# 1.0 INTRODUCTION

This 2017 Annual Report addresses volatile organic compounds (VOCs) in groundwater downgradient of the former Navy-owned, Northrop Grumman-operated Naval Weapons Industrial Reserve Plant (NWIRP) Bethpage and the separate former Northrop Grumman-owned and Northrop Grumman-operated industrial facility adjacent to the former NWIRP (Figures 1-1 and 1-2).

This document was developed in response to Title VII, Subtitle E, Section 7502 of the Water Infrastructure Improvements for the Nation (WIIN) Act of 2016, which requires the Secretary of the Navy to submit this initial Annual Report by June 14, 2017 and annual reports thereafter, to the United States Congress. The requirements of the Act are as follows:

> "(1) a description of the status of the groundwater contaminants that are leaving the site [former NWIRP Bethpage and two former Northrop Grumman facilities] and migrating to a location within a 10-mile radius of the site, including -
>
> (A) detailed mapping of the movement of the plume over time; and
>
> (B) projected migration rates of the plume;
>
> (2) an analysis of the current and future impact of the movement of the plume on drinking water facilities; and
>
> (3) a comprehensive strategy to prevent the groundwater contaminants from the site from contaminating drinking water wells that, as of the date of the submission of the report, have not been affected by the migration of the plume."

This report describes the status and strategy primarily for what is known as the Operable Unit (OU) 2 Plume, which consists of impacted groundwater downgradient of the former NWIRP and one of the two former Northrop Grumman facilities. The groundwater contaminants associated with the former NWIRP and Northrop Grumman facilities are identified in the New York State Department of Environmental Conservation (NYSDEC) 2001 Record of Decision (ROD) for OU2 Groundwater – Northrop Grumman and Naval Weapons Industrial Reserve Plant Sites (Site Numbers 1-30-003A & B) and the Navy 2003 ROD for NWIRP Bethpage, New York OU2 – Groundwater (NYS Registry 1-30-003B). These documents list chlorinated VOCs in groundwater, primarily trichloroethene (TCE), that have migrated south of the former NWIRP and Northrop Grumman facilities (NYSDEC, 2001 and Navy, 2003).

There are other plumes adjacent to and within the footprint of the OU2 Plume that have sources other than NWIRP and Northrop Grumman facilities. Hooker Ruco (a Superfund Site) and some local dry cleaners and gasoline stations are likely contributing to the footprint of the OU2 Plume (Figure 1-3). In addition, NYSDEC issued the Bethpage Park – Former Grumman Settling Ponds and Adjacent Areas (Bethpage Community Park) 2013 OU3 ROD, Nassau County Site No. 1-30-003A to address VOCs from another adjacent former Northrop Grumman facility (NYSDEC, 2013). While investigations have identified other chemicals, including cadmium and chromium in the on-facility groundwater wells, currently, there is no

evidence that these chemicals are present in off-facility groundwater; and therefore, these other chemicals are not discussed in this report.

The NYSDEC OU2 2001 ROD, Navy OU2 2003 ROD, and NYSDEC Bethpage Community Park OU3 2013 ROD provide strategies and identify response actions to mitigate offsite groundwater impacts to possible receptors, and to protect human health and the environment from actual or threatened releases of hazardous substances. These response actions include:

- Installation and continued operation of on-site containment systems consisting of groundwater extraction wells and treatment plants to capture and treat VOCs before they migrate off facility from the former NWIRP and/or Northrop Grumman facilities (OU2 and OU3).
- Offsite groundwater capture and treatment of hotspots at the GM38 Area Hotspot (OU2) (in operation), the RW21 Area Hotspot (OU3) (under construction), and the RE108 Area Hotspot (OU2) (in design), with the objective of weakening the plume and limiting its downgradient migration.
- Continued monitoring and tracing of the plumes through the installation of vertical profile borings and monitoring wells.
- Installation of wellhead treatment for impacted and prospectively-impacted public water supply wells.

These response actions continue to be effective and protective of human health and the environment. The Navy and Northrop Grumman continue to work closely with NYSDEC in implementing the ROD remedies. Northrop Grumman and the Navy are currently planning additional groundwater hotspot area extraction and treatment systems that will further weaken the off-facility plumes and limit its migration towards downgradient public water supply wells. Due to these measures, the remedy for the off-facility groundwater is currently protective of human health and the environment.

The Navy holds Restoration Advisory Board meetings twice per year in Bethpage to inform the community of the actions being taken by the Navy to clean up soil and groundwater at/from the former NWIRP facility. The public as well as representatives of NYSDEC, New York State Department of Health (NYSDOH), Nassau County Department of Health (NCDOH), United States Environmental Protection Agency (U.S. EPA), Town of Oyster Bay, and the local water districts are invited to attend. Actions being conducted by the Navy to address groundwater contamination, including monitoring, treatment, and other protective measures are discussed at these meetings. Navy, Northrop Grumman, NYSDEC, NYSDOH, U.S. EPA, and local water districts also participate in separate quarterly meetings to facilitate progress.

The Navy maintains a public repository, which includes supporting technical documents and correspondence related to NWIRP Bethpage, at the following location:

Bethpage Public Library
47 Powell Avenue
Bethpage, New York 11714
(516) 931-3907

A public web site with the Administrative Record can be accessed at the following web page:

http://go.usa.gov/DyXF

## 1.1 BACKGROUND

The Navy Environmental Restoration Program (ERP) is implemented pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), 42 U.S.C. Secs. 9601-9675, and Defense Environmental Restoration Program (DERP), 10 U.S.C. Secs 2701 – 2711 to address Navy and Marine Corps facilities that were contaminated with hazardous substances or pollutants or contaminants.

## 1.2 REPORT ORGANIZATION

This report is organized as shown in the Table of Contents. Acronyms and abbreviations are presented after the Table of Contents. Figures and appendices are provided at the end of the document.

# 2.0 SITE BACKGROUND

This section provides a summary of background information for the former NWIRP Bethpage and Northrop Grumman facilities, the surrounding area, and the OU2 and OU3 groundwater plumes.

## 2.1 NWIRP BETHPAGE FACILITY INFORMATION

NWIRP Bethpage is located in Nassau County on Long Island, New York; approximately 30 miles east of New York City (Figure 1-1). Starting in World War II, NWIRP Bethpage was established in 1942 for the research prototyping, testing, design engineering, fabrication, and primary assembly of military aircraft. At its peak operation, the facilities at NWIRP Bethpage included four plants used for assembly and prototype testing; a group of quality control laboratories, two warehouse complexes (north and south), a salvage storage area, water recharge basins, an Industrial Wastewater Treatment Facility, and several smaller support buildings (Figure 1-2).

NWIRP Bethpage was a government-owned facility operated by Northrop Grumman until 1996. As a result of Northrop Grumman's decision to terminate operations at NWIRP Bethpage, the U.S. Congress passed special legislation under Section 2852 of the National Defense Authorization Act of 1998 (P.L.105-85, 111 Stat. 1629), permitting conveyance of the Navy real property at NWIRP Bethpage to Nassau County, New York for economic redevelopment. NWIRP Bethpage originally included a main parcel of approximately 105 acres and a separate parcel of approximately 4.5 acres located to the north of the main parcel.

In 2002, the Navy transferred the 4.5 acre parcel to Nassau County. On February 26, 2008, the Navy transferred 96 acres of the 105-acre main parcel to Nassau County and is leasing the remaining 9 acres to Nassau County. Two Navy Environmental Restoration sites located on the main parcel that were transferred, Site 2 – Recharge Basins and Site 3- Salvage Storage Area, require land use controls (LUCs) and Five-Year Reviews as a part of the selected remedy. These LUCs are in place and reviews are being conducted, as required. The nine-acre parcel the Navy retains for environmental investigation and remediation includes Navy Environmental Restoration Site 1 – the Former Drum Marshalling Area and Site 4 – Former Underground Storage Tank area. Upon successful remediation of the nine-acre parcel, it will also be transferred to Nassau County. The transfer and lease documents provide LUCs and notifications of areas in which residual impacts remain.

