Section 1

Introduction

The purpose of this Addendum is to provide additional information pertaining to the Aerial Photograph, Anomaly Area 5 (hereinafter referred to as Anomaly Area 5), at the Marine Corps Air Station El Toro, California (hereinafter referred to as the Station). Field sampling was conducted at the Anomaly Area 5 site in response to comments received from the California Regional Water Quality Control Board (RWQCB) Santa Ana Region dated January 17, 2001 and from the Department of Toxic Substances Control (DTSC) Southern California Branch dated February 8, 2001. OHM Remediation Services Corp. (OHM) performed the work under Delivery Order (DO) 0070 for the Southwest Division Naval Facilities Engineering Command (SWDIV) under Remedial Action Contract No. N68711-93-D-1459.

In December 1999, OHM conducted verification drilling and sampling activities in the vicinity of Anomaly Area 5. A total of 5 soil borings were advanced to approximate total depths of 15 feet below ground surface (PHA5 SB-01 through PHA5 SB-05). TPH analytes (extractable or purgeable) were not detected in concentrations equal to or exceeding the laboratory reporting limits in any of the soil samples. No volatile organic compound (VOC) analytes, including methyl tert-butyl ether (MTBE), were detected at or exceeding the laboratory reporting limits in the soil samples collected from borings. OHM submitted *Summary Report, Aerial Photograph Anomaly Area 5 (APHO 31, APHO 43, APHO 66, APHO 67 and APHO 68), Marine Corps Air Station, El Toro* in November 2000 (Appendix A).

The DTSC and the RWQCB responded to the summary report in letters dated February 8 and January 17, 2001, respectively. The DTSC inquired about the presence of disturbed soils during sampling activities and a copy of geophysical survey results. The RWQCB also inquired about geophysical survey results and also soil boring locations near APHO 43, APHO 67 and APHO 68 of Anomaly Area 5 site. A copy of the letters from RWQCB and DTSC and response to comments are included in Appendix B.

OHM advanced three hand auger borings (APHO5-43, APHO5-67 and APHO5-68) near photograph anomalies APHO 43, APHO 67 and APHO 68 as requested by the RWQCB. Approximately 6 inches of road base was noted directly under the concrete pad, and the soil under the 6 inches of road base appeared to be native, undisturbed soil. TPH as gas, diesel and JP-5 were not detected at or exceeding the laboratory reporting limits in soil samples collected from all three borings. No volatile organic compound (VOC) analytes, including benzene, toluene, ethylbenzene and total xylenes (BTEX) and methyl tert-butyl ether (MTBE), were detected at or exceeding the laboratory reporting limits in the soil samples collected from three borings. Metals were not detected above background levels for the station.

The Anomaly Area 5 is located in the southeast quadrant of the Station, immediately east of the former "Desert Storm" temporary staging area (MSC D1), located northeast of the

intersection of East Marine Way and "Z" Street. Anomaly Area 5 includes five aerial photograph (APHO) anomalies identified by Science Applications International Corporation (SAIC) on aerial photographs taken from 1967 to 1988.

Section 2

Field Activities

The RWQCB noted that no borings were advanced near anomalies APHO-43, APHO-67, and APPO-68 in the concrete pad in Anomaly Area 5. Therefore, OHM advanced three (3) soil borings in February 2001, (APHO5-43, APHO5-67 and APHO5-68) under the concrete pad near the three anomalies at Anomaly Area 5. Locations of these soil borings were selected and placed using historical and geophysical survey data and are shown on Figure 2-1. A summary of field activities is provided in this section.

Hand Auger Borings and Soil Sampling Techniques

On February 8 and February 15, OHM advanced soil borings APHO5-43, APHO5-67 and APHO5-68, using hand auger techniques. Eight soil samples were collected from 3 soil borings that were advanced in the vicinity of anomaly areas APHO 43, APHO 67 and APHO 68 in the concrete pad area of Anomaly Area 5. The sampling equipment was decontaminated between each boring location and between each sample interval. Soil samples were collected at approximate depths of 2, 5 and 10 feet below ground surface for boring APHO5-43; 0, 5, and 9 feet below ground surface for boring APHO5-67; and 5 and 10 feet below ground surface for boring APHO5-68. A total of 8 soil samples were collected from three borings. Soil samples collected from the borings were submitted for laboratory analysis. Following the completion of sampling activities, the soil borings were back-filled with cement-bentonite grout.

Sample Tracking and Analytical Methods

Sample handling, chain-of-custody documentation, and packaging was conducted in accordance with the procedures described in the approved *Final Work Plan* (OHM, 1995).

The soil samples were analyzed for:

- Total petroleum hydrocarbons (TPH-extractable and purgeable) as JP-5, diesel and gasoline using CA LUFT Method 8015 Modified
- California Assessment Metals (CAM) by U.S. Environmental Protection Agency (EPA) Method 6010B
- Mercury by EPA Method 7471A
- VOCs, including MTBE, using EPA Method 8260A.

Subsurface Soil Investigation

Hand Auger Techniques were employed to determine the presence of disturbed soil at the APHO5-43, APHO5-67 and APHO5-68 locations. APHO5-43 was advanced to approximately 10 feet below ground surface, APHO5-67 was advanced to approximately 9 feet below ground surface and APHO5-68 was advanced to approximately 10 feet below

ground surface. Upon visual inspection of the soil lithology, an IT field registered geologist noted approximately 6 inches of road base directly under the concrete pad, and native soil under the 6 inches of road base. Both construction debris and disturbed soil were not encountered at all three boring locations.

Geophysical Survey

GEOVision conducted a geophysical survey at Anomaly Area 5 in order to determine if there was a presence of disturbed soil or subsurface fill material. The geophysical survey revealed the presence of two large buried metallic objects suspected to be associated with the station's underground utility system. The survey did not reveal indications of subsurface construction debris or subsurface fill material. A copy of the geophysical survey is included in Appendix C.

Analytical Results

TPH as gas, diesel and JP-5 were not detected at or exceeding the laboratory reporting limits. VOC analytes, including MTBE were not detected at or exceeding the laboratory reporting limits in the soil samples collected from borings APHO5-43, APHO5-67 and APHO5-68. CAM metals were detected at concentrations less than the established background levels (BNI, 1997) for the Station. Laboratory reporting limits for several CAM metal analytes exceeded the established background values. Arsenic was detected in soil samples at concentrations ranging from an estimated 0.779J mg/kg to a maximum concentration of 4.81 mg/kg (sample number 18609-4214A), which exceeds the industrial PRG levels (2.7 mg/kg) however, the concentrations of detected arsenic are less than the established background concentration levels of 6.86 mg/kg (BNI, 1996) for the station.

These results do not indicate that a release has occurred from the Anomaly Area 5 site to the vadose zone. A summary of the analytical results of the soil samples collected from the verification borings, the background concentrations and PRGs are included in Table 2-1 and summarized in Figure 2-1. Laboratory analytical reports are included in Appendix D.

Land Surveying

After completing the soil sampling at APHO 5, the hand auger soil boring locations were surveyed by Cal Vada Surveying Inc., a California-licensed land surveyor. The surveyed locations were measured to +0.01 foot horizontally and tied to the California State Plan Coordinate Systems, North American Datum 1983. The surveyed elevations were measured to +0.01 foot vertically and tied to mean sea level datum. The land survey data for APHO 5 are included in Appendix E.

Section 3

Findings and Recommendations

The following observations and conclusions are based upon information from the OHM *Summary Report, Aerial Photograph Anomaly Area 5 (APHO 31, APHO 43, APHO 66, APHO 67 and APHO 68), Marine Corps Air Station, El Toro* and soil sampling data from the three verification soil borings:

- In response to RWQCB and DTSC comments, OHM collected soil samples from three hand-augered borings and examined the cuttings for evidence of disturbed soils or fill materials.
- Upon visual inspection of the soil lithology, an IT field registered geologist noted approximately 6 inches of road base directly under the concrete pad, and native soil under the 6 inches of road base down to 10 feet below ground surface. Construction debris was not encountered under the concrete pad during hand augering activities.
- TPH as gas, TPH as diesel, VOC analytes, including MTBE were not detected at or exceeding laboratory reporting limits in all of the 8 soil samples collected from the three borings.
- With the exception of arsenic, CAM metals were detected at concentrations below the current EPA Region 9, PRG values. Arsenic was detected at a maximum concentration of 4.81 mg/kg (sample number 18609-4214A), which is less than the established background concentration levels of 6.86 mg/kg (BNI, 1996) for the Station.
- The geophysical survey revealed the presence of two large buried metallic objects suspected to be associated with the Station's underground utility system. The survey did not reveal indications of subsurface construction debris.

Based upon information included in the *Summary Report, Aerial Photograph Anomaly Area 5 (APHO 31, APHO 43, APHO 66, APHO 67 and APHO 68), Marine Corps Air Station, El Toro* dated November 2000 and the results of the field sampling activities that were conducted in January 2001, it is recommended that *no further action status* (NFA) be designated for Anomaly Area 5 (APHO 31, APHO 43, APHO 66, APHO 67, and APHO 68).

Section 1

Introduction

The purpose of this Summary Report is to present information pertaining to aerial photograph anomalies, designated as Aerial Photograph Anomaly Area 5 in the vicinity of east end of the east-west runway in the eastern portion of the Marine Corps Air Station (MCAS), El Toro (herein after referred to as Station), California. OHM Remediation Services Corp (O+HM) performed the work under Delivery Order (DO) 0070 for the Southwest Division Naval Facilities Engineering Command (SWDIV) under Remedial Action Contract No. N68711-93-D-1459.

Anomaly Area 5 includes five aerial photograph (APHO) anomalies identified by Science Applications International Corporation (SAIC) on aerial photographs taken from 1967 to 1988. These site numbers are listed with their associated photograph dates: APHO 66 [SAIC 161 (1967)], APHO 31 [SAIC 215 (1971)], APHO 43 [SAIC 287 (1974)], APHO 67 [SAIC 314 (1975)], and APHO 68 [SAIC 542 (1988)].

Site Location

The MCAS comprises of approximately 4,700 acres (Figure 1-1) and is located in eastern Orange County approximately 45 miles southeast of Los Angeles, California. The Anomaly Area 5 is located in the southeast quadrant of the Station, immediately east of the former "Desert Storm" temporary staging area (MSC D1), located northeast of the intersection of East Marine Way and "Z" Street, Figure 1-2.

Station officially closed on July 2, 1999 in accordance with the Base Realignment and Closure Act of 1993 (BRAC III). Anomaly Area 5 is located within a parcel designated as Recreation Golf Area according to Preferred Land Use Plan (Concept B) as published by the County of Orange in September 1999, as shown in Figure 1 of Appendix A.

Anomaly Area 5 encompasses an area of approximately 250 feet by 450 feet adjacent to the east end of the east-west runway in the vicinity of miscellaneous site of concern (MSC)-D1 and Solid Waste Management Unit (SWMU) 264, Defense Reutilization and Marketing Office Yard 3.

This Summary Report includes a description of information collected during the investigation of nearby Environmental Locations of Concern, results of the historical records, results from the field verification activities and visual inspection of the Anomaly Area 5. The field sampling analytical results indicate that no petroleum hydrocarbons and Volatile Organic Carbons (VOCs) were released to the ground surface at this site. Some metals were detected above the stated laboratory-reporting limit however; concentrations detected were below the established background levels for MCAS El Toro. Based upon the review of the field data and historical documentation, it is recommended that "*no further action status*" designated for Anomaly Area 5 (APHO 66, APHO 31, APHO 43, APHO 67, and APHO 68) in the next Base Realignment and Closure Business Plan update.

Section 2

Field Inspections and Historical Records

Anomaly Area 5 includes the following five anomaly sites: Anomaly Descriptions were derived from the following source document; Final Report, Aerial Photograph Assessment (SAIC, 1993) are presented in italics:

APHO 31(SAIC 215-date of photograph: 1971): *There is disturbed ground (DG) about 250 by 350 feet in area, dark-toned mounded material (MMDT), and a probable trench (TR), all about 1600 feet westerly of West Marine Road and Magazine Road. There is also a possible light-toned unidentified object (UO). Additional investigation of the site as a possible disposal or storage site is recommended.*

APHO 43(SAIC 287-date of photograph: 1974): *There is an excavation (EX) about 1,600 feet west of the Perimeter Road and Magazine Road intersection. The purpose of the excavation is unknown, and investigation of the site history as a possible disposal area is recommended.*

APHO 66 (SAIC 161-date of photograph: 1967): *Disturbed ground (DG) and probable backfilled trenches (TR) are noted in the western corner of Perimeter Road and Magazine Road, and about 1,400 feet westerly of the intersection. Additional investigation of the purpose of these sites is recommended. The northeasterly-oriented, backfilled trench (TR) adjacent to Perimeter Road is the Perimeter Road Landfill (Site 5). No Additional investigation of Site 5 is recommended at this time. The present IR program field investigation Site 5 appears to be adequate, relative to the features noted here.*

APHO 67(SAIC 314-date of photograph: 1975): *Disturbed ground (DG) can be seen about 1000 feet northeast of Building 673, near North/East Marine and N 3rd Street. The cause of the disturbance is unknown. Investigation of the site's history as a possible disposal area is recommended.*

APHO 68 (SAIC 542-date of photograph: 1988): *A light-colored pad, possibly concrete, was constructed west of Perimeter Road and Magazine Road. The purpose of the pad is unknown, but the area was probably graded (GR). No additional investigation is recommended at this time.*

2.1 Field Inspections

OHM conducted a visual inspection, including taking photographs of Anomaly Area 5 on December 1, 1999. Photographs of Anomaly Area 5 and the checklist forms for the visual inspection of APHO 66, APHO 31, APHO 43, APHO 67, and APHO 68, are presented in Appendix B.

Anomaly Area 5 is relatively flat with most of the area covered with grass, however some of the individual anomalies appear to be located beneath the end of the runway. OHM

inspected the site on December 1, 1999. No apparent soil stains or evidence of waste materials or petroleum hydrocarbon releases were observed during the site inspection. Also, no evidence of disturbed ground, mounted materials, or trenches was observed during OHM's visual inspections of Anomaly Area 5. Building 841 former Liquid Oxygen (LOX) facility with concrete pad is within the Anomaly Area 5 site boundary. A grass-covered area surrounds Anomaly Area 5 to the west and northwest, and IRP Site 5 is located southeast side of Anomaly Area 5. MSC-D1, the Desert Storm Staging area is located southwest of the site.

2.2 Environmental Program Records

The records from petroleum and Comprehensive Environmental Response Compensation and Liability Act (CERCLA) investigations in the vicinity of Anomaly Area 5 were acquired and reviewed along with other environmental program records. Ground water conditions at Anomaly Area 5 have been investigated during the investigation of nearby IRP Site 5 during the CERCLA investigations. The depth to ground water is approximately 163 feet below ground surface and the gradient is northwest.

Brief descriptions of the sites that are located near Anomaly Area 5 is presented in Table 2-1 and are shown in Figure 1-2.

Underground Storage Tank (UST) Program

UST 442 is located approximately 800 feet northwest of Anomaly Area 5. OHM removed UST 442 in 1996 and site was closed by Orange County Health Care Agency (OCHCA) in December 1996.

Resource Conservation and Recovery Act Facility Assessment (RFA)

Three Solid Waste Management Units (SWMUs), SWMU 225, 181, and 264 were identified in the vicinity of Anomaly Area 5 during the RFA by Jacobs Engineering Group (JEG, 1993). Soil samples were collected at all three SWMUs during the RFA Sampling Visit. The results of the field inspection and Sampling Visit are published in the *Installation Restoration Program, Final Resource Conservation and Recovery Act Facility Assessment for Marine Corps Air Station, El Toro, California* (Jacobs Engineering Group, 1993).

Miscellaneous Site of Concern (MSC) D1

MSC D1 is a former staging area used to stage materials for embarkation to *Operation Desert Storm* in the Middle East during August to November 1991. OHM collected a total of 24 soil samples from 8 soil borings to evaluate the subsurface soil conditions at the MSC D1 site. Laboratory analytical results did not indicate a release of petroleum hydrocarbons and/or volatile organic compounds to the vadose zone beneath MSC D1 (OHM, 2000).

Temporary Accumulation Area (TAA) 772

TAA 772 (identified as SWMU 225) is located adjacent to Anomaly Area 5. Seven soil samples were collected by JEG from one 60-foot angle boring during the RFA Sampling Visit. Subsurface soil consists primarily of clays, clayey sand and sandy clays. TPH, VOCs, SVOCs, pesticide and PCB compounds were not detected from all seven soil samples. TAA 772 was taken out of service several years ago and final closure activities are in progress as of December 1999.

Excerpts from the RFA documentation, including laboratory test results and boring log are presented in Appendix C.

Adjacent Installation Restoration Program (IRP) Sites

IRP Site 5, the Perimeter Road Landfill, is located approximately 400 feet southeast of Anomaly Area 5. Soil and ground water samples were collected at IRP Site 5 – Perimeter Road Landfill – during the Phase I and Phase II Remedial Investigations (RI).

Storm Water Pollution Prevention Plan

The Station's environmental compliance program management plans were acquired and reviewed in order to identify any locations at or near Anomaly Area 5 that may have been designated for storage or usage of hazardous materials or hazardous wastes. The Storm Water Pollution Prevention Plan (SWPPP) was reviewed and the SWPPP does not identify storage or usage of hazardous substances at Anomaly Area 5. Excerpts from the SWPPP are presented in the Appendix D.

Surface water runoff in the vicinity of Anomaly Area 5 discharges to Borrego Canyon Wash. Borrego Canyon Wash and other surface drainage channels were investigated during the RI of IRP Site 25. Sediment and water samples were collected from the drainage channels, human health and ecological risks were assessed, and a Record of Decision for No Action at IRP Site 25 was signed in September 1997.

Surface water quality in Borrego Canyon Wash is monitored under the Station's National Pollutant Discharge Elimination System (NPDES) Permit for Storm Water. The permit was issued by the California Regional Quality Control Board (RWQCB), Santa Ana Region.

Hazardous Materials and Hazardous Waste Management Plan

The Station's Hazardous Material and Hazardous Waste Management Plan (HM/HWMP) was reviewed, and the nearest hazardous waste temporary accumulation area is TAA 772 located adjacent to MSC D1, Desert Storm Staging Area. Extracts from HM/HWMP are presented in the Appendix E.

Section 3

Environmental Setting

This section summarizes the general physiographic, geologic, and hydrogeologic setting in the vicinity of Anomaly Area 5.

3.1 Physiography and Topography

The Station is located on the southeastern edge of the Tustin Plain and extends into the Santa Ana Mountains. The Tustin Plain slopes gently toward the west-southwest with land surface elevations ranging from approximately 215 feet above mean sea level (msl) at the western corner to approximately 410 feet msl at the eastern edge of the Station. Elevations within the portion of the Station in the Santa Ana Mountains extend upward to 800 feet msl near the northeast corner of the Station. The topography in the area of Area 5 gently slopes to the west, with elevations ranging from 408 to 421 feet above msl datum.

3.2 Geology

The Station is situated on alluvial materials derived mainly from the Santa Ana Mountains. These Holocene materials consist of coarse-grained stream channel deposits and fine-grained overbank deposits that are up to 300 feet thick (Herndon and Reilly, 1989).

The Holocene alluvial materials conformably overlie Pleistocene sediments predominantly composed of interlayered fine-grained lagoonal and near-shore marine deposits. These materials become increasingly mixed with beach sands, terrace deposits, and stream channel deposits in the eastern portion of the Tustin Plain and along the eastern plain edges. The Quaternary deposits form a heterogeneous mixture of silts and clays, with interbedded sands and fine gravels up to 500 feet thick in the western portion of the Tustin Plain (Singer, 1973).

Review of the OHM verification soil boring logs at the Anomaly Area 5 indicate that the site is underlain by a shallow sand (SP, SW, and SM) extending from the surface to approximately 15 feet depth. Underlying the shallow sand unit is interbedded silt (ML) and silty fine sand (SM). These units appear typical of the channel and overbank deposits in comprising the Holocene deposits of the Tustin Plain.

3.3 Hydrogeology

The Station is situated within the Irvine Groundwater Subbasin, which comprises the southeast segment of the Main Orange County Groundwater Basin. Regional groundwater flow in the subbasin has been to the west and northwest since the 1940s and is controlled locally by large groundwater withdrawal depressions. From 1969 to 1982, an average gradient of 0.0046 foot per foot (ft/ft) to the northwest was reported in the principal aquifer zone of the Irvine area (Banks, 1984). Phase I remedial investigation data indicated a similar

groundwater flow direction in the shallower groundwater zone, with a slightly higher gradient of 0.008 ft/ft (JEG, 1993).

The depth to groundwater beneath the Station ranges from approximately 45 feet below ground surface in the foothills to 240 feet below ground surface in the deepest portion of the Irvine Subbasin. The depth to groundwater in the vicinity of Anomaly Area 5 is estimated to be approximately 170 feet below ground surface, based on extrapolated groundwater elevation data and surveyed topographic elevation of the site. These data are presented in the Groundwater Monitoring Report (Camp Dresser & McKee, Inc. [CDM] Federal Programs, 1997) and summarized in Table 3-1. The well locations are shown in Figure 1-2 (CDM, 1997).

3.3.1 Groundwater Conditions

Groundwater conditions have been investigated in the vicinity of Anomaly Area 5 during the investigations of IRP Site 5. The nearest well 05_DGMW67 is located 250 feet southeast of Anomaly Area 5. Based upon measurement from this well, groundwater is located approximately 170 feet below ground surface and the gradient is 0.009 foot/foot towards the northwest.

A total of five groundwater wells (05_DGMW67, 05_DBMW41, 05_UGMW27, 05_DGMW68 and 05NEW1) have been monitored at IRP Site 5. Excerpts from the CDM groundwater monitoring report (CDM, 1997) showing the water levels at IRP Site 5 wells are presented in Appendix F.

Section 4

Field Verification Activities

OHM collected shallow soil samples on December 10, 1999 at five locations in the vicinity of Anomaly Area 5 in order to ascertain whether a release had occurred. Sampling activities were conducted in accordance with the strategy identified by the SWDIV Navy in the facsimile transmittal of June 1999, DTSC comments dated June 22, 1999 on the SWDIV Navy facsimile sampling strategy of May 1999, and Supplemental Sampling Strategy. Aerial Photograph Areas 4 and 5 issued by OHM in November 1999(OHM, 1999). Copies of June and November 1999 Sampling Strategy are included in Appendix G. Field activities included: a site inspection; a geophysical survey; verification soil sampling; and a land survey.

