Executive Summary

This report summarizes the results and findings of previous investigations and remediation activities at Tank 398 (site) at the Marine Corps Air Station (MCAS) El Toro, California. This report includes an evaluation of the data collected from routine groundwater monitoring, free product recovery, site investigations, soil vapor extraction treatment operations, and confirmation sampling activities. These data were compared with the corrective actions required for an unauthorized release from an underground storage tank, which are specified in Title 23, Division 3, Chapter 16, Article 11, §2722 of the California Code of Regulations. These data were also compared with the protocols developed by the American Society for Testing and Materials (ASTM) standard (ASTM E1943-98) and by the Air Force Center for Environmental Excellence for the evaluation of natural attenuation.

Based on the findings, no further action in the vadose zone is proposed. Natural attenuation is efficiently controlling the off-site migration of residual free product and total petroleum hydrocarbon (TPH)-impacted groundwater based on the findings presented in this report. Therefore, we also propose to implement a long-term groundwater monitoring program to monitor the progress of natural attenuation.

The site is located in the northeast section of the MCAS El Toro. Tank 398 was installed in 1960 and was used to store and dispense jet propellant (JP)-5 fuel. The tank and its associated piping were removed in 1993. The extent of JP-5 jet fuel in the vadose zone and in the groundwater was delineated in several site investigation reports. The quantity of JP-5 spilled or leaked is not known. Residual TPH was detected in the soil layer above the groundwater table (vadose zone), and free-floating product and dissolved-phase plume are present in the groundwater. During the period of record, the groundwater levels varied from 180 to 210 feet below ground surface.

Jet fuel contains trace amounts of benzene, which is a known human carcinogen and the primary risk driver at the site. JP-4, which is more volatile than JP-5, contains approximately 0.5 percent by weight of benzene. During a preliminary risk assessment, potential intake of groundwater from downgradient wells was the only identified potential exposure pathway of human receptors to the contamination. Potential surface exposure to the contaminated soil vapor was shown to be negligible mainly because benzene, toluene, ethylbenzene, and total xylenes were not detected in the upper 25 feet of subsurface soil.

Corrective actions that have been implemented since 1995 to remedy the JP-5-impacted soil and groundwater at the site have consisted of soil-vapor extraction (SVE) and treatment of vadose zone contamination, recovery of free-floating product, and natural attenuation of the dissolved-phase groundwater plume. To date, approximately 18,000 gallons of TPH were removed from the vadose zone using the SVE system and 10,000 gallons were recovered using an automatic free-product recovery system. The groundwater plume appears to be stable and has not migrated off-site. The stability of the plume is thought to be the result of both containment by stratigraphic boundaries and natural attenuation of the petroleum hydrocarbon compounds in groundwater.

The site is underlain by a complex stratigraphy composed of interlayered lithic units with low, moderate, and high permeability. The SVE and free-product recovery systems implemented thus far have reached their technical limitations due to the complex lithology of the site; future operation of the remediation system would no longer be cost-effective. The groundwater monitoring data indicate that natural attenuation is occurring and the extent of the free product and the dissolved-phase plume has been stable and remains on-site.

No further action in the vadose zone is recommended because of the technical limitations of the active remedial systems, the stable groundwater plume, and active natural attenuation process noted in the groundwater sampling results. However, semiannual groundwater monitoring of the residual free product and dissolved-phase groundwater plume is proposed. During the first five years of monitoring, parameters indicating the process of natural attenuation will also be monitored and reported on an annual basis. This monitoring program will be implemented until the free product is degraded and dissolved phase concentrations of BTEX constituents achieve "low risk" site cleanup criteria. It is also proposed that on-site groundwater extraction for any beneficial use be prohibited until the remedial goal is reached.

Section 1

Introduction

This report summarizes findings and results of the previous investigations and remedial activities at the Tank 398 site (site) at the Marine Corps Air Station (MCAS) El Toro, California. IT Corporation (IT) subcontracted Accord Engineering, Inc., to prepare this report on behalf of the Southwest Division Naval Facilities Engineering Command (SWDIV) under the Remedial Action Contract No. N68711-93-D-1459, Delivery Order Number 0112. Based on these findings and results, no further action in the vadose zone is proposed. The groundwater monitoring data appears to show that the extent of the dissolved-phase plume and the free product plume is relatively stable. We also propose to implement a long-term groundwater monitoring program to monitor the progress of natural attenuation and the extent of the free product and dissolved phase plumes.

1.1 Site Location

MCAS El Toro is located approximately 45 miles southeast of Los Angeles and 1 mile north of the intersection of Interstate Highways 5 and 405. The site is located in the northeast section of MCAS El Toro (Figures 1-1 and 1-2).

1.2 Site Geology and Hydrogeology

MCAS El Toro is located in the Peninsular Ranges geomorphic province near the southern boundary of the Tustin Plain. The Tustin Plain is a broad coastal plain that encompasses an area of approximately 103 square miles in Orange County, California. Ground elevation at the site varies from 370 to 380 feet above mean sea level.

The geology underlying the site consists of an intricate sequence of interfingering lenses of slightly to moderately indurated alluvial deposits consisting of clays, silts, and sands, with some gravel and cobble lenses or channel fills. The geologic units are not laterally continuous. The sand and gravel channels in the saturated zone can provide higher permeability pathways for contaminants to migrate.

Drilling and monitoring records dating back to 1990 at the site indicate that the depth to groundwater has been from 180 to 210 feet below ground surface. Groundwater levels have risen since 1994 at an approximate rate of 2 feet per year. The shallow groundwater levels at the site were at approximately 183 to 194 feet of mean sea level based on the monitoring data in March 2000. Details of groundwater elevations and contour maps are discussed in the following sections.

Section 2

Site Assessment Activities

Previous activities at the site are discussed in the following section.

2.1 Site History

Tank 398 was installed in 1960 and was used to store and dispense jet propellant (JP)-5 jet fuel. The Tank 398 refueling facility consisted of one 108,000-gallon underground storage tank connected to the four fueling islands via a 14-inch-diameter underground pipeline (Figure 2-1).

2.2 Tank and Pipeline Removal

Integrity testing of Tank 398 and associated pipeline was performed from December 1988 to March 1989. A leak was detected in a 14-inch-diameter product distribution line, approximately 20 feet north of the vacuum pit (Figure 2-1). Also in the Tank 398 area, a sand-filled sump (or a dry well) historically was used to drain excess JP-5 prior to 1972. The leaking pipe and dry well appear to be the major sources contributing to soil and groundwater contamination at the site. Tank 398 with its associated piping was removed in 1993 (Southwest Division Naval Facilities Engineering Command, 1991).

2.3 Site Investigations

As part of a refueling system upgrade, a soil characterization study was conducted in the vicinity of Tank 398 in August 1988. Petroleum-hydrocarbon contamination was identified in the soil adjacent to the tank. A series of investigations, including soil borings and groundwater sampling, were subsequently conducted to assess the extent of contamination. Some of the borings were converted into groundwater monitoring wells.

In summary, 24 groundwater monitoring wells were installed at the site between 1990 and 1993. The wells were constructed of 4-inch or 6-inch-diameter Schedule 40 polyvinyl chloride (PVC) casing. The total depths of these wells ranged from 231 to 253 feet below ground surface. Screened intervals ranged from 25 to 50 feet in length, with the top of the screens predominantly set at approximately 200 feet below ground surface. Well construction information is provided in Table 2-1.

The previous soil boring locations are shown in Figures 2-1 and 2-2. The lithology and sampling results are illustrated in geologic cross-sections A-A' and B-B' in Figures 2-3 and 2-4, respectively. The locations of groundwater monitoring wells are shown in Figure 2-5. The results from each of the investigations are briefly summarized below.

Site Investigation in 1988 – Six shallow soil borings (B1 through B6 as shown in Figure 2-1) were drilled. Total recoverable petroleum hydrocarbon (TRPH) concentrations were detected in soil samples collected to a depth of at least 45 feet.

Site Investigation in 1989 (Southwest Division, Naval Facilities Engineering Command, 1991) – Fourteen soil borings were completed to depths of 82 to 242 feet (SB398-01 through SB398-10, SB398-12, SB398-13, SB398-03D, and SB398-06D as shown in Figure 2-2). Among the 14 soil borings, 7 were subsequently completed as groundwater monitoring wells (MW398-01 through MW398-06 and MW398-08, as shown in Figure 2-5). Relatively high concentrations of TPH and benzene, toluene, ethylbenzene, and total xylenes (BTEX) were detected in groundwater samples collected beneath and downgradient of Tank 398. Free product was detected in well MW398-02.

Site Investigation between November 1991 and February 1992 (Southwest Division, Naval Facilities Engineering Command, 1992) – Two soil borings (SB398-22 and SB398-23) were completed to depths of 90 to 100 feet. Eleven groundwater monitoring wells were also installed (MW398-09, MW398-10, MW-398-11, MW398-12, MW398-13, MW398-13D, MW398-14, MW398-15, MW398-16, MW398-17, and MW398-18 as shown in Figure 2-5). Samples taken from the drilled soil borings indicated residual TPH and BTEX concentrations were present in the interfingering lenses of fine-grade deposits.

Aquifer Pump Test and Sand Channel Investigation in 1993 (Southwest Division, Naval Facilities Engineering Command, 1993a) – Six groundwater monitoring wells (MW398-19, MW398-20, MW398-21, MW398-25, MW398-26, and MW398-27 as shown in Figure 2-5) were installed. Groundwater flow direction was generally to the northwest at a gradient of 0.0085 foot per foot (ft/ft). Average transmissivity for the aquifer beneath the site was estimated at 0.3 square feet per minute (ft²/min), and average storativity was estimated at 0.007. The average hydraulic conductivity was 12 feet per day (ft/day). The calculated average velocity of groundwater flow was 0.5 ft/day. Free-product plume was migrated along sand and gravel lenses at or above the water table and capillary fringe, which were in the northeasterly and southeasterly directions.