From 1998 to 2011, activities occurring at the former 105-acre NWIRP Bethpage included facility maintenance (security and mowing), storage of Nassau County impounded vehicles, and environmental investigations and/or remediation of soil, groundwater, and soil vapor.

In 2011, Steel-Los III, LP bought 84 acres of the 96-acre property that the Navy had transferred to Nassau County and has been renovating the facility to attract new tenants. Nassau County has retained the remaining 12 acres for economic development. The Navy-owned nine-acre parcel being leased to Nassau County was also subleased to Steel-Los III, LP in 2011. Steel-Los III currently utilizes the owned and leased properties for light industrial and commercial activities, miscellaneous outdoor storage, and as a

movie production set. Steel-Los III, LP maintains security for the facility. Since 2011, the Navy has continued environmental investigations and response activities on the 9-acre parcel.

Until the 1990s, Northrop Grumman owned approximately 500 acres of property that was adjacent to and surrounded much of the former NWIRP (Figure 1-2). Since that time Northrop Grumman has sold most of the 500 acres of property. Until 1962, Northrop Grumman also owned a parcel of land in addition to its 500 acres of property, which NYSDEC described in its OU3 ROD as the Former Grumman Settling Ponds and Adjacent Areas. Northrop Grumman had transferred this parcel to the Town of Oyster Bay in 1962 for construction of the Bethpage Community Park.

### 2.1.1 Surface Features

The former NWIRP Bethpage and Northrop Grumman facilities are located on a relatively flat, glacial outwash plain. The facilities and nearby vicinity are highly urbanized. Because of this, most of the natural physical features have been reshaped or destroyed. The topography at the former NWIRP Bethpage is relatively flat with a gentle slope toward the south. Elevations range from greater than 140 feet (above mean sea level [msl]) in the north to less than 110 feet (above msl) at the southwest corner. The dominant features at the NWIRP facility are Plant 3 (the former manufacturing facility), North Warehouses, South Warehouses, and three groundwater recharge basins located at Site 2. The recharge basins are each approximately 1.5 to 2.5 acres in area and about 30 to 40 feet deep, (Figure 1-2). Similar features were present at the former Northrop Grumman facility, including Plants 1 and 2, which are former manufacturing facilities and recharge basins along the southern and southwestern borders of the former Northrop Grumman facility. An air strip was also present at the former Northrop Grumman facility.

### 2.1.2 Surrounding Land Use

Currently, the land surrounding the former NWIRP Bethpage is primarily a mixture of commercial and residential development. The residential development surrounding much of the former NWIRP and Northrop Grumman facilities is located in the Hamlets of Bethpage and Plainedge, located in the Town of Oyster Bay, and the Hamlets of Levittown and Hicksville, located in the Town of Hempstead.

## 2.2 GEOLOGY

The former NWIRP Bethpage and Northrop Grumman facilities are underlain by approximately 1,100 feet of unconsolidated sediments that overlie crystalline bedrock (Isbister, 1966). The unconsolidated sediments consist of four distinct geologic units: the Upper Glacial Formation; Magothy Formation; Raritan Clay; and Lloyd Sand Formations (McClymonds and Franke, 1972). The Upper Glacial Formation (glacial deposits) forms the surface deposits across the entire NWIRP. This formation consists primarily of coarse sands and gravels, and is approximately 30 to 45 feet thick. Variations in the thickness of the glacial deposits are common due to undulating contact with the underlying Magothy Formation. The Upper Magothy Formation consists primarily of coarse sands to a depth of approximately 100 feet, below which finer sands, silts, and clay predominate. Individual clay units (also called “clay lenses”) significantly increase below subsurface depths of 100 feet, but are laterally discontinuous; no individual clay horizon of

regional extent underlies the facilities in the Magothy. The 100 to 150-foot thick Raritan Clay Formation underlies the Magothy Formation at a depth of approximately 700 to over 1,000 feet below the ground surface (bgs). The underlying Lloyd Sand Formation is approximately 300 feet thick.

## 2.3 HYDROGEOLOGY

Most of Long Island is bisected by an east-west-trending regional groundwater divide (see Section 4.0). The former NWIRP Bethpage and Northrop Grumman facilities occupy an area of recharge, lying south of the divide where regional groundwater flows southward toward South Oyster Bay and the Atlantic Ocean. Groundwater is in contact with the lower portion of the Upper Glacial and Upper Magothy Formations beneath the facilities. With limited distinction between the formations, groundwater may be considered a common unconfined aquifer. The glacial deposits underlying the facilities are characterized by a high porosity (in excess of 25 percent). Most of the glacial deposits are above the groundwater table in the former NWIRP area; however, the high permeability of the glacial deposits allows for rapid recharge of the Magothy Formation from precipitation (Isbister, 1966; McClymonds and Franke, 1972). The number and thickness of clay lenses increase with depth in the Magothy Formation; however, these clay units are laterally discontinuous and do not function as a fully-developed confining unit within the aquifer.

The Magothy aquifer is used to supply large quantities of water for domestic, agricultural, commercial, and industrial uses on Long Island. Based on water level measurements from 2010 to 2016, groundwater across NWIRP Bethpage flows to the south-southeast and the elevation ranges from approximately 73 to 70 feet above msl at the facility. The groundwater ultimately discharges to South Oyster Bay, which is at sea level, approximately seven miles south of the NWIRP facility. Higher groundwater velocities can occur in gravel zones and/or in response to pumping stresses. Subtle vertical hydraulic gradients occur in a downward direction. Groundwater in the Magothy Formation is considered a sole source aquifer (NYSDEC Class GA), and is the primary source of potable water for Nassau County. Groundwater is encountered at a depth of approximately 50 feet bgs at the facilities.

From the 1960s to the 1990s, Northrop Grumman operated 16 deep production wells (seven wells on the NWIRP facility and nine wells on the Northrop Grumman facility). Extracted water from these production wells was used primarily for non-contact single-pass cooling for plant operations. The wells were screened within the Magothy Formation and each yielded approximately 1,200 gallons per minute (gpm). The majority of the wells were located along the western edge of the facilities. Based on the location and extraction rates, the pumping action of these production wells caused groundwater on the NWIRP facility to flow predominantly west and southwest. In addition, the pumping action of these production wells would also be expected to cause groundwater further west of them to flow east and be captured by these wells.

The production wells extracted groundwater from depths of approximately 280 to 500 feet bgs. Water was discharged into nearby surficial recharge basins. The extraction from the production wells and near surface recharge resulted in vertical gradients across the facilities that would enhance the downward migration of chemicals that may be in the groundwater. Most of the production wells on the former NWIRP and Northrop

Grumman facilities have been decommissioned. Currently, as part of the OU2 On-Site Containment (ONCT) System operated by Northrop Grumman, two of the Northrop Grumman production wells and three additional containment (response action) wells operate with a combined flow rate of approximately 4,600 gpm or 6.4 million gallons per day (mgd) (Figure 1-2). The OU2 ONCT system removes VOCs from the groundwater and limits the migration of VOC-impacted groundwater south of these extraction wells.

## 2.4 GROUNDWATER CONCEPTUAL SITE MODEL

A conceptual site model was developed for these facilities to describe the migration of VOC-impacted groundwater from the various sources through the groundwater aquifer to potential receptors (i.e., public water supply wells). The VOCs in groundwater that may have migrated from the former NWIRP Bethpage and Northrop Grumman facilities are identified in the NYSDEC OU2 2001 ROD, Navy OU2 2003 ROD, and the NYSDEC Bethpage Community Park OU3 2013 ROD. The RODs also address residual VOC-impacted groundwater beneath the former Northrop Grumman and NWIRP facilities. The VOC releases from these facilities form a 3,000-acre plus horizontal area of multiple VOC-impacted groundwater plumes that extend south of Hempstead Turnpike. The VOC-impacted groundwater extends to a depth of approximately 750 feet, but it is not continuous throughout this area and is not present at all depths. Other groundwater plumes, not associated with the former NWIRP or Northrop Grumman facilities, are known or believed to be present in the area that include the Hooker Ruco Superfund Site and some local dry cleaners and gasoline stations which are likely contributing to the footprint of the OU2 plume (Figure 1-3). Furthermore, there is evidence that additional plumes are present to the north and west of the facilities that may be impacting groundwater on or south of the former Northrop Grumman and NWIRP facilities (Figure 1-3). Figure 2-1 depicts the conceptual site model that identifies the following primary NWIRP and Northrop Grumman VOC groundwater plumes.