Sampling activities were conducted in accordance with the following documents: 1) Agency approved Preliminary Draft DO 0024 documents: Work Plan, Contractor Quality Control Plan Addendum, Waste Management Plan, Chemical Data Acquisition Plan (OHM, 1995a), and Site-Specific Health and Safety Plan (OHM, 1995b); 2) DO 0070 Draft Supplemental Work Plan, Closure of Various Temporary Accumulation Areas and RCRA Facility Assessment Sites, Marine corps Air Station (MCAS), El Toro (OHM 1997).

4.1 Utility Clearance and Geophysical Survey

The utility clearance consisted of reviewing site-specific utility maps obtained from the Station, reviewing the site inspection log, performing a geophysical survey of the site, and notifying Underground Service Alert of the intent to drill.

On December 6, 1999, Geovision conducted a geophysical survey at Anomaly Area 5 using a utility locator and ground-penetrating radar (GPR), to locate the presence of underground utilities in the vicinity of proposed drilling areas.

4.2 Verification Drilling Activities

On December 10, 1999, OHM conducted verification drilling and sampling activities at Anomaly Area 5 to evaluate the sub surface conditions. A total of 5 soil borings were advanced (PHA5 SB-01 through PHA5 SB-05) to approximate total depths of 15 feet below ground surface. These boring locations were selected based on field visit. The soil boring locations are shown in Figure 4-1.

Drilling and Soil Sampling Techniques

BC² Environmental Corporation, an OHM subcontractor, advanced a total of five soil borings with a tractor mounted CME 75 mobile drilling rig using hollow-stem auger drilling techniques. A total of 10 soil samples including, a duplicate sample, were collected using a California-modified split-spoon sampler. Soil samples were collected from depths of 5 and

10 feet below ground surface and submitted for laboratory analyses. Following the completion of sampling activities, the soil borings were backfilled with a cement-bentonite grout.

To minimize the potential for cross-contamination, drilling and sampling equipment was decontaminated before initiating work at the site, between each soil boring, and at the completion of the work at the site. Decontamination was accomplished by using a pressure washer and/or scrubbing with a non-phosphate detergent and water solution, rinsing with tap water, and rinsing with deionized water.

Soil Lithology

Based on the soil samples collected from borings PHA5 SB-01 through SB-05, soil conditions appeared consistent throughout the investigated area. The boring logs indicate that the subsurface soil in the vicinity of Anomaly Area 5 primarily consists of silt, silty-sand, and fine-grained sand mixtures. The field boring logs, describing soils underlying the site and indicating soil sample collection intervals are presented in Appendix H.

Sample Tracking and Analytical Methods

Sample handling, documentation, and packaging, was conducted in accordance with the procedures described in the approved draft work plan (OHM, 1995a). The soil samples were analyzed for:

- Total petroleum hydrocarbons (TPH-extractable and purgeable) as JP-5 using CA LUFT Method 8015 Modified
- Volatile organic compounds (VOCs), including methyl tert-butyl ether (MTBE) using EPA Method 8260A
- Metals by EPA 6010A and EPA 7471A.

Analytical Results

TPH as gas or diesel was not detected in concentrations equal to or exceeding the stated laboratory reporting limits in the soil samples collected from borings PHA5 SB01 through SB05. No benzene, MTBE, or other VOC compounds were detected, except for the suspected laboratory contaminants; acetone (18J $\mu\text{g}/\text{kg}$) and methylene chloride (2J $\mu\text{g}/\text{kg}$) detected in the soil sample 18609-2522 from boring PHA5-SB03 at 5-foot depth. Acetone and Methylene chloride, chemicals commonly used for cleaning laboratory glassware, and are common laboratory contaminants.

Metal analytes such as barium, beryllium, chromium, cobalt, copper, lead, manganese, nickel, vanadium, and zinc were detected above the stated laboratory reporting limits; however, the concentrations were significantly less than the EPA PRGs for Residential use and MCAS El Toro background levels established during the RI (BNI, 1996). However, thallium was detected (at 1.19 mg/kg and 1.41 mg/kg) in two samples (sample numbers 18609-2514 from boring SB-02 at 5 feet bgs and 18609-2520 from boring SB-04 at

5 feet bgs, respectively) above the MCAS El Toro established background concentration of 0.42 mg/kg. The residential PRG for thallium is 5.5 mg/kg.

Arsenic was detected at levels exceeding the PRG, but below the MCAS El Toro established background level. Therefore, risk caused by arsenic at Anomaly Area 5 appears to be attributable to background conditions rather than to a release of hazardous substances.

Analytical results of the soil samples collected from the verification borings are summarized in Figure 4-1, and are listed with the background concentrations and PRGs in Table 4-1. Laboratory analytical reports with chain of custody are provided in Appendix I, Laboratory Analytical Reports.

Quality Assurance/Quality Control

Field quality assurance/quality control (QA/QC) samples were collected during sampling activities to evaluate the consistency and accuracy of the analytical data. Field QC samples for the Anomaly Area 5 consisted of equipment rinsate, soil sample duplicate, and trip blank samples as follows:

- Equipment rinsate samples were collected at a frequency of 1 per day.
- One duplicate soil sample was collected (sample number 18609-2523).
- Trip blank samples were collected at a frequency of 1 blank for each cooler containing samples for VOC analysis.

Analytical results of the trip blank and equipment rinsate samples are summarized in Table 4-2.

4.3 Land Surveying

After completing the verification drilling, the soil boring locations were surveyed on December 14, 1999 by Cal Vada Surveying, Inc., a California-registered land surveyor. The surveyed locations were measured to ± 0.01 ft/ft horizontally and tied to the California State Plane Coordinate Systems, North American Datum 1983. The surveyed elevations were measured to ± 0.01 foot vertically and tied to mean sea level datum. The surveyed plan for Anomaly Area 5 is presented as Appendix J, Land Survey Plan.

Section 5

Findings and Recommendations

The following findings are based upon information collected from existing records, visual inspections and soil sampling data from verification soil borings at Anomaly Area 5:

- Anomaly Area 5 (APHO 66, APHO 31, APHO 43, APHO 67, and APHO 68) contains part of the end of the east-west runway where munitions were formerly placed into aircraft. The anomalies were identified on photographs taken during the time period from 1967 through 1988.
- OHM visually inspected Anomaly Area 5 vicinity in December 1999 and no visual evidence of surface stains, waste materials, disturbed ground, mounded materials or trenches was observed. Also, historical documentation did not identify the storage or usage of hazardous substances at Anomaly Area 5.
- Anomaly Area 5 is located near SWMU 225 (also known as TAA 772) and MSC D1 (Desert Storm Staging area) site. Soil samples were collected for SWMU 225 during the RFA Sampling Visit and OHM performed MSC D1 site soil sampling in 1999.
- The depth to groundwater at Anomaly Area 5 is estimated to be approximately 170 feet bgs.
- Verification soil sampling data from five shallow soil borings indicated that TPH analytes (extractable or purgeable) were not detected in concentrations equal to or exceeding the laboratory reporting limits in any of the soil samples. No benzene, MTBE, or other VOCs were detected, except for acetone and methylene chloride, suspected laboratory contaminants. Some metal analytes were detected above the stated laboratory reporting limit; however, for most of the detected metal analytes the concentrations were less than established background levels for MCAS El Toro and EPA PRGs. Arsenic was detected at levels exceeding the EPA PRGs; however, arsenic was not detected at or above the established background levels for MCAS El Toro. Thallium was detected above the established background levels for MCAS El Toro in two samples at 1.19 mg/kg and 1.41 mg/kg, respectively, but below the residential PRG of 5.5 mg/kg.

Based on results of the field verification sampling data at Anomaly Area 5, the results of the record search activities, and the results of the visual inspection, it is recommended *that no further action (NFA)* status be designated for Anomaly Area 5 (APHO 66, APHO 31, APHO 43, APHO 67, and APHO 68) and that *NFA* status be documented in the next BRAC Business Plan update.

RCRA Permitted Facility 673-T3	No Further Action, Building 673-T3 was closed by California Department of Toxic Substance Control (DTSC) on March 8, 1996	Sampling was conducted during decontamination of Building 673-T3 structure
TAA 772	Field work completed and Closure Report submitted to DTSC with recommendation for No Further Action	5 shallow hand auger borings during the RFA
SWMU 225	TAA 772 was investigated as SWMU 225.	Soil sampling was conducted during the RFA
MSC D1	Pending Recommendation for No Further Action status	Soil sampling was conducted during the RFA and 8 soil borings were drilled by OHM in 1999
SWMU 181	NFA for former land farming area	Soil sampling was conducted during the RFA
SWMU 264	NFA for former DRMO Storage Yard No.3	Soil sampling was conducted during the RFA
IRP Site 5	RI, FS, and Proposed Plan (PP) complete. Draft ROD submitted in 1999. Awaiting results of radiological survey	VOCs, SVOCs, petroleum hydrocarbons, herbicides, metals and Gross alpha, beta have been detected in the groundwater from 3 wells at IRP Site 5 located southeast of Anomaly Area 5

Table 3-1
Groundwater Monitoring Well Data Summary – Anomaly Area 5

Monitoring Well Identification Number	Approximate Distance from Anomaly Area 5 (feet)	Direction from Anomaly Area 5	Top of Casing (feet, msl)	Screened Interval (feet, bgs)	Depth to Water (feet TOC)	Well Total Depth (feet, bgs)	Depth to Groundwater (feet, msl)
18_BGMW02E	950	Southeast	391.72	198-233	163.64	238	228.08
05_DGMW67	240	Southeast	429	177-227	163.20	232	265.70
05_DGMW68	600	Southeast	417	190-210	164.22	215	252.78

bgs – below ground surface

MSC – miscellaneous site of concern

TOC – top of casing

msl – mean sea level

OHM Remediation Services Corp.

Table 4-1 Summary of Analytical Results — Anomaly Area 5

Explanation:

B - result exceeds established background limits

CA LUFT - California Leaking Underground Fuel Tank

EPA - United States Environmental Protection Agency

J - estimated

M - Modified

MDL - method detection limit

mg/kg - milligrams per kilogram

NA - not analyzed

NE - not established

OHM - OHM Remediation Services Corp.

PRG - Preliminary Remediation Goal, EPA Region IX, October 1999

RL - reporting limit

SB - soil boring

TPH - total petroleum hydrocarbons

U - not detected above or equal to the stated reporting limit.

If the analyte had been detected between the MDL and RL

the actual value would have been reported and flagged with

a "J" qualifier. For the samples in question, the laboratory did not

detect analyte concentrations between the MDL and the RL. As

a result, the samples are qualified as non-detect ("U").

X - result exceeds industrial PRGs

Y - result exceeds residential PRGs

µg/kg - micrograms per kilogram

Field Inspection Checklist

CHECKLIST

**Aerial Photograph Anomaly Program, Marine Corps Air Station, El Toro
Anomaly Identification Information:
Date of Photograph: 19 May 1971**

APHO (from BRAC Cleanup Plan)	SAIC	EPA
31	215	

Recommendation: *No Further Investigation Status*

Anomaly Description: From source document: Final Report, Aerial Photograph Assessment (SAIC, 1993):

SAIC 215: *There is disturbed ground (DG) about 250 feet by 350 feet in area, dark-toned mounded material (MMDT), and a probable trench (TR), all about 1600 feet westerly of West Marine Road and Magazine Road. There is also a possible light-toned unidentified object (UO). Additional investigation of the site as a possible disposal or storage site is recommended. [Comment by the writer of the summary report: The annotations on the 1971 photograph in the SAIC report point to the unpaved access road as a trench and the grass unpaved area as dark toned mounded material.]*

Visual Inspection Date (s): 1 December 1999.

Participant(s) (with affiliation (s)) in inspection(s): Dhananjay Rawal
OHM Corporation, Project Engineer

Current Site Conditions: Anomaly Area 5 is relatively flat. Building 840/841, former LOX/Explosive Safety office, with concrete pad is within Anomaly Area 5. More than half of Anomaly Area 5 is former weapons loading area concrete pad. Anomaly Area 5 is surrounded by grass-covered area to the south, the edges of the runways to the north, and IRP Site 5 to the southeast. MSC-D1 remains southwest of Anomaly Area 5. No evidence of recent excavations or trenches was observed during the inspection. Also, no stains or discolored areas were observed on the unpaved and concrete pad area of Anomaly Area 5. [Comment: APHO 31, 43, 66,67 and 68 are grouped together]

Is there visual evidence of the anomaly identified in the photograph present at the site? *None, No construction debris, materials or other items were being stored at the site.*

Is there evidence of past releases? *No*

Description of photograph(s): *Photographs of Anomaly Area 5 (adjacent to the east-end of the east-west runway and IRP Site 5).*

Date of preparation of checklist: December 3, 1999

CHECKLIST

**Aerial Photograph Anomaly Program, Marine Corps Air Station, El Toro
Anomaly Identification Information:
Date of Photograph: 9 December 1974**

APHO (from BRAC Cleanup Plan)	SAIC	EPA
43	287	

Recommendation: *No Further Investigation Status*

Anomaly Description: (from source document): Final Report, Aerial Photograph Assessment (SAIC, 1993):

SAIC 287: *There is an excavation (EX) about 1600 feet west of the Perimeter Road and Magazine Road intersection. The purpose of the excavation is unknown, and investigation of the site history as a possible disposal area is recommended.*

[Comment by the writer of the summary report: The annotations on the 1974 photograph in the SAIC report point to a dark area that may have been a topographically low area that was filled with rainwater.]

Visual Inspection Date (s): 1 December 1999.

Participant(s) (with affiliation (s)) in inspection(s): Dhananjay Rawal
OHM Corporation, Project Engineer

Current Site Conditions: Anomaly Area 5 is relatively flat. Building 840/841, former LOX/Explosive Safety office, with concrete pad is within Anomaly Area 5. More than half of Anomaly Area 5 is former weapons loading area concrete pad and APHO 43 (SAIC 287) is located beneath the weapons loading pad. Anomaly Area 5 is surrounded by grass-covered area (which was mowed regularly to keep the grass from growing too high) and IRP Site 5 to the southeast. MSC-D1 is located southwest of Anomaly Area 5. No evidence of recent excavations or trenches was observed during the inspection. Also, no stains or discolored areas were observed on the unpaved and concrete pad area of Anomaly Area 5. [Comment: APHO 31, 43, 66,67 and 68 are grouped together]

Is there visual evidence of the anomaly identified in the photograph present at the site? *None, No construction debris, materials or other items were being stored at the site.*

Is there evidence of past releases? *No*

Description of photograph(s): *Photographs of Anomaly Area 5 (adjacent to the east-end of the east-west runway and IRP Site 5).*

Date of preparation of checklist: December 3, 1999

CHECKLIST

Aerial Photograph Anomaly Program, Marine Corps Air Station, El Toro
Anomaly Identification Information:
Date of Photograph: 27 June 1967

APHO (from BRAC Cleanup Plan)	SAIC	EPA
66	161	

Recommendation: *No Further Investigation Status*

Anomaly Description: (from source document): Final Report, Aerial Photograph Assessment (SAIC, 1993):

SAIC 161: *Disturbed ground (DG) and probable backfilled trenches (TR) are noted in the western corner of Perimeter Road and Magazine Road, and about 1400 feet westerly of the intersection. Additional investigation of the purpose of these sites is recommended. The northeasterly-oriented, backfilled trench (TR) adjacent to Perimeter Road is the Perimeter Road Landfill (Site 5). No Additional investigation of Site 5 is recommended at this time. The present IR program field investigation Site 5 appears to be adequate, relative to the features noted here. [Comment by the writer of the summary report: The annotations on the 1967 photograph in the SAIC report point to the unpaved area next to concrete pad as a trench.]*

Visual Inspection Date (s): 1 December 1999.

Participant(s) (with affiliation (s)) in inspection(s): Dhananjay Rawal
OHM Corporation, Project Engineer

Current Site Conditions: Anomaly Area 5 is relatively flat. More than half of Anomaly Area 5 is former weapons loading area concrete pad. Anomaly Area 5 is surrounded by grass-covered area, and IRP Site 5 to the southeast. MSC-D1 is located southwest of Anomaly Area 5. No evidence of disturbed ground was observed during the inspection. Also, no stains or discolored areas were observed on the unpaved and paved areas of Anomaly Area 5. [Comment: APHO 31, 43, 66,67 and 68 are grouped together]

Is there visual evidence of the anomaly identified in the photograph present at the site? *None, No construction debris, materials, trenches were observed and no waste items were being stored at the site.*

Is there evidence of past releases? *No*

Description of photograph(s): *Photographs of Anomaly Area 5 (adjacent to the east-end of the east-west runway and IRP Site 5).*

Date of preparation of checklist: December 3, 1999

**Evaluation Form
SWMU/Area of Concern
Number 225**

Name: Hazardous Waste Storage Area 772

Location: South of DRMO Storage Yard #3

Size: Approximately 144 sq ft

Date of Site Visit: 02 May 1991

Period of Operation

Currently inactive

**Evaluation Form
SWMU/Area of Concern
Number 225**

Unit Characteristics

This HWSA is one of the six DHS-permitted HWSAs at MCAS El Toro. These six HWSAs (SWMU/AOC Numbers 222 through 227) are not planned for future use. Historically, these six HWSAs have had drums stored outside of the storage area. HWSA 772 is located approximately 100 ft south of DRMO Storage Yard #3. The HWSA consists of a concrete pad and berm, an aluminum roof, and a chain-link fence on all sides. An access ramp is located on the northern side of the HWSA. At the time of the visit, no drums were stored in the HWSA. The concrete pad is covered with approximately 2 to 3 in. of stagnant, green liquid. Due to the presence of the liquid, the condition of the concrete pad was not discernable. No significant cracks or stains were observed on the concrete berms. The HWSA is bordered on all sides by unpaved, sparsely vegetated soil. An apparently abandoned 500-gallon diesel fuel tank is located approximately 10 ft west of the HWSA. No evidence of release from the tank (i.e., soil stains) was observed.

Waste Characteristics

Unknown

Possible Migration Pathways

Soil

Evidence of Release

None observed

Exposure Potential

On-Station personnel

Recommendations

Although there was no evidence of a release during the site visit and hazardous waste was not currently stored in the area, the past and present HWSAs at MCAS El Toro are recommended for a sampling visit.

Name: Landfarming Site

Location: Adjacent to DRMO Storage Yard #3, near Building 673

Size: Approximately 3 acres

Date of Site Visit: 02 May 1991

Period of Operation

Currently active

**Evaluation Form
SWMU/Area of Concern
Number 181**

Unit Characteristics

A landfarming area for remediating petroleum-contaminated soil was identified near Building 673 through interviews with current on-Station personnel. The landfarming area is located east of Building 673, adjacent to the southeastern corner of DRMO Storage Yard #3, and is paved. The landfarming area consists of various piles of soil, approximately 4 to 6 ft in height. There are two main piles, divided to the north and south by a dirt road extending east from "Z" Street. The piles consist of dirt, broken asphalt and concrete chunks, sand, and gravel. Miscellaneous garbage is also mixed in the soil piles. The piles support sparse vegetative growth.

Waste Characteristics

Petroleum-contaminated soil

Possible Migration Pathways

Surface soil

Evidence of Release

None observed

Exposure Potential

On-Station personnel

Recommendations

Although there is no current evidence of a release at the landfarming site, it is not known whether a release may have occurred in the past. A sampling visit is recommended for this site.

**Evaluation Form
SWMU/Area of Concern
Number 264**

Name: DRMO Storage Yard #3

Location: North 3rd St and East Marine Way

Size: Approximately 3 acres

Date of Site Visit: 02 May 1991

Period of Operation

Currently active

**Evaluation Form
SWMU/Area of Concern
Number 264**

Unit Characteristics

DRMO Storage Yard #3 is located on the southeast corner of North 3rd Street and East Marine Way. The entrance to the storage yard is located at the southern corner of the site. The storage yard is used to store miscellaneous items and equipment including tires, automobiles, refrigerators and other appliances. The entire area of the storage yard is unpaved with a thin layer of gravel over most of the surface. There is little or no vegetation within the lot. The perimeter of the lot is enclosed with chain-link fencing. The storage yard is bordered on the southwest side by North 3rd Street and on the remaining sides by unpaved areas.

Several areas of darkly stained soil were observed in the storage yard. The most significant stain was located in the central portion of the storage yard near the jeep storage area. Other stains were observed in the storage yard at the north corner, the west corner near the tire storage area, and the southeast side near the appliance storage area. The stains appeared to be crankcase oil.

INTEGRATED ENVIRONMENTAL MANAGEMENT, INC.

7. MATERIALS INVENTORY

Based on the information collected during the field survey conducted to gather facility information for the preparation of the SWPPP, and information kept by MCAS El Toro Environmental Department, a materials inventory for MCAS El Toro is presented in Table 7-1. This information can be used in tracing storm water pollution, if it is detected, through the storm water conveyance system to likely source facilities. Materials inventory data can also be used as an aid in developing SPCC plans and management of storm water pollution prevention.

- b) Gross Alpha by SM7110C/Gross Beta by EPA Method 900.
- c) Selected Radionuclides include: Radium-226 by EPA Method 903.1, Radium-228 by EPA Method 904.0, Strontium-89 by EPA Method 905.0, and Cesium-134 by EPA Method 901.1.
- d) Metals (Target Analyte List) by CLP SOW Version ILM03.0 for Metals (filtered samples).
- e) General Chemistry includes: Nitrate/Nitrite (as N), Chloride, Sulfate by EPA Method 300.0; Carbonate and Bicarbonate by SM2320B; Alkalinity by EPA Method 310.1, and Total Dissolved Solids (TDS) by EPA Method 160.1.
- f) Treatability Parameters include: Chemical Oxygen Demand (COD) by EPA Method 410.4, Total Organic Carbon (TOC) by EPA Method 415.1, Ammonia-Nitrogen by EPA Method 350.2, Phosphate by EPA Method 300.0, Silica (dissolved) by EPA Method 370.1, Strontium-90 by EPA Method 905.0, Radon by EPA Method 913.0, Total Suspended Solids (TSS) by EPA Method 160.2, and Color by EPA Method 110.2.