Continuous Groundwater Monitoring from January 1996 through August 1997 (Southwest Division, Naval Facilities Engineering Command, 1996, 1997a, 1997b, 1997d) – Groundwater samples were taken quarterly from January 1996 through April 1998 from selected monitoring wells at the site to assess the progress of natural attenuation and monitor the extent of groundwater contamination. The most recent groundwater sampling event was conducted in June 2000. The groundwater quality data from 1996 through 2000 are presented in Appendix A.

BTEX constituents were detected in the groundwater samples collected from most of the wells, except for MW398-21. Benzene was detected at least once in all the monitoring wells, except MW398-21. Detected benzene concentrations ranged from approximately 1 micrograms per liter (µg/L) to a maximum detected concentration of 2,200 µg/L in well ASMW-01. Toluene, ethylbenzene, and xylenes were detected in concentrations below the 1999 Region 9 primary remediation goals (PRGs).

Methyl tert-butyl ether (MTBE) was detected in the groundwater samples from monitoring wells MW398-01, 04, 05, 06, and 17. The maximum concentration detected was 19⁰⁰ μg/L in the groundwater sample from MW398 05 in March 1998. MTBE was not detected in concentrations equal to or above the California primary MCL (May 2000), 13 μg/L, in groundwater samples collected from any other well during the sampling program in June 2000. MTBE was detected in MW398-01, which is hydrologically upgradient of Tank 398 and the dry well. As a result of the upgradient detection, and the fact that fuels containing MTBE were not used at the site, the source is not thought to be Tank 398.

2.4 Extent of Petroleum Contamination

The previous site investigations indicate that residual TPH and BTEX were detected in the vadose zone and groundwater at the site. In addition, free-floating product of JP-5 was detected in certain groundwater monitoring wells. The distribution of petroleum contamination was discussed in two project status reports (Southwest Division, Naval Facilities Engineering Command, 1997e and 1998) and is briefly summarized below.

2.4.1 Extent of Vadose Zone Contamination

Prior to 1993, TPH as JP-5 presented in the vadose zone and extended to a depth of approximately 205 feet, where the capillary fringe was encountered. TPH concentrations ranged from 37,000 milligrams per kilogram (mg/kg) at a depth of 40 feet to 52,000 mg/kg at a depth of 200 feet. The relatively high TPH concentrations may represent free-phase liquid hydrocarbon retained above and within the fine lithologic units of silt and silty clay.

The 200-foot-thick vadose zone significantly affects the distribution and migration of hydrocarbons (primary free product) to the saturated zone. As shown in Figure 2-3, and Figure 2-4, free product migration is considered to be controlled by the site lithology. Free product migration traveled vertically downward in relatively permeable sand and gravel units and spread laterally in the less permeable silt and silty clay units. The highest relative hydrocarbon concentrations were found in these fine materials.

2.4.2 Extent of Free-Product Contamination

JP-5 fuel has migrated through the vadose zone forming a free-product layer on top of the groundwater table and an aqueous-phase dissolved plume. The thickness of the free product at the site has ranged from 0.1 foot to 12.3 feet, as shown in Figures 2-5 and 2-6. After 1998, the monitoring of free-product plume was ceased because most of the screens of groundwater monitoring wells were submerged due to the rising groundwater level since 1994. Wells with free product in the well bore, but with the screen submerged, are labeled FP-NM in Figures 2-5 and 2-6.

Free product located in a coarse-grain sand to gravel unit was interpreted to be a channel-fill structure. The plume shape was believed to be semiconstrained in the buried channel feature. Groundwater underlying the site has risen over 15 feet, causing the free product to also rise so that it is currently located in a low permeable silty zone, which also restricts its migration. The

product has retained its elongated shape, transecting the groundwater gradient approximately 30 degrees to the southwest.

2.4.3 Extent of Dissolved-Phase Contamination

The distributions of TPH and benzene concentrations in the groundwater are illustrated in Figures 2-5 through 2-7. As shown in the figures, the size of the dissolved-phase plume appears to be stable without significant evidence of off-site migration. The petroleum hydrocarbon-impacted groundwater did not extend beyond wells MW-13D and MW-12 in the downgradient direction and beyond wells MW27 and MW9 in the upgradient direction.

Groundwater samples were collected in June 2000 from the perimeter monitoring wells MW398 01, MW398 04, MW398 09, MW398 12, MW398 13 and 13D, MW398 17, MW398 21, and MW398 27, and submitted for laboratory analyses. Analysis of groundwater samples suggests that the analytes TPH as gasoline (TPHg) and benzene are more limited in areal extent and lower in concentration than in previous sampling events (Figure 2-7 and Appendix B). Benzene was detected in groundwater samples collected from two monitoring wells: MW398-01 (11 µg/L in the primary sample and 22 µg/L in the duplicate sample) and MW398-17 (21 µg/L). TPHg was detected in groundwater samples from MW398-01 (1.6 milligrams per liter [mg/L]) and MW398-04 (0.85 mg/L). The evaluation of the TPHg data indicates no significant change in these wells.

Groundwater level measurements and free-product gauging, conducted in March 2000, indicate that the free-product thickness measured in recovery well RW398 02 is 2.93 feet thick (Figure 2-7). The screen in this well is not submerged. Free-product thickness has decreased 6.7 feet, from 9.6 feet in 1997 to the current 2.9 feet.

Based on the extent of contamination discussed above, a site-specific conceptual model was developed to illustrate the suspected causes of contamination and the distribution of TPH in the subsurface (Figure 2-8). This model was used to assess the appropriate remedial technologies that were implemented at the site.

Section 3

Remedial Goals and Corrective Actions

Remedial goals and corrective actions are discussed in the following section.

3.1 Remedial Goals

A comprehensive remediation strategy was implemented at the site to remediate soil and groundwater contamination present since 1996. The following factors were considered during the development of remedial goals:

- The horizontal distance to the nearest two groundwater wells (TIC-55 and TIC-111) is approximately 1 mile. Well TIC-55 is located on the MCAS property near IRP Site 14, and the screened interval is from 300 to 497 feet below ground surface. Well TIC-111 is located adjacent to the northwest perimeter (off MCAS property) and the screened interval is from 200 to 750 feet below ground surface. The two wells are designated as active production wells for irrigation purposes. The water of the aquifer is designated for beneficial use, although the groundwater quality is impacted with high total dissolved solids, nitrate, and chlorinated organic compounds. The groundwater in the immediate vicinity of the plume is not used for human consumption, irrigation, or industrial processing.
- Free product presented in several low-permeability lenses in the vadose zone at a depth starting at approximately 25 feet below ground surface and extending to the groundwater table. BTEX were not detected in the upper 25 feet of the vadose zone.
- The calculated average velocity of groundwater flow was approximately 0.5 foot per day. The migration of dissolved-phase plume and free product appeared to be limited.

A preliminary risk assessment was conducted to evaluate the potential risks of exposure by human receptors (Southwest Division Naval Facilities Engineering Command, 1992). BTEX was identified as the four chemicals of concern. Because the chemicals of concern were not detected in the top 25 feet of soil, three potential exposure pathways were eliminated (dispersion in air via wind erosion or volatilization, direct contact with soil, and dispersion in surface water). The only identified pathway of potential exposure was dispersion in groundwater. In addition, any additional excavation or water extraction at the site could potentially expose receptors to the chemicals of concern.

The site is underlain by a complex stratigraphy composed of interlayered lithic units with low, moderate, and high permeability. As a result of the preliminary risk assessment and the complex lithology at the site, a phased approach of remediation was considered. In the first phase of remediation, the goal was established to remove as much free product and VOCs as is economically and technically practical using active systems. When the active remediation systems reach their technical limitations, an engineering evaluation will be conducted to assess whether natural attenuation is active at the site and can effectively control the off-site migration

of the residual contamination. If the evaluation results were positive, a semiannual groundwater monitoring program will be implemented to monitor the progress of natural attenuation of the residual free product and dissolved-phase groundwater plume. This monitoring program will be implemented until the free product is removed and the dissolved phase concentrations of BTEX achieve the "low risk" site cleanup criteria as proposed by Lawrence Livermore National Laboratory (LLNL) report (LLNL, October 1995) and the California Regional Water Quality Control Board, Santa Ana Region (RWQCB) (RWQCB, January 26, 1996). The proposed cleanup levels for low risk sites are:

Benzene	250 ppb
Toluene	300 ppb
Ethylbenzene	680 ppb
Xylene	1,750 ppb

It is also proposed that on-site groundwater extraction for any beneficial use be prohibited until the remedial goal is reached. If the evaluation results are negative, other remedial measures may be considered based on the engineering evaluation of effectiveness, implementability, and cost-benefit analysis.

In the first phase of remediation, a soil-vapor extraction system was implemented to remediate the VOCs in the vadose zone. An automated recovery system was installed to recover the floating product on the top of groundwater. A network of wells was implemented to monitor the progress of natural attenuation of the dissolved-phase groundwater plume. To date, approximately 18,000 gallons of TPH were removed from the vadose zone using the soil vapor extraction (SVE) system and 10,000 gallons recovered using an automatic free-product recovery system. However, the active systems have reached their technical limitations and are no longer cost-effective. In addition, the historical groundwater monitoring data indicate that natural attenuation is effectively controlling the migration of the dissolved-phase plume. An engineering evaluation was conducted according to the original remediation approaches and the evaluation results are presented below.

3.2 Soil-Vapor-Extraction

An SVE system was implemented to remediate the TPH contamination in the vadose zone at the site. The SVE system used vertical wells to remove vapor-phase VOCs from the subsurface and conveyed the extracted vapor through a network of piping to an aboveground system for treatment. A thermal/catalytic oxidizer unit was used to oxidize the VOCs in the extracted vapor before discharge to the atmosphere.

