** The Navy is preparing a technical memorandum that addresses the issue of data outliers and non-detect values in the soil and groundwater

background sets for Alameda Point. The tech memo will be focused to address the specific issues raised by Dr. Polisini.

3. **Comment:** Comment number 5 in the attached memorandum contains a repeated recommendation that a wetland delineation be performed using the U.S. Fish and Wildlife Service wetland criteria. DTSC subsequently consulted with the California Fish and Game and we agree with the Navy's commitment to complete a wetland delineation in the future, if required.

**Response:** As noted in the Response to Specific Comment number 5, this issue will be addressed through the feasibility study as necessary.

4. **Comment:** Comment number 6 in the attached memorandum contains a recommendation to collect additional soil samples at soil boring location DP-5. Since the Navy indicated that the need for additional soil sampling will be evaluated in a Feasibility Study, DTSC will likely reiterate this last comment in our review of the draft Feasibility Study for Site 34, if additional sampling is not recommended in the vicinity of soil boring location DP-5.

**Response:** After further review and the clarification provided by DTSC Comment 6 below, the Navy is revising its original response to this issue. DTSC HERD Specific Comment number 6 below, requests additional sampling in the vicinity of DP-5 if soil samples at this location showed elevated concentrations for the constituents found elevated in groundwater samples. Please refer to response to Specific Comment number 6 below. In summary, the Navy does not believe there is a need to conduct additional sampling at DP-5, at this time.

## RESPONSES TO COMMENTS FROM DTSC HERD

### General Comments

The majority of the RTC, and accompanying changes to the Human Health Risk Assessment (HHRA) and Screening Ecological Risk Assessment (SLERA) are adequate. However, several issues remain to be resolved.

### Specific Comments

1. **Comment:** Response to Specific Comment number 2: The response states that the Navy does not intend to change methods or data sets used to evaluate

background. HERD has not requested any changes to methodology only that the data sets provide a reasonable estimate of soil and/or groundwater background concentrations. This comment is meant for the DTSC Project Manager and no response is required from the Navy or Navy contractor.

**Response:** Comment noted.

2. **Comment:** Response to Specific Comment number 10: The response indicates, by reference to the response to EPA HHRA General Comment number 3, that dermal exposure will not be evaluated for the construction worker scenario based on similar exclusion for IR Site 28 and IR Site 32. The same response is provided to HERD Specific Comment number 2 on the HHRA (Appendix J, page 50). HERD continues to recommend that dermal exposure be included in the construction worker scenario based on shallow groundwater. However, the DTSC Project Manager should be aware that the construction worker scenario estimates of risk and/or hazard would be greater than those presented in this HHRA if this exposure pathway were included.

**Response:** The Navy agrees that a construction worker scenario that included exposure to groundwater would be greater than currently presented in the IR Site 34 RI Report. However, the Navy does not believe that a construction worker scenario involving exposure to groundwater necessarily represents a reasonable exposure scenario. Workers would have to dewater an excavation to be able to perform any practical type of work. In addition, it is not reasonable to expect that a worker is going to be constantly exposed to groundwater during any reasonable exposure duration.

3. **Comment:** Response to Specific Comment number 12: The HERD comment did not mean to indicate that the HERD June 12, 2006 memorandum addressed groundwater. The table presented in the comment, and included below, outlines discrepancies in the groundwater background data set originally furnished for HERD review in 2006:

aluminum	Potentially two populations with the upper population beginning at about 410 µg/L to 440 µg/L.
antimony	n=194 with only 3 Detected; 13 Detected and Estimated (J-qualified).
beryllium	1 Detected and 17 Estimated (J-qualified). Insufficient detected concentrations.
cadmium	n=194 total; 22 Estimated (J-qualified). Insufficient detected concentrations.
chromium	One outlier at 82.4 µg/L should be removed. Remainder acceptable.
cobalt	n=194 total; 1 Detected; 11 Estimated (J-qualified). Insufficient detected concentrations.
iron	One outlier at 24,400 µg/L should be removed.

lead	One outlier at 28.4 µg/L should be removed. Remainder acceptable.
manganese	Concentrations above 1500 µg/L may be separate population.
mercury	n=198 total; 2 Detected; 2 Estimated (J-qualified). Insufficient detected concentrations.
nickel	Two obvious outliers with concentrations of 138 µg/L and 151 µg/L should be removed. Remainder of data set insufficient given shape of probability plots.
selenium	[n=193 total; 0 Detected; 1 Estimated (J-qualified). Insufficient detected concentrations.
silver	n=188; 1 Detected; 3 Estimated (J-qualified). Insufficient detected concentrations.
thallium	n=193 total; 0 Detected; 3 Estimated (J-qualified). Insufficient detected concentrations.
zinc	One obvious outlier at 46,800 µg/L and seven additional outliers at concentrations ranging from 226 µg/L to 90.7 µg/L should be removed.