2. Wells from which duplicate samples were collected:

01MW101	05UGMW27	09DBMW45	21UGMW37
01MW102	05NEW1	09DGMW75	22DBMW47
01MW202	09DBMW45	15DBMW51	24NEW4
			24NEW7

3. Samples were not collected at the following wells:

04UGMW63	: Pump failed.
05DGMW67	: Controller box cut out, pump impeller was overheated.
17DGMW82	: Pump failed.

4. Wells 01 MW101, 01 MW102, and 01 MW201 were resampled for VOCs on September 12, 1997 (see Section 2.2).

*Sampling Strategy – Anomaly Areas 4 and 5,
June and November 1999*

FACSIMILE

Date: 7 June 1999

From: Lynn Marie Hornecker 

To: Glenn Kistner (USEPA)
Tayseer Mahmoud (Cal EPA)
Patricia Hannon (RWQCB)

Subj: Sampling Strategy for Aerial Photograph Anomaly Areas 4 and 5
Marine Corps Air Station, El Toro

The purposes of this facsimile are to provide notification of our planned schedule for sampling and to provide additional information pertaining to the sampling strategy for Aerial Photograph Anomaly Areas 4 and 5 (also known as Anomaly Areas 4 and 5) at the Marine Corps Air Station, El Toro, California. If you have questions pertaining to this facsimile, please do not hesitate to call me at (619) 532-4162.

Schedule and Background Information

We will have an opportunity to conduct sampling activities at Anomaly Areas 4 and 5 in July or August 1999. We plan to investigate these sites under the Station's petroleum corrective action program and we plan to report the results in a Site Assessment Report that will include site photographs, laboratory test results, an assessment of the potential risk to ground water caused by residual petroleum hydrocarbons at the anomaly sites, and recommendations for the future management of the sites. Copies of the Site Assessment Report(s) will be provided to all BRAC Cleanup Team members.

Sampling will be conducted in accordance with the procedures described in *the Draft Supplemental Work Plan, Closure of Various Temporary Accumulation Areas and RCRA Facility Assessment Sites, Marine Corps Air Station, El Toro* (OHM, 1997). This work plan, that is used for the current sampling activities at Temporary Accumulation Areas, includes procedures for sample collection and test methods for analyses of samples for petroleum hydrocarbons, volatile organic compounds, metals, and other potential contaminants of concern.

Detailed information, including the historical aerial photographs on which the individual anomalies within Areas 4 and 5 were identified, are presented in the Technical Memorandum, Aerial Photograph Anomalies (Southwest Division, April 1999) that was submitted to the Base Realignment and Closure Cleanup Team (BCT) members on 5 April 1999.

Sampling Strategy

Anomaly Area 4 (former slurry beds identified on 1946 photograph):

Anomaly Area 4 is located adjacent to Building 306, the former water treatment facility, within the boundaries of Installation Restoration Program (IRP) Site 24 – the Volatile Organic Compound (VOC) Source Area. The former water treatment plant appears to have operated during the 1940's. The former water treatment plant included slurry beds (or surface impoundments) that have been filled with soil to match the existing grade. The vicinity of the former impoundments located north of Building 307 is covered with a grass cover. The vicinity of the former slurry beds located immediately northwest of Building 306 is covered with asphalt pavement.

Proposed sampling locations are shown on Figure 2. Five shallow soil borings are proposed for the slurry beds immediately adjacent to Building 306 and three shallow soil borings are proposed for the impoundments located north of Building 307 (total of eight borings). Samples will be analyzed for petroleum hydrocarbons, volatile organic compounds (including methyl tertiary butyl ether (MTBE)), and metals.

Monitoring wells for Installation Restoration Program (IRP) Site 9 (the Crash Crew Training Pit Number 1) and IRP Site 12 (the former Sludge Drying Beds) are located in the vicinity of Anomaly Area 4, and water quality information from these wells will be reviewed during the assessment of Anomaly Area 4. Anomaly Area 4 overlies the VOC ground water plume from IRP Site 24, and the depth to ground water is approximately 100 feet.

Anomaly Area 5 (former construction staging area (and areas of disturbed ground) identified on photographs during the period from 1967 to 1988):

Anomaly Area 5 is located adjacent to the east end of the east-west runway in the vicinity of MSC D1 (the Desert Storm Staging Area) and Solid Waste Management Unit 264 (Defense Reutilization and Marketing Office Yard 3). Most of Anomaly Area 5 is covered with a grass cover, however, some of the individual anomalies appear to be located beneath the end of the runway.

Proposed sampling locations are shown on Figure 3. Five shallow borings are proposed near the edge of the east-west runway. Samples will be analyzed for petroleum hydrocarbons and volatile organic compounds (including MTBE), and metals.

Monitoring wells for IRP Site 5 (the Perimeter Landfill) are located nearby, and water quality data from these wells will be reviewed during the assessment of Anomaly Area 5. The depth to ground water at IRP Site 5 is approximately 160 feet.

**Table. Proposed Sampling Strategy for Aerial Photograph
 Anomaly Areas 4 and 5
 Marine Corps Air Station, El Toro**

Site Identification	Sampling Strategy	Comments
<p>Anomaly Area 4 (SAIC 39 (1946) former slurry beds</p>	<p>8 shallow borings, each approximately 20 feet deep, with analysis of two samples per boring by EPA Methods 8015M (jet fuel, diesel, gasoline), 8260 (Volatile Organic Compounds including MTBE), and 6000/7000 metals</p>	<p>Site is located near Buildings 306 and 307. Small slurry bed area, near Building 306, is approximately 60 feet by 60 feet. Large slurry bed area, north of Building 307, is approximately 100 feet by 800 feet.</p>
<p>Anomaly Area 5 (SAIC 161 (1967), SAIC 215 (1971), SAIC 287 (1974), SAIC 314 (1975), and SAIC 542 (1988)) (Staging Area for previous construction projects (anomaly sites)</p>	<p>5 shallow borings, each approximately 20 feet deep, with analysis of two samples per boring by EPA Methods 8015M (jet fuel, diesel, gasoline), 8260 (Volatile Organic Compounds including MTBE), and 6000/7000 metals</p>	<p>Site is located adjacent to the east end of the east-west runway. Desert Storm Staging Area (MSC D1) may be investigated concurrently with Area 5. Anomaly Area 5 is approximately 250 feet by 450 feet.</p>

Santa Ana, California 92709-5001

Dear Mr. Joyce:

COMMENTS ON SAMPLING STRATEGY FOR AERIAL PHOTOGRAPH ANOMALY AREAS 4 & 5, MARINE CORPS AIR STATION (MCAS) EI TORO

The Department of Toxic Substances Control (DTSC) has reviewed the above subject document dated June 7, 1999. The document provides information regarding the sampling strategy for investigation of Aerial Photograph Anomaly Areas 4 and 5 and a schedule for conducting the sampling activities. The results of investigation and recommendations for future management of the sites will be submitted to the regulatory agencies for review and comments. DTSC comments are as follows:

GENERAL COMMENTS:

1. Please ensure that quality assurance/quality control (QA/QC) laboratory samples are in accordance with the procedures described in the Draft Supplemental Work Plan, Closure of Various Temporary Accumulation Areas and RCRA Assessment Sites (OHM, 1997). The Site Assessment Report(s) should contain a narrative pertaining to the laboratory analyses that includes description of sampling techniques, decontamination procedures, analytical methods and laboratory procedures, laboratory data quality, and data validation results.
2. The Sampling Strategy states that sample analyses will be conducted for petroleum hydrocarbons, volatile organics compounds (VOCs), metals, and other potential contaminant of concern. The Sampling Strategy must also specify the contaminants of concern (COCs), appropriate test methods, and detection limits.
3. The Sampling Strategy states that "shallow" soil samples, approximately 20 feet deep will be collected. Please provide the rationale for the depth proposed for taking the samples

Mr. Joseph Joyce
June 21, 1999
Page 2

SPECIFIC COMMENTS:

4. **Anomaly Area 4 - former slurry beds identified on 1946 photograph. Located adjacent to Building 306, the former water treatment facility, within the boundaries of IRP site 24, the VOC source area.**
 - a. All samples collected from the former slurry beds should, at a minimum, be analyzed for the same COCs identified at IRP Site 12, the former Sludge Drying Beds, since they probably handled the same waste. Soil samples collected at IRP Site 12 were analyzed for VOCs, TPH, SVOCs (specifically for PAHs), PCBs, Pesticides, Herbicides, and cyanide.
 - b. Five shallow soil borings adjacent to Building 306 and three shallow soil borings are proposed for the impoundments located north of Building 307. DTSC recommends that two samples be collected from each proposed sample location; one sample at a depth near the bottom of the slurry bed and one sample five feet below the bottom of the slurry bed. Additional samples may be required at deeper depths if contamination is discovered. Continuous coring should be conducted and the lithology recorded.
5. **Anomaly Area 5 - former construction staging area (and areas of disturbed ground) identified on photographs during the period from 1967 to 1988.**

DTSC recommends the soil samples be collected within 10 feet below ground surface (bgs). The information will be useful for preparing a risk assessment if contamination is found. Should the disturbed earth extend beyond 10 feet bgs, additional samples should be collected at the contact surface between the disturbed and native soil.

If you have any questions, please contact me at (714) 484-5418.

Sincerely,

Tayscer Mahmoud

**Subject: Supplemental Sampling Strategy, Aerial Photograph Areas 4 and 5
Contract N68711-93-D-1459, Delivery Order 070,
Remediation of Various UST, AOC and RFA Sites, MCAS El Toro, California**

Dear Ms. Hornecker:

The attached Supplemental Sampling Strategy, Aerial Photograph Anomaly Areas 4 and 5 provides a response to the comments generated by DTSC on the original Sampling Strategy the you faxed to the agencies on June 7, 1999. This supplemental document addresses the questions raised and includes the chemicals of concern and detection limits anticipated for these chemicals.

Following your concurrence, and that of DTSC, OHM will implement the field sampling discussed in the document.

If you have any questions or need additional information or copies please call or e-mail me.

Sincerely,

A handwritten signature in cursive script that reads 'William Sedlak'.

William Sedlak, P.E.
Sr. Project Manager

**Supplemental Sampling Strategy, Aerial Photograph Anomaly Areas 4 and 5
Clarification of Comments from California Department of Toxic Substances Control**

Background

A sampling strategy was developed and submitted to the BRAC Cleanup Team (BCT) (including U.S. EPA, California Department of Toxic Substances Control and Regional Water Quality Control Board) in early June 1999. The Department of Toxic Substances Control (DTSC) submitted comments on the strategy on June 22, 1999. In these comments, DTSC requested clarification of the sampling quality control and laboratory methodology.

	Comments by Tayseer Mahmoud, June 22, 1999 General Comments	Response/Clarification
1	Please ensure that quality assurance/quality control (QA/QC) laboratory samples are in accordance with the procedures described in the Draft Supplemental Work Plan, Closure of Various Temporary Accumulation Areas and RCRA Assessment Sites (OHM, 1997). The Site Assessment Reports should contain a narrative pertaining to the laboratory analyses that includes description of sampling techniques, decontamination procedures, analytical methods and laboratory procedures. Laboratory data quality, and data validation results.	The procedures identified in the Final Supplemental Work Plan(OHM 1997) will be followed.
2	The Sampling Strategy states that sample analyses will be conducted for petroleum hydrocarbons, volatile hydrocarbons, volatile organic compounds (VOCs), metals and other potential contaminant of concern. The Sampling Strategy must also specify the contaminants of concern (COCs), appropriate test methods, and detection limits.	The COCs are provided in Table 1. along with test methods and anticipated levels of detection. Analyses will include VOCs, TPH, semi-volatile organic compounds (SVOC), pesticides/herbicides, metals, and PCBs. The detection levels are dependent on a variety of factors including the nature of the contaminant, type of media analyzed, and other contaminants that mask, or due to higher concentrations raise the detection limit. Detection limits are desired below the Preliminary Remediation Goal (PRGs) for each compound. The same methodology used in the analysis of samples from the temporary accumulation areas will be used for the anomalies.
3	The sampling Strategy states that "shallow" soil samples, approximately 20 feet deep will be collected. Please provide the rationale for the depth proposed for taking the samples.	The 20 foot depth referred to in the Proposed Strategy Table is the anticipated maximum depth. Sample depths are discussed in response to item 4 and 5 below.
	Specific Comments	

4	Anomaly Area 4 - former slurry beds identified on 1946 photograph. Located adjacent to Building 306, the former water treatment facility, within the boundaries of IRP Site 24, the VOC source area.	
4	a. All samples collected from the former slurry beds should, at a minimum, be analyzed for the same COCs identified at IRP Site 12, the former Sludge Drying Beds, since they probably handled the same waste. Soil samples at IRP Site 12 were analyzed for VOCs, TPH, SVOCs (specifically for PAHs), PCBs, Pesticides, Herbicides, and cyanide.	Agreed. Table 1 identifies the COCs and test methods.
4	b. Five shallow soil borings adjacent to Building 306 and three shallow soil borings are proposed for the impoundments located north of Building 307. DTSC recommends that two samples be collected from each proposed sample location: one sample at a depth near the bottom of the slurry bed and one sample five feet below the bottom of the slurry bed. Additional samples may be required at deeper depths if contamination is discovered. Continuous coring should be conducted and the lithology recorded.	<p>The depth of the slurry bed is estimated to be from 9 to 10 feet below the surface grade. This is based on a 1949 drawing of the slurry pit and vicinity (see attached copy). Based on the details provided in the Phase II RI for IRP Site 12, the slurry beds at that site were abandoned in place, and simply tilled into the existing grade. This resulted in an increased ground elevation of approximately 5 feet.</p> <p>Due to the uncertainty in the depth of the slurry pits, sampling is proposed at 5, 10 and 15 feet bgs. The 5-foot sample theoretically would be in the tilled materials, the 10 foot should be at the bottom of the bed, and the 15 foot sample should be below the bottom of the bed. Lithology will be recorded adjacent to sampling depths.</p>
5	<p>Anomaly Area 5 - former construction staging area (and areas of disturbed ground) identified on photographs during the period from 1967 to 1988.</p> <p>DTSC recommends the soil samples be collected within 10 feet below ground surface (bgs). The information will be useful for preparing a risk assessment if contamination is found. Should the disturbed earth extend beyond 10 feet bgs, additional samples should be collected at the contact surface between the disturbed and native soil.</p>	Two samples are proposed per boring. Proposed sample depths are from 5 to 7 feet bgs (depending on whether surface is paved or dirt) and 10 to 12 feet bgs.

If required for semi-volatile organic compounds, the Selected Ion Monitoring (SIM) technique may be used to achieve lower detection limits to meet certain EPA Region IX PRG values. The OHM criteria for acceptance of the SIM data is that the laboratory Method Detection Limit must be equal to or less than half of the PRG value.

Aerial Photograph Anomalies

Marine Corps Air Station, El Toro, California

Southwest Division, Naval Facilities Engineering Command

NAFAC Operations Office — April 5, 1999

Technical Memorandum

TABLE 1. Anomaly Areas Recommended for Additional Evaluation or Sampling

ANOMALY AREA NUMBER ^a	ANOMALY NUMBERS ^b (date of associated photograph)	LOCATION AND DESCRIPTION	STUDY AREA ^c	SITE VISIT PERFORMED ^d	DoN RECOMMENDATION ^e	ESTIMATED DIMENSIONS ^f	COMMENTS ^g
1	SAIC 144 (1964), SAIC 169 (1967), EPA 7 (1952, 1965), EPA 36 (1980)	A circular scar on the unpaved ground surface southwest of former Tank Farm 1.	A	Yes	Management of the site as a petroleum corrective action program site with soil sampling for petroleum hydrocarbons.	125 foot diameter turning circle (unpaved roadway)	This unpaved area may have been used to dispose of excess oil. No stains were observed during the site visit.
2	SAIC 173 (1967), EPA 21 (1970)	The former location of four fuel bladder revetments southeast of Tank Farm 3.	A	Yes	Management of the site as a petroleum corrective action program site with soil sampling for petroleum hydrocarbons.	130 by 40 feet	Fuel bladder revetments (FBR) were located in an area adjacent to and east of the vehicle storage yard. The area is presently paved with asphalt. The FBR were present at this location from at least 1962 through 1970. No stained areas were observed during the site visit.
3	SAIC 20 (1946), SAIC 64 (1952), SAIC 106 (1960), SAIC 156 (1967), SAIC 443 (1981), SAIC 536 (1988), SAIC 564 (1992)	The area between Pusan Way and Agua Chinon Wash, East of Bldg. 722.	B	Yes	Management of the site as an RFA site with trenching and visual inspections.	1000 by 300 feet	Refuse was noted in anomaly SAIC 156. Construction debris is visible at scattered locations throughout the site. Station personnel have indicated this was a construction debris disposal area.
4	SAIC 39 (1946)	The area west of Bldg. 306.	D	Yes	Management of the site as a petroleum corrective action program site with soil sampling for petroleum hydrocarbons.	60 by 60 feet	This area is listed as "slurry beds" on historical plans up to 1951. The slurry beds were used as part of the potable water treatment system.
5	SAIC 161 (1967), SAIC 215 (1971), SAIC 287 (1974), SAIC 314 (1975), SAIC 542 (1988)	The area located approximately 1600 feet west of the intersection of Perimeter Road and Magazine Road (LOX FAX facility is inside the area) and adjacent to MSC D1-the Desert Storm Staging Area.	E	Yes	Management of the site as a petroleum corrective action program site with soil sampling for petroleum hydrocarbons.	450 by 250 feet	Disturbed ground, grading, and trenching were observed in this area. The EBS indicates that hazardous materials from Desert Storm activities were staged in this area. This area was reportedly used as a bivouac area for Boy Scout Jamborees.

Notes:

- ^a = This column lists areas recommended for potential sampling or additional evaluation. Each area consists of one or more anomalies.
- ^b = This column identifies the anomalies contained in the area.
- ^c = Refers to the study area (A through F) of MCAS El Toro that the anomaly is located. The designations are derived from the USEPA Site Analysis Report. These study areas are illustrated on Figure 1.
- ^d = This column indicates whether a site reconnaissance has been performed for this the area.
- ^e = This column identifies the Navy recommendation for the area.
- ^f = Dimensions include areas containing all anomalies obtained from the aerial photographs in the U.S. EPA and SAIC reports. The dimensions are rough estimates due to the small scale of photographs and absence of photographs in some uses.
- ^g = Comments include information on anomalies obtained from U.S. EPA and SAIC reports as well as information obtained from historical documents.

TABLE 2. Proposed List of Aerial Photograph Anomalies for BCP Table 3-2, Year 2000 Update

Database Tracking	Anomaly Identification Number	Year of Photograph	Anomaly Area Number *	1998 Reuse Parcel	Point of Reference	Description/Explanation for Proposed Management Strategy **	NFA
APHO 6	SAIC 39	1946	Anomaly Area 4	29	B 306	Two impoundments (IM) can be observed on the southwest side of Building 306, near S 11th Street and L Street. Historical station maps from the 1940's show a water treatment facility at Building 306 with adjacent slurry beds (impoundments). Further investigation is proposed	
APHO 7	SAIC 46	1946		29	B 1389	There is wet soil (WS) or stains (ST) in the area now occupied by the southwest corner of Building 1389 and in the open storage (OS) area about 200 feet northwest of Building 1389. This comment may actually refer to the former Building 1589 in the vicinity of IRP Site 11 (and southwest of Building 369) which includes a small drainage ditch (Unit 2). No further action is proposed based upon the sampling that has been conducted at IRP Site 11. Additionally, the anomaly site is located within IRP Site 24 and soil gas surveying was conducted near the site and this data was evaluated for the Remedial Investigation of IRP Site 24.	X
APHO 8	SAIC 52	1946		7	Runways 34-L & 34-R	In the area north of the railroad tracks, between Agua Chinon Wash and Borrego Canyon Wash, there are four open storage (OS) areas. All appear to contain refuse (R) or materials in storage. The westerly area appears to have been excavated (EX) and the spoil (FA) placed toward the southeast. The spoil area (FA) and the excavated (EX) area appear to be covered with refuse (R) or other materials. The southerly open storage (OS) area is an aircraft salvage area with several fuselage and wing sections visible. Smaller open storage (OS) areas occur near the four major sites. This area is located beneath Runways 34R and 34L and/or the approaches to the runways and the southwestern portion of the golf course. The anomaly site is adjacent to Perimeter Road, and no refuse, aircraft parts, or other materials are visible. It is likely that all surface debris was removed as the runway approaches were modified and as the golf course area expanded toward the runways. No further action is proposed due to the absence of additional evidence to support the observation that refuse may have been stored at this area.	X

TABLE 2. Proposed List of Aerial Photograph Anomalies for BCP Table 3-2, Year 2000 Update

Database Tracking	Anomaly Identification Number	Year of Photograph	Anomaly Area Number *	1998 Reuse Parcel	Point of Reference	Description/Explanation for Proposed Management Strategy **	NFA
APHO 9	SAIC 53	1946		23	Agua Chinon Wash	Liquid (LQ) can be seen flowing from a former (?) hangar near the northeast end of the aircraft parking apron on the northerly side of the present ACER site (Site 19). The liquid (LQ) discharges into a drainage ditch from a small building behind the former hangar. The anomaly site corresponds to the location of Agua Chinon Wash near Site 19. The drainages, including Agua Chinon Wash, have been investigated during the Remedial Investigation of Site 25 - the Major Drainages. No further action recommended based upon the sampling conducted at Site 25 and at Site 19, Units 1, 2, 3, and 4 in the vicinity of Agua Chinon Wash.	X
APHO 10	SAIC 79	1955		23	B 286	There is an open storage (OS) area on the westerly side of Building 286, near N 7th Street and West Marine Way. Historical property records do not indicate that hazardous wastes were managed at Building 286, and consequently, no further action is proposed.	X
APHO 11	SAIC 81	1955		29	B 307	A trench (TR) and disturbed ground (DG) can be seen about 230 feet northwesterly of Building 307, near S 14th Street and K Street. The purpose is unknown. The location of the disturbed area corresponds approximately with the location of one of the slurry beds associated with the former water treatment facility. The slurry beds, including SAIC 81, are proposed for further investigation in Anomaly Area 4 (SAIC 39).	
APHO 12	SAIC 92	1958		8	DRMO Yard 2	There is wet soil (WS) in the open field between East Marine Way and Z Street. This area is near or at Solid Waste Management Unit (SWMU) 46 which has been investigated under the Resource Conservation and Recovery Act Facility Assessment (RFA). No further action recommended.	X
APHO 13	SAIC 102	1960		40	B 415	Possible drums (D) are located on the northeast side of Building 415, located easterly of the rodeo area. Historical records do not indicate that hazardous wastes were managed or stored at Building 415, most recently used for storage of materials by the Marine Air Group (MAG) -11, and consequently, no further action is recommended.	X
APHO 14	SAIC 105	1960		40	Horse Stables	Stains (ST) or wet soil (WS) can be seen in the cleared areas on the northeast and southeast sides of the Rodeo Area complex. Historical records do not indicate that hazardous wastes were managed in this area. No further action recommended based upon the review of historical records.	X