Shallow Plumes - VOCs are located in the groundwater between approximately 50 and 300 feet bgs. The VOCs include a mixture of individual organics, including TCE, tetrachloroethene (PCE), 1,1,1-trichloroethane (TCA), and 1,1-dichloroethane (DCA) and are generally found at concentrations of 0.5 to 10 micrograms per liter (µg/L) for each contaminant. There are multiple shallow plumes that result from a range of potential sources including the former NWIRP and former Northrop Grumman facilities, as well as dry cleaners, gasoline stations, and residential properties (i.e., septic systems) that in combination form a series of unique, layered, non-continuous plumes throughout the area. Higher concentrations of VOCs (greater than 10 µg/L) were found on the former NWIRP and former Northrop Grumman facilities, but these VOCs have been mostly remediated through response actions conducted at the sources (e.g., NWIRP Site 1 Air Sparge/Soil Vapor Extraction System) and/or by containment systems at the former facility boundaries (e.g., NWIRP and Northrop Grumman OU2 and the Bethpage Community Park OU3 containment systems). Plumes that have migrated beyond these boundaries represent the other plumes described below.

GM38 Area Hotspot (OU2) - VOCs were located in the groundwater between 300 to 500 feet bgs approximately 1.6 miles southeast of the former NWIRP Bethpage. Before the GM-38 treatment system

was installed in 2009, the hotspot encompassed an area of approximately 38 acres and contained a mixture of TCE, PCE, cis-1,2-dichloroethene (DCE), TCA, and DCA with concentrations ranging between 100 to 2,000 µg/L. Groundwater from this hotspot is being treated by the GM38 Area Hotspot (OU2) Treatment System and groundwater concentrations have decreased by over 80 percent.

Deep Western Plume (OU2) - VOCs are located in the groundwater between 300 to 750 feet bgs southwest of the former NWIRP Bethpage, in the western portions of the former NWIRP and Northrop Grumman facilities and the Hooker Ruco Superfund Site. The plume continues south of Hempstead Turnpike. Although this plume likely resulted from multiple sources, including the former NWIRP Bethpage and Northrop Grumman facilities, the apparent origin and depth of this plume appears to be associated with the extensive historic pumping conducted in this area. This plume is predominately TCE, with lower concentrations of other VOCs. VOC concentrations range between 50 to 8,200 µg/L. This plume is typically 100 to 200 feet thick north of Hempstead Turnpike, and thins outs to the south.

- *RE108 Area Hotspot (OU2)* - In 2011, a hotspot was identified 1.5 miles south of the former NWIRP Bethpage. It is a subset of the Deep Western Plume (OU2). The hotspot is estimated to be approximately 170 acres and is present at a depth of approximately 520 to 720 feet bgs. This hotspot is predominantly TCE, with lower concentrations of other VOCs. VOC concentrations range between 1,000 to 8,200 µg/L. A treatment system is currently being designed.

Deep Eastern Plume (OU3) - VOCs are located in the groundwater between 300 to 650 feet bgs south and hydraulically downgradient of the Bethpage Community Park. The plume continues toward Hempstead Turnpike. This plume contains a mixture of primarily TCE and DCE, with concentrations ranging between 50 µg/L to over 10,000 µg/L.

- *RW21 Area Hotspot (OU3)* – The hotspot was identified in the NYSDEC Bethpage Community Park 2013 OU3 ROD as “presently located approximately 2,500 feet upgradient of and approaching, the Bethpage Water District No. 4 well field.” It is a subset of the Deep Eastern Plume. This hotspot contains a mixture of primarily TCE and DCE, with concentrations ranging from approximately 1,000 µg/L to over 10,000 µg/L and is present at a depth of approximately 550 to 750 feet bgs. The RW21 Area Hotspot (OU3) and the Deep Eastern Plume (OU3) are deeper than the GM38 Area Hotspot (OU2) groundwater in this area, and therefore flow under the GM38 Area Hotspot (OU2).

# 3.0 GROUNDWATER PLUME STATUS

This section describes the current and historical understanding of the off-facility groundwater plumes, and provides estimated migration rates. For discussion purposes, the regional groundwater system is separated into four depth-based intervals, as follows: (1) less than 300 feet bgs; (2) 300 to 500 feet bgs; (3) 500 to 700 feet bgs; and (4) greater than 700 feet bgs. These depth intervals correspond to the predominant groundwater flow pathways and associated plume movements through the aquifer. The intervals cut through portions of the Deep Eastern and Deep Western Plumes as described in Section 2.4.

TCE is the primary VOC in the off-facility groundwater and forms the largest of the individual VOC groundwater plumes. However, there are some areas of VOC-impacted groundwater where TCE and associated byproducts are not present (e.g. benzene and methyl tert butyl ether). As a result, these plumes may not be associated with the former NWIRP or Northrop Grumman facilities and the source of these other VOCs is uncertain.

The groundwater results are obtained from the vertical profile boring (VPB) program and monitoring well data. The VPB program advances soil borings at strategic locations and collects groundwater samples for VOC laboratory analyses at intervals ranging from every 50 feet in the 50 to 200 feet bgs depth range to every 20 feet below 200 feet bgs depth range. This sampling provides detailed VOC results from the water table down to over 1,000 feet bgs. Based on the results from the VPB program, permanent monitoring wells are installed at each location. The monitoring well screen depths are selected based on the location of permeable flow zones, and the current or potential future presence of VOCs within those flow zones. Although more limited in vertical coverage, the monitoring wells provide reproducible data that can be tracked over time. Additional details of the VPB and monitoring well program are described in Section 5.2.

## 3.1 CURRENT CONDITIONS

The current (2016) estimates of the TCE-impacted groundwater (TCE greater than 5 µg/L) potentially associated with the former NWIRP and Northrop Grumman facilities are presented in Figures 3-1 through 3-4, for the depth intervals of 0 to 300 feet bgs, 300 to 500 feet bgs, 500 to 700 feet bgs, and greater than 700 feet bgs, respectively. The development of these isoconcentration contours is based on analytical results and groundwater flow. Public water supply extraction wells are also shown on figures where the depth of the extraction well screen (i.e., groundwater intake point) coincides with the appropriate depth interval. For example, Bethpage Water District (BWD) well BWD-6-1 (BWD-3876) with a screened depth of 328 to 381 feet is shown on Figure 3-2 (300 to 500 feet bgs interval). The groundwater results discussed below represent the highest concentration detected at each location. For most of the locations and depth intervals, the vertical extent of the contamination is found in only a portion of the depth interval (e.g., the plume may only be 20 to 50 feet thick in a depth interval of 200 feet). More detailed location- and depth-data is provided in Appendix A.

The following sections describe the current (2016) distribution of VOCs, primarily TCE, at four depth intervals, each of which encompasses multiple plumes and/or hotspots:

- Shallow VOC-Impacted Groundwater, 0 to 300 feet bgs
- Intermediate-Depth VOC-Impacted Groundwater, 300 to 500 feet bgs
- Upper Deep VOC-Impacted Groundwater, 500 to 700 feet bgs
- Lower Deep VOC-Impacted Groundwater, greater than 700 feet bgs.