As part of the HERD review of the document titled *Draft Final Feasibility Study Report IR Site 2, Westbeach Landfill and Wetlands, Alameda Point, California*, dated April 4, 2007, and subsequent conference calls, HERD was furnished the 'current' NASA groundwater background data set as an attachment to a March 5, 2008 electronic mail message. The filename of this Excel dataset is BCK\_GW\_METALS\_111202.xls. The HERD notes regarding the extremely low frequency of detection and/or apparent outliers included in the table above, originally prepared as part of a 2006 HERD internal review of the groundwater dataset, are still present in the groundwater background data set furnished for IR Site 2 in March of 2008. While there might be some argument about the 'methodology' of using cumulative frequency plots to identify outliers, there cannot be an argument with the identification of elements with frequency of detections of 0.01 (2/198) for mercury or 0.00 for selenium (0/193) and thallium (0/193). The NASA groundwater background data set should be revised to account for these HERD comments.

A comparison of the detected groundwater concentrations (Appendix I, Section I6.1.2, pages I-24 through I-26) indicates that any reasonable estimate of groundwater background, taking into account the HERD review of the data set, would have no impact on the conclusions of the potential adverse aquatic effects associated with the eight inorganic elements selected for the U.S. EPA Ecological Risk Assessment Step 3A refined evaluation.

**Response:** With respect to the IR Site 34 RI Report, it should be noted that no background screening was conducted for selenium and thallium because there were no detected concentrations. For mercury, there are some detected concentrations; however, the Navy agrees that the detection frequency precludes any meaningful conclusions about distributions or statistical significance.

4. **Comment:** Response to Specific Comment number 16; Appendix I (SLERA) Specific Comment numbers 5 and 6: **HERD accepts the enlarged habitat description of the current IR Site 34 as sufficient to exclude the plant and/or soil invertebrate community from the SLERA performed. However, changes in planned future use which lead to the establishment of significant terrestrial habitat may require revision of the terrestrial ERA to include these biological components.**

**Response:** Comment noted; however, the Navy is not concurring with the potential for revisions to the SLERA to account for changes in future land use.

5. **Comment:** Response to Specific Comment number 22 and Appendix I (SLERA) Specific Comment number 2: **HERD continues to recommend that a wetland delineation be performed using the U.S. Fish and Wildlife Service wetland criteria as implemented by the Department of Fish and Game (DFG). DFG Comment number 4 (Appendix J, page 59) and DFG Comment number 5 (Appendix J, page 60) also outline a wetland delineation for the applicable areas. The DFG requirements for the evaluator and the reporting format are provided.**

**Response:** The Navy will consider conducting wetland delineation after evaluation of the remedial alternatives recommended in the feasibility study.

6. **Comment:** Response to Appendix I (SLERA) Specific Comment number 11: **The intention of this comment was not to indicate that soil concentrations were elevated at groundwater sample location DP-5, but that elevated groundwater concentrations may be an indication of elevated soil concentrations. If soil sample results are available from groundwater sample location DP-5 which indicate soil concentrations are not elevated, that would be an adequate response. Otherwise, HERD recommends soil sampling at location DP-5 at the same time the Navy collects additional soil samples at location DP-2 as indicated in response to Specific Comment number 20.**

**Response:** The Navy reviewed the sampling results at DP-5 from the Remedial Investigation. Soil samples were taken at 0.5 ft, 2 ft, and 7 ft bgs at this location. With the exception of arsenic, analytical results of the soil samples did not correspond with any other elevated results for groundwater samples collected. This includes, but is not limited to, mercury, TPH, and, PAHs. Although arsenic was elevated in both soil and groundwater at DP-5, arsenic was not identified as a risk driver under the residential use scenario at DP-5. Therefore, the Navy does not believe additional soil sampling is necessary. Consequently, the Navy would like

to withdraw its original response in the Response to Comments on the Draft Final Remedial Investigation Report that additional sampling at DP-5 would be conducted.