TABLE 2
SAIC Aerial Photograph Anomaly List

SAIC 467	LQ	1983	B	Liquid is apparently flowing southwesterly into a parking area from buildings located about 200 feet southeast of Bldg 392	SAIC 17, SAIC 150, SAIC 198 SAIC 198, SAIC 338, SAIC 388 SAIC 422, EPA 81, EPA 66, EPA 68	Motor Pool Area	2	FI	NFI (4)	NFI	This anomaly is part of an site indicated to be the "Motor Pool Area" in the USEPA report. Several SWMUs have been investigated in this area. Most of the anomalies in this area are stains or liquid.
SAIC 483	ST, LQ	1984	B	Stains or liquids are at three locations: near the northwest edge of the aircraft parking apron, the northeast portion of Tank Farm No. 4, and the parking area to the southeast.	SAIC 12, SAIC 22, SAIC 148 SAIC 237, SAIC 332, SAIC 369 SAIC 459, EPA 73	Tank Farm 4	2	FI	NFI (4)	NFI	This anomaly has been addressed by excavations or soil investigations related to Tank Farm 4.
SAIC 484	ST	1984	B	Probable stains on the southerly side of Bldg 658		IRP Site 4	N/A	FI	FI (2)	NFI	This anomaly only identified on this aerial photograph.
SAIC 497	B, DG	1984	B	New construction and associated disturbed ground in the triangular area southeast of Perimeter Road and Magazine Road.		This anomaly is only Nonetted on one aerial photograph.	1	NFI	NFI	NFI	
SAIC 508	LQ	1987	B	Liquid is apparently flowing near the northeast side of Bldg 125.		None	2	FI	NFI (3)	NFI	
SAIC 518	ST, WS	1987	B	Probable stains or wet soil are on the northeast side of Bldg 415.	SAIC 102	SWMU 125	2	NFI	NFI	NFI	
SAIC 519	GR	1987	B	The Rodeo Area has expanded to the northwest following probable site grading.		None	1	NFI	NFI	NFI	
SAIC 527	VT	1988	B	A vertical tank is near the northwest corner of Bldg 121.		None	4	FI	NFI (4)	NFI	
SAIC 538	EXT, FA	1988	B	The former extraction area at the mouth of Agus Chwon Wash has been filled.	SAIC 20, SAIC 64, SAIC 108 SAIC 158, SAIC 443, SAIC 564	None	1	NFI	NFI	FI	Construction debris is visible at scattered locations throughout the site. Station personnel have indicated this area was a disposal area.
SAIC 539	DG, B, MMLT, DG, TR	1988	B	The Rodeo Area has expanded to the northwest where disturbed soil, buildings, and light-toned mounded material can be seen. There is an area of disturbed ground along the southerly side of Irvine Blvd that may be a backfilled trench.		None	1	FI	NFI (4)	NFI	
SAIC 557	B, UO, VT	1992	B	A new building and unidentified object (tank or circular horse training area) are at the Rodeo Area		None	4	NFI	NFI	NFI	
SAIC 564	GR	1992	B	Grading appears to be complete in the south central area of MCAS	SAIC 20, SAIC 64, SAIC 106 SAIC 156, SAIC 443, SAIC 536	None	1	NFI	NFI	FI	Construction debris is visible at scattered locations throughout the site. Station personnel have indicated this area was a disposal area.
SAIC 97	UO, MMLT	1958	C	No significant changes are noted at Site 1		IRP Site 1	6	NFI	NFI	NFI	
SAIC 116	ST, TR, LQ	1960	C	Several stains and a trench with with probable liquid at Site 1.		IRP Site 1	2	NFI	NFI	NFI	
SAIC 221		1971	C	No significant changes are noted at the EOD range		IRP Site 1		NFI	NFI	NFI	
SAIC 254	TR, HT	1973	C	Two possible trenches and a horizontal tank at Site 1		IRP Site 1	1	NFI	NFI	NFI	
SAIC 571		1974	C	No significant changes at Site 1		IRP Site 1		NFI	NFI	NFI	
SAIC 572		1975	C	No significant changes at Site 1		IRP Site 1		NFI	NFI	NFI	
SAIC 373		1977	C	No significant changes are noted at Site 1		IRP Site 1		NFI	NFI	NFI	
SAIC 444	IM, LQ	1981	C	A berm has been constructed in the northern portion of Site 1. Pounded liquid is noted in photographs from some years.		IRP Site 1	5	NFI	NFI	NFI	
SAIC 472	LQ, IM	1983	C	A liquid filled impoundment (about 100 by 150 feet) is at the northern portion of Site 1. A liquid filled trench is in the center of Site 1.		IRP Site 1	5	NFI	NFI	NFI	
SAIC 513		1987	C	No significant changes are noted at Site 1		IRP Site 1		NFI	NFI	NFI	
SAIC 34	VT	1946	D	A probable vertical tank near S 11th Street and L Street		SWMU 45	4	FI	NFI (4)	NFI	Possibly Tank 155?
SAIC 35	UO, VT, M	1946	D	Unidentified object, possibly a vertical tank or mound on the north side of perimeter road	No	None	4	FI	NFI (4)	NFI	
SAIC 37	LQ	1946	D	Liquid flowing southwesterly from the southwest side of Bldg 132	No	None	2	FI	NFI (4)	NFI	Location is questionable
SAIC 39	IM	1946	D	Two impoundments on the southwest side of Bldg 306		None	5	FI	FI	FI	Listed as "Slurry Beds" on station plans from 1940s. This anomaly was recommended for further investigation in Table 5 of this Report
SAIC 40	VT	1946	D	Two vertical tanks on the northeast side of Bldg 306		None	4	FI	NFI (4)	NFI	
SAIC 41	OS, D	1946	D	An open storage area, possibly with drums on the westerly side of Building 320	SAIC 181 SAIC 410	IRP Site 21	N/A	FI	NFI (3)	NFI	
SAIC 42	ST	1948	D	Soil stains beneath the present aircraft apron about 500 feet southeast of Tank 174		IRP Site 10	N/A	FI	FI (2)	NFI	This anomaly is contained within IRP Site 10
SAIC 43	OS, D	1946	D	Open storage areas with possible drums beneath the present aircraft parking apron about 700 to 1000 feet southeast of Tank 174		IRP Site 10	N/A	FI	FI (2)	NFI	This anomaly is contained within IRP Site 10
SAIC 44	ST, OS	1946	D	Soil stains in an open storage area now occupied by Bldgs 386 and 1389		IRP Site 10	N/A	FI	FI (2)	NFI	A portion of this anomaly is contained within IRP Site 10
SAIC 45	WS, ST, OS	1946	D	Wet soil or stains in an open storage area about 500 feet northwest of Bldg 322		None	2	FI	NFI (4)	NFI	

TABLE 2
SAIC Aerial Photograph Anomaly List

SAIC 46	WS, ST, OS	1948	D	Wet soil or stains in the area now occupied by the southwest corner of Bldg 1369, and in the open storage area about 200 feet northwest of Bldg 1369.		None	2	F1	F1	NF1	This anomaly only identified on this aerial photograph.
SAIC 47	OS, D	1948	D	An open storage area with possible drums near the		None	3	F1	NF1 (4)	NF1	
SAIC 48	ST, LQ, D	1948	D	Stains caused by liquid flowing easterly from the aircraft parking apron about 200 feet east of Bldg 296.		Adjacent to IRP Site 7	N/A	F1	F1 (2)	NF1	This anomaly is contained within IRP Site 7.
SAIC 49	D, OS	1948	D	There may be drums in an open storage area about 200 feet east of Bldg 296.		Adjacent to IRP Site 7	N/A	F1	F1 (2)	NF1	
SAIC 50	OS	1948	D	An open storage area at the present location of Bldg 360.		None	3	F1	F1 (2)	NF1	Building 360 was constructed prior to December 1952.
SAIC 51	MMDT	1948	D	Dark-toned mounded material adjacent to the drainage ditch between Perimeter road and the Southeast corner of the aircraft parking apron.		None	6	NF1	NF1	NF1	Mounds appear to be soil related to maintenance of the ditch.
SAIC 52	OS	1948	D	Four open storage areas north of the railroad tracks, between Ague Chlon Wash and Borrego Canyon Wash.		None	3	F1	F1	NF1	This area has now been covered by the end of Runways 34-L and 34-R.
SAIC 68	TR	1952	D	Shallow or backfilled trench		None	1	F1	NF1 (4)	NF1	
SAIC 69	MMLT	1952	D	Light-toned mounded material can be seen on the westerly side of Bee Canyon Wash, South of Perimeter Road	SAIC 246 SAIC 277 SAIC 485	Adjacent SWMUs	6	NF1	NF1	NF1	Disturbed ground, trenches, and/or mounded material was observed on aerial photographs from four different years.
SAIC 70	TR, LQ	1952	D	A trench with possible liquid at its northern end		None	1	NF1	NF1	NF1	
SAIC 81	TR, DG	1955	D	A trench and disturbed ground about 230 feet northwest of Bldg 307.	EPA 125	None	1	F1	F1	NF1	This anomaly is only identified on this aerial photograph. No liquids, refuse or other materials were noted in the trenches.
SAIC 82	OS	1955	D	Open storage areas in much of the north-central portion of Area D from the USEPA Report		IRP Sites 10, 22, 24	N/A	NF1	NF1	NF1	
SAIC 83	ST	1955	D	Probable stains adjacent to the northwest corner of the aircraft parking apron		IRP Site 22	N/A	NF1	NF1	NF1	
SAIC 84	VT	1955	D	Two vertical tanks can north of Bldg 355		None	4	F1	NF1 (4)	NF1	
SAIC 85	VT	1955	D	Two vertical tanks about 200 feet south of Bldg 368	EPA 131 (?)	IRP Site 12	N/A	F1	F1 (2)	NF1	This anomaly is contained within IRP Site 12
SAIC 86	OS	1955	D	Open storage area parallel to S Manne Way, extends from SAIC 85 to Bldg 317	SAIC 488	None	3	NF1	NF1	NF1	
SAIC 90	LQ, WS	1958	D	Possible liquid or wet soil at the northerly end of the sludge drying beds		IRP Site 12	N/A	NF1	F1 (2)	NF1	This anomaly is contained within IRP Site 12
SAIC 129	IM, VT	1961	D	An impoundment and six vertical tanks near S Manne Way, S. 15th Street, and Plant Road	EPA 129	IRP Site 12	N/A	F1	F1 (2)	NF1	This anomaly is contained within IRP Site 12
SAIC 130	ST, DG	1961	D	Stains and disturbed ground near the near the northerly and easterly sides of Bldg 1585 about 200 feet north of the Bldg 322		SWMUs 243, 291	2	F1	NF1 (4)	NF1	
SAIC 131	LQ	1961	D	Liquid appears to be flowing from a hangar (Bldg 296) at the southeast corner of the aircraft parking apron and discharging into the ditch each of the apron		IRP Site 24	N/A	F1	F1 (2)	NF1	This anomaly is partially contained within IRP Site 7.
SAIC 132	ST	1961	D	Stains in the proximity of Bldg 1749	SAIC 137 SAIC 461	IRP Site 8	N/A	F1	F1 (2)	NF1	This anomaly is contained within IRP Site 8
SAIC 134	MMLT	1964	D	Light-toned mounded material on the north side of the railroad tracks near the approach end of Runway 34R		None	6	NF1	NF1	NF1	Materials appear to be soil and vegetation from earthmoving activities
SAIC 135	TR, DG	1964	D	A trench and disturbed ground about 1000 feet northeast of SAIC 134		None	1	F1	NF1 (4)	NF1	Could be backfilled trench or disposal site
SAIC 137	ST	1964	D	Stains are observed in the cleared or graded area easterly of Bldg 360 and Site 8		IRP Sites 8 & 24, SWMU 232	N/A	F1	F1 (2)	NF1	Northern portion of anomaly is contained within IRP Site 8
SAIC 138	OS, ST, D	1964	D	An open storage area, probable stains and drums about 500 feet Southeast of the southeast corner of the aircraft parking apron	SAIC 247 SAIC 305	None	3	F1	F1 (2)	NF1	Western portion of anomaly is contained within IRP Site 8
SAIC 139	ST	1964	D	Stains in the vicinity of Bldg 325		None	2	F1	F1	NF1	This anomaly only noted on the aerial photograph. Within in area where several soil gas samples have been taken.
SAIC 140	ST	1964	D	Stains on the westerly side of Bldg 324		IRP Site 24 boring at West Edge of anomaly	2	F1	F1	NF1	This anomaly only noted on this aerial photograph. Within in area where several soil gas samples have been taken.
SAIC 141	ST, LQ	1964	D	Stains in the general area of Bldgs 309, 311, and 312, probable liquid flow from toward the northeast from near Bldg 312	EPA 163	IRP Site 10	N/A	F1	F1	NF1	Within in area where several soil gas samples have been taken as part of Site 24 investigation.
SAIC 142	ST	1964	D	Stains in the open area within and south of Site 10		IRP Site 9, 10, 22	N/A	NF1	NF1	NF1	All of the eastern portion and half of the western portion of anomaly is contained within IRP Site 10
SAIC 167	ST	1967	D	Extensive staining at Sites 9, 10, and 22		IRP Site 9, 10, 22	N/A	NF1	NF1	NF1	
SAIC 168	OS, D	1967	D	An open storage area with probable drums adjacent to the southwest corner of the aircraft parking apron near Bldgs 388 and 655		IRP Site 10	N/A	F1	F1 (2)	NF1	Anomaly is contained within IRP Site 10
SAIC 176	EXT	1968	D	A 400 by 70 feet extraction between Runways 34L and 34R about 500 feet south of Runway 25R		None	1	F1	F1	NF1	This anomaly is likely related to some type of runway construction.
SAIC 177	EX	1968	D	An excavation near threshold of Runway of 34R containing unidentified equipment or materials		None	1	F1	NF1 (4)	NF1

soil contaminated with PCBs located in a large pit with a 10-foot-deep layer of clean soil. This action met the U.S. EPA remedy requirements for PCB-contaminated soil.

- Soil vapor extraction (SVE) pilot tests, initiated at IRP Site 24 in 1996, were continued at various vapor extraction wells during 1998. Over 870 pounds of VOCs were removed during the SVE pilot testing.
- Groundwater remediation pilot tests, initiated at IRP Site 24 in 1997, were continued during 1998. The purpose of the testing program was to compare and evaluate the effectiveness of groundwater extraction, SVE-enhanced groundwater extraction and groundwater injection during remediation of VOCs in groundwater. The testing program provided additional data to assist in the design of a remedial alternative capable of (1) minimizing the migration of VOCs within the shallow groundwater unit and (2) minimizing the migration of VOCs from the shallow groundwater unit to the principle aquifer.

Table 3-3 will be revised in updates of this BCP as early actions for IRP sites are implemented and/or completed.

3.1.2 Installation-Wide Source Discovery and Assessment Status

An EBS for MCAS El Toro was completed on 01 April 1995. One of the main objectives of the EBS was to evaluate the ECP at the Station to facilitate property disposal. Information from this study related to source discovery and assessment are detailed below.

3.1.2.1 Aerial Photograph Features/Anomalies

In 1991 and 1993, surveys of historical aerial photographs of MCAS El Toro were performed by the U.S. EPA and Science Applications International Corporation (SAIC) (SAIC 1993), respectively. The survey included photographs dating back to 1946. The photographs were reviewed for features/anomalies of potential environmental concern. Over 500 features/anomalies were identified by SAIC which took into account hundreds of anomalies initially identified by the U.S. EPA report. The features/anomalies that related to IRP sites were evaluated and incorporated, as appropriate, in the Phase II RI Work Plan. As part of the EBS, the remaining aerial photograph features/anomalies were further evaluated. The final EBS Report identified a total of 53 features/anomalies requiring more detailed assessment. These 53 features/anomalies are described in Table 3-2 and shown in Figure 3-1. DoN initiated a more detailed assessment of these features/anomalies in 1997. Physical sampling in some of the areas of consolidated anomalies is anticipated in 1999.

Table 3-2
Aerial Photograph Features/Anomalies
 (Sheet 1 of 7)

Database Tracking	SAIC Anomaly ID No.	LRA Reuse Parcel	Point of Reference	Year	SAIC Observations ¹	SAIC Comments ²	Comments	ECP Area Type
APHO 1	7	32	Tank Farm 3	1946	ST	C	The stains appear adjacent to the southeastern side of Tank Farm 3 where a former fuel bladder may have been located. Also see anomalies 113, 173, 190, 227, 235, and 272.	7
APHO 2	14	42	B 136	1946	OS, D	C	Miscellaneous equipment is stored along the southeast side of B 135. The ground surface is paved with asphalt, and surface runoff flows in a southwest direction.	7
APHO 3	21	43	B 120	1946	OS, D	C	Miscellaneous equipment is stored along the southeast side of B 120. The ground surface is paved with asphalt, and surface runoff flows in a southwest direction.	7
APHO 4	22	23	Tank Farm 4	1946	ST	C	Miscellaneous equipment is stored along all sides of this building. Portions of the ground surface along the east and west sides of the building are unpaved. Surface runoff flows in a southwesterly direction.	7
APHO 5	25	32	B 50	1946	OS	C	This area is commonly used for open storage. The ground surface is unpaved.	7
APHO 6	39	29	B 306	1946	IM	C	Unknown impoundments. Additional investigation recommended.	7
APHO 7	46	29	B 1389	1946	WS, ST, OS	C	The liquid is probably surface runoff.	7
APHO 8	52	7	Golf Course Hole 12	1946	OS, R, EX, FA	C	Portions of this storage area has been covered by the extension of runways 34-L and 34-R.	7
APHO 9	53	23	Agua Chinon Wash	1946	LQ	C	The liquid could be surface runoff flowing into Agua Chinon Wash.	7

Table 3-2
Aerial Photograph Features/Anomalies
(Sheet 2 of 7)

Database Tracking	SAIC Anomaly ID No.	LRA Reuse Parcel	Point of Reference	Year	SAIC Observations ¹	SAIC Comments ²	Comments	ECP Area Type
APHO 10	79	23	B 286	1955	OS	A	The open storage area may be associated with B 286.	7
APHO 11	81	29	B 307	1955	TR, DG	C	This feature is located adjacent to the NW side of the storage yard for the trade shops and NE of B 307. Activities associated with the disturbed ground are unknown.	7
APHO 12	92	8	DRMO Yard 2	1958	WS	C	Two areas of wet soil are identified in this anomaly. One is located near the SE corner of the DRMO storage yard #2 (SWMU 46) and the other is located SW of B 457. No analytical data has been collected for the general area SW of B 457.	7
APHO 13	102	40	B 415	1960	D	C	SWMU 125 is located on the NE side of B 415. The storage area featured in the photograph is located in an unpaved area on the NW side of the building. Also see anomalies 289 and 431	7
APHO 14	105	40	Horse Stables	1960	ST, WS	C	This feature is located near the horse stables. No HW-generating activities are known to have occurred at the stable area.	7
APHO 15	113	32	Tank Farm 3	1960	ST	C	Several stains appear at various locations adjacent to the parking apron near Tank Farm 3. It is possible that the stains could be due to runoff from the apron.	7
APHO 16	115	32	Tank Farm 3	1960	WS, LQ	C	The wet soil appears in a storage yard located adjacent to the SW side of Tank Farm 3. The storage yard is used to store vehicles and miscellaneous equipment.	7
APHO 17	139	29	B 357	1964	ST	C	Currently, this area is unpaved. A hazardous materials storage locker is located approximately 20 feet north of the anomaly.	7

Notes:

1 The abbreviations in this column correspond to the following:

B - Building
 D - Drums
 DB - Debris
 DG - Disturbed ground
 DT - Dark-toned
 EX - Excavation
 EXT - Extraction

FA - Fill area
 FBR - Fuel bladder revetment
 HT - Horizontal tank
 IM - Impoundment
 LQ - Liquid
 M - Material
 MM - Mounded material
 OS - Open storage
 R - Refuse

Rd - Road
 St - Street
 ST - Stain
 SW - Southwest
 TR - Trench
 UO - Unidentified object
 VT - Vertical tank
 WS - Wet soil

2 The letters in this column correspond to the following:

A - Verification of a feature identified in U.S. EPA, 1991, "Site Analysis, El Toro MCAS" and occurring within the Sampling and Analysis Plan (SAP) Amendment RI/FS site boundaries.
 B - Features identified in SAIC assessment that occur within the SAP Amendment IRP site boundaries.
 C - Sites outside of the SAP Amendment RI/FS site boundaries

Abbreviations:

APHO - aerial photograph anomaly
 DRMO - Defense Reutilization Marketing Office
 EPA - Environmental Protection Agency
 HW - hazardous waste
 HWSA - hazardous waste storage area
 NE - northeast
 NFA - no further action

NW - northwest
 RFA - Resource Conservation and Recovery Act (RCRA) Facility Assessment
 RI - Remedial Investigation
 SE - southeast
 SW - southwest
 SWMU - Solid Waste Management Unit

11-2050 000495

2.23 1988 PHOTOGRAPHS

FIGURE: 24
DATE: 21 JANUARY 1988
PHOTOGRAPH: 3697-161
NOTES: The photographs are of a small scale and provide only partial coverage of the site.

c 522. There is disturbed ground (DG) at a construction site on the southeast side of Perimeter Road, between N 4th Street and N 6th Street. No additional investigation is recommended at this time.

c 523. Liquid (LQ) is flowing southwesterly across a parking area from Building 15, near West Marine Way and N 3rd Street. The flow discharges into a ditch (WS). Additional investigation is recommended.

c 524. Three possible vertical tanks (VT) are noted: two (2) are along the southerly side of Building 5, near S 3rd Street and West Marine Way; the third is in an open field southerly of Building 517, near S 5th Street and H Street. The tanks should be verified and their contents determined.

c 525. There is probable wet soil (WS) westerly of Building 52 and southerly of Building 692, near El Toro Boulevard and H Street. No additional investigation is recommended at this time.

c 526. There is an open storage (OS) area with possible drums (D) west of the Battery Acid Disposal Area (Site 14). Additional investigation is recommended. The current IR program field investigation of Site 14 should be expanded to include this area.

c 527. A vertical tank (VT) is located near the northwest corner of Building 121, near N 9th Street and P Street. Determination of the tank contents is recommended.

c 528. There is possible liquid (LQ) at the southerly corner of Building 369, near S 12th Street and N Street. Additional investigation is recommended.

c 529. Liquid (LQ) is flowing southeasterly into the parking area from the northwest corner of Building 307, near S 14th Street and K Street. The current IR program field investigation of the Petroleum Disposal Area (Site 10) or of the TAFDS area (Site 22) should be expanded to include this area.

c 530. There are three probable vertical tanks (VT): about 100 feet east of Building 442, near North Marine Way and N 3rd Street; about 200 feet west of Building 442; and at the north side of Building 1791. The tanks should be verified and their contents determined.

c 540. Several features can be observed at the industrial/agricultural area south of Lambert Reservoir. Dark-toned mounded material (MMDT) is located in the northern and southern portions of the site. There is probable liquid (LQ): at the southern edge of the northern mounded material; in the pond adjacent to the road in the southwestern portion of the site; and at the western corner of the southern mounded material. There are stains (ST) in the southwestern corner of the site. No additional investigation is recommended at this time unless contamination is detected near the site, or downgradient of the site, in areas of interest to the IR program.

c 541. No significant changes are noted at the South Coast Agriculture Field Station.