The locations of SVE wells are shown in Figure 3-1. The vapor extraction wells are constructed of 2-inch or 4-inch-diameter PVC or stainless steel wire-wrapped screen with a screen slot size of 0.020 inch and PVC blank casing. Monitoring well MW398-18 is a 6-inch-diameter well that was also connected to the SVE system. The maximum depth of these wells is approximately 244 feet below ground surface, with screened intervals ranging from 30 to 244 feet below ground surface. Table 3-1 provides a detailed specification of these wells. Details of the system design and performance are described below.

3.2.1 Vapor Extraction Pilot Test

An SVE pilot test was conducted in 1993 using three vapor extraction wells (SVE398-22, SVE398-23, and SVE398-24). Based on the pilot test data (Southwest Division, Naval Facilities Engineering Command, 1993b), a radius of vacuum influence of 28 feet was used to design and construct a full-scale SVE system in 1996.

3.2.2 Full-Scale Vapor Extraction and Treatment System

The full-scale system constructed in 1996 included an additional eight vapor extraction wells (SVE398-18, SVE398-27, SVE398-28/29/30, SVE398-31, and SVE398-32/33). Wells SVE398-28/29/30 and SVE398-32/33 are nested wells with multiple well casings installed into a single borehole.

The aboveground treatment system consisting of a vacuum blower, moisture knockout pot, a thermal/catalytic oxidizer unit, and associated control sensors and instruments, extracted and treated the soil vapor before discharge to the atmosphere. Two thermal/catalytic units were used for this project and one was rated at 500 standard cubic feet per minute (scfm) vapor flow rate and another at 400 scfm at a maximum vacuum of 110 inches of water column. The system was operated under air discharge permits (Permit No. F01210, and F8226) issued by the South Coast Air Quality Management District (SCAQMD).

The oxidizer unit was initially operated under the thermal mode, which combusted the vapor in a combustion chamber at 1,450 degrees Fahrenheit (°F). The system was switched to the catalytic mode, which oxidized the VOCs in a catalyst chamber at 750°F, when the VOC concentrations in the extracted vapor were reduced to below approximately 3,500 parts per million by volume (ppmv). Propane was used as supplementary fuel to operate the system. The propane was supplied from an on-site 1,000-gallon tank.

3.2.3 System Performance

The SVE system was operated from September 1996 to February 1999 and removed approximately 18,000 gallons, or 124,000 pounds, of petroleum hydrocarbons. (Details of the operation data and engineering evaluation information can be found in two reference documents: Southwest Division, Naval Facilities Engineering Command, 1997c, 1998). A table of SVE operation data is attached in Appendix B. The concentration changes of benzene and TPH in the SVE inlet are illustrated in Figure 3-2.

The vacuum measured at each operating extraction well has ranged from 25 to 80 inches of water. Vapor flow rates at the wells ranged from 3 to 171 scfm. Inlet vapor flow rates to the oxidizer ranged from 432 to 471 scfm. Tedlar bag samples were taken periodically from the inlet of the thermal treatment unit and the discharge and were analyzed in stationary laboratories to evaluate the remedial progress and the system efficiency. Concentrations of TPH and benzene at the inlet of the SVE system, determined by the Tedlar-bag sampling and U.S. Environmental Protection Agency (EPA) TO-3 testing results, are illustrated in Figure 3-2.

The inlet TPH concentrations were maintained at approximately 10 mg/L (or 10,000 µg/L) due to the presence of free-phase liquid hydrocarbon retained within the fine lithologic units of silt

and silty clay in the vadose zone. However, based on the carbon-chain analysis data of the Tedlar bag samples, the molecular weight of the hydrocarbons in the extracted vapor increased from 105 to 130 during the operational period from September 1996 to July 1998. This information indicates that the light-end of hydrocarbons was efficiently removed by the SVE system. The changes in benzene concentrations, as shown in Figure 3-2, also reflect this fact. The benzene concentrations showed a trend of significant reduction from the initial 181 $\mu\text{g/L}$ in October 1996 to 0.2 $\mu\text{g/L}$ in October 1998. The benzene concentrations rebounded to 3.2 $\mu\text{g/L}$ in November 1998 because the system operation was ceased approximately for 3 weeks for system repair and maintenance. Based on the operational data, we can conclude that the SVE system has successfully removed the volatile portion of the residual hydrocarbons from the vadose zone, especially benzene.

The costs incurred for the operation of the SVE system included the costs for SVE equipment rental, supplemental fuel, sampling, maintenance parts, field labor, and office engineering. As a result of the reduced amount volatile organic compounds that can be extracted from the subsurface, the unit cost of system operation has increased and is no longer cost-effective. The causes for the increase of unit cost are mainly because more supplementary fuel was required for the thermal treatment unit.

3.3 Free-Product Recovery

A product recovery pilot test was conducted in 1991 using well MW398-02 (Southwest Division, Naval Facilities Engineering Command, 1993c). The field data indicated that the factors controlling free product migration were more related to the type of sediments at the water table than to groundwater gradient. A sand channel encountered in MW398-01, 02, and 18 appeared to be a preferential flow path.

A full-scale automated removal system, including two additional wells (RW398-01 and 02), was designed and installed based on the pilot testing data. (Southwest Division, Naval Facilities Engineering Command, 1995). The system consisted of pneumatic pumps installed in selected wells and a system of steel pipes to transport fluids from the well to a 4,000-gallon aboveground tank. Product recovery pumps were installed at different times in a total of nine wells (MW398-02, 04, 10, 18, 19, 25, and 26, and RW398-01 and 02). Manual bailing of free product occurred, on occasion, in each of the nine wells, and in wells MW398-01 and MW-398-03.

Operation of the free-product removal system began on December 1995. Bio-fouling and buildup of slimy bio-film in the pump intakes resulted in a limited removal of free product. These conditions led to the temporary removal of the pump in February 1996 and the subsequent manual bailing of free product from specific wells. A well rehabilitation program was conducted from October to December 1996 in six selected wells (MW398-01, 02, 10, 18, and 19 and RW398-01) to remove the biologic buildup from the well screens (Southwest Division, Naval Facilities Engineering Command, 1997e). The product recovery rates increased significantly after well rehabilitation. Approximately 10,000 gallons, or 69,000 pounds, of free product have been removed to date. Details of recovery data are presented in Appendix C.

3.4 Natural Attenuation of Groundwater

Groundwater sampling and analysis were conducted on a routine basis on selected monitoring wells that did not contain measurable free product. The monitoring was conducted from November 1995 through June 2000 (Southwest Division, Naval Facilities Engineering Command, 1997d, 1997e, 1997f). The monitoring data are summarized in Appendix D. The review of historical monitoring data indicates that natural attenuation has been occurring since 1995, the first year having available groundwater monitoring data.

The evidence of natural attenuation was evaluated based on a guide for remediation by natural attenuation at petroleum release sites developed by American Society for Testing and Materials (ASTM Standard E1943-98) in 1998 (American Society for Testing and Materials, 1998). The guide suggests the demonstration of natural attenuation may include primary, secondary, and additional lines of evidence:

- *Primary Lines of Evidence* – including contaminant data is used to define the plume as shrinking, stable, or expanding.
- *Secondary Lines of Evidence* – including geochemical indicators of naturally occurring biodegradation and estimates of natural attenuation rate.
- *Additional Lines of Evidence* – including modeling, estimates of assimilative capacity (to estimate the mass of BTEX degraded), and microbiological studies.

For sites that have sufficient historical monitoring data, primary lines of evidence will often be adequate to demonstrate natural attenuation. In the Tank 398 site, all three lines of evidence of natural attenuation were noted based on the data collected from the groundwater monitoring events, the well rehabilitation program, and an air sparging pilot test. Details of the evidence are discussed below.

3.4.1 Primary Lines of Evidence

Monitoring data for the dissolved hydrocarbon plume typically included collection of groundwater samples for laboratory analysis of TPH as gasoline, TPH as diesel, TPH as JP-5, BTEX, and MTBE. The concentration changes of TPH as diesel and benzene from 1996 to 2000 are illustrated in Figures 3-3 and 3-4, respectively. As shown in the figures, the dissolved-phase plume has essentially remained the same size.

The plume migration rate could be estimated based on the following equation:

$$V_c = \frac{V_x}{1 + \rho K_d / n} = \frac{V_x}{R}$$

Where

- V_c = Average velocity of contaminant parallel to groundwater flow
- V_x = Average linear groundwater velocity parallel to groundwater flow

- ρ = Bulk density of soil, 1.6 kg/L for sand (Table C.3.2, Air Force Center for Environmental Excellence, Technology Transfer Division, 1995)
- K_d = Distribution coefficient, an indicator of tendency of a chemical to be sorbed to the solid phase in a solid-liquid system
- n = Total porosity of soil, average 0.4 for sand (Table C.3.2, Air Force Center for Environmental Excellence, Technology Transfer Division, 1995)
- R = Coefficient of retardation

The average linear groundwater velocity, V_x , can be estimated based on the following equation:

$$V_x = -\frac{K}{n} \frac{\partial h}{\partial l}$$

Where

- K = Hydraulic conductivity, 12 ft/day based on the pumping test data (Southwest Division, Naval Facilities Engineering Command, 1993d)
- $\partial h/\partial l$ = Hydraulic gradient, 0.0085 feet per foot (ft/ft) (Southwest Division, Naval Facilities Engineering Command, 1993d)

The derived site-specific hydraulic conductivity of 12 ft/day falls in the range for silty sand to clean sand (Table 2.3, Freeze and Cherry, 1979). The distribution coefficient can be estimated based on the following equation:

$$K_d = K_{oc} f_{oc}$$

Where

- K_{oc} = Adsorption coefficient expressed on an organic carbon basis
- f_{oc} = Mass fraction of organic carbon in soil, approximately 0.1 percent for sandy soil (Southwest Division, Naval Facilities Engineering Command, 1993d)