**Shallow VOC-Impacted Groundwater, 0 to 300 Feet bgs (see Figure 3-1)**: The western edge of the shallow VOC-impacted groundwater is shown in Figure 3-1 as originating near the western edge of the former Northrop Grumman facility and extends 3.3 miles to the south-southeast. The eastern edge of the shallow VOC-impacted groundwater originates near the Bethpage Community Park and extends 3.6 miles to the southeast and south-southeast. Although illustrated as one overall area of contamination, the shallow plumes are actually a series of individual plumes that are separated horizontally and vertically from each other due to the release point, migration, and vertical gradients. In addition, these plumes commonly vary by chemical characteristics of the original source (e.g., TCE versus PCE) and aquifer conditions (other organics that may result in the formation of degradation products such as DCE). In addition, because of the operation of groundwater extractions and treatment systems and the discharge of treated water back into the shallow aquifer resulting in the flushing of the aquifer, there are likely large portions of the aquifer that are compliant with Federal and State Drinking Water Standards throughout this shallow aquifer that are not depicted on this figure. The interpreted, irregular shape of the southern portion of the VOC plume likely results from the combined releases from multiple locations over time, variable migration rates, and attenuation within the aquifer.

In much of the shallow zone in the southern-most portion of the investigation area near Southern State Parkway, several VPBs demonstrated that TCE was either not present, or were present at concentrations less than Federal or State Drinking Water Standards (i.e., Maximum Contaminant Levels [MCLs]).

**Intermediate-Depth VOC-Impacted Groundwater, 300 to 500 Feet bgs (see Figure 3-2):** The spatial distribution for TCE in this depth interval is less extensive than for the shallower depth interval described above. While the western and eastern TCE boundaries are similar to those of the shallower zone, the southern extent of the TCE detections is more limited.

The areal extent of TCE contours greater than 100 µg/L and 1,000 µg/L are more extensive than those identified in the shallower depth interval. An area of elevated TCE concentrations in groundwater is present along the western boundary in this depth interval. Also, along the western boundary, the extension of TCE impacts in groundwater beyond the inferred western boundary of the OU2 plume (based on groundwater flow direction) suggests that other (non-Northrop Grumman or non-NWIRP) sources may be impacting the plume. The source of this other contamination is uncertain. Additional groundwater investigations are

being conducted to better define the source of this contamination to the west of the former Northrop Grumman facility.

The residual impacted groundwater associated with the GM38 Area Hotspot (OU2) (greater than 100 µg/L contour) remains vertically separate from the lower Deep Eastern Plume (OU3). Since 2009, the TCE concentrations in the GM38 Area Hotspot (OU2) have been significantly reduced through the operation of the associated extraction, treatment, and discharge system.

**Upper Deep VOC-Impacted Groundwater, 500 to 700 Feet bgs (see Figure 3-3):** The spatial distribution for TCE in this depth interval is less extensive than for the shallower zones described above and the difference between the Deep Western (OU2) and the Deep Eastern (OU3) Plumes are more defined. This depth interval is estimated to contain the majority of contaminant mass in both the Deep Western (OU2) and the Deep Eastern (OU3) Plumes.

The Deep Western (OU2) Plume extends further south than the two shallower zones described above, to a distance of approximately 1 mile south of Hempstead Turnpike. The Deep Eastern Plume (OU3) is depicted in Figure 3-3 as ending north of Hempstead Turnpike; however, there is an absence of data south of the plume to confirm its southern extent. While not graphically depicted in this report, because it does not appear to be associated with the former NWIRP or Northrop Grumman facilities, there is evidence of a relatively pure Freon-113 plume (VPB-165) along the western edge of the Deep Western Plume (OU2) that appears to be influenced by additional plumes further north and west of the former NWIRP and Northrop Grumman facilities (Appendix A). In particular, the plumes associated with the former NWIRP and Northrop Grumman facilities have TCE as the primary component of the total VOCs present, whereas Freon-113 is only a minor component.

The RE108 Area Hotspot (OU2) (a subset of the Deep Western Plume [OU2]) and the RW21 Area Hotspot (OU3) (a subset of the Deep Eastern Plume [OU3]) are also located in this depth interval. The TCE concentrations in the RE108 Area Hotspot (OU2) range from 1,000 to 8,200 µg/L and the TCE concentrations in the RW21 Area Hotspot (OU3) range from 1,000 to 13,200 µg/L.

**Lower Deep VOC-Impacted Groundwater, Greater than 700 Feet bgs (see Figure 3-4):** The spatial distribution for TCE in this depth interval generally follows the footprint of the 500 to 700 feet bgs depth interval; however, the TCE concentrations in this zone are present at a maximum concentration of 1,800 µg/L, which is substantially lower in concentration than the 500 to 700 feet bgs depth interval. For the Deep Western Plume (OU2), the presence of TCE at concentrations greater than 1,000 µg/L are believed to have been influenced by the operation of a nearby public water supply well (Bethpage Water District Well 6-2, screened from 700 to 770 feet bgs) pulling groundwater from the 500 to 700 feet bgs depth interval downward. For the Deep Eastern Plume (OU3), there were a few TCE MCL exceedances noted below 700 feet bgs.

## 3.2 MAPPING OF VOC PLUMES OVER TIME

Since 2001, the understanding of the Northrop Grumman and NWIRP OU2 and Bethpage Community Park OU3 plumes has developed significantly based on data collected from VPBs and new groundwater monitoring wells installed during this time period. While migration of TCE-impacted groundwater to the south would be expected during this time period, pumping and natural attenuation processes that decrease concentrations would also occur.

Figures 3-5 through 3-8 provide temporal mapping of TCE in groundwater for the four depth intervals of: less than 300 feet bgs (Figure 3-5); 300 to 500 feet bgs (Figure 3-6); 500 to 700 feet bgs (Figure 3-7); and greater than 700 feet bgs (Figure 3-8). Each of the figures identifies the TCE plumes for the years 2001, 2006, 2011 and 2016. The TCE contours were developed using available groundwater data for those years. Additional details for each of the TCE maps are presented in Appendix B and data for the other VOCs are presented in Appendix A. Major changes to the TCE plumes for the four depth intervals from 2001 through 2016 are discussed below.

**Shallow VOC-Impacted Groundwater, 0 to 300 Feet bgs (see Figure 3-5)**: The shallow TCE-impacted plume exhibits some relatively minor variations in the boundaries depicted in Figure 3-5 that result primarily from inclusion of new data and refinement of the edges over time. In 2001, the shallow TCE-impacted plume is depicted as extending south of Hempstead Turnpike; and there were two isolated areas of higher TCE concentrations (TCE greater than 100 or 1,000 µg/L), one near Hempstead Turnpike and one associated with the GM38 Area Hotspot (OU2).

Between 2001 and 2006, several VPBs were installed south of the Bethpage Community Park that identified TCE (and other VOCs) greater than 100 and 1,000 µg/L in that area. Between 2006 and 2016, additional investigations south of the Bethpage Community Park were used to refine the boundaries of the greater than 100 and 1,000 µg/L contours in that area.

The GM38 Area Hotspot (OU2) (TCE greater 1,000 µg/L) is shown on both the 2001 and 2006 maps. As a result of the startup of the GM38 Area Hotspot (OU2) Treatment System in 2009, the groundwater concentrations in this area are less than 100 µg/L in this depth interval in 2011 and 2016.

The southernmost plume boundaries depicted for 2001 and 2006 are nearly equivalent because only limited new data was available (one new well was added in that area during this time). Between 2006 and 2011, additional VPBs were installed in the southern portion of the plume area, confirming the absence or low (less than MCL) detections of TCE. In 2016, several new VPB results further refined the southern extent of the plume boundary, indicating the presence of two distinct lobes.

**Intermediate-Depth VOC-Impacted Groundwater, 300 to 500 Feet bgs (see Figure 3-6):** With the exception of the Deep Eastern Plume, the variations in the plume boundaries depicted in Figure 3-6 result primarily from inclusion of new data that was collected over time. In 2001, the TCE groundwater plume is depicted as extending south of Hempstead Turnpike; and there were three isolated areas of higher TCE

concentrations, near Hempstead Turnpike, the GM38 Area Hotspot (OU2), and Bethpage Water District Plant 6.