→ c 542. A light-colored pad, possibly concrete, was constructed west of Perimeter Road and Magazine Road. The purpose of the pad is unknown, but the area was probably graded (GR). No additional investigation is recommended at this time.

~~c 543. There has been industrial/commercial development (buildings (B) and grading (GR)) southwest of Building 360, between the railroad tracks and Interstate Highway 5. No additional investigation is recommended at this time, unless contamination is detected near the site, or downgradient of the site, in areas of interest to the IR program.~~

a 544. A pad, probably of concrete and asphalt was constructed immediately south of Crash Crew Pit No. 2 (Site 16). The site was probably graded (GR). No additional investigation is recommended. The current IR program field investigation of the Site 16 area appears to be adequate, relative to the features noted here.

c 545. The impoundment (IM), probably for irrigation water or flood control, on the northerly side of Irvine Boulevard, near the departure end of Runway 34R, is dry. No additional investigation is recommended at this time.

c 546. No significant changes are noted at the Rifle Range, or in its immediate vicinity.

c 547. There has been continued commercial and industrial development (buildings (B) and grading (GR)) along the southeastern border of the activity. No additional investigation is recommended at this time, unless contamination is detected near the site, or downgradient of the site, in areas of interest to the IR program.

2.8 1967 PHOTOGRAPHS

FIGURE: 9
DATE: 27 JUNE 1967
PHOTOGRAPH: GS-VBTA-1-34
NOTE: The scale of this photograph is poor, rendering recognition and identification of small features difficult.

- c 145. Wet soil (WS) can be seen on the northerly side of Building 1793, and wet soil (WS) with probable liquid (LQ) occurs near the edge of the aircraft parking apron near the Base Operations facilities. Additional investigation is recommended.
- c 146. Liquid (LQ) is flowing easterly from the northerly side of Building 1798 in the Rodeo Area. Additional investigation is not recommended at this time.
- c 147. Apparent soil stains (ST) form three parallel lines on the westerly side of Building 139, near N 9th Street and M Street. Additional investigation is recommended.
- c 148. There is an area of disturbed ground (DG), with four, dark-toned, rectangular features, in the southerly portion of Tank Farm No. 4. Additional investigation is recommended.
- c 149. There appears to be liquid (LQ) flowing northerly from Building 114, near N 8th Street and S Street. Additional investigation is recommended.
- c 150. There are soil stains (ST) and probable liquid (LQ) flowing southerly from the former building located about 550 feet south of Building 392 (Motor Pool). Additional investigation is recommended.
- c 151. No significant changes are noted at the South Coast Agriculture Field Station.
- c 152. There appears to be continuing development for an unknown purpose in the former quarry (EXT) south of Lambert Reservoir. Additional investigation is recommended if contamination is identified near the site, or downgradient of the site, in areas of interest to the IR program.
- c 153. No significant changes are noted at the Rifle Range at the northern tip of the activity. However, there are disturbed ground (DG) and buildings (B) adjacent to the northwest corner of the range. This appears to be an agricultural area, and as such, fuel, solvents, oil, pesticides, fertilizers, and other potential contaminants may have been used or stored at the site. Additional investigation may be advised if contamination is detected near the site, or downgradient of the site, in areas of interest to the IR program.

c 154. There are buildings (B), cultivation, and disturbed ground (DG) in the industrial or agricultural complex south of Lambert Reservoir. Fuel, solvents, oil, pesticides, fertilizers, and other potential contaminants may have been used or stored at the site. Additional investigation may be advised if contamination is detected near the site, or downgradient of the site, in areas of interest to the IR program.

c 155. Disturbed ground (DG), probably due to vegetation clearing, is noted northwesterly of the activity's residential area. The purpose is unknown and no additional investigation is recommended at this time.

c 156.) Extraction (EXT) can be observed near the mouth of Agua Chinon Wash. There appears to be dark-toned material, possibly refuse (R) or liquid (LQ), in the eastern portion of the excavation. Additional investigations to determine if potential contaminants were placed in the quarry is recommended if contamination is detected near the site, or downgradient of the site, in areas of interest to the IR program.

c 157. Areas of extraction (EXT) and filling (FA) are noted at Fuel Road and Quarry Road. If a fuel tank farm exists at this location, an investigation of tank and ancillary equipment integrity is recommended.

c 158. No activity is noted at the Communication Station Landfill (Site 17).

c 159. At the Magazine Road Landfill (Site 2) there is evidence of extraction (EXT), disturbed ground (DG) and stains (ST). In addition, a stain (ST) "path" in the form of a loop appears to have resulted from liquid discharge from a moving vehicle. There is an open storage (OS) area surrounded by disturbed ground (DG) north of the landfill. Quarrying (EXT) of the ridge to the west continues. No additional investigation is recommended at this time; the present IR program field investigation of Site 2 appears to be adequate, relative to the features noted here.

c 160. The County Industrial Farm and sewage disposal area contains two (2) liquid-filled (LQ) impoundment areas (IM) and several buildings (B). Fuel, oil, solvents, pesticides, fertilizers, and other potential contaminants may have been used or stored at the site. Additional investigation is recommended if contamination is detected at the site or downgradient of the site, in areas of interest to the IR program.

→ c 161 Disturbed ground (DG) and probable backfilled trenches (TR) are noted in the western corner of Perimeter Road and Magazine Road, and about 1400 feet westerly of the intersection. Additional investigation of the purpose of these sites is recommended. The northeasterly-oriented, backfilled trench (TR) adjacent to Perimeter Road is the Perimeter Road Landfill (Site 5). No additional investigation of Site 5 is recommended at this time. The present IR program field investigation Site 5 appears to be adequate, relative to the features noted here.

2.12 1974 PHOTOGRAPHS

FIGURE: 13
DATE: 9 DECEMBER 1974
PHOTOGRAPH: TG-7400-10-16
NOTE: The photographs do not provide complete stereographic coverage.

c 270. Probable liquid (LQ) is noted on the southwest side of Building 279, near N 7th Street and H Street. Additional investigation is recommended.

c 271. There are probable drums (D) on the southwest side of Building 287, near N 7th Street and J Street. Additional investigation is recommended.

c 272. Stains (ST) or wet soil (WS) can be seen on the southwest side of Building 624, near N 6th Street and J Street. The pattern suggests probable liquid flow from the south corner of the building. Additional investigation is recommended.

c 273. There is disturbed ground (DG) on the northwest sides of Buildings 25, 27 and 29, near West Marine Way and S 6th Street. Investigation of the site's history as a possible disposal area is recommended. Expansion of the Suspended Fuel Tank (Site 15) IR program field investigation to include this general area may be advisable.

c 274. There are stains (ST) on the northwest side of Building 31, near West Marine Way and S 8th Street. Additional investigation is recommended. Expansion of the Suspended Fuel Tank (Site 15) IR program field investigation to include the entire area is recommended.

c 275. There are possible stains (ST) southwest of the Battery Disposal Area (Site 14), adjacent to the parking area. The possible stains may be the result of healthier vegetation due to locally increased runoff. Additional investigation not recommended at this time.

c 276. There is an impoundment (IM) with possible liquid (LQ) at Crash Crew Pit No. 2 (Site 16), stains (ST) about 220 feet south of Site 16, and vertical tank (VT) about 450 feet southeast of Site 16. Determination of the tank's contents is recommended. The origin of the stain (ST) is unknown. The current IR program field investigation of Site 16 appears to be adequate, relative to the features noted here, and additional investigation of the site is not recommended at this time. However, investigation of the other areas noted here is advisable.

c 277. Light- and dark-toned mounded material (MMLT and MMDT) are located about 200 feet southwest of S 15th Street and Plant Road. The features appear to be stockpiling of soil (DG) on the northwesterly side of Bee Canyon Wash. There is a possible drum (D) in the open storage (OS) area on the northerly side of S 15th Street.

contaminants would be used and probably stored at the facility. No additional investigation is recommended unless contamination is detected at the site, or downgradient of the site, in areas of interest to the IR program.

→ c 287. There is an excavation (EX) about 1600 feet west of the Perimeter Road and Magazine Road intersection. The purpose of the excavation is unknown, and investigation of the site history as a possible disposal area is recommended.

c 288. Disturbed ground (DG), mounded material (MM) and probable trench (TR) can be seen about 700 feet southeast of the Perimeter Road and Quarry Road intersection. The purpose of the features is unknown, and investigation of site history as a possible disposal area is recommended.

c 289. There are wet soil (WS) or a stain (ST), and possible liquid (LQ) flow to the southwest from the open storage area on the northeast side of Building 415, adjacent to the Rodeo Area. Drums (D) may also be present. Additional investigation is recommended.

c 290. No significant changes are noted at the South Coast Agriculture Field Station.

c 291. No significant changes are noted at this apparent industrial or agricultural site.

a 292. At the Magazine Road Landfill, the trenches (TR) remain open and there are unidentified objects (UO) probably containers, but there are no significant changes.

c 293. There is wet soil (WS) and probable liquid (LQ) in the open area north of Trabuco Road, about 700 feet northwest of Gate No. 1. The features probably due to irrigation. Additional investigation is not recommended at this time.

a 571. No significant changes are noted at the EOD Range. The site is not indicated on the photograph.

2.10 1971 PHOTOGRAPHS

FIGURE: 11
DATE: 19 MAY 1971
PHOTOGRAPH: AXK-1MM-63

c 197. There are light-toned mounded materials (MMLT) on the northeast and southeast sides of Tank Farm No. 5. The mounds appear to be stockpiled soil. Expansion of the Original Landfill (Site 3) investigation to include this area is recommended.

a 198. Liquid (LQ) is flowing south to southwest from the Motor Pool (Building 392). This feature has been noted previously. Additional investigation is recommended.

a 199. Liquid (LQ) is flowing easterly from Building 138, near N 9th Street and N Street. Additional investigation is recommended.

b 200. There is a stain (ST) on north side of the fuel bladders at ACER (Site 19). No additional investigation is recommended at this time. The current IR program field investigation of Site 19 appears to be adequate, relative to the features noted here.

c 201. Probable drums (D) can be seen in the open storage (OS) area about 800 feet southeast of the southeast corner of the aircraft parking apron. Expansion of the Drop Tank Drainage Area No. 2 (Site 7) investigation to include this site is recommended.

b 202. Wet soil (WS) and probable liquid (LQ) can be seen at the east end of the Crash Crew complex (Buildings 435 and 1649). The features are also noted in other years. Additional investigation is not recommended at this time. The current IR program field investigation of Site 9 appears to be adequate, relative to the features noted here.

c 203. Liquid (LQ) is flowing northeast from near Crash Crew Pit No.1 (Site 9), toward the taxiway about 300 feet east of the Crash Crew complex (Buildings 435 and 1649). The liquid may be contaminated with materials from the Site 9 area. Expansion of the Site 9 IR program field investigation to include this area is recommended.

c 204. There is a stain (ST) about 80 feet by 250 feet in dimension near Crash Crew Pit No. 1 (Site 9). Expansion of the IR program field investigation area to include the stained area is recommended.

a 205. There is a possible vertical tank (VT) near the Oil Change Area (Site 13), adjacent to Building 1505. There is also a stain (ST) on the northerly side of the tank area. Additional investigation is not recommended at this time. The current IR program field investigation of Site 13 appears to be adequate, relative to the features noted here.

between the developed quarry and the MCAS El Toro residential area appear to be inactive.

→ c 215. There is disturbed ground (DG) about 250 feet by 350 feet in area, dark-toned mounded material (MMDT), and a probable trench (TR), all about 1600 feet westerly of West Marine Road and Magazine Road. There is also a possible light-toned unidentified object (UO). Additional investigation of the site as a possible disposal or storage site is recommended.

c 216. Two (2) probable vertical tanks (VT) are adjacent to buildings at the west corner of Perimeter Road and Magazine Road. Verification of the tanks and determination of their contents is recommended.

c 217. Mounded material (MM) and disturbed ground (DG) can be seen about 500 feet southeast of Perimeter Road and Quarry Road. The purpose is unknown. Investigation of the site's history as a possible disposal area is recommended.

b 218. At the Magazine Road Landfill (Site 2) there is a trench (TR) about 600 feet by 70 feet in area, containing probable liquid (LQ). There are also three smaller trenches (TR), an excavation (EX) in the southern portion of area, and disturbed ground (DG) over the entire site. Additional investigation is not recommended at this time. The current IR program field investigation of Site 2 appears to be adequate, relative to the features noted here. The site area is not shown on the photograph.

c 219. There is an area of disturbed ground (DG) with a trench (TR), mounded material (MM) and an excavation (EX) located east of Magazine Road Landfill, near the MCAS El Toro boundary. The purpose of the features is unknown. Additional investigation is recommended. The site area is not shown on the photograph.

c 220. At the County Industrial Farm and Sewage Disposal Facility there are impoundments (IM) with liquids (LQ), two (2) vertical tanks (VT), a trench (TR) and a southerly flow of liquid (LQ) from a building. No additional investigation is recommended unless contamination is detected near the site, or downgradient of the site, in areas of interest to the IR program. The site area is not shown on the photograph.

b 221. No significant changes are noted at the EOD Range. The site area is not shown on the photograph.

c 222. The Magazine Road Landfill (Site 2) remains active and extraction (EXT) from the ridge west of the landfill continues. No additional investigation is recommended at this time. The current IR program field investigation of Site 2 appears to be adequate, relative to the features noted here. The site area is not shown on the photograph.

c 223. There is a probable horizontal tank (HT) (Building 517?) with a revetment (IM) near 4th Street and H Street. Verification of the tank and determination of its contents are recommended.

2.13 1975 PHOTOGRAPHS

FIGURE: 14
DATE: 13 JANUARY 1975
PHOTOGRAPHS: 157-10-17 and 157-11-16
NOTE: Copyrighted photograph. reproduction not authorized.

c 294. Liquid (LQ) can be seen flowing southeast and then southwest from the area of Building 99, near N 3rd Street and West Marine Way. The liquid appears to be irrigation runoff; additional investigation is not recommended at this time.

c 295. Light-toned mounded material (MMLT), probably construction related, can be seen near B Street, between N 4th Street and N 5th Street. Additional investigation is not recommended at this time.

c 296. There is possible liquid (LQ) in the street at the front of Building 443. Additional investigation is not recommended at this time.

c 297. There are disturbed ground (DG) and a fill area (FA) at the site of Building 694, near N 4th Street and Perimeter Road. These features appear to be related to construction. Additional investigation is not recommended at this time.

c 298. Possible wet soil (WS) is noted on the westerly side of West Marine Way, between Buildings 27 and 29. Additional investigation is recommended.

c 299. No significant changes are observed at Crash Crew Pit No. 2 (Site 16), but an impoundment (IM) with possible liquid (LQ) and a fill area (FA) are noted. The current IR program field investigation of Site 16 should include this entire area.

a 300. Liquid (LQ) is flowing southeasterly into the parking area from the east side of Building 435 (Crash Crew). The liquid is noted over a period of several years. Verification of the type of liquid is recommended, however, the current IR program field investigation of the Site 9 area appears to be adequate, relative to the features noted here.

c 301. There are mounded material (MM) and a fill area (FA) about 1000 feet northwest of Building 317, near Bee Canyon Wash Aqueduct. No additional investigation is recommended unless contamination is detected near the site, or downgradient of the site, in areas of interest to the IR program.

c 302. There is probable wet soil (WS) in the open area about 200 feet east of Building 322 (Mess Hall). The feature appears to be related to irrigation. Additional investigation is not recommended at this time.

c 313. There is an open storage (OS) area with possible drums (D) about 700 feet northeast of Building 673, near North/East Marine and N 3rd Street. Additional investigation is recommended.

→ c314. Disturbed ground (DG) can be seen about 1000 feet northeast of Building 673, near North / East Marine and N 3rd Street. The cause of the disturbance is unknown. Investigation of the site's history as a possible disposal area is recommended.

b 315. Light-and dark-toned mounded material (MMLT, MMDT) occur over much of the Communication Station Landfill (Site 17). The mounds appear to be soil. Additional investigation is not recommended at this time; the current IR program field investigation of the Site 17 area appears to be adequate, relative to the features noted here.

b 316. The Magazine Road Landfill (Site 2) is active with disturbed ground (DG) several trenches (TR) and fill areas (FA) noted. Most of area has been stripped of vegetation. No additional investigation is recommended at this time; the current IR program field investigation of the Site 2 area appears to be adequate, relative to the features noted here.

c 317. Ten (10) unidentified objects (UO) can be observed on the hillside about 1000 feet east of the Magazine Road Landfill. The objects are light colored, and may be vertical tanks (VT). Identification of the objects is recommended.

c 318. There is a large stain (ST), about 1600 feet long, on Runway 21, apparently caused by a flowing liquid. The stain extends to soil areas adjacent to the runway and into a drainage ditch. The cause of the stain is unknown, but it may be related to a fuel spill or fire suppressant. Investigation of recent occurrences on runway prior to date of photograph (13 Jan 1975) is recommended.

c 319. There is a trench (TR) about 300 feet northerly of the railroad tracks, on the easterly side of Agua Chinon Wash. The purpose of the trench is unknown. Investigation of the site's history as a possible disposal area is recommended.

c 320. With the exception of localized wet soil (WS) and liquid (LQ) no significant changes are noted at the International Raceway, near the southwestern corner of the activity.

c 321. There is wet soil (WS) in the cultivated field west of Perimeter Road near S 5th Street. The wet soil is probably due to irrigation; additional investigation is not recommended at this time.

c 322. No significant changes are noted at the South Coast Agriculture Field Station.