Based on these two equations, the average velocity of BTEX migration can be calculated as in the following table:

Compound	K_{oc} (L/kg)	f_{oc}	ρ (kg/L)	N	R	V_x (ft/yr)	V_c (ft/yr)
Benzene	79	0.0010	1.6	0.4	1.32	93.08	70.73
Toluene	190	0.0010	1.6	0.4	1.76	93.08	52.88
Ethylbenzene	468	0.0010	1.6	0.4	2.87	93.08	32.41
m-xylene	405	0.0010	1.6	0.4	2.62	93.08	35.52
o-xylene	422	0.0010	1.6	0.4	2.69	93.08	34.63
p-xylene	357	0.0010	1.6	0.4	2.43	93.08	38.33

Source: (Tables C.3.2, C.3.3, and C3.4, Air Force Center for Environmental Excellence, Technology Transfer Division, 1995)

ft/yr - feet per year
 kg/L - kilograms per liter
 L/kg - liters per kilogram

As shown in the calculations, benzene would migrate the fastest among the BTEX compounds, which is one of reasons that was selected as the indicator for our discussions in this report. The distance from the dry well, the suspected source of contamination, to the downgradient wells, MW398-12 and 13, is approximately 320 and 500 feet, respectively. Assuming the leaking fuel reached the groundwater in 1989 (the first available investigation data), the benzene plume would migrate approximately 750 feet downgradient. However, the groundwater monitoring data since 1996 indicate that TPH and BTEX were below the laboratory detection limits in wells MW398-12 and 13. The results of this engineering calculation demonstrates that natural attenuation has been occurring and is effectively retarding the migration of the dissolved-phase plume.

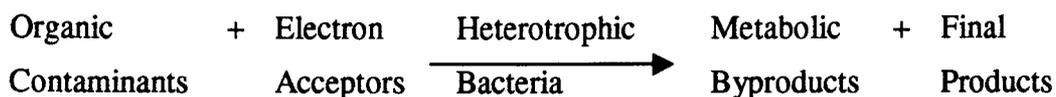

3.4.2 Secondary Lines of Evidence

The indicators of naturally occurring biodegradation include the following (American Society for Testing and Materials, 1998):

Indicator	Concentration Trend During Biodegradation	Indicator	Concentration Trend During Biodegradation
Dissolved Oxygen	Decrease	Oxidation/Reduction Potential	Decrease
pH	6-8	Manganese	Increase
Temperature	N/A	Alkalinity	Increase
Conductivity	Increase	Methane	Increase
Nitrate	Decrease (denitrification)	Carbon Dioxide	Increase
Sulfate	Decrease (sulfate reduction)	Ferrous Iron	Increase (Iron III reduction)

Dissolved oxygen concentrations define aerobic versus anaerobic conditions. Oxidation/reduction potential identifies oxidizing versus reducing conditions in groundwater. Nitrate and sulfate may serve as electron acceptors after dissolved oxygen is consumed. Carbon dioxide, methane, ferrous iron, manganese, and alkalinity are the products of aerobic or anaerobic biodegradation of petroleum hydrocarbons.

Microorganisms transform organic molecules, such as TPH and BTEX, and obtain carbon and energy from these substrates for survival, growth, and reproduction. Dissolved oxygen in the groundwater will be consumed first in a process called aerobic respiration. In the aerobic respiration process, oxygen molecules serve as electron acceptors to bind with the electrons generated from the food breakdown process. In the absence or near absence of dissolved oxygen and in the order presented, nitrate, manganese, ferric iron, sulfate, or carbon dioxide may serve, if available, as electron acceptors in a process called anaerobic respiration. The biodegradation process can be explained as the following reaction:

Geochemical data were also collected in several rounds of sampling from May 1996 to January 1997 and in April 2000 (Appendix D). Data of dissolved oxygen, ferrous iron, carbon dioxide, and methane were not available. However, the results of nitrate, manganese, total iron, sulfate, and alkalinity indicate the evidence of natural attenuation. The concentration changes of these natural attenuation indicators in 1996, 1997, and 2000 are illustrated in Figures 3-5 through 3-7, respectively.

The changes of nitrate, manganese, and sulfate were significant to demonstrate the evidence of natural attenuation. As shown in the figures, the background concentrations of nitrate were approximately 5 to 10 mg/L. The nitrate concentrations in the contaminated area were below the laboratory detection limit of 0.5 mg/L. The manganese data also indicated similar results. The background concentrations of manganese were approximately 10.6 to 17.5 mg/L, while the levels in the contaminated area were approximately 376 to 1,180 mg/L. These results demonstrate that anaerobic respiration occurred after the depletion of dissolved oxygen. Both nitrate and manganese, the next two sources of electron acceptors for microorganisms, were also depleted within the contaminated plume.

Sulfate is the next available electron acceptor after depletion of nitrate, manganese, and iron in anaerobic biodegradation. As shown in the figures, the background concentrations in both the upgradient and downgradient wells, away from the plume, were in the range of 117 to 158 mg/L in May 1996, 125 to 225 mg/L in April 1997, and 138 to 169 mg/L in July 2000. The sulfate concentrations in the contaminated plume area were in the range of 32 to 100 mg/L in May 1996, 13 to 68 mg/L in April 1997, and 32 to 58 in July 2000. These data demonstrate that sulfate is currently the available source of electron acceptors for natural attenuation.

A similar trend of increasing alkalinity concentrations in the contaminated plume can also be found in the historical groundwater monitoring data. In addition, the data of total iron concentrations also indicate a trend of accumulation within the plume area.

It is difficult to estimate the total mass of petroleum hydrocarbons that has been biodegraded at the site because some of the factors could not be accurately estimated, such as the rate of free product dissolved into groundwater and the surface contact area between the dissolved-phase plume and clean groundwater. However, the data demonstrate that the size of free product and dissolved-phase plume has reached a steady state without further expansion, thus indicating the migration rate of petroleum hydrocarbons is equivalent to the biodegradation rate at the plume boundary. The rate of biodegradation at the plume boundary can be estimated as noted in the following table:

Electron Acceptor	Background Concentration (mg/L)	Concentration in Core of Plume (mg/L)	BTEX Degraded by Natural Attenuation (mg/L) ^a
Dissolved Oxygen	7 ^b	0.2 ^b	2.2
Nitrate	8 ^c	0 ^c	1.7
Iron (II) ^d	0.043 ^c	3.92 ^c	0.2
Manganese	0.015 ^c	0.75 ^c	0.04
Sulfate	150 ^b	35 ^c	24
Total			28.1

- a. From a mass balance standpoint, the potential mass of BTEX biodegraded by respiration is given by:

$$BTEX_{bio} = A (O_b - O_m)$$

where:

$BTEX_{bio}$ = Reduction in BTEX concentrations via natural attenuation (mg/L)

A = mg/L BTEX biodegraded per mg/L of electron acceptor consumed according to the stoichiometry; A = 0.32 for dissolved oxygen, 0.21 for nitrate, -0.06 for manganese, -0.05 for iron (II), and 0.21 for sulfate (Table B.5.5, Air Force Center for Environmental Excellence, Technology Transfer Division, 1995)

O_b = Background concentration of electron acceptor (mg/L)

O_m = Measured concentration of electron acceptor in the core of plume (mg/L)

- b. July 2000 groundwater monitoring data
c. April 1997 groundwater monitoring data
d. Ferrous iron concentrations were assumed based on total iron concentrations in Appendix C:

The above table demonstrates that approximately 28 mg/L of BTEX will be biodegraded due to the supply of electron acceptors from the surrounding non-impacted groundwater. The amount of BTEX biodegraded could be estimated as described below.

For a conservative estimate, the supply of the electron acceptors only occurs at the upgradient interface of the plume and fresh groundwater in a vertical cross-sectional area of 300 feet wide by 20 feet deep (estimated based on the benzene plume and geochemical figures). Groundwater flow direction was generally to the northwest at a gradient of 0.0085 ft/ft. The average hydraulic conductivity was 12 ft/day (Southwest Division, Naval Facilities Engineering Command, 1993d). The groundwater flow rate at the interface can be calculated based on Darcy's Law:

$$Q = -K (dh/dl) A = 612 \text{ cf/day} = 1.73 \times 10^4 \text{ L/day}$$

where:

- Q = Groundwater flow rate
 K = Hydraulic conductivity (12 ft/day)
 dh/dl = Hydraulic gradient (-0.0085 ft/ft)
 A = Upgradient cross-sectional area perpendicular to the groundwater flow
 (300 ft x 20 ft)

The amount of BTEX biodegraded would be

$$M = Q \text{ BTEX}_{bio} = (1.73 \times 10^4 \text{ L/day}) (28 \text{ mg/L}) = 4.85 \times 10^5 \text{ mg/day} = 1.1 \text{ lb/day}$$

3.4.3 Additional Lines of Evidence

Heterotroph is the microorganism that utilizes organic compounds for its energy and carbon requirements. The levels of heterotrophic bacterial population in the groundwater samples were determined during a well rehabilitation program and one round of groundwater sampling. The sampling results are summarized in Table 3-2. The levels of heterotrophic bacterial (bacteria that uses organic carbon as an energy source) population were in the order of 10^5 to 10^8 colony-forming unit per milliliter of groundwater (cfu/mL) in wells RW398-01 and 02, MW398-01, 02, 10, and 19 (Southwest Division, Naval Facilities Engineering Command, 1997g). In addition, bacteria counts of groundwater samples were conducted in the December 1997 monitoring event. The levels of heterotrophic bacteria population were in the order of 10^2 to 10^3 cfu/mL in the upgradient and downgradient wells (MW398-09, 12, 13D, and 27), away from the dissolved-phase plume (Appendix B). The levels of heterotrophic bacteria population within the plume are approximately 100 to 1,000 times higher than those outside of the plume, which provides direct evidence of natural biodegradation of TPH in the groundwater.