Between 2001 and 2006, several VPBs were installed south of the Bethpage Community Park that identified TCE (and other VOCs) greater than 100 and 1,000 µg/L in that area. Between 2006 and 2016, the boundaries of the greater than 100 and 1,000 µg/L contours south of the Bethpage Community Park were better defined. This area is referred to as the Deep Eastern Plume (OU3).

The GM38 Area Hotspot (OU2) (greater 1,000 µg/ contour) is shown on both the 2001 and 2006 maps. As a result of the startup of the GM38 Area Hotspot (OU2) Treatment System in 2009, the corresponding 1,000 µg/L contour in that area is no longer present in the 2011 and 2016 maps. By 2016, the 100 µg/L contour remains, but the TCE and other VOC concentrations in the area continue to decrease.

Before 2006, there was only limited data to support the development of the Deep Western Plume (OU2). Between 2001 and 2006, one well in this area had a TCE concentration greater than 1,000 µg/L, but concentrations quickly decreased to less than 1,000 µg/L by December 2003. The extent of the Deep Western Plume (OU2) was then identified and refined through subsequent investigations in the area. Also, investigations along the western boundary indicate that the Deep Western Plume (OU2) may result from multiple sources, not all of them definitively associated with former NWIRP and Northrop Grumman facilities.

Between 2001 and 2006, only four monitoring wells were present in the southern portion of the plume areas. The 2006 TCE concentrations for the four wells ranged up to 1.4 µg/L and were similar to TCE concentrations in nearby VPBs up to 2 µg/L (Appendix B). Between 2006 and 2016, additional VPBs were installed in the southern portion of the plume areas, confirming the absence or low level detections of TCE (Appendix B).

**Upper Deep VOC-Impacted Groundwater, 500 to 700 Feet bgs (see Figure 3-7):** In 2001, the western portion of the TCE groundwater plume is depicted in Figure 3-7 as extending south of Hempstead Turnpike; and there was one isolated area of higher TCE concentrations, extending from near the southwestern corner of the former Northrop Grumman facility south toward Hempstead Turnpike. This plume is referred to as the Deep Western Plume (OU2). In 2006 and 2011, there was no evidence of high concentrations (greater than 1,000 µg/L) of TCE in this area. Subsequent investigations found higher concentrations of TCE and a portion of the Deep Western Plume (OU2) was identified as the RE108 Area Hotspot (OU2).

As of 2006, there was limited evidence of what would become the Deep Eastern Plume (OU3). Between 2006 and 2016, supplemental investigations in the Deep Eastern Plume (OU3) identified and then refined the RW21 Area Hotspot (OU3).

Between 2001 and 2006, two new wells were sampled in the southern portion of the Deep Western Plume (OU2). The 2006 results from the two wells reported an absence of TCE and confirmed the results of nearby VPBs (an absence of TCE) (Appendix B). Between 2006 and 2016, additional VPBs and wells were

sampled in the southern portion of the Deep Western Plume (OU2). The detection of TCE in the borings resulted in a slight widening of the plume boundaries south of Hempstead Turnpike.

**Lower Deep VOC-Impacted Groundwater, Greater than 700 Feet bgs (see Figure 3-8):** In 2001, the TCE groundwater plume in this depth interval is depicted in Figure 3-8 as a relatively small area near Hempstead Turnpike that resulted from one detection of TCE at 120 µg/L and one detection of TCE at 2 µg/L. Additional data collected through 2016, resulted in refinement of the areal extent of this initial area, and also identified the presence of more contaminated groundwater (TCE greater than 1,000 µg/L) in the area south of Bethpage Water District Plant 6. This more contaminated groundwater is referred to as the RE108 Area Hotspot (OU2).

### 3.3 VOC PLUME MIGRATION RATES

Groundwater and the associated VOC plume migration rates are estimated using hydrogeological data collected from Northrop Grumman and NWIRP wells in 2016 and values of aquifer hydraulic conductivities from recent field studies (Appendix C). Plume migration rates may vary from the groundwater flow rates due to non-uniform flow pathways, dilution, area-wide pumping by supply wells, and targeted VOC mass removal from groundwater by remedial wells.

The 2016 groundwater data included measured groundwater depths (i.e., levels) at area-wide monitoring wells. The levels were converted to elevation and plotted on regional maps to determine groundwater iso-elevation contour maps. The groundwater iso-elevation contour maps were developed for the four depth intervals: less than 300 feet bgs (Figure 3-9); 300 to 500 feet bgs (Figure 3-10); 500 to 700 feet bgs (Figure 3-11); and greater than 700 feet bgs (Figure 3-12). With this level of detail, groundwater flow velocities could be estimated for various locations in the study area and for different vertical hydrogeological zones.

The migration of VOCs is dependent on several factors. On a microscopic scale, groundwater (and groundwater contaminants) moves through open pore spaces in saturated aquifer sediments comprised of gravel, sand, silt, and clay in response to elevation and/or pressure-head differences (i.e., hydraulic gradients) between two locations. Over large areas, the “average linear velocity” provides an estimate of how long it would take groundwater (and a non-reactive chemical) to move in an aquifer. Average linear velocity is computed using hydraulic conductivity, hydraulic gradient (determined from a groundwater contour map), and effective porosity (i.e., specific yield).

Detailed hydrogeological calculations are presented in Appendix C. The evaluations are based on pumping test data collected from trials at Bethpage Water District Well 6-2 (Tetra Tech, 2014 and Resolution, 2016) and GM38 Area Hotspot Treatment System (OU2) (Tetra Tech, 2010). Hydraulic gradients are presented in Figures 3-9 through 3-12. These groundwater flow paths cover the entire study area and would incorporate effects from pumping wells active at the time of the measurements (May 2016). The month of May represents a moderate pumping period for local water districts, between the minimum pumping rates that occur in the winter months, and peak pumping rates that occur in the summer months. The results of this evaluation indicate that groundwater flow rates and directions are highly variable based on depth within

the aquifer and location relative to pumping water wells. Additional location specific migration rates are discussed in Section 4.2.

# 4.0 CURRENT AND FUTURE IMPACTS TO DRINKING WATER FACILITIES

This section discusses well fields currently impacted or that may be impacted by VOCs associated with the former Northrop Grumman and NWIRP facilities. This section also identifies those well fields with treatment systems to remove the VOCs migrating or potentially migrating from the former Northrop Grumman and NWIRP facilities.

Figure 4-1 shows the former Northrop Grumman and NWIRP facilities, the 2016 estimated extent of VOC plumes in groundwater potentially associated with the former Northrop Grumman and NWIRP facilities, and public water supply well fields near the former Northrop Grumman and NWIRP facilities. The light blue east-west line on Figure 4-1 north of the former Northrop Grumman and NWIRP facilities represents the regional Long Island groundwater divide, groundwater north of this line flows northward toward Long Island Sound and groundwater south of this line flows southward towards the Atlantic Ocean (Como, et al., 2015). As shown on Figure 4-1, the former Northrop Grumman and NWIRP facilities are south of the line so groundwater flow is to the south; therefore, only well fields south of the groundwater divide are relevant to discussions in this section.

Shown on Figure 4-1 are public water supply well fields with VOC treatment systems (red or yellow stars). In addition, the figure shows other public water supply well fields south and potentially hydraulically downgradient of the former Northrop Grumman and NWIRP VOC plumes that do not have treatment (green triangles) and are near or within the potential groundwater flow path (red dashed line). Locations represented by the green triangles are well fields that could be affected if VOC-impacted groundwater were to travel those distances from the former Northrop Grumman and NWIRP facilities, without significant attenuation, at the depth of the extraction well screen. Because of these factors, this evaluation is very conservative and it is unlikely that all of these well fields would be impacted by former Northrop Grumman and NWIRP VOC plumes. The area depicted within the red dashed lines near South Oyster Bay is widened to reflect uncertainty with groundwater flow path in that area.