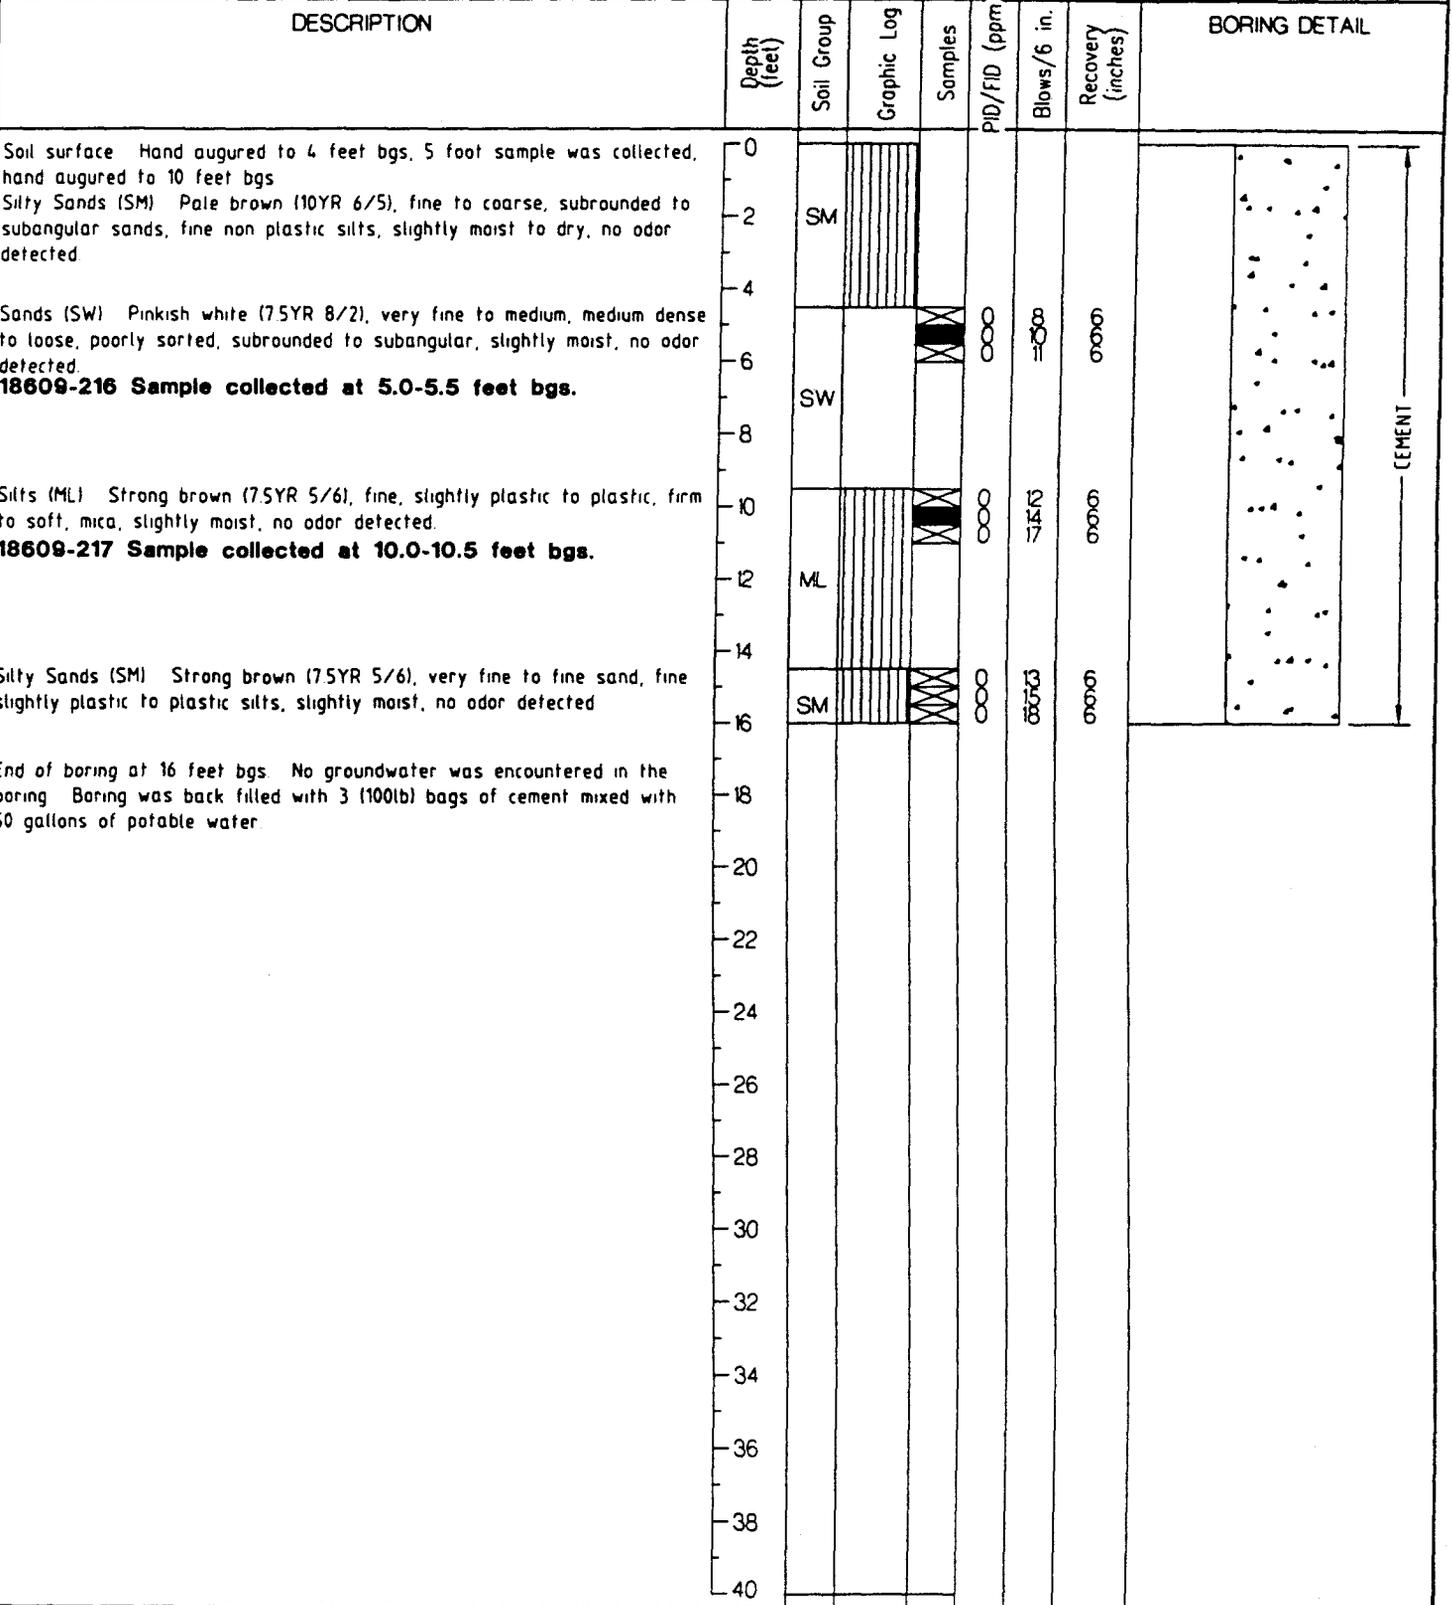

c 323. No significant changes are noted at the former quarry site.

c 324. No significant changes are noted at industrial/agricultural complex.

Geologic Log of Boring PHA5-SB03

Project MCAS/EL TORO	Northing - 2189590.811	Drilling Company BC2	
Project Number 18609	Easting - 6116654.147	Drill Rig CME75	Begin Drilling 12/10/99
Client SWDIV	TOC Elevation NA	Driller Diego Torres	End Drilling 12/10/99
Location PHOTO ANOMALY AREA 5	TOP OF RIM NA	Drill Method HSA	Well Completion Date 12/10/99
Geologist B. Tanaka	DIAGRAM NOT TO SCALE		
Borehole Diameter 8-INCHES	Total Depth of Borehole 16 FEET	Depth to Water NOT ENCOUNTERED	

DESCRIPTION	Depth (feet)	Soil Group	Graphic Log	Samples	PID/FID (ppm)	Blows/6 in.	Recovery (inches)	BORING DETAIL
Soil surface Hand augured to 4 feet bgs. 5 foot sample was collected, hand augured to 10 feet bgs	0							
Silty Sands (SM) Pale brown (10YR 6/5), fine to coarse, subrounded to subangular sands, fine non plastic silts, slightly moist to dry, no odor detected	2							
Same as above (SM) Strong brown (7.5YR 5/3), slightly moist, no odor detected 18609-2522 & 18609-2523 Sample collected at 5.0-5.5 feet bgs.	4	SM	[Vertical lines]	[X-pattern]	000	015/10	00000	
Sands (SP) Yellow (10YR 8/6), fine sands, well sorted, medium dense, subrounded to subangular, slightly moist, no odor detected. 18609-2524 Sample collected at 10.0-10.5 feet bgs.	10	SP	[Dotted pattern]	[X-pattern]	000	20/10	00000	
Silts (ML) Strong brown (7.5YR 5/6), fine slightly plastic firm to hard silts, slightly moist, no odor detected	16	ML	[Vertical lines]	[X-pattern]	000	000/10	00000	
End of boring at 16 feet bgs. No groundwater was encountered in the boring. Boring was back filled with 3 (100lb) bags of cement mixed with 50 gallons of potable water.	18

Subject: Laboratory Report

Project: MCAS El Toro/18609/D.O. 70

Enclosed is the Laboratory report for samples received on
12/10/99. The data reported include :

Sample ID	Control #	Col Date	Matrix	Analysis
18609-2513	L066-01	12/10/99	WATER	Modified 8015 by Purge & Trap Volatile Organics by GC/MS
18609-2514	L066-02	12/10/99	SOIL	Modified 8015 by Purge & Trap Modified 8015 by Extraction Volatile Organics by GC/MS M8015 JP-5 CAM Metals Mercury
18609-2515	L066-03	12/10/99	SOIL	Modified 8015 by Extraction Modified 8015 by Purge & Trap M8015 JP-5 Volatile Organics by GC/MS CAM Metals Mercury
18609-2516	L066-04	12/10/99	SOIL	Modified 8015 by Extraction Modified 8015 by Purge & Trap M8015 JP-5 Volatile Organics by GC/MS CAM Metals

Sample ID	Control #	Col Date	Matrix	Analysis
18609-2517	L066-05	12/10/99	SOIL	Mercury Modified 8015 by Extraction Modified 8015 by Purge & Trap M8015 JP-5 Volatile Organics by GC/MS CAM Metals
18609-2518	L066-06	12/10/99	SOIL	Mercury Modified 8015 by Extraction Modified 8015 by Purge & Trap M8015 JP-5 Volatile Organics by GC/MS CAM Metals
18609-2519	L066-07	12/10/99	SOIL	Mercury Modified 8015 by Extraction Modified 8015 by Purge & Trap M8015 JP-5 Volatile Organics by GC/MS CAM Metals
18609-2520	L066-08	12/10/99	SOIL	Mercury Modified 8015 by Extraction Modified 8015 by Purge & Trap M8015 JP-5 Volatile Organics by GC/MS CAM Metals
18609-2521	L066-09	12/10/99	SOIL	Mercury Modified 8015 by Extraction Modified 8015 by Purge & Trap M8015 JP-5 Volatile Organics by GC/MS CAM Metals
18609-2522	L066-10	12/10/99	SOIL	Mercury Modified 8015 by Extraction Modified 8015 by Purge & Trap M8015 JP-5 Volatile Organics by GC/MS CAM Metals
18609-2523	L066-11	12/10/99	SOIL	Mercury Modified 8015 by Extraction Modified 8015 by Purge & Trap M8015 JP-5 Volatile Organics by GC/MS

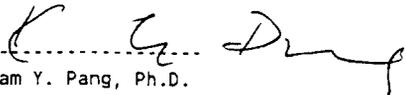

1001

Sample ID	Control #	Col Date	Matrix	Analysis
18609-2524	L066-12	12/10/99	SOIL	CAM Metals Mercury Modified 8015 by Extraction Modified 8015 by Purge & Trap M8015 JP-5 Volatile Organics by GC/MS CAM Metals

Introduction

This data review covers 13 soil samples and 2 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260A for Volatiles.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (February 1994) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section V.

Field duplicates are summarized in Section XVI.

Samples indicated by a double asterisk on the front cover underwent a NFESC Level D review. A NFESC Level C review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by Level C criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 30.0% for all calibration check compounds and less than or equal to 50.0% for all other compounds.

Average relative response factors (RRF) for all semivolatile target compounds and system monitoring compounds were greater than or equal to 0.05 as required.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

All of the continuing calibration percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were less than or equal to 25.0% for all calibration check compounds and less than or equal to 50.0% for all other compounds.

All of the continuing calibration RRF values were within validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Analysis Date	Compound TIC (RT in minutes)	Concentration	Associated Samples
MBLK1W	12/22/99	Methylene chloride	3.8 ug/L	All water samples in SDG 99L066
MBLK1S	12/22/99	Methylene chloride	3.8 ug/Kg	18609-2514 18609-2515 18609-2516

Method Blank ID	Analysis Date	Compound TIC (RT in minutes)	Concentration	Associated Samples
MBLK2S	12/23/99	Methylene chloride	3.9 ug/Kg	18609-2517 18609-2518 18609-2519 18609-2520 18609-2521 18609-2524 18609-2523**

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Compound TIC (RT in minutes)	Reported Concentration	Modified Final Concentration
18609-2513	Methylene chloride	4.7 ug/L	5U ug/L
18609-2525	Methylene chloride	3.7 ug/L	5U ug/L
18609-2514	Methylene chloride	4.6 ug/Kg	5.8U ug/Kg
18609-2515	Methylene chloride	3.6 ug/Kg	5.7U ug/Kg
18609-2516	Methylene chloride	3.1 ug/Kg	3.1U ug/Kg
18609-2517	Methylene chloride	4.1 ug/Kg	6.1U ug/Kg
18609-2518	Methylene chloride	3.2 ug/Kg	5.2U ug/Kg
18609-2519	Methylene chloride	3.2 ug/Kg	5.5U ug/Kg
18609-2520	Methylene chloride	3.7 ug/Kg	5.6U ug/Kg
18609-2521	Methylene chloride	3 ug/Kg	5.3U ug/Kg

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

All target compound identifications were within validation criteria for samples on which a NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by Level C criteria.

XII. Compound Quantitation and CRQLs

All compound quantitation and CRQLs were within validation criteria for samples on which a NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by Level C criteria.

XIII. Tentatively Identified Compounds (TICs)

Tentatively identified compounds were not reported by the laboratory.

XIV. System Performance

The system performance was within validation criteria for samples on which a NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by Level C criteria.

XV. Overall Assessment of Data

Data flags have been summarized at the end of the report.

XVI. Field Duplicates

Samples 18609-2523** and 18609-2524 were identified as field duplicates. No volatiles were detected in any of the samples.

XVII. Field Blanks

Sample 18609-2513 was identified as a trip blank. No volatile contaminants were found in this blank with the following exceptions:

Trip Blank ID	Compound	Concentration (ug/L)
18609-2513	Methylene chloride	4.7

**Indicates sample underwent NFESC Level D review

Introduction

This data review covers 13 soil samples and 3 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Methods 6010 and 7000 for Metals. The metals analyzed were Antimony, Arsenic, Barium, Beryllium, Cadmium, Chromium, Cobalt, Copper, Lead, Manganese, Mercury, Molybdenum, Nickel, Silver, Thallium, Vanadium, and Zinc.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (February 1994) as there are no current guidelines for the methods stated above.

A table summarizing all data qualification flags is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from specified protocols or is of technical advisory nature.

Blanks are summarized in Section III.

Field duplicates are summarized in Section XIII.

Samples indicated by a double asterisk on the front cover underwent a NFESC Level D review. A NFESC Level C review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by Level C criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

An initial calibration was performed.

The frequency and analysis criteria of the initial calibration verification (ICV) and continuing calibration verification (CCV) were met.

III. Blanks

Method blanks were reviewed for each matrix as applicable.

Data qualification by the initial, continuing and preparation blanks (ICB/CCB/PBs) was based on the maximum contaminant concentration in the ICB/CCB/PBs in the analysis of each analyte. No contaminant concentrations were found above the reporting limit in the initial, continuing and preparation blanks with the following exceptions:

Method Blank ID	Analyte	Maximum Concentration	Associated Samples
ICB/CCB	Chromium Silver Vanadium	4.34 ug/L 7.10 ug/L 4.73 ug/L	All soil samples in SDG 99L066
ICB/CCB	Zinc	3.65 ug/L	All water samples in SDG 99L066

Sample concentrations were compared to the maximum contaminant concentrations detected in the ICB/CCB/PBs. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks.

IV. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

V. Matrix Spike Analysis

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VI. Duplicate Sample Analysis

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VIII. Internal Standards

ICP-MS was not utilized in this SDG.

IX. Furnace Atomic Absorption QC

Graphite furnace atomic absorption was not utilized in this SDG.

X. ICP Serial Dilution

Not required by the method.

XI. Sample Result Verification

All sample result verifications met validation criteria for samples on which a NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by Level C criteria.

XII. Overall Assessment of Data

Data flags have been summarized at the end of this report.

XIII. Field Duplicates

Samples 18609-2523** and 18609-2524 were identified as field duplicates. No metals were detected in any of the samples with the following exceptions:

Analyte	Concentration (mg/Kg)		RPD
	18609-2523**	18609-2524	
Arsenic	3.27	1.2	93
Barium	113	25.3	127
Beryllium	0.529	0.206U	200
Chromium	12.2	3.38	113

Analyte	Concentration (mg/Kg)		RPD
	18609-2523**	18609-2524	
Cobalt	4.34	1.32	107
Copper	6.9	1.82	116
Lead	2.76	1.03U	200
Manganese	223	76.4	98
Nickel	8.04	2.08	118
Vanadium	32.3	8.97	113
Zinc	38.2	9.3	122

XIV. Field Blanks

No field blanks were identified in this SDG.

Introduction

This data review covers 13 soil samples and 4 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8015 modified for Total Petroleum Hydrocarbons (TPH) as Gasoline.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (February 1994) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section III.

Field duplicates are summarized in Section IX.

Samples indicated by a double asterisk on the front cover underwent a NFESC Level D review. A NFESC Level C review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by Level C criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

a. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 20.0% .

b. Calibration Verification

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 15.0% QC limits.

III. Blanks

Method blanks were reviewed for each matrix as applicable. No total petroleum hydrocarbons as gasoline contaminants were found in the method blanks.

IV. Accuracy and Precision Data

a. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

b. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

c. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

V. Target Compound Identification

All target compound identifications were within validation criteria for samples on which a NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by Level C criteria.

VI. Compound Quantitation and CRQLs

All compound quantitation and CRQLs were within validation criteria for samples on which a NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by Level C criteria.

VII. System Performance

The system performance was within validation criteria for samples on which a NFESC Level D review was performed. Raw data were not evaluated for the samples reviewed by Level C criteria.

VIII. Overall Assessment of Data

Data flags have been summarized at the end of this report.

IX. Field Duplicates

Samples 18609-2523** and 18609-2524 were identified as field duplicates. No total petroleum hydrocarbons as gasoline were detected in any of the samples.

X. Field Blanks

Sample 18609-2613 was identified as a trip blank. No total petroleum hydrocarbons as gasoline contaminants were found in this blank.

RESPONSES TO COMMENTS FROM THE DEPARTMENT OF TOXIC SUBSTANCES CONTROL DATED 8 February 2001.

Subject: *Summary Report, Aerial Photograph Anomaly Area 5 (APHO 31, APHO 43, APHO 66, APHO 67 and APHO 68), Former Marine Corps Air Station, El Toro dated 1 November 2000*

Comment	Response
<p>Comments prepared by Triss Chesney, Department of Toxic Substances Control, Southern California Branch dated 8 February 2001. Addressee: Mr. Dean Gould, BRAC Environmental Coordinator, MCAS El Toro</p>	
<p>Comment 1. On June 7, 1999, the Department of the Navy (DON) forwarded a letter regarding "Sampling Strategy for Aerial Photograph Anomaly Areas 4 and 5." Following review of the letter, DTSC forwarded comments in a letter dated June 22, 1999. DTSC comment number 5 included, "Should the disturbed earth extend beyond 10 feet bgs [below ground surface], additional samples should be collected at the contact surface between the disturbed and native soil."</p> <p>The report does not indicate whether disturbed or native soil was encountered during sampling activities. Further, information is not provided to determine if samples were collected at the contact surface between the disturbed and native soil as requested. Please address DTSC comment number 5 from the June 22, 1999 letter.</p>	<p>Response 1. Information regarding the presence (or lack thereof) of disturbed soils is provided in the addendum to the summary report.</p>
<p>Comment 2. Section 4.1, Utility Clearance and Geophysical Survey: This section states that a geophysical survey was conducted at Anomaly Area 5 in December 1999. However, the results of the survey are not included in the report.</p> <p>Please forward the results of the geophysical survey to DTSC for review. Additionally, information contained in the geophysical survey may provide useful information regarding disturbed and native soil.</p>	<p>Response 2. A copy of the Anomaly Area 5 geophysical investigation will be provided in the addendum to the summary report.</p>

SUMMARY REPORT, AERIAL PHOTOGRAPH ANOMALY AREA 5 (APHO 31, APHO 43, APHO 66, APHO 67 AND APHO 68), MARINE CORPS AIR STATION (MCAS) EL TORO

Dear Mr. Gould:

The Department of Toxic Substances Control (DTSC) reviewed the above document dated November 1, 2000. The document includes an evaluation of historical records, results of visual inspections of the anomaly sites, and the results of field sampling activities. Anomaly Area 5 consists of five aerial photograph anomalies identified as APHO 31, APHO-43, APHO 66, APHO 67 and APHO 68.

APHO 31 (also referenced as Science Applications International Corporation (SAIC) 215) was identified on a 1971 aerial photograph as disturbed ground about 250 by 350 feet in area, dark-toned mounded material, and a probable trench located approximately 1,600 feet west of West Marine and Magazine Roads. APHO 43 (also referenced as SAIC 287) was identified on a 1974 aerial photograph as an excavation about 1,600 feet west of the intersection of Perimeter and Magazine Roads. APHO 66 (also referenced as SAIC 161) was identified on a 1967 photograph as disturbed ground and probable backfilled trenches noted in the western corner of Perimeter and Magazine Roads, and approximately 1,400 feet west of the intersection. APHO 67 (also referenced as SAIC 314) was identified on a 1975 aerial photograph as disturbed ground approximately 1,000 feet northeast of Building 673, near North/East Marine and North 3rd Street. APHO 68 (also referenced as SAIC 542) was identified on a 1988 aerial photograph as a light-colored pad constructed west of Perimeter and Magazine Roads.

The energy challenge facing California is real. Every Californian needs to take immediate action to reduce energy consumption. For a list of simple ways you can reduce demand and cut your energy costs, see our Web-site at www.dtsc.ca.gov.

After review of the report, DTSC has the following comments.

1. On June 7, 1999, the Department of the Navy (DON) forwarded a letter regarding "Sampling Strategy for Aerial Photograph Anomaly Areas 4 and 5." Following review of the letter, DTSC forwarded comments in a letter dated June 22, 1999. DTSC comment number 5 included, "Should the disturbed earth extend beyond 10 feet bgs [below ground surface], additional samples should be collected at the contact surface between the disturbed and native soil."

The report does not indicate whether disturbed or native soil was encountered during sampling activities. Further, information is not provided to determine if samples were collected at the contact surface between the disturbed and native soil as requested. Please address DTSC comment number 5 from the June 22, 1999 letter.

2. Section 4.1, Utility Clearance and Geophysical Survey: This section states that a geophysical survey was conducted at Anomaly Area 5 in December 1999. However, the results of the survey are not included in the report.

Please forward the results of the geophysical survey to DTSC for review. Additionally, information contained in the geophysical survey may provide useful information regarding disturbed and native soil.

The report recommends designating a status of no further action for Anomaly Area 5 based on the results of field verification sampling, record search activities, and visual inspection. Based on review of the report, DTSC does not concur with the recommendation. Please provide the information and clarification as requested.

If you have any questions, please contact me at (714) 484-5395.

COMMENTS ON SUMMARY REPORT, AERIAL PHOTOGRAPH ANOMALY AREA 5, APHO 31, APHO 43, APHO 66, APHO 67, AND APHO 68, FORMER MARINE CORPS AIR STATION, EL TORO

Dear Mr. Gould:

We have completed our review of the above-referenced document, dated November 1, 2000, which we received on November 27, 2000. We do not concur with the recommendation for no further action based on the following comments:

1. **Section 4.1 Utility Clearance and Geophysical Survey**, page 4-1: A geophysical survey was performed at Anomaly Area 5. Results of the geophysical survey should be included in the appendix of this report.
2. **Section 4.2 Verification Drilling Activities**, page 4-1: The boring locations were selected based on a field visit in 1999. APHO 43, APHO 67, and APHO 68 were identified between 1974 and 1988. These anomalies now lie underneath the concrete pad in Anomaly Area 5. No boring locations were selected near these three anomalies.