Section 4

Confirmatory Soil Sampling

Confirmatory soil sampling was conducted in January 2000 and in June 2000 to provide a basis to assess current conditions in the vadose zone and evaluate the effectiveness of SVE remediation in the vadose zone. The initial confirmatory sample borings CB398 01, CB398 02, CB398 03, CB398 10, CB398 11, CB398 28, were implemented to sample the vadose zone from approximately 40 feet below ground surface to the groundwater table (approximately 180 feet). These data were intended to evaluate the potential for residual contaminant concentrations to impact groundwater quality. Appendix D presents the geologic logs and Appendix E contains the analytical reports.

The shallow confirmatory soil borings, SCB 01, SCB 02, SCB 03, SCB 10, SCB 11, SCB 27, SCB 28, and HP1, were implemented to collect soil samples in the vadose zone from ground surface to a 40-foot depth. Borings SCB 02, 03, 10, 11, and 28 were advanced in proximity to the CB398 boring locations having the same number, in order to provide continuity with deeper vadose zone soil data. Borings SCB 01, SCB 27, and HP1 were implemented to expand information about the shallow vadose zone surrounding Tank 398. The data were intended to evaluate residual contaminants in the shallow vadose zone above the apparent confining layer, and the potential to impact recipients on the surface.

The borings were advanced using hollow-stem auger techniques and soil samples were collected at predetermined depths using a California method split-spoon sampler. The samples were collected and screened with a photoionization detector (PID), a boring log was prepared, samples were labeled, documented, and submitted for laboratory analysis following the *Tank 398 Sampling Strategy, OHM 2000*. The boring number, sample number, sample depth, and laboratory analytical results are summarized in Table 4-1. The boring locations are shown in Figure 4-1.

Evaluation of the soil analytical results indicates that the shallow vadose zone from ground surface to an approximate 20-foot depth is largely free of the target analytes: TPHg and benzene. In the area of a suspected leak at a 20-foot depth, south of the dry well, TPHg (1,300 mg/kg) and TPH JP5 (3400 mg/kg) were detected in the soil sample from SCB 28 and total petroleum hydrocarbons as diesel (TPHd) (900 mg/kg) was detected in the soil sample from CB398 02. There were no other detections of petroleum hydrocarbons or benzene at this depth or shallower.

The zone from 20-feet to 40-feet below ground surface reflects the presence of the relatively less permeable zone extending from approximately 35 feet to 60 feet below ground surface. The less permeable zone is composed of horizontally laminated silty clay that creates a perched-like zone, concentrating petroleum hydrocarbons. TPHg concentrations ranged from 1.1 mg/kg in boring SCB 01 to 8,500 in boring SCB 10. Benzene was detected in one sample, CB398 02 (1.8 µg/L leachate) at a 40-foot depth. The relatively impermeable layer appears to act as a barrier to product migrating downward and is thought to act as a barrier to vapors migrating upward.

In the interval from approximately 40 to 190 feet below ground surface, TPHg, TPHd, and TPH JP5 were all detected. Benzene was detected only once in soil sample CB398 10 (360J $\mu\text{g}/\text{kg}$) at 188 feet below ground surface.

The general interpretation of these data is that there are no significant residual constituents in the vadose zone shallower than at a 20-foot depth and very limited residual constituents between a 20- and 40-foot depth, as shown in the cross sections in Figure 4-2 and Figure 4-3. The occurrence of the less permeable stratigraphic layer extending from 35 feet to approximately 60 feet below ground surface acts as a perched layer to some residual petroleum hydrocarbons and as a barrier to soil vapor from the relatively high concentrations of petroleum hydrocarbons in the strata below a 60-foot depth.

Section 5

Conclusions and Recommendations

The following conclusions and recommendations were made based on the findings in previous investigation activities and results of corrective actions.

5.1 Conclusions

Tank 398, a former JP-5 storage tank, was removed in 1993 and the release of JP-5 from this site has been remediated using free product recovery techniques and SVE technology. Benzene, a primary risk driver for the site, is present in concentrations less than 0.5 percent by weight in JP-5 fuel and residual levels in the vadose zone have been significantly reduced as a result of the remediation projects. To date, approximately 18,000 gallons of petroleum hydrocarbons have been removed from the vadose zone using the SVE system and 10,000 gallons recovered using a free product recovery system. Benzene concentrations in the extracted soil vapor were reduced from the initial 181 µg/L in 1996 to 3.2 µg/L at the end of SVE operation in 1999.

Groundwater is located approximately 180 to 210 feet below ground surface at the site. The approximate dimensions of the dissolved-phase plume have remained relatively constant during the six years of groundwater monitoring. The groundwater gradient is north-northwest and the dissolved phase plume is aligned in this direction. The free product plume is not flowing in the direction of the regional gradient but is flowing toward the southwest along a channel deposit.

The active systems have reached their technical limitations and are no longer cost effective. Engineering evaluation indicates that natural attenuation is effectively controlling the migration of the dissolved phase plume. The levels of geochemical indicators in the groundwater clearly illustrate that natural attenuation has been occurring. Indigenous microorganisms are using available supplies of dissolved oxygen, nitrate, iron, manganese, and sulfate as the electron acceptors to biodegrade the petroleum hydrocarbon compounds in the water.

5.2 Recommendations

The SVE and free-product recovery system implemented has reached its limitation due to the lithology of the site. Future operation of the remediation system would no longer be cost-effective. In addition, the SVE system has successfully removed the TPH contamination in the upper 20 feet of soil in the vadose zone. The potential surface exposure to human receptors by the contaminated soil vapor has been shown to be negligible. In addition, the groundwater monitoring data indicated the groundwater plume has been stable since 1996. Therefore, no further action in the vadose zone is recommended.

It is recommended that monitored natural attenuation be implemented for a five-year period followed by long-term monitoring of the plume. The natural attenuation parameters will be evaluated on an annual basis and summarized in an annual monitoring report. It is also proposed

that on-site groundwater extraction for any beneficial use be prohibited until the remediation is completed.

A modified network of wells is proposed to monitor the progress of natural attenuation based on the historical groundwater monitoring data. Details of the proposed network are discussed below.

An effective monitoring well network is a key factor in the successful implementation of the natural attenuation approach for remediation of groundwater contamination. Groundwater levels have risen since 1994 at an approximate rate of 2 feet per year. The screen intervals of most of the existing older wells are currently submerged in groundwater, making them unusable for the original design functions. We have evaluated the current conditions of all monitoring wells and implemented measures to effectively monitor free product and the dissolved phase plume at this site, described in the following paragraphs.

The future monitoring network will include new wells, replacement wells, and existing wells. The new wells have been installed in locations with no existing wells. The replacement wells have been installed next to existing wells in strategic locations that have totally submerged screen intervals. Existing wells, strategically located and properly screened, may also be incorporated into the network.

In order to locate new wells, soil data from confirmation borings and shallow borings, groundwater data from existing wells, and Hydropunch samples were used to evaluate optimum monitoring locations. Figure 4-1 shows the shallow soil boring and hydropunch groundwater sample locations and the new and replacement groundwater monitoring well locations. Current conditions of the existing groundwater monitoring wells are summarized in Table 2-1. Details of the proposed well and boring locations are discussed below and summarized in Table 5-1.

New Wells – Three additional groundwater monitoring wells complete monitoring coverage in all directions for potential groundwater plume migration. As shown in Figure 5-2, well MW398-28 is located approximately 120 feet west of well RW398-01 to delineate the western extent of the free-product layer. Two wells are recommended to delineate the dissolved-phase plume: one (MW398-29) approximately 200 feet west of well MW 398-17, and one (MW398-30) approximately 100 feet northeast of well MW398-04. Hydropunch groundwater sampling was used to assess the final locations of these wells.

Replacement Wells – Two types of replacement wells were installed: boundary well MW398-19D, located near the center of the free-product layer and hot spot well ASMW3908-02D, located at the midpoint of the dissolved-phase plume.

Existing Wells – Six existing wells are recommended for incorporation into the future groundwater monitoring network. Four wells, (MW398-01, MW398-12, MW398-21, and MW398-27) will monitor groundwater quality at the edge of the plume. Well RW398-02 is located near the center of the free-product layer and well MW398-17 will monitor groundwater quality near the midpoint of the plume.

In summary, the proposed future groundwater monitoring network at the site consists of eleven wells as follows:

- Seven wells at the plume boundary (MW398-01, MW398-12, MW398-21, MW398-27, MW398-28, MW398-29, and MW398-30)
- Two wells at the hot spots (MW398-19D and RW398-02)
- Two wells at the midpoints of the plume (MW398-17 and ASMW-02D).

Note: All 4-inch wells are constructed with flush-threaded, Schedule 40 PVC. All 6-inch wells are constructed with flush-threaded, Schedule 80 PVC unless otherwise noted.

The screen slot size is 0.01 inch for all wells unless otherwise noted. All wells are flush mounted.

a - Well is constructed with flush-threaded steel pipe. The screen slot size is 0.020 inch.

b - Well is constructed with flush-threaded steel pipe and stainless steel screen. The screen slot size is 0.020 inch.

bgs - below ground surface

ID - identification

NA - not available

PVC - polyvinyl chloride

STA - Stollar and Associates

IT - International Technology Corporation

OHM - OHM Remediation Services Corp.

Legend:

- (a) - Reference point and elevation data was collected by Towill Surveying of Tustin, California. Data collected August 6, 1996, with the exception of 398RW-02 and 398SVE-34. Those wells were surveyed on No
- NA - Data not available for well
- SS - stainless steel
- PVC - polyvinyl chloride casing
- LCS - low carbon steel
- bgs - below ground surface
- ID - identification
- # - bentonite seal includes #0/30 transition sand for water wells
- * - triple-casing well
- ** - dual-casing well
- 398-SVE-27 - multiple screen completion well
- Multiple completion well - 398 SVE 28/29/30 and 398 SVE 32/33, multiple completion wells have stainless steel 5-foot by 2-inch diameter sumps installed directly below the screened zone.