## 4.1 CURRENT IMPACTS

Due to VOC impacts of the groundwater or imminent threat of VOCs affecting groundwater quality, as discussed more fully below, well-head treatment systems have been placed at certain public water supply well fields operated by Bethpage Water District (BWD), South Farmingdale Water District (SFWD), and New York American Water (NYAW) to ensure that MCL-compliant water (i.e., water that meets or exceeds Federal and State drinking water quality standards) is provided to their customers. In addition, quarterly groundwater monitoring of wells is conducted to evaluate whether or not additional upgrades would be required. These public water supply wells have been providing MCL-compliant water for over 25 years.

### 4.1.1 Bethpage Water District

Between 1990 and 1996, the Navy and Northrop Grumman funded treatment systems that were installed at the three impacted well fields operated by the Bethpage Water District Plants 4, 5, and 6 (Figure 1-2,

Bethpage Water District Well Nos. 4-1, 4-2, 5-1, 6-1, and 6-2). At Plant 4, due to increasing concentrations of VOCs associated with the Deep Eastern Plume (OU3), Bethpage Water District implemented an upgrade of the treatment system in 2010. At Plant 5, the treatment system is continuing to effectively treat the VOCs in groundwater. At Plant 6, due to increasing VOC concentrations, Bethpage Water District installed liquid-phase granular activated carbon (GAC) polishing in 2011, which the United States reimbursed. Bethpage Water District is also in the process of planning another upgrade of the treatment system for Plant 6 that the United States has committed to fund.

### 4.1.2 South Farmingdale Water District

Pursuant to an agreement with South Farmingdale Water District, in 2011, based on the detection of low-level VOCs in outpost monitoring wells, the United States funded South Farmingdale Water District's design, construction, operation, and maintenance of a VOC treatment system for two of the three wells at Plant 1 (Figure 1-2, South Farmingdale Water District Well Nos. 1-2 and 1-3). In order to provide advance warning of potential contamination at the third (deeper) well, in 2008, the Navy installed additional outpost wells to monitor the quality of the water that may be captured by the third well.

Pursuant to an agreement with South Farmingdale Water District, in 2013, based on the detection of VOCs in outpost monitoring wells, the United States funded South Farmingdale Water District's design, construction, operation, and maintenance of a VOC treatment system at Plant 3 (Figure 1-2, South Farmingdale Water District Well No. 3-1).

### 4.1.3 New York American Water (formerly AQUA New York)

As a result of increasing detections of low-level (less than MCL) TCE in wells at the New York American Water (formerly AQUA New York) supply wells located at the Seaman's Neck Road Facility, the Navy constructed VOC treatment for an interim system in 2012 and completed the permanent system in 2015 (Figure 1-2, New York American Water Well Nos. 3S and 4S).

## 4.2 POSSIBLE FUTURE IMPACTS

In the area of the former Northrop Grumman and NWIRP facilities, and from other nearby facilities that may also be contributing to the VOC-impacted plumes, groundwater regionally flows to the south and southeast. As a result, possible future impacts would be limited to those areas. The current TCE plume boundaries are presented in Figures 3-1 to 3-4. There are other plumes adjacent to and within the footprint of the OU2 Plume that have sources other than former NWIRP and Northrop Grumman facilities. Hooker Ruco (a Superfund Site) and some local dry cleaners and gasoline stations are likely contributing to the footprint of the OU2 Plumes (Figure 1-3).

The public water supplies that are currently not impacted by the former Northrop Grumman and NWIRP groundwater plumes, but are relatively closer to the downgradient edge of the plumes are South Farmingdale Water District Well 1-4, and South Farmingdale Water District Well Nos. 6-1 and 6-2 (Figure 1-2). These wells do not currently have treatment systems in place, but outpost monitoring wells were

installed to provide early indication of when treatment might be necessary for each of these well fields (Figures 3-2 to 3-4). The outpost monitoring wells are placed at depths associated with the public water supply wells and are located between the plumes and the public water supply wells such that VOCs would have to flow through outpost monitoring wells several years prior to entering the public water supply wells. The advance notice of VOCs provides early warning that an action is needed.

As the various groundwater plumes move to the south and southeast, they are undergoing dilution, and are affected by pumping, and VOC mass removal systems that serve to weaken them. In addition, portions of these plumes are being intercepted by water supply wells with treatment that would further hinder migration. Each of these actions reduces the intensity of the plumes. The result is that many of the water districts to the south may never be impacted, or if they are impacted, the effects from the plumes may not be seen for decades.

For South Farmingdale Water District Plant 6, based on site-specific hydrogeological calculations presented in Appendix C, groundwater in this area could travel from the currently known edge of the OU2 plume to South Farmingdale Water District Wells 6-1 and 6-2 (a distance of 2,800 feet) in approximately 11 years. However, plume migration in this area would be hindered by the operation of South Farmingdale Water District Plant 3 and New York American Water (both with VOC treatment), and it is unclear whether or not the plume would ever reach South Farmingdale Water District Wells 6-1 and 6-2. Because of uncertainty inherent in this type of calculation, outpost wells are in place to provide five-year advance notice so that installation of treatment at these supply wells can be initiated, if necessary.

For Massapequa Water District Wells 4 and 5, it is unclear whether or not the VOC plume would be able to reach these wells, because the migration would be hindered by the pumping of multiple water supply wells at South Farmingdale Water District Plants 3 and 6 and New York American Water – Seamans Neck Road Facility that operate between the OU2 plume edge and Massapequa Water District wells. In addition, operation of the RE108 Area Hotspot Treatment System would be expected to further limit mass flow of VOCs toward the South Farmingdale Water Districts and New York American Water District Plants, and thereby further limit mass flow toward Massapequa Water District.

The impact of South Farmingdale Water District and New York American Water groundwater pumping on limiting continued plume migration to the south toward Massapequa Water District wells is indicated by the low point in the groundwater contours shown in Figures 3-11 and 3-12 in the area of Southern State Parkway. The arc in the 35-foot groundwater elevation contour on Figure 3-11, near South Farmingdale Water District Well 3-1, indicates that groundwater is converging towards that well. The closed-loop, 25- and 30-foot groundwater elevation contours on the figures suggest that groundwater from the north and south is converging towards South Farmingdale Water District Plant 6 and New York American Water wells. Groundwater flow in this area is based on groundwater elevation data at wells BPOW 6-1 through BPOW 6-6, north of Southern State Parkway, and the 35-foot groundwater elevation contours south of Southern State Parkway on both figures. Figures 3-11 and 3-12 show ridges of higher groundwater elevations at well

BPOW 6-4 (500 to 700 feet bgs zone) and wells BPOW 6-3 and BPOW 6-6 (greater than 700 feet bgs zone). Groundwater north of these ridges will flow primarily to the north, and groundwater south of these ridges will flow to the south. These contours indicate that some portion of groundwater is being captured by the South Farmingdale Water District and New York American Water wells that are located several thousand feet north of Massapequa Water Supply Wells 4 and 5.

VOCs in the 0 to 300 feet bgs plumes are not expected to impact the South Farmingdale Water District and Massapequa Water District wells, since the VOC concentrations in the Shallow Plumes are low, and movement of VOCs from the shallow aquifer zone to deep water supply wells is inhibited by the presence of low-permeability, clay-rich layers and substantially lower vertical hydraulic conductivities.

# 5.0 COMPREHENSIVE STRATEGY FOR OFFSITE GROUNDWATER

## 5.1 OVERVIEW AND REMEDIAL ACTION OBJECTIVES

There are several RODs that address groundwater potentially impacted by VOCs beneath both former NWIRP and Northrop Grumman facilities and also address groundwater potentially impacted by VOCs that had migrated beyond both facilities into the surrounding community. In 2001, NYSDEC issued its OU2 ROD to select the groundwater remedy and set forth the public water supply protection program.

Under its CERCLA authority, Navy evaluated and adopted significant portions of the NYSDEC OU2 2001 ROD that could be implemented by the Navy. The Navy OU2 2003 ROD selected cleanup actions to address contamination at and from the NWIRP. The Navy OU2 remedial program implements a remedy for groundwater that is protective of human health and the environment, is permanent and cost-effective, and complies with Applicable and Relevant and Appropriate Requirements (ARARs). The primary goal of the remedy is to effectively mitigate significant threat to public health and the environment through the proper application of scientific and engineering principles.