For any questions on this review or related matters, please call me at (909) 782-4494.

Sincerely,

John Broderick

1 INTRODUCTION

A geophysical investigation was conducted from February 23 to March 3, 2001 in an approximate 20-acre area encompassing Aerial Photographic Anomaly Area 5, Marine Corps Air Station (MCAS), El Toro, California. The purpose of the investigation was to screen the site for buried metallic and/or construction debris.

The geophysical survey area consisted of a runway parking apron and surrounding grass field in the northeast portion of the base. The location of the survey area is shown on Figure 1.

There was no surficial evidence of disposal activities at the site. Surface cultural features within the survey area that could adversely affect the geophysical data included concrete walls with steel plates, manholes, fire hydrants, monitoring wells, runway lights, tie downs and miscellaneous other surface infrastructure.

Geophysical techniques used during this investigation included the magnetic and electromagnetic (EM) induction methods. These techniques complement one another as each responds to different physical properties of subsurface materials and has different strengths and limitations. The magnetic method was applied to this investigation because it has the greatest depth of investigation of the geophysical techniques typically applied to mapping buried metallic debris. However, this greater depth of investigation comes at the expense of lateral resolution. The EM induction technique was applied to this investigation because it can map both shallow buried metallic debris and variations in soil conductivity. Changes in soil conductivity may be used to infer the presence of fill soils, providing the fill has a different composition than native soils.

Geophysical techniques used during the investigation are discussed in Section 2. Field procedures are described in Section 3. Data processing and interpretation are discussed in Section 4. Conclusions are presented in Section 5, and our professional certification is presented in Section 6.

2 GEOPHYSICAL TECHNIQUES

This section presents background information on the magnetic and EM methods used during this investigation. A description of the geophysical methods used during this investigation, common applications of the methods, photographs of the instruments, and example applications are included in Appendix A.

2.1 Magnetic Method

The magnetometers used during this investigation consisted of a Geometrics G858 optically pumped cesium-vapor magnetometer (G858) and a GEM GSM-19 base station magnetometer. These instruments measure the intensity of the earth's magnetic field in nanoteslas (nT).

The earth's magnetic field is believed to originate in convection currents in the earth's liquid outer core. The magnetic field varies in intensity from about 25,000 nT at the equator, where it is parallel to the earth's surface to about 70,000 nT at the poles where it is perpendicular to the earth's surface. The intensity of the earth's magnetic field in North America varies from about 45,000 to 60,000 nT, and has an associated inclination that varies from about 60 to 75 degrees. The earth's magnetic field undergoes low-frequency diurnal variations (drift) caused by the earth's rotation. The magnetic field can also undergo short-period, high-amplitude variations during periods of sunspot activity called magnetic storms. Often magnetic field intensity can be so variable during a magnetic storm that meaningful magnetic data cannot be acquired. When it is necessary to correct for magnetic drift a base station magnetometer is set up in a quiet portion of the site and programmed to record total magnetic field intensity at fixed increments (i.e. 5-second intervals) throughout the day. This base station data is then used to remove the effects of drift from the field data. In small survey areas where the data is acquired over a small amount of time and the anomalies have large amplitudes correction for diurnal variation is not necessary.

Buried ferromagnetic objects give rise to local perturbations (anomalies) in the earth's magnetic field. In North America, these anomalies are often dipolar with a positive response south and a negative response north of the object. The dimensions and amplitude of a magnetic anomaly are a function of the size, mass, depth and magnetic properties of the source. Magnetometers can typically locate a metallic object the size of a 55-gallon drum to a depth of about 10 feet providing background noise levels are not too high and the object is not significantly corroded. Larger metallic objects can be located to greater depths. The magnetic anomaly due to an object the size of a 55-gallon drum is expected to have dimensions of greater than 10- by 10-feet. Magnetometers are not able to detect nonferrous metals such as aluminum or brass.

Typical applications of the magnetic method include:

- Locating pits and trenches containing ferrous metallic debris
- Locating buried drums, tanks and pipes
- Delineating boundaries of landfills containing ferrous debris
- Locating abandoned well casing
- Detecting unexploded ordnance
- Mapping basement faults and geology

- Mapping archeological sites.

Some advantages of magnetic surveys are:

- Rapid – modern instruments can acquire up to 10 readings per second as the operator walks down survey lines
- Depth of investigation – magnetometers can often locate buried ferrous metallic objects to greater depths than other methods
- Anomalies are much larger than the source allowing for larger line spacing in some situations

Some limitations of the magnetic surveys are:

- Unable to detect nonferrous metals such as aluminum or brass
- Magnetic anomalies are unsymmetrical and much larger than the source and it can, therefore, be difficult to determine the precise locations and size of the source
- Ineffective in areas having extensive metallic debris at the surface as no distinction can be made between anomalies caused by surface and buried debris
- Metallic structures such as buildings, fences, reinforced concrete, and light posts interfere with the measurements
- High voltage powerlines can often strongly interfere with the measurements
- Data can be very noisy in areas containing volcanic rock, specifically basalt

2.2 Electromagnetic Induction Method

EM induction equipment used during this investigation consisted of a Geonics EM-31 terrain conductivity meter (EM-31) coupled to a digital data logger. The EM-31 consists of a transmitter and receiver coil, one at each end of 12-foot long boom. An alternating current is applied to the transmitter coil, causing the coil to radiate a primary EM field. This primary EM field generates eddy currents in subsurface materials, which give rise to a secondary EM field. The EM-31 measures the components of the secondary EM field both in-phase and 90-degrees out-of-phase with the primary EM field. The out-of-phase component is converted to apparent conductivity in millisiemens per meter (mS/m) and the in-phase component is measured as parts per thousand of the primary EM field. A negative EM-31 response with positive shoulders is generally observed over shallow, buried metallic objects. The EM-31 can locate both ferrous and nonferrous metallic objects and can locate a metallic object the size of a 55-gallon drum to a maximum depth of about 5 feet. The EM-31 must pass directly over or immediately adjacent to a buried metallic object to detect it. Because of the 12-foot separation between the transmitter and receiver coils, the EM-31 cannot detect very small, buried metallic objects. The EM-31 can also map changes in the electrical conductivity of subsurface soils caused by certain types of conductive contaminants (i.e. brines, drilling mud, chloride, metals, etc.) or simply a change in soil type (i.e. low conductivity sand to high conductivity clay).

Applications of EM Induction methods include:

- Locating buried tanks

- Locating pipes and utilities
- Locating pits and trenches containing metallic and/or nonmetallic debris
- Delineating landfill boundaries
- Delineating oil production sumps and mud pits
- Mapping conductive soil and groundwater contamination
- Mapping soil salinity in agricultural areas
- Characterizing shallow subsurface geology
- Mapping buried channel deposits
- Locating sand and gravel deposits
- Mapping conductive fault and fracture zones
- Mapping lateral variation in subsurface soil type

Strengths of EM Induction Methods include:

- Rapid – data can be acquired at a slow walking pace
- Locate both metallic and some nonmetallic targets
- Better resolution than magnetometer
- Not as sensitive to very small surface debris as other methods
- Can locate electrical and telephone cables which often cannot be located by other methods
- Anomalies of buried objects have simple shape facilitating identification and positioning of the source

Limitations of EM Induction Methods include:

- Metallic structures such as buildings, fences, reinforced concrete, and light posts interfere with the measurements
- High voltage powerlines can often strongly interfere with the measurements
- Depth of investigation not as great as that of a magnetometer for detection of buried ferrous metallic objects
- Highly variable soil conductivity can complicate quadrature component interpretation

3 FIELD PROCEDURES

This section describes the field procedures used during the investigation, including site preparation, magnetic and EM-31 survey procedures, and field verification procedures.

3.1 Site Preparation

Before conducting the geophysical investigation, 4-foot long survey lathe was placed at 20-foot intervals along the south (S) and north (N) edges of the approximate 1150- by 760- foot survey area to provide spatial control for the geophysical survey. The staking of survey control was conducted on February 26 and 27, 2001.

A Sokkia GIR1000 single-frequency global positioning system (GPS) was coupled to the geophysical instruments to provide horizontal control for the geophysical data. Differential corrections were applied to the GPS data using GPS base station data recorded at the Sokkia office in Orange, California. GPS data were collected in geodetic coordinates based on the WGS84 system and transformed to approximate California State Plane Coordinates, Zone 6, North American Datum of 1983 (NAD83) after applying differential corrections. Ellipsoid heights measured using the GPS system were converted to NAVD 88 elevations using the Geoid Model of 1996. Maximum horizontal errors in the corrected GPS data are estimated to be about 3 feet, with average errors being about 1 to 2 feet.

The GPS system was also used to map pertinent surficial features at the site, including roads, monitoring wells, surface infrastructure. Site mapping activities were conducted on February 28 and March 2, 2001.

A site map showing the location of the geophysical survey area, State Plane Coordinate System, and surficial features is presented as Figure 2.

3.2 Magnetic Survey

Magnetic data were acquired on March 1 and 2, 2001. Prior to data acquisition, the base station magnetometer was set up north of the survey area in a location free of surface debris. The internal clock of the base station and G858 were synchronized to GPS time and the base station was programmed to record the magnetic field intensity of the earth at 5-second intervals throughout the day. The G858 and GPS unit were then programmed with the appropriate settings. The magnetometer was operated with the sensor about 3 feet above ground surface. Measurements of the earth's total magnetic field intensity were made at 0.2-second intervals as the operator walked along S-N survey lines nominally spaced 10 feet apart. The 0.2-second sampling interval resulted in an average station spacing of about 1 foot. The stakes placed at the ends of the survey area allowed the instrument operator to walk in a relatively straight line, thereby ensuring uniform site coverage. It was not possible to walk straight lines in all areas due to concrete walls that limited line of site. The magnetic data were stored in the internal memory of the magnetometer, along with line number, and time of measurement. If an error was made on a survey line the line was deleted from the magnetometer's internal memory and reacquired.

GPS, base station and magnetic field data were downloaded to a laptop computer at the end of each field day.

3.3 Geonics EM-31 Survey

EM-31 data were acquired concurrently with magnetic data on February 28 and March 1 to 2, 2001. Prior to data acquisition, the EM-31 was assembled and battery levels were checked and found to be within acceptable levels. The in-phase component was then set to zero in a portion of the site with no buried metallic objects. The EM-31 digital data logger was synchronized to GPS time and programmed with the appropriate file name, line number, measurement increment, and direction. Changes in these parameters were made as necessary throughout the survey. The EM-31 was operated in vertical dipole mode with an approximate 3-foot instrument height and the instrument boom parallel to the survey lines. EM-31 measurements of conductivity and in-phase component were made at 0.5-second intervals as the operator walked along SW-NE survey lines nominally spaced 10 feet apart. The 0.5-second sampling interval resulted in an average station spacing of about 2 feet. The EM-31 data were stored in a digital data logger along with line and station number. If an error was made acquiring a line, a note was made in the field log and the line repeated. EM-31 and GPS data were downloaded to a laptop computer at the end of each field day.

4 DATA PROCESSING AND INTERPRETATION

This section presents the data processing procedures and interpretation of the geophysical data.

4.1 Data Processing

Color-enhanced contour maps of magnetic and EM-31 data were generated using the GEOSOFT® geophysical mapping system. Prior to contour map generation, a number of preprocessing steps were completed. These preprocessing steps consisted of the following:

- Backup of all original field data files to floppy disk.
- Downloading GPS base station data from Sokkia bulletin board.
- Applying differential corrections to GPS data and outputting an ASCII file containing approximate State Plane Coordinates, elevation, and time.
- Correcting of all data acquisition errors (typically only deleting the first portion of a reacquired line, renaming lines incorrectly labeled, deleting additional readings outside the grid, etc.)
- Reformatting field data files to free format XYZ files containing at a minimum GPS time and field measurements.
- Merging GPS position data and geophysical data using in-house software.
- Removing diurnal variation from total magnetic field measurements using the base station data file and in-house software, if necessary.
- Merging of multiple data files into a single file and sorting, if necessary.

These data adjustments were made using a combination of commercial and in-house software. All adjustments made to data files and resulting file names were documented and are retained in project files.

The outputs of the data preprocessing were data files containing California State Plane, Zone 6, NAD83 Easting and Northing, and the various data measurements. The magnetic data file contained total magnetic field intensity. The EM-31 data file contained conductivity and in-phase response.

These data files were imported into the GEOSOFT® mapping system and the following data processing steps applied:

- Reformatting of data files to GEOSOFT® format.
- Generating final map scale.
- Gridding data using minimum curvature and a 5-foot cell size.
- Masking grid in areas where data not acquired (i.e. around obstructions).
- Applying a single pass Hanning filter to smooth the data.
- Generating color zone file describing color for different data ranges.
- Contouring the data.
- Generating map surrounds (title block, legend, scale, color bar, north arrow, etc.)
- Annotating anomalies.
- Merging various plot files and plotting final map.

The names of the files generated and the processing parameters used were recorded on data processing forms. All completed data processing forms are retained in project files. All files generated during the processing sequence were archived on CD-ROM.

4.2 Interpretation

Color-enhanced contour maps of total magnetic field intensity, EM-31 conductivity and EM-31 in-phase response are presented as Figures 3 to 5, respectively. The coordinates shown in these figures reference the California State Plane Coordinate System, Zone 6, NAD83. The color bar indicates the amplitude of the measured quantity with the magenta and cyan colors indicating high- and low-amplitudes, respectively. The light orange, yellow and light green colors in the contour maps of total magnetic field intensity and EM-31 in-phase response indicate average "background" values of the measured quantity.

Significant anomalies in the magnetic and EM-31 data were field checked to determine if a metallic object at the surface caused the anomaly. A number of surface metallic features, such as concrete walls, surface structures, manholes, utility vaults, tie downs, runway lights, monitoring wells, and other surface metallic objects caused anomalies in the geophysical data. These anomalies are labeled as "SM" on the contour maps.

There are several anomalies on the contour maps of magnetic and EM-31 data (Figures 3 to 5) interpreted as being caused by buried pipes. These anomalies are labeled as "P" on the contour maps and the locations of the pipes are shown on Figure 2. The locations of these pipes were interpreted directly from geophysical data and, therefore, locations should be considered approximate. No effort was made to locate or interpret all pipes in the survey area as this was outside the scope of work.

There are several small magnetic and/or EM-31 anomalies interpreted as being caused by small, buried metallic objects. These anomalies are labeled as "B" on the respective contour maps and are depicted on Figure 2. The anomalies are probably caused by small pieces of metallic debris at shallow depth.

There are two large magnetic and EM-31 anomalies in the northwestern portion of the survey area warranting further discussion. These anomalies are labeled as A-1 and A-2 on the contour map of magnetic and EM-31 data (Figures 3 to 5) and are discussed below.

The source of anomaly A-1 is centered at 6116885E, 2189790N and gives rise to a large dipolar magnetic anomaly (positive response south and negative response north of source) and positive EM-31 anomaly with negative shoulders. This anomaly may be caused by either subsurface infrastructure (e.g. a large concrete vault) or a large buried metallic object or debris. EM-31 data indicates that the source of this anomaly may be as large as 30 feet long and 20 feet wide.

Anomaly A-2 is located east of anomaly A-1 at 6116950E, 2189800N. The source of this anomaly gives rise to a large reversed dipolar magnetic anomaly and weak positive EM-31 in-

phase anomaly with negative shoulders. This anomaly may have a similar source as anomaly A-1, however the source of the reversed magnetic dipole is unknown.

Anomaly A-3 is a high amplitude magnetic and EM-31 anomaly located in the southeastern corner of the survey area. This anomaly is caused by the Site 5 Landfill and is not depicted on Figure 2 because the survey area appears to end at the edge of the landfill.

The EM-31 conductivity data (Figure 4) provided no conclusive evidence for the placement of large amounts of fill soil. Near-surface soil conductivities are quite variable at the site, ranging from about 20 to 50 mS/m. The near-surface soils in the lower conductivity zones probably consist of coarser grained soils with only minor amounts of clay (i.e. clean sand), whereas the higher conductivity zones probably have silty sands, clayey sands or silt in the near surface. A narrow east to west trending low-conductivity zone in the northeastern portion of the survey area may be associated with a former channel.

5 SUMMARY

A magnetic and Geonics EM-31 (EM-31) survey was conducted in an approximate 20-acre area encompassing Aerial Photographic Anomaly Area 5 at MCAS EL Toro, California to screen the site for buried metallic and/or construction debris and fill soils. Interpretation of the geophysical data is presented in Figure 2. Contour maps of total magnetic field intensity and EM-31 conductivity and in-phase response are presented as Figures 3 to 5, respectively.

The geophysical survey revealed the presence of two large buried metallic objects/debris in the northwest portion of the survey area as shown on Figure 2. These large geophysical anomalies, discussed as anomalies A-1 and A-2 in the previous section, may either be caused by unknown subsurface infrastructure or buried metallic objects/debris. The source of the anomalies can only be accurately determined by excavation.

The geophysical data also revealed the presence of several pipes within the survey area and several small, buried metallic objects/debris as shown on Figure 2. No attempt was made to locate all pipes within the survey area as this was outside the scope of work.

Near-surface soil conductivity is quite variable at the site ranging from about 20 to 50 mS/m. Much of the conductivity variation is probably related to natural soil variation although the placement of fill soils cannot be discounted.

The geophysical survey was designed to map small accumulations of metallic debris in the subsurface and strong variations in near-surface soil type that could be indicative of fill soils. It was assumed that any debris buried at the site would contain enough metallic components (i.e. rebar, pipe segments, steel plates, etc.) to be detectable by the magnetic and EM methods.

6 CERTIFICATION

All geophysical data, analysis, interpretations, conclusions, and recommendations in this document have been prepared under the supervision of and reviewed by a *GEOVision* California Registered Geophysicist.

Antony J. Martin

MAGNETIC METHOD

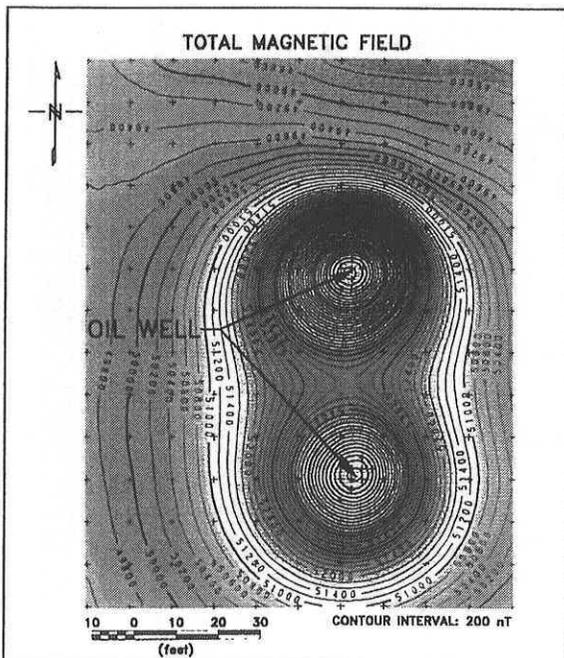

The magnetic method generally involves the measurement of the earth's magnetic field intensity or vertical gradient of the earth's magnetic field. Anomalies in the earth's magnetic field are caused by induced or remanent magnetism. Induced magnetic anomalies are the result of secondary magnetization induced in a ferrous body by the earth's magnetic field. The shape and amplitude of an induced magnetic anomaly is a function of the orientation, geometry, size, depth, and magnetic susceptibility of the body as well as the intensity and inclination of the earth's magnetic field in the survey area. The magnetic method is an effective way to search for small metallic objects, such as buried ordnance and drums, because magnetic anomalies have spatial dimensions much larger than those of the objects themselves. Typically, a single buried drum can be detected to a depth of about 10 feet.

Larger metallic objects can often be located to greater depths. Induced magnetic anomalies over buried objects such as drums, pipes, tanks, and buried metallic debris generally exhibit an asymmetrical, south up/north down signature (positive response south of the object and negative response to the north).

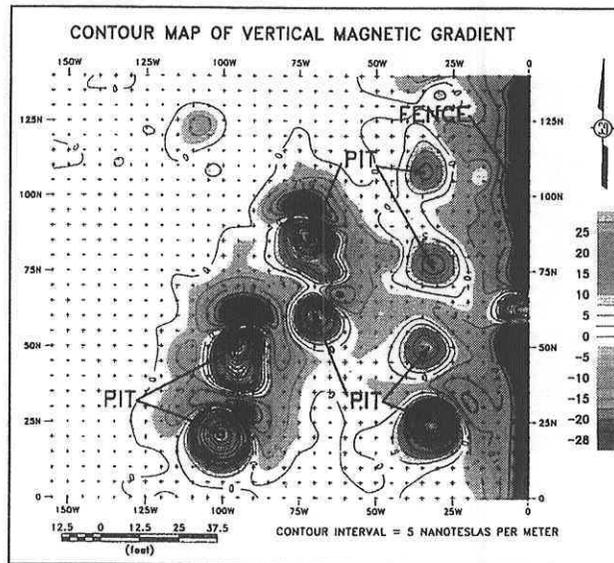

Magnetic data is typically acquired along a grid with results being presented as color-enhanced contour maps generated by the Geosoft™ Mapping System or OASIS montaj. The approximate location and depth of magnetic objects can be calculated using the Geosoft™ UXO System.