Proposed Location	Status	Function	Justification
Proposed Soil and Hydropunch Sample Locations:			
SBC-1	Completed August 2000	Shallow soil sample boring	Provide shallow soil analytical data east of former TF398 tank, where no previous data was collected.
SBC-02	Completed August 2000	Shallow soil sample boring	Provide shallow soil analytical data at the CB398-02 location.
SBC-03	Completed August 2000	Shallow soil sample boring	Provide shallow soil analytical data at the CB398-03 location.
SBC-10	Completed August 2000		Provide shallow soil analytical data at the CB398-10 location.
SCB-11	Completed August 2000	Shallow soil sample boring	Provide shallow soil analytical data at the CB398-11 location.
SCB-27	Completed August 2000	Shallow soil sample boring	Provide shallow soil analytical data at the CB398-27 location.
SBC-28	Completed August 2000	Shallow soil sample boring	Provide shallow soil analytical data at the CB398-28 location.
HP-1	Soil boring Completed August 2000. Hydropunch sampling will be completed to obtain groundwater information.	Shallow soil sample and hydropunch groundwater sample	Provide shallow soil data in an area where no previous data exists and provide groundwater quality data to assist in placing proposed monitoring well MW398-30 at location NE of former 398 tank.
HP-2	New groundwater data location	Hydropunch groundwater sample	Provide groundwater quality data to assist in placing proposed monitoring well MW398-28 at SW boundary of plume
HP-3	New groundwater data location	Hydropunch groundwater sample	Provide groundwater quality data to assist in placing proposed monitoring well MW398-29 at NW boundary of plume
Proposed Groundwater Sampling Locations:			
MW398-01	Proposed existing monitoring well as part of the Monitoring Well Network	Monitor groundwater quality at the east boundary of plume.	Although the screen is submerged this well will provide some upgradient data about aqueous constituents. Free product plume is thought not to exist at this location.
MW398-21	Proposed existing monitoring well as part of the Monitoring Well Network	Provide background water quality data southeast and upgradient of the plume	Although the screen is submerged this well will provide upgradient data about aqueous constituents. Free product plume is not thought to exist at this location.

**Table 5-1
Proposed Boring and Well Locations**

Proposed Location	Status	Function	Justification
MW398-27	Proposed existing monitoring well as part of the Monitoring Well Network	Provide background water quality data south and upgradient of the plume	Although the screen is submerged this well will provide upgradient data about aqueous constituents. Free product plume is not thought to exist at this location.
MW398-12	Proposed existing monitoring well as part of the Monitoring Well Network	Monitor groundwater quality North and downgradient of the plume	This well has a proper screened interval and could monitor a free product plume.
MW398-17	Proposed existing monitoring well as part of the Monitoring Well Network	Monitor groundwater quality on the Western boundary of the plume	Although the screen is submerged this well will provide mid plume data about aqueous constituents.
RW398-02	Proposed existing monitoring well as part of the Monitoring Well Network	Monitor groundwater quality at the center of the plume "hot spot."	Existing well in good shape with proper screened interval. This well was located in the center of plume with the greatest free product thickness.
ASMW398-02D	Proposed Replacement Well	Monitor groundwater quality near the north edge of the free product plume and within the aqueous plume	The ASW well data provides historic continuity. The well must be replaced because the top of the screen in the original well is submerged, making it impossible to measure freeproduct.
MW398-19D	Proposed Replacement Well	Near the south edge of the free product plume and within the aqueous plume	The MW well data provides historic continuity. The well must be replaced because the top of the screen in the original well is submerged, making it impossible to measure free product.
MW398-28	Proposed New Well	Monitor Northeast plume boundary	New well in area where no wells are located currently. Monitor potential extent of plume into that area.
MW398-29	Proposed New Well	Monitor Northwest plume boundary	This well will be installed if data from the MW398-17 well indicates the presence of the plume constituents.
MW398-30	Proposed New Well	Monitor Southwest plume boundary	

Appendix A
Groundwater Monitoring Data

Subject: Laboratory Report
Project: MCAS El Toro/18609/D.O. 70

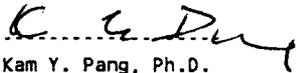

Enclosed is the Laboratory report for samples received on
06/20/00. The data reported include :

Sample ID	Control #	Col Date	Matrix	Analysis
18609-3125	F114-01	06/20/00	WATER	TPH DIESEL TPH GASOLINE TPH JP-5 VOLATILE ORGANICS BY GC/MS ALKALINITY SULFATE BY IC

The results are summarized on the following pages.

Please feel free to call if you have any questions concerning
these results.