The Navy 2003 ROD addresses onsite and offsite OU2 VOC-contaminated groundwater, and specifies the following remedial action objectives to protect human health and the environment:

- Eliminate, to the extent practicable, site-related contaminants from the affected public water supplies and to prevent, to the extent practicable, the future contamination of public water supplies through the implementation of the offsite groundwater remediation.
- Eliminate, to the extent practicable, exposures to contaminated groundwater.
- Eliminate, to the extent practicable, off-site migration of contaminated groundwater and, where practicable, to restore the groundwater to pre-disposal conditions.
- Eliminate, to the extent practicable, exceedances of applicable environmental quality standards related to releases of contaminants to the waters of the state.
- Eliminate, to the extent practicable, detections of site-related VOC contamination affected drinking water supplies using U.S. EPA Method 502.2 to a detection limit of 0.5 µg/l.

## 5.2 COMPREHENSIVE STRATEGY AND REMEDIAL ACTIONS

The Navy and Northrop Grumman have implemented multiple response actions as part of their groundwater cleanup programs to achieve the Remedial Action Objective (RAOs) in the off-facility groundwater. RAOs are site-specific goals based on the chemicals of concern (COCs), the impacted media, COC fate and transport, potential exposure routes and receptors. RAOs provide a clear and concise description of what the remedial action should accomplish. The remedial program to address offsite groundwater contamination includes the following:

- The OU2 ONCT System to minimize migration of VOC impacted water downgradient, thus weakening the offsite plumes.

- An active remedial program including design, implementation, and operation and maintenance (O&M) of an extraction well system near the GM38 location (operating since 2009) that further weakens the plume. The extraction wells have removed significant VOC mass from the aquifer.
- Development of Public Water Supply Contingency Plan (PWSCP) (ARCADIS, 2003) that would use the VPB and monitoring well data along with groundwater modeling to target outpost monitoring well locations and to develop trigger values.
    - Installation of outpost monitoring wells that can provide early notice of any impending impacts to public water supplies from the VOC plume.
    - A provision for wellhead treatment for public water supply systems or alternative approach pursuant to the PWSCP.
- Installation of VPBs and monitoring wells to continue identification and monitoring of the spatially and temporally evolving VOC plume and to determine the need for future outpost monitoring wells.
- Detailed reviews conducted every five years to evaluate the effectiveness of the offsite groundwater remedial program and assess whether the remedy continues to be protective of human health and the environment in accordance with CERCLA standards.
- Implementation of well head treatment at public water supply wells.
- An optimization study to evaluate the effectiveness of the groundwater remedial program.
- Evaluation of the other areas of groundwater, to determine whether another hotspot is present.

The Navy, with review and input from NYSDEC and U.S. EPA, continues to work to optimize the remedy, as required. For example, in response to the discovery of the RE108 Area Hotspot (OU2), the Navy is designing an extraction, treatment, and discharge system for VOC mass removal. This RE108 Area Hotspot (OU2) System will further weaken the plume and limit its southward migration.

### 5.2.1 Northrop Grumman Onsite Containment System

Northrop Grumman operates the OU2 ONCT system at the south and southwestern border of the former Northrop Grumman and NWIRP facilities as a component of the NYSDEC OU2 2001 ROD. The OU2 ONCT system was originally constructed as an Interim Remedial Measure consisting of four extraction wells and two treatment systems that started operation in 1998. In 1998, approximately 3,375 gpm of VOC-impacted groundwater were treated. Later a fifth well was added and the system currently treats 4,600 gpm of VOC-impacted groundwater. By containing the portion of the plume(s) that are on-site, the future VOC load to the downgradient public water supplies is reduced.

The OU2 ONCT data, as reported and evaluated by Northrop Grumman, indicate that the onsite portion of the OU2 groundwater remedy has formed an effective hydraulic barrier that controls the offsite migration of VOC-impacted groundwater to depths of approximately 600 feet bgs. The concentration of VOCs in

downgradient monitoring wells screened to a depth of approximately 500 feet bgs or less have been decreasing as would be expected based on the operation of the OU2 ONCT System. Similarly, the concentrations of VOCs in Bethpage Water District Well 6-1 (screened from 328 to 381 feet bgs) are decreasing as expected, from approximately 200 µg/L in 2001 to 32 µg/L in 2016.

### 5.2.2 GM38 Area Hotspot (OU2) Treatment System Design, Implementation, and Operation and Maintenance

In 2009, the Navy started operation of the GM38 Area Hotspot (OU2) Treatment System, which is approximately 8,500 feet south-southeast and hydraulically downgradient of NWIRP Bethpage (Figure 1-2). The system includes two recovery wells. Extracted groundwater is treated to remove VOCs and is then returned to the groundwater by discharge through Nassau County Recharge Basin #495. Samples are collected from eight monitoring wells to determine its effectiveness. From 2009 to December 2016, approximately 3.5 billion gallons of groundwater containing 10,200 pounds of VOCs were effectively extracted and treated. Quarterly and Annual Reports on the operation and maintenance of the GM38 Area Hotspot (OU2) Treatment System are submitted to NYSDEC.

### 5.2.3 Public Water Supply Contingency Plan

The PWSCP provides for installation and monitoring of outpost (or sentinel wells) (ARCADIS, 2003). These wells are proximal to water supply wells and trigger values (or action levels) were established in certain wells that would identify the need for discussions between the Navy, Northrop Grumman, and the affected water district about wellhead treatment or other alternatives. The trigger values provide an approximate five-year warning prior to a VOC detection of 0.5 µg/L in the public water supply wells. In 2015, additional preliminary trigger values were established for South Farmingdale Water District Plant 6 and Massapequa Water District (Resolution, 2015).

### 5.2.4 Installation of Vertical Profile Borings, Monitoring Wells, and Long-Term Monitoring

The Navy program of installing VPBs and associated monitoring wells is ongoing. Additionally, Northrop Grumman has installed its own VPBs and monitoring wells and provides reporting for its own monitoring well program. The Navy and Northrop Grumman report the results of their programs to NYSDEC and other parties. These investigations are also used to identify potential new hotspots, and if found, to delineate the extent of the impacts.

A Long Term Monitoring (LTM) program is ongoing to further define the configuration of the groundwater plumes and to determine effectiveness of remedial measures implemented to date. In the LTM program, there are a total of approximately 190 wells, which are sampled quarterly, semiannually, or annually by Northrop Grumman and Navy, and reported on a quarterly and annual basis.

### 5.2.5 Five-Year Review

In accordance with CERCLA requirements for sites where chemicals remain at concentrations above unrestricted levels, the Navy most recently conducted a five-year review in 2013 (Resolution, 2014). The

review evaluated the effectiveness of the groundwater remedy in protecting human health and the environment. The detailed study concluded that the response actions implemented to meet RAOs are still valid for offsite groundwater, and ensure continued protectiveness by limiting exposure potential to contaminated groundwater.

The review proposed follow-up actions for offsite groundwater as follows:

- Continue to install VPBs and wells to further delineate the extent of the plume, monitor plume migration and attenuation, and serve as sentry points for public water supply wells. Establish trigger values for the new outpost wells and update the PWSCP.
- Continue to investigate capture by the OU2 ONCT system.
- Complete the delineation of the RE108 Areas Hotspot (OU2) with concentrations greater than 1,000 µg/L of VOCs in the area of Bethpage Water District Plant 6 and pursue implementation of a mass removal system in this area.

The Navy has either implemented or is currently pursuing these recommended actions.

### 5.2.6 Well Head Treatment of Public Water Supplies

Wellhead treatment systems were installed and are operating at Bethpage Water District Plants 4, 5, and 6, South Farmingdale Water District Plants 1 and 3, and New York American Water facility at Seamans Neck Road (Figure 4-1). The NYSDEC's Water Quality Regulations that are contaminant-specific are currently being met at these water supplies, through air stripping and/or GAC treatment technologies. The water that is distributed to the community is tested at least monthly to ensure that the drinking water standards promulgated by the NYSDOH are met. The water supplied by these facilities meets all the applicable drinking water standards.