Geometrics G858 Cesium Magnetic Gradiometer

Magnetic Survey to Locate Abandoned Oil Wells

Magnetic Survey to Locate Pits Containing Buried Metallic Containers

Magnetic surveys are typically conducted to:

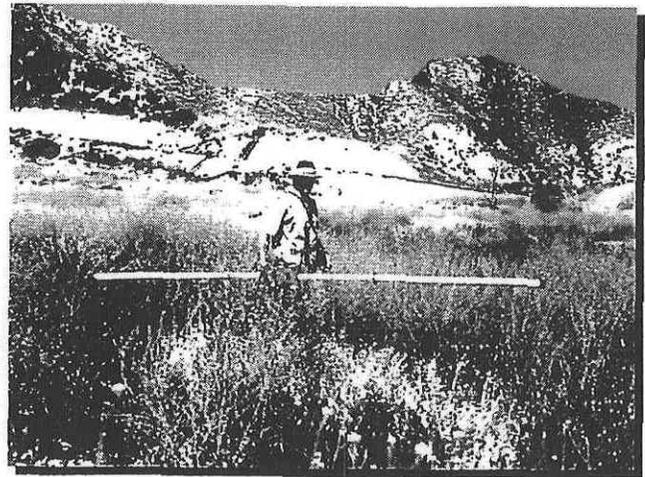

- Locate abandoned steel well casings
- Locate buried tanks and pipes
- Locate pits and trenches containing buried metallic debris
- Detect buried unexploded ordnance (UXO)
- Map old waste sites and landfill boundaries
- Clear drilling locations
- Map basement faults and geology
- Investigate archaeological sites

ELECTROMAGNETIC METHODS

Electromagnetic (EM) methods typically applied to shallow environmental investigations include frequency domain EM methods, such as EM induction and EM utility location methods, time domain electromagnetic (TDEM) metal detection methods, and ground penetrating radar (GPR) methods.

EM Induction Method

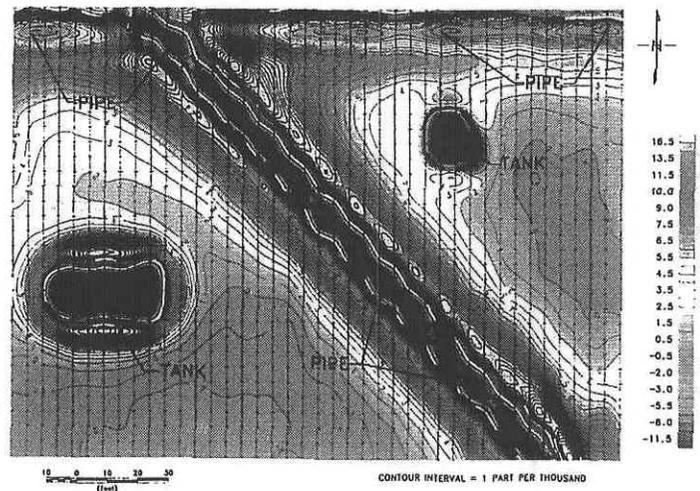

EM induction surveys are often conducted using the Geonics EM-31 terrain conductivity meter (EM-31). The EM-31 consists of a transmitter coil mounted at one end and a receiver coil mounted at the other end of a 3.7-meter long plastic boom. Electrical conductivity and in-phase component field strength are measured and stored along with line and station numbers in a digital data logger. In-phase component measurements generally only respond to buried metallic objects; whereas conductivity measurements also respond to conductivity variations caused by changes in soil type, moisture or salinity and the presence of nonmetallic bulk wastes. The EM-31 must pass over or immediately adjacent to a buried metallic object to detect it. Typical EM-31 anomalies over small, buried metallic objects consist of a negative response centered over the object and a lower amplitude positive response to the sides of the object. When the instrument boom is oriented parallel to long, linear conductors such as pipelines a strong positive response is observed. The EM-31 can explore to depths of about 6 meters, but is most sensitive to materials about 1 meter below ground surface. Single buried drums can typically be detected to depths of about 5 feet.

Geonics EM-31 Terrain Conductivity Meter

EM-31 surveys are typically conducted to:

- Locate buried tanks and pipes
- Locate pits and trenches containing metallic and/or nonmetallic debris
- Delineate landfill boundaries
- Delineate oil production sumps and mud pits
- Map conductive soil and groundwater contamination
- Map soil salinity in agricultural areas
- Characterize shallow subsurface hydrogeology
 - Map buried channel deposits
 - Locate sand and gravel deposits
 - Locate conductive fault and fracture zones

Geonics EM-31 Survey to Locate Underground Storage Tanks

EM Utility Location Methods

EM utility locators; such as the Metrotech 810, Metrotech 9890 and Radiodetection RD400, are designed to accurately trace metallic pipes and utility cables and clear drilling/excavation locations. These utility locators consist of a separate transmitter and a receiver. The transmitter emits a radio frequency EM field that induces secondary fields in nearby metallic pipes and cables. The receiver detects these fields and is used to accurately locate and trace the pipes, often to distances over 200 feet from the transmitter. Many of the utility locators have a passive 60Hz mode to locate live electrical lines. Modern utility locators are also capable of providing rough depth estimates of the pipes.

← **Metrotech EM Utility Locator**

TDEM Metal Detection Methods

A Geonics EM-61 (EM-61) is a high sensitivity, time-domain, digital metal detector which is often used to detect both ferrous and non-ferrous metallic objects. It is designed specifically to locate buried metallic objects such as drums, tanks, pipes, UXO, and metallic debris and to be relatively insensitive to above ground structures such as fences, buildings, and vehicles.

The EM-61 consists of two square, 1-meter coils, one mounted over the other and arranged on a hand-towed cart. The bottom coil acts as both a transmitter and receiver while the top coil is a receiver only. While transmitting the bottom coil generates a pulsed primary magnetic field, which induces eddy currents into nearby metallic objects. When the transmitter is in its off cycle both coils measure the decay of these eddy currents in millivolts (mV) with the results being stored in a digital data logger along with position information.

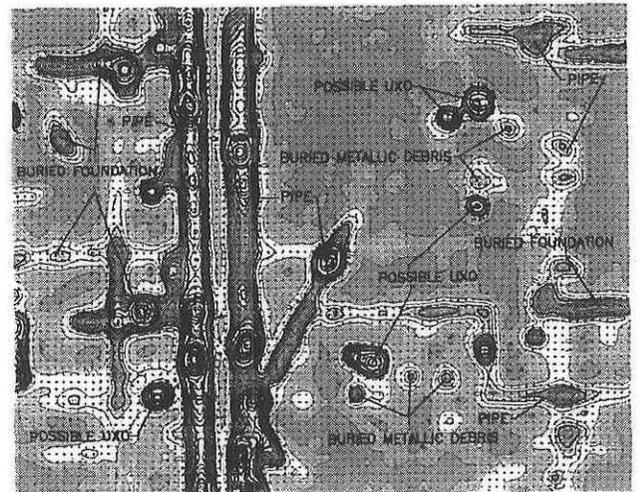

The decay of the eddy currents is proportional to the size and depth of the metallic target. A symmetrical positive anomaly is recorded over metallic objects with the peak centered over the object. The signal from the top coil is amplified in such a way that both coils record effectively the same response for a metallic object on the surface and the top coil records a larger response for buried metallic objects. The response of near surface objects can, therefore, be suppressed by subtracting the lower coil response from the upper coil response (differential response).

In practice, the usable depth of investigation of the EM-61 depends on the size and shape of the object and the amount of above ground interference encountered at the site. A single buried drum can often be detected at a depth of about 10 feet.

GSSI SIR-10A GPR Unit

GPR Methods

Ground-penetrating radar (GPR) is a high-frequency electromagnetic method commonly applied to a number of engineering and environmental problems.

A GPR system radiates short pulses of high-frequency EM energy into the ground from a transmitting antenna. This EM wave propagates into the ground at a velocity that is primarily a function of the relative dielectric permittivity of subsurface materials. When this wave encounters the interface of two materials having different dielectric properties, a portion of the energy is reflected back to the surface, where it is detected by a receiver antenna and transmitted to a control unit for processing and display.

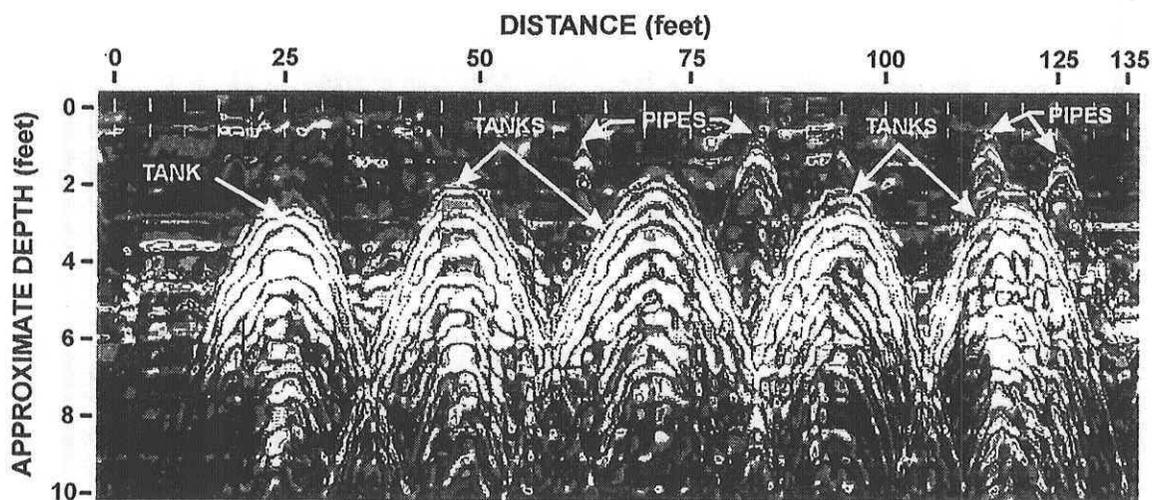

Depth penetration is a function of antenna frequency and the electrical conductivity of the soils in the survey area. Lower frequency antennas achieve greater depth penetration than higher frequency antennas, but have poorer spatial resolution. Conductive soils, such as clays, attenuate the radar waves much more rapidly than resistive dry sand and rock. In many environments in California, depth penetration of 500 and 300 MHz

antennas is limited to 3 to 5 feet. Depth penetration may be greater if shallow soils consist of clean sands and less if shallow soils consist of clay.

GPR surveys are typically conducted to:

- Locate and delineate underground storage tanks (metallic and non-metallic)
- Locate metallic and nonmetallic pipes and utility cables
- Map rebar in concrete structures
- Map landfill boundaries
- Delineate pits and trenches containing metallic and nonmetallic debris
- Delineate leach fields and industrial cribs
- Delineate previously excavated and backfilled areas
- Map shallow groundwater tables
- Map shallow soil stratigraphy
- Map shallow bedrock topography
- Map shallow subsurface voids and cavities
- Characterize archaeological sites

Geophysical Survey Systems Inc. (GSSI) SIR-2 or SIR-10 GPR systems with antennas in the frequency range of 50 to 1,000 MHz are often used during GPR investigations. Mala Geoscience and Sensors and Software, Ltd also manufacture GPR systems. GPR data is processed using a variety of software including the RADAN™ or GRADIX software packages by GSSI and Interpex Ltd., respectively.

Mercury	mg/kg	0.22	23	610	.108 U	.11 U	.103 U

OIHM Remediation Services Corp.

Table D-1
Summary Analytical Results for Soil Samples — Anomaly Area 5

Explanation:

B - result exceeds established background limits

CA LUFT - California Leaking Underground Fuel Tank

EPA - United States Environmental Protection Agency

J - estimated

M - Modified

MDL - method detection limit

mg/kg - milligrams per kilogram

NA - not analyzed

NE - not established

OIHM - OIHM Remediation Services Corp.

PRG - Preliminary Remediation Goal, EPA Region IX, October 1999

RL - reporting limit

SB - soil boring

TPH - total petroleum hydrocarbons

U - not detected above or equal to the stated reporting limit.

If the analyte had been detected between the MDL and RL, the actual value would have been reported and flagged with a "J" qualifier. For the samples in question, the laboratory did not detect analyte concentrations between the MDL and the RL. As a result, the samples are qualified as non-detect ("U").

X - result exceeds industrial PRGs

Y - result exceeds residential PRGs

µg/kg - micrograms per kilogram

**Laboratory Data Consultants, Inc.
Data Validation Report**

Project/Site Name: MCAS El Toro, DO #70
Collection Date: February 7 through February 8, 2001
LDC Report Date: March 8, 2001
Matrix: Soil
Parameters: Total Petroleum Hydrocarbons as Extractables
Validation Level: NFESC Level C
Laboratory: EMAX Laboratories, Inc.
Sample Delivery Group (SDG): 01B100

Sample Identification

18609-4160
18609-4161
18609-4163
18609-4164
18609-4165
18609-4161MS
18609-4161MSD

Introduction

This data review covers 7 soil samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8015 modified for Total Petroleum Hydrocarbons (TPH) as Extractables.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section III.

Field duplicates are summarized in Section IX.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

a. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 20.0% .

b. Calibration Verification

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 15.0% QC limits.

III. Blanks

Method blanks were reviewed for each matrix as applicable. No total petroleum hydrocarbons as extractable contaminants were found in the method blanks.

IV. Accuracy and Precision Data

a. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

b. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

c. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

V. Target Compound Identification

Raw data were not reviewed for this SDG.

VI. Compound Quantitation and CRQLs

Raw data were not reviewed for this SDG.

VII. System Performance

Raw data were not reviewed for this SDG.

VIII. Overall Assessment of Data

Data flags have been summarized at the end of this report.

IX. Field Duplicates

No field duplicates were identified in this SDG.

X. Field Blanks

No field blanks were identified in this SDG.

Introduction

This data review covers 5 soil samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8015 modified for Total Petroleum Hydrocarbons (TPH) as Gasoline.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section III.

Field duplicates are summarized in Section IX.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

a. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 20.0% .

b. Calibration Verification

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 15.0% QC limits.

III. Blanks

Method blanks were reviewed for each matrix as applicable. No total petroleum hydrocarbons as gasoline contaminants were found in the method blanks.

IV. Accuracy and Precision Data

a. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

b. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

c. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

V. Target Compound Identification

Raw data were not reviewed for this SDG.

VI. Compound Quantitation and CRQLs

Raw data were not reviewed for this SDG.

VII. System Performance

Raw data were not reviewed for this SDG.

VIII. Overall Assessment of Data

Data flags have been summarized at the end of this report.

IX. Field Duplicates

No field duplicates were identified in this SDG.

18609-4164
18609-4165
18609-4166

Introduction

This data review covers 7 soil samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260A for Volatiles.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section V.

Field duplicates are summarized in Section XVI.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 30.0% for all calibration check compounds and less than or equal to 50.0% for all other compounds.

Average relative response factors (RRF) for all volatile target compounds and system performance check compounds (SPCCs) were greater than or equal to 0.05 as required.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

All of the continuing calibration percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were less than or equal to 25.0% for all calibration check compounds and less than or equal to 50.0% for all other compounds.

All of the continuing calibration RRF values were greater than or equal to 0.05 .

V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and CRQLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment

Data flags have been summarized at the end of the report.

XVI. Field Duplicates

No field duplicates were identified in this SDG.

XVII. Field Blanks

No field blanks were identified in this SDG.

18609-4160
18609-4161
18609-4163
18609-4164
18609-4165

Introduction

This data review covers 5 soil samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Methods 6010 and 7000 for Metals. The metals analyzed were Antimony, Arsenic, Barium, Beryllium, Cadmium, Chromium, Cobalt, Copper, Lead, Manganese, Mercury, Molybdenum, Nickel, Selenium, Silver, Thallium, Vanadium, and Zinc.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (February 1994) as there are no current guidelines for the methods stated above.

A table summarizing all data qualification flags is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from specified protocols or is of technical advisory nature.

Blanks are summarized in Section III.

Field duplicates are summarized in Section XIII.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

An initial calibration was performed.

The frequency and analysis criteria of the initial calibration verification (ICV) and continuing calibration verification (CCV) were met.

III. Blanks

Method blanks were reviewed for each matrix as applicable.

Data qualification by the initial, continuing and preparation blanks (ICB/CCB/PBs) was based on the maximum contaminant concentration in the ICB/CCB/PBs in the analysis of each analyte. No contaminant concentrations were found above the reporting limit in the initial, continuing and preparation blanks with the following exceptions:

Method Blank ID	Analyte	Maximum Concentration	Associated Samples
PB (prep blank)	Barium Beryllium Cobalt Lead Molybdenum	0.0422 mg/Kg 0.0115 mg/Kg 0.424 mg/Kg 0.184 mg/Kg 1.09 mg/Kg	All samples in SDG 01B100
ICB/CCB	Barium Beryllium Cobalt Silver Molybdenum	1.26 ug/L 0.160 ug/L 3.41 ug/L 9.38 ug/L 10.9 ug/L	All samples in SDG 01B100

Sample concentrations were compared to the maximum contaminant concentrations detected in the ICB/CCB/PBs. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Analyte	Reported Concentration	Modified Final Concentration
18609-4160	Cobalt	1.81 mg/Kg	1.81U mg/Kg

Sample	Analyte	Reported Concentration	Modified Final Concentration
18609-4161	Cobalt Lead Silver Molybdenum	1.23 mg/Kg 0.871 mg/Kg 0.552 mg/Kg 1.11 mg/Kg	1.23U mg/Kg 0.871U mg/Kg 0.552U mg/Kg 1.11U mg/Kg
18609-4163	Molybdenum	1.33 mg/Kg	1.33U mg/Kg
18609-4164	Silver	0.716 mg/Kg	0.716U mg/Kg
18609-4165	Cobalt Lead Silver Molybdenum	1.39 mg/Kg 0.86 mg/Kg 0.641 mg/Kg 1.08 mg/Kg	1.39U mg/Kg 0.86U mg/Kg 0.641U mg/Kg 1.08U mg/Kg

IV. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

V. Matrix Spike Analysis

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VI. Duplicate Sample Analysis

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in this SDG, and therefore duplicate analyses were not performed for this SDG.

VII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VIII. Internal Standards (ICP-MS)

ICP-MS was not utilized in this SDG.

IX. Furnace Atomic Absorption QC

Graphite furnace atomic absorption was not utilized in this SDG.

X. ICP Serial Dilution

ICP serial dilution was not required by the method.

XI. Sample Result Verification

Raw data were not reviewed for this SDG.

XII. Overall Assessment of Data

Data flags have been summarized at the end of this report.

XIII. Field Duplicates

No field duplicates were identified in this SDG.

XIV. Field Blanks

No field blanks were identified in this SDG.

**Laboratory Data Consultants, Inc.
Data Validation Report**

Project/Site Name: MCAS El Toro, DO #70
Collection Date: February 15, 2001
LDC Report Date: March 8, 2001
Matrix: Soil
Parameters: Total Petroleum Hydrocarbons as Extractables
Validation Level: NFESC Level C
Laboratory: EMAX Laboratories, Inc.
Sample Delivery Group (SDG): 01B155

Sample Identification

18609-4213A
18609-4214A
18609-4215A

Introduction

This data review covers 3 soil samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8015 modified for Total Petroleum Hydrocarbons (TPH) as Extractables.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section III.

Field duplicates are summarized in Section IX.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

a. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 20.0% .

b. Calibration Verification

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 15.0% QC limits.

III. Blanks

Method blanks were reviewed for each matrix as applicable. No total petroleum hydrocarbons as extractable contaminants were found in the method blanks.

IV. Accuracy and Precision Data

a. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

b. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

c. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

V. Target Compound Identification

Raw data were not reviewed for this SDG.

VI. Compound Quantitation and CRQLs

Raw data were not reviewed for this SDG.

VII. System Performance

Raw data were not reviewed for this SDG.

VIII. Overall Assessment of Data

Data flags have been summarized at the end of this report.

IX. Field Duplicates

No field duplicates were identified in this SDG.

X. Field Blanks

No field blanks were identified in this SDG.

Sample Identification

18609-4212 A

18609-4213A

18609-4214A

18609-4215A

Introduction

This data review covers 3 soil samples and one water sample listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260A for Volatiles.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (October 1999) as there are no current guidelines for the method stated above.

A table summarizing all data qualification is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Blank results are summarized in Section V.

Field duplicates are summarized in Section XVI.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 30.0% for all calibration check compounds and less than or equal to 50.0% for all other compounds.

Average relative response factors (RRF) for all volatile target compounds and system performance check compounds (SPCCs) were greater than or equal to 0.05 as required.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

All of the continuing calibration percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were less than or equal to 25.0% for all calibration check compounds and less than or equal to 50.0% for all other compounds.

All of the continuing calibration RRF values were greater than or equal to 0.05 .

V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and CRQLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment

Data flags have been summarized at the end of the report.

XVI. Field Duplicates

No field duplicates were identified in this SDG.

XVII. Field Blanks

Sample 18609-4212 was identified as a trip blank. No volatile contaminants were found in this blank.

18609-4214MS
18609-4214MSD

Introduction

This data review covers 5 soil samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Methods 6010 and 7000 for Metals. The metals analyzed were Antimony, Arsenic, Barium, Beryllium, Cadmium, Chromium, Cobalt, Copper, Lead, Manganese, Mercury, Molybdenum, Nickel, Selenium, Silver, Thallium, Vanadium, and Zinc.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (February 1994) as there are no current guidelines for the methods stated above.

A table summarizing all data qualification flags is provided at the end of this report. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from specified protocols or is of technical advisory nature.

Blanks are summarized in Section III.

Field duplicates are summarized in Section XIII.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Calibration

An initial calibration was performed.

The frequency and analysis criteria of the initial calibration verification (ICV) and continuing calibration verification (CCV) were met.

III. Blanks

Method blanks were reviewed for each matrix as applicable.

Data qualification by the initial, continuing and preparation blanks (ICB/CCB/PBs) was based on the maximum contaminant concentration in the ICB/CCB/PBs in the analysis of each analyte. No contaminant concentrations were found above the reporting limit in the initial, continuing and preparation blanks with the following exceptions:

Method Blank ID	Analyte	Maximum Concentration	Associated Samples
PB (prep blank)	Lead	0.228 mg/Kg	All samples in SDG 01B155
ICB/CCB	Zinc	9.42 ug/L	All samples in SDG 01B155

Sample concentrations were compared to the maximum contaminant concentrations detected in the ICB/CCB/PBs. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks.

IV. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

V. Matrix Spike Analysis

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VI. Duplicate Sample Analysis

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable.

VII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VIII. Internal Standards (ICP-MS)

ICP-MS was not utilized in this SDG.

IX. Furnace Atomic Absorption QC

Graphite furnace atomic absorption was not utilized in this SDG.

X. ICP Serial Dilution

Although ICP serial dilution analysis was not required by the method, it was performed by the laboratory. The analysis criteria were met.

XI. Sample Result Verification

Raw data were not reviewed for this SDG.

XII. Overall Assessment of Data

Data flags have been summarized at the end of this report.

XIII. Field Duplicates

No field duplicates were identified in this SDG.

XIV. Field Blanks

No field blanks were identified in this SDG.