Sincerely yours,

Kam Y. Pang, Ph.D.
Laboratory Director

METHOD M8015
TOTAL PETROLEUM HYDROCARBONS BY EXTRACTION

```

Subject: Laboratory Report
Project: MCAS El Toro/18609/D.O. 70

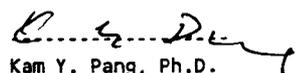

Enclosed is the Laboratory report for samples received on
06/21/00. The data reported include :

Sample ID	Control #	Col Date	Matrix	Analysis
18609-3126	F124-01	06/21/00	WATER	HOLD
18609-3127	F124-02	06/21/00	WATER	VOLATILE ORGANICS BY GC/MS
18609-3128	F124-03	06/21/00	WATER	TPH GASOLINE TPH DIESEL TPH JP-5 VOLATILE ORGANICS BY GC/MS ALKALINITY SULFATE BY IC
18609-3129	F124-04	06/21/00	WATER	VOLATILE ORGANICS BY GC/MS TPH DIESEL TPH GASOLINE TPH JP-5 ALKALINITY SULFATE BY IC

The results are summarized on the following pages.

Please feel free to call if you have any questions concerning these results.

Sincerely yours,

Kam Y. Pang, Ph.D.
Laboratory Director

Subject: Laboratory Report
Project: MCAS El Toro/18609/D.O. 70

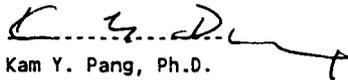

Enclosed is the Laboratory report for samples received on
06/22/00. The data reported include :

Sample ID	Control #	Col Date	Matrix	Analysis
18609-3130	F134-01	06/22/00	WATER	HOLD
18609-3131	F134-02	06/22/00	WATER	VOLATILE ORGANICS BY GC/MS
18609-3132	F134-03	06/22/00	WATER	TPH GASOLINE TPH DIESEL TPH JP-5 VOLATILE ORGANICS BY GC/MS
18609-3133	F134-04	06/22/00	WATER	TPH GASOLINE TPH DIESEL TPH JP-5 VOLATILE ORGANICS BY GC/MS ALKALINITY SULFATE BY IC

The results are summarized on the following pages.

Please feel free to call if you have any questions concerning
these results.

Sincerely yours,

Kam Y. Pang, Ph.D.
Laboratory Director

Introduction

This data review covers one water sample listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8015 modified for Total Petroleum Hydrocarbons (TPH) as Extractables.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section III.

Field duplicates are summarized in Section IX.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

a. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 20.0% .

b. Calibration Verification

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 15.0% QC limits.

III. Blanks

Method blanks were reviewed for each matrix as applicable. No total petroleum hydrocarbons as extractable contaminants were found in the method blanks.

IV. Accuracy and Precision Data

a. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

b. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

c. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

V. Target Compound Identification

Raw data were not reviewed for this SDG.

VI. Compound Quantitation and CRQLs

Raw data were not reviewed for this SDG.

VII. System Performance

Raw data were not reviewed for this SDG.

VIII. Overall Assessment of Data

Data flags have been summarized at the end of this report.

IX. Field Duplicates

No field duplicates were identified in this SDG.

X. Field Blanks

No field blanks were identified in this SDG.

Introduction

This data review covers one water sample listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260A for Volatiles.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section V.

Field duplicates are summarized in Section XVI.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

N Presumptive evidence of presence of the constituent.

UU Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 30.0% for all calibration check compounds and less than or equal to 50.0% for all other compounds.

Average relative response factors (RRF) for all volatile target compounds and system performance check compounds (SPCCs) were within method and validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

All of the continuing calibration percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were less than or equal to 25.0% for all calibration check compounds and less than or equal to 50.0% for all other compounds.

All of the continuing calibration RRF values were within method and validation criteria with the following exceptions:

Date	Compound	RRF (Limits)	Associated Samples	Flag	A or P
6/21/00	Acetone	0.044 (≥ 0.05)	All samples in SDG 00F114	J (all detects) R (all non-detects)	A

V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and CRQLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment of Data

Data flags have been summarized at the end of the report.

XVI. Field Duplicates

No field duplicates were identified in this SDG.

XVII. Field Blanks

No field blanks were identified in this SDG.

- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

a. Initial Calibration

All criteria for the initial calibration were met with the following exceptions:

Sample	Analyte	Finding	Criteria	Flag	A or P
All samples in SDG 00F114	Sulfate	A blank was not used to establish the calibration curve.	A blank must be used to establish the calibration curve.	None	P

b. Calibration verification

Calibration verification frequency and analysis criteria were met.

III. Blanks

Method blanks were reviewed for each matrix as applicable. No alkalinity or sulfate contaminants were found in the method blanks.

IV. Accuracy and Precision Data

a. Matrix Spike/(Matrix Spike) Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

b. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

V. Sample Result Verification

Raw data were not reviewed for this SDG.

VI. Overall Assessment of Data

Data flags are summarized at the end of this report.

VII. Field Duplicates

No field duplicates were identified in this SDG.

VIII. Field Blanks

No field blanks were identified in this SDG.

II. Calibration

a. Initial Calibration

All criteria for the initial calibration were met with the following exceptions:

Sample	Analyte	Finding	Criteria	Flag	A or P
All samples in SDG 00F124	Sulfate	A blank was not used to establish the calibration curve.	A blank must be used to establish the calibration curve.	None	P

b. Calibration verification

Calibration verification frequency and analysis criteria were met.

III. Blanks

Method blanks were reviewed for each matrix as applicable. No alkalinity or sulfate contaminants were found in the method blanks.

IV. Accuracy and Precision Data

a. Matrix Spike/(Matrix Spike) Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

b. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

V. Sample Result Verification

Raw data were not reviewed for this SDG.

VI. Overall Assessment of Data

Data flags are summarized at the end of this report.

VII. Field Duplicates

No field duplicates were identified in this SDG.

VIII. Field Blanks

No field blanks were identified in this SDG.

LDC Report Date: July 21, 2000
Matrix: Water
Parameters: Total Petroleum Hydrocarbons as Extractables
Validation Level: NFESC Level C
Laboratory: EMAX Laboratories, Inc.
Sample Delivery Group (SDG): 00F134

Sample Identification

MS
918609-3132
918609-3133

Introduction

This data review covers 2 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8015 modified for Total Petroleum Hydrocarbons (TPH) as Extractables.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section III.

Field duplicates are summarized in Section IX.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

a. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 20.0% .

b. Calibration Verification

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 15.0% QC limits.

III. Blanks

Method blanks were reviewed for each matrix as applicable. No total petroleum hydrocarbons as extractable contaminants were found in the method blanks.

IV. Accuracy and Precision Data

a. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

b. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

c. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

V. Target Compound Identification

Raw data were not reviewed for this SDG.

VI. Compound Quantitation and CRQLs

Raw data were not reviewed for this SDG.

VII. System Performance

Raw data were not reviewed for this SDG.

VIII. Overall Assessment of Data

Data flags have been summarized at the end of this report.

IX. Field Duplicates

No field duplicates were identified in this SDG.

X. Field Blanks

Sample 918609-3132 was identified as an equipment rinsate. No total petroleum hydrocarbons as extractable contaminants were found in this blank.

18609-3131
18609-3132
18609-3133

Introduction

This data review covers 3 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260A for Volatiles.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section V.

Field duplicates are summarized in Section XVI.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UU Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 30.0% for all calibration check compounds and less than or equal to 50.0% for all other compounds.

Average relative response factors (RRF) for all volatile target compounds and system performance check compounds (SPCCs) were within method and validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

All of the continuing calibration percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were less than or equal to 25.0% for all calibration check compounds and less than or equal to 50.0% for all other compounds.

All of the continuing calibration RRF values were within method and validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Analysis Date	Compound TIC (RT in minutes)	Concentration	Associated Samples
MBLK1W	6/27/00	Methylene chloride	1.5 ug/L	All samples in SDG 00F134

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Compound TIC (RT in minutes)	Reported Concentration	Modified Final Concentration
18609-3131	Methylene chloride	1.6 ug/L	5U ug/L

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and CRQLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment of Data

Data flags have been summarized at the end of the report.

XVI. Field Duplicates

No field duplicates were identified in this SDG.

XVII. Field Blanks

Sample 918609-3131 was identified as a trip blank. No volatile contaminants were found in this blank.

Sample 918609-3133 was identified as an equipment rinsate. No volatile contaminants were found in this blank.

Introduction

This data review covers one water sample listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 310.1 for Alkalinity and EPA Method 300.0 for Sulfate.

The review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (February 1994) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section III.

Field duplicates are summarized in Section VII.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

a. Initial Calibration

All criteria for the initial calibration were met with the following exceptions:

Sample	Analyte	Finding	Criteria	Flag	A or P
All samples in SDG 00F134	Sulfate	A blank was not used to establish the calibration curve.	A blank must be used to establish the calibration curve.	None	P

b. Calibration verification

Calibration verification frequency and analysis criteria were met.

III. Blanks

Method blanks were reviewed for each matrix as applicable. No alkalinity or sulfate contaminants were found in the method blanks.

IV. Accuracy and Precision Data

a. Matrix Spike/(Matrix Spike) Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

b. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

V. Sample Result Verification

Raw data were not reviewed for this SDG.

VI. Overall Assessment of Data

Data flags are summarized at the end of this report.

VII. Field Duplicates

No field duplicates were identified in this SDG.

VIII. Field Blanks

No field blanks were identified in this SDG.

Introduction

This data review covers 3 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8015 modified for Total Petroleum Hydrocarbons (TPH) as Extractables.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section III.

Field duplicates are summarized in Section IX.

Samples indicated by a double asterisk on the front cover underwent NFESC Level D review. NFESC Level C review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by NFESC Level C criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

a. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 20.0% .

b. Calibration Verification

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 15.0% QC limits.

III. Blanks

Method blanks were reviewed for each matrix as applicable. No total petroleum hydrocarbons as extractable contaminants were found in the method blanks.

IV. Accuracy and Precision Data

a. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

b. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

c. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

V. Target Compound Identification

All target compound identifications were within validation criteria for samples on which NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by NFESC Level C criteria.

VI. Compound Quantitation and CRQLs

All compound quantitation and CRQLs were within validation criteria for samples on which NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by NFESC Level C criteria.

VII. System Performance

The system performance was within validation criteria for samples on which NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by NFESC Level C criteria.

VIII. Overall Assessment of Data

Data flags have been summarized at the end of this report.

IX. Field Duplicates

Samples 918609-3137 and 918609-3138** were identified as field duplicates. No total petroleum hydrocarbons as extractables were detected in any of the samples with the following exceptions:

Compound	Concentration (mg/L)		RPD
	918609-3137	918609-3138**	
TPH as JP-5	0.81	0.98	19

Introduction

This data review covers 6 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8015 modified for Total Petroleum Hydrocarbons (TPH) as Gasoline.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section III.

Field duplicates are summarized in Section IX.

Samples indicated by a double asterisk on the front cover underwent NFESC Level D review. NFESC Level C review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by NFESC Level C criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

a. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 20.0% .

b. Calibration Verification

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 15.0% QC limits.

III. Blanks

Method blanks were reviewed for each matrix as applicable. No total petroleum hydrocarbons as gasoline contaminants were found in the method blanks.

IV. Accuracy and Precision Data

a. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits with the following exceptions:

Sample	Surrogate	%R (Limits)	Compound	Flag	A or P
918609-3134	Bromofluorobenzene	175 (65-135)	TPH as gasoline	J (all detects)	A
918609-3134RE	Bromofluorobenzene	156 (65-135)	TPH as gasoline	J (all detects)	A
918609-3137	Bromofluorobenzene	176 (65-135)	TPH as gasoline	J (all detects)	A
918609-3137RE	Bromofluorobenzene	168 (65-135)	TPH as gasoline	J (all detects)	A
918609-3138**	Bromofluorobenzene	188 (65-135)	TPH as gasoline	J (all detects)	A

Sample	Surrogate	%R (Limits)	Compound	Flag	A or P
918609-3138RE**	Bromofluorobenzene	177 (65-135)	TPH as gasoline	J (all detects)	A

b. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

c. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

V. Target Compound Identification

All target compound identifications were within validation criteria for samples on which NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by NFESC Level C criteria.

VI. Compound Quantitation and CRQLs

All compound quantitation and CRQLs were within validation criteria for samples on which NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by NFESC Level C criteria.

VII. System Performance

The system performance was within validation criteria for samples on which NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by NFESC Level C criteria.

VIII. Overall Assessment of Data

Data flags have been summarized at the end of this report.

IX. Field Duplicates

Samples 918609-3137 and 918609-3138** and samples 918609-3137RE and 918609-3138RE** were identified as field duplicates. No total petroleum hydrocarbons as gasoline were detected in any of the samples with the following exceptions:

Compound	Concentration (mg/L)		RPD
	918609-3137	918609-3138**	
TPH as gasoline	1.1	1.1	0

Compound	Concentration (mg/L)		RPD
	918609-3137RE	918609-3138RE**	
TPH as gasoline	0.96	1.0	4

Introduction

This data review covers 4 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260A for Volatiles.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section V.

Field duplicates are summarized in Section XVI.

Samples indicated by a double asterisk on the front cover underwent a NFESC Level D review. A NFESC Level C review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by Level C criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 30.0% for all calibration check compounds and less than or equal to 50.0% for all other compounds.

Average relative response factors (RRF) for all volatile target compounds and system monitoring compounds were greater than or equal to 0.05 as required.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

All of the continuing calibration percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were less than or equal to 25.0% for all calibration check compounds and less than or equal to 50.0% for all other compounds.

All of the continuing calibration RRF values were within method and validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Analysis Date	Compound TIC (RT in minutes)	Concentration	Associated Samples
MBLK1W	6/27/00	Methylene chloride	1.5 ug/L	All samples in SDG 00F147

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Compound TIC (RT in minutes)	Reported Concentration	Modified Final Concentration
18609-3137	Methylene chloride	1.7 ug/L	5U ug/L
18609-3138**	Methylene chloride	1.8 ug/L	5U ug/L

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

All target compound identifications were within validation criteria for samples on which a NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by Level C criteria.

XII. Compound Quantitation and CRQLs

All compound quantitation and CRQLs were within validation criteria for samples on which a NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by Level C criteria.

XIII. Tentatively Identified Compounds (TICs)

Tentatively identified compounds were not reported by the laboratory.

XIV. System Performance

The system performance was within validation criteria for samples on which a NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by Level C criteria.

XV. Overall Assessment of Data

Data flags have been summarized at the end of the report.

XVI. Field Duplicates

Samples 918609-3137 and 918609-3138** were identified as field duplicates. No volatiles were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD
	918609-3137	918609-3138**	
Benzene	21	22	5
Ethylbenzene	15	16	6
Methylene chloride	1.7	1.8	6
Toluene	2.1	1.9	10

XVII. Field Blanks

Sample 918609-3135 was identified as a trip blank. No volatile contaminants were found in this blank.

Laboratory Data Consultants, Inc. Data Validation Report

Project/Site Name: MCAS El Toro
Collection Date: June 23, 2000
LDC Report Date: July 24, 2000
Matrix: Water
Parameters: Alkalinity & Sulfate
Validation Level: NFESC Level C & D
Laboratory: EMAX Laboratories, Inc.
Sample Delivery Group (SDG): 00F147

Sample Identification

918609-3134
918609-3137
918609-3138**
918609-3134MS
918609-3134MSD

**Indicates sample underwent NFESC Level D review

Introduction

This data review covers 5 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 300.0 for Sulfate and EPA Method 310.1 for Alkalinity.

The review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (February 1994) as there are no current guidelines for the methods stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section III.

Field duplicates are summarized in Section VII.

Samples indicated by a double asterisk on the front cover underwent a NFESC Level D review. A NFESC Level C review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by Level C criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

a. Initial Calibration

All criteria for the initial calibration of each method were met with the following exceptions:

Sample	Analyte	Finding	Criteria	Flag	A or P
All samples in SDG 00F147	Sulfate	A blank was not used to establish the calibration curve.	A blank must be used to establish the calibration curve.	None	P

b. Calibration Verification

Calibration verification frequency and analysis criteria were met for each method when applicable.

III. Blanks

Method blanks were reviewed for each matrix as applicable. No contaminant concentrations were found in the method blanks.

IV. Accuracy and Precision Data

a. Matrix Spike/(Matrix Spike) Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) analyses were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

b. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

V. Sample Result Verification

All sample result verifications were within validation criteria for samples on which a NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by Level C criteria.

VI. Overall Assessment of Data

Data flags are summarized at the end of this report.

VII. Field Duplicates

Samples 918609-3137 and 918609-3138** were identified as field duplicates. No contaminant concentrations were detected in any of the samples with the following exceptions:

Analyte	Concentration (mg/L)		RPD
	918609-3137	918609-3138**	
Alkalinity	716	710	0.8
Sulfate	32	31.4	2

VIII. Field Blanks

No field blanks were identified in this SDG.

Data Validation Report**

Project/Site Name: MCAS El Toro
Collection Date: June 26, 2000
LDC Report Date: August 6, 2000
Matrix: Water
Parameters: Total Petroleum Hydrocarbons as Extractables
Validation Level: NFESC Level C
Laboratory: EMAX Laboratories, Inc.
Sample Delivery Group (SDG): 00F158

Sample Identification

918609-3139
918609-3141
918609-3142

Introduction

This data review covers 3 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8015 modified for Total Petroleum Hydrocarbons (TPH) as Extractables.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section III.

Field duplicates are summarized in Section IX.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

a. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 20.0% .

b. Calibration Verification

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 15.0% QC limits.

III. Blanks

Method blanks were reviewed for each matrix as applicable. No total petroleum hydrocarbons as extractable contaminants were found in the method blanks.

IV. Accuracy and Precision Data

a. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

b. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

c. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

V. Target Compound Identification

Raw data were not reviewed for this SDG.

VI. Compound Quantitation and CRQLs

Raw data were not reviewed for this SDG.

VII. System Performance

Raw data were not reviewed for this SDG.

VIII. Overall Assessment of Data

Data flags have been summarized at the end of this report.

IX. Field Duplicates

No field duplicates were identified in this SDG.

X. Field Blanks

No field blanks were identified in this SDG.

18609-3141
18609-3142

Introduction

This data review covers 4 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260A for Volatiles.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section V.

Field duplicates are summarized in Section XVI.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 30.0% for all calibration check compounds and less than or equal to 50.0% for all other compounds.

Average relative response factors (RRF) for all volatile target compounds and system performance check compounds (SPCCs) were within method and validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

All of the continuing calibration percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were less than or equal to 25.0% for all calibration check compounds and less than or equal to 50.0% for all other compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
6/30/00	2-Chloroethylvinyl ether	60.6	All samples in SDG 00F158	J (all detects) UJ (all non-detects)	A

All of the continuing calibration RRF values were within method and validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and CRQLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment of Data

Data flags have been summarized at the end of the report.

XVI. Field Duplicates

No field duplicates were identified in this SDG.

XVII. Field Blanks

Sample 918609-3140 was identified as a trip blank. No volatile contaminants were found in this blank.

Introduction

This data review covers 2 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 310.1 for Alkalinity and EPA Method 300.0 for Sulfate.

The review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (February 1994) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section III.

Field duplicates are summarized in Section VII.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

a. Initial Calibration

All criteria for the initial calibration were met with the following exceptions:

Sample	Analyte	Finding	Criteria	Flag	A or P
All samples in SDG 00F158	Sulfate	A blank was not used to establish the calibration curve.	A blank must be used to establish the calibration curve.	None	P

b. Calibration verification

Calibration verification frequency and analysis criteria were met.

III. Blanks

Method blanks were reviewed for each matrix as applicable. No alkalinity or sulfate contaminants were found in the method blanks.

IV. Accuracy and Precision Data

a. Matrix Spike/(Matrix Spike) Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

b. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

V. Sample Result Verification

Raw data were not reviewed for this SDG.

VI. Overall Assessment of Data

Data flags are summarized at the end of this report.

VII. Field Duplicates

No field duplicates were identified in this SDG.

VIII. Field Blanks

No field blanks were identified in this SDG.

DESCRIPTION	Depth (feet)	Soil Group	Graphic Log	Samples	PID/FID (ppm)	Blows/6 In.	Recovery (6 inches)	WELL DETAIL
Same as above, strong hydrocarbon odor. Sand begins to show up in soil cuttings at 84 feet.	80	ML				25	6	 GROUT (CEMENT-BENTONITE MIXTURE)
	82							
Poorly graded SAND (SP): Grayish brown (2.5Y 5/2), 100% fine well sorted sand, trace fines, slightly moist, medium dense, hydrocarbon odor, bottom 3" of sample consist of discolored dark grayish brown to dark gray silty sand.	84	SP			231	18	6	
	86							
	88							
Silty SAND (SM): Dark grayish brown (2.5Y 4/2), 70% fine sand, 30% medium plastic fines, slightly moist, dense, strong hydrocarbon odor.	90	ML			471	15	6	
	92							
	94							
Silty SAND (SM): Olive brown (2.5Y 4/3), 80% fine sand, 20% fines, slightly moist, dense, hydrocarbon odor.	96	SP			287	33	6	
	98							
	100							
Poorly graded SAND (SP): Light olive brown (2.5Y 5/4), 95% fine to medium sand, 5% fines, slightly moist, dense, upper 6" contains 20% fine to coarse gravel, hydrocarbon odor.	102	ML			60	20	6	
	104							
	106							
Sandy/clayey SILT (ML): Olive brown (2.5Y 4/4), 80% medium plastic fines, 20% fine sand, slightly moist, hard, hydrocarbon odor.	108	SP			829	10	6

Silty SAND (SM): Olive brown (2.5Y 4/4), 80% fine sand, 20% medium plastic fines, slightly moist, medium dense, interbedded with clayey silt and sandy silt, hydrocarbon odor.	160							

Nov 20, 2000 - 07:07:14 I:\OHM CORP\PROJECTS\18609\LOGS\TF398\CB398-28-29-30-4.dwg

Geologic Log/Well Construction CB 398-28/29/30

Project **MCAS-EL TORO**

Project No. **918609**

DESCRIPTION	Depth (feet)	Soil Group	Graphic Log	Samples	PID/FID (ppm)	Blows/6 in.	Recovery (6 inches)	WELL DETAIL
<p>18609-2664 Sample collected at 160-160.5 feet bgs. Silty SAND (SM): Olive brown (2.4Y 4/4) 80% fine sand, 20% medium plastic fines, slightly moist, medium dense, interbedded with clayey silt and sandy silt, hydrocarbon odor.</p>	160	SM	[Pattern: Vertical lines]	[Symbol: Solid black]		23	6	<p style="text-align: center;">GROUT (CEMENT-BENTONITE MIXTURE)</p>
	162							
	164							
	166							
	168							
<p>18609-2665 Sample collected at 169.5-170 feet bgs. Poorly graded SAND (SP): Light olive brown (2.5Y 5/4), 100% fine sand, trace fines, slightly moist, very dense.</p>	170	SP	[Pattern: Dotted]	[Symbol: X]	534	10 32 42	6 6 6	
<p>Based on cuttings: sandy GRAVEL layer from 172-178', from 172', fine to coarse subangular to subrounded gravel begins to show up in soil cuttings, from 179', soil cuttings are discolored with strong hydrocarbon odor.</p>	172							
	174							
	176							
	178							
<p>Gravelly SAND (SP): Based on soil cuttings, becomes slightly siltier at approximately 179', probably thin layers of sandy silt, approximately 25% gravel begin showing up in sand at 182' in soil cuttings.</p>	180	SP	[Pattern: Dotted]					
	182							
	184							
<p>18609-2666 Sample collected at 185-185.5 feet bgs. Sandy SILT (ML): Yellowish brown (10YR 5/4), 65% low plastic fines, 35% fine sand, slightly moist, hard, hydrocarbon odor.</p>	186	ML	[Pattern: Vertical lines]	[Symbol: X]	30	11 18 31	6 6 6	
	188							
	190							
<p>18609-2667 Sample collected at 189.5-190 feet bgs. Silty SAND (SM): Olive brown (2.5Y 4/4), 70% fine sand, 30% medium plastic fines, very moist, dense, strong hydrocarbon odor, bottom sleeve saturated with free product.</p>	190	SM	[Pattern: Vertical lines]	[Symbol: X]	349	13 27 39	6 6 6	
<p>End of boring at 190.5 feet.</p>	192							
	194							
	196							
	198							
	200