### 5.2.7 Remedy Optimization

The OU2 groundwater remedy has been assessed on two occasions to review its effectiveness since the implementation of the OU2 remedy. The first assessment was detailed in the Remedy Optimization Team Report for the Bethpage Groundwater Plume Remedy (Gavaskar, et al., 2011). For this study, the Navy convened a team of independent nationally-recognized experts to evaluate the effectiveness of the on-going remedy for the Bethpage plumes and recommend potential future steps for optimizing the remedy. In addition to the Navy, this team included third-party technical experts from H2M Group, United States Geological Survey, GSI Environmental Inc., Battelle Memorial Institute, and Virginia Polytechnic Institute and State University. The Optimization Report developed by this team recommended the following:

- Installation of VPBs and monitoring wells to evaluate containment in the deeper portion of the OU2 aquifer.
- Installation of monitoring wells/clusters midway between the leading edge of the plume and Massapequa Water District supply wells to monitor plume progress.

- Evaluation of technical/economic feasibility of plume containment at the current leading edge.
- Enhance the outpost monitoring well network to improve early detection of potential impacts to downgradient public water supply wells.
- Enhance the use of existing infrastructure, such as enhanced pumping at public water supply wells with VOC treatment in place, to increase the capture of VOC-impacted groundwater and reduce associated migration.

To optimize performance of the outpost wells, the Navy is implementing a more robust outpost well program, upgradient of each public water supply well field, and conducting connectivity testing between the well field and the outpost wells. The Navy is also conducting discussions with the water districts and appropriate regulators to evaluate the possibility of enhanced pumping which could reduce plume migration.

Based on the recommendations in the Optimization Team Report, the Navy developed the Study of Alternatives for Management of Impacted Groundwater at NWIRP Bethpage (Tetra Tech, 2012) to evaluate the technical and economic feasibility of alternatives for management of impacted groundwater downgradient of the former Northrop Grumman facility, former NWIRP facility, and other sources. The study concluded that the OU2 ROD remains protective of the public water supplies in the area (i.e., that considerable plume capture is already ongoing via the OU2 ONCT, hot spot treatment, and capture in treatment systems for potentially impacted public water supply wells). Since 2011, the Navy has carried out or is carrying out the following activities for OU2 Groundwater:

- Continued operation of the GM38 Area Hotspot (OU2) Treatment System and sampling of GM38 monitoring wells.
- Strategic installation and sampling of approximately 32 VPBs, 13 outpost wells, and 49 monitoring wells throughout the area.
- Construction and operation of the New York American Water Interim and Final Wellhead Treatment Systems. The final system is operating in compliance with the ROD and the NCDOH permit.
- Funding the South Farmingdale Water District Plant No. 1 Wellhead Treatment System. The system is operating in compliance with the NCDOH permit.
- Funding the South Farmingdale Water District Plant No. 3 Wellhead Treatment System. The system is operating in compliance with the NCDOH permit.
- Funding the Bethpage Water District Plant No. 6 Wellhead Treatment System GAC polishing unit and an agreement to fund a further upgrade of the treatment system. The current treatment system is operating in compliance with the NCDOH permit.

### 5.2.8 Evaluation of Potential Hotspots

The Navy OU2 ROD anticipated that new hotspots may be identified in the future. The potential presence of the RE108 Area Hotspot was initially identified in 2011 based on sustained detections of TCE in Bethpage Water District Well 6-2. The concentration of TCE in Bethpage Water District Well 6-2, (screened from 700 to 770 feet bgs), increased from less than 50 µg/L prior to 2006; to approximately 400 µg/L in 2007 to 2009; to 800 µg/L in 2010; and approximately 1,000 to 1,200 µg/L in 2011 to 2013, respectively. Under sustained pumping, the TCE concentration has remained greater than 1,000 µg/L since 2013. In 2016, the TCE concentration in this well was 1,280 µg/L. In 2011, in response to the higher concentrations of TCE in Well 6-2, liquid phase GAC was added to the treatment system to ensure effective treatment of the groundwater prior to distribution and reduce the migration of VOC impacted groundwater. Pursuant to an agreement, the United States has committed to fund an additional upgrade to the treatment system.

The RE108 Area Hotspot (OU2) is defined by the 1,000 µg/L contour, as shown on Figures 3-3 and 3-4. A VOC mass removal treatment system for this groundwater is being designed.

## 5.3 BETHPAGE COMMUNITY PARK OU3 ROD

The NYSDEC Bethpage Community Park 2013 OU3 ROD selected as the remedy the operation of an onsite containment system (OU3) and a system to capture and treat the RW21 Area Hotspot (OU3) groundwater to the maximum extent practicable (Figure 3-3). The Northrop Grumman's operation of the Bethpage Community Park OU3 onsite containment system is a continuation of an IRM system that started operation in 2009. The extraction wells are located along the southern border of the Bethpage Community Park (Figure 1-2). The OU3 onsite containment system captures VOC impacted groundwater to a depth of approximately 145 feet bgs (ARCADIS, 2016)

The RW21 Area Hotspot represents the core of the Deep Eastern Plume (OU3). Northrop Grumman is in the process of designing and constructing the RW21 Area Hotspot (OU3) Treatment System.

## 5.4 OTHER STRATEGIES CONSIDERED

Several parties have suggested that full plume containment could be implemented as a potential remedy to prevent future impacts to public water supplies south of the former Northrop Grumman and NWIRP facilities. This potential response action was evaluated by NYSDEC in a 2016 Remedial Options Report (HDR [Henningson, Durham, and Richardson Architecture and Engineering P.C.], 2016). As identified in comments on the report, the Navy, Northrop Grumman, and other parties reviewed this report and did not agree with its conclusions. The Navy continues to believe that hydraulic containment of the plume is not practicable because the plumes have evolved into a large, deep, fragmented, and complex collection of groundwater impacts, which continue to evolve. Hydraulic containment is infeasible, would waste enormous amounts of drinkable water, would be cost prohibitive, and could severely damage Long Island's sole-source aquifer. Also, dispersion, pumping, and VOC mass removal by containment and supply wells

continue to weaken the plumes and it is therefore unclear whether or not many of the downgradient supply wells will be impacted by the plumes in the future.

Strategies for clean-up of the plumes have been carefully chosen based upon input from a group of highly qualified engineers and scientists, including personnel from U.S. EPA, U.S. Army Corps of Engineers (USACE), NYSDEC, NYSDOH, U.S. Geological Survey (USGS), and NCDOH, as well as technical representatives from affected and potentially effected water districts. In 2012, the Navy (with concurrence from NYSDEC, U.S. EPA, USACE, and USGS) completed an analysis of remediation technologies, including an evaluation of full plume containment. Full containment was found to be technically and practicably infeasible due to the highly porous nature of Nassau County's geology and the tremendous amount of groundwater pumping that occurs in the region. A full containment approach could create significant negative effects including saltwater intrusion, adverse impacts to sensitive environmental receptors, reduction of groundwater in the aquifer for drinking water consumption, and may lead to condemnation of many family residences or commercial facilities to install wells, pipelines, treatment systems, and treated groundwater disposal locations (wells or ponds) without improving human health protection.

# 6.0 SUMMARY

This 2017 Annual Report for offsite groundwater from the former Northrop Grumman and NWIRP Bethpage, New York was prepared in response to Title VII, Subtitle E, Section 7502 of the 2016 WIIN Act, which requires the Secretary of the Navy to submit this initial report and annual reports to the United States Congress. In accordance with requirements of the 2016 WIIN Act, this report provides the following:

- A description of the status of the groundwater contaminants that are leaving the site and migrating to a location within a 10-mile radius of the site, including:
  - detailed mapping of the movement of the plume over time, and
  - projected migration rates of the plume;
- An analysis of the current and future impact of the movement of the plume on drinking water facilities; and
- A comprehensive strategy to prevent the groundwater contaminants from the site from contaminating drinking water wells that, as of the date of the submission of the report, have not been affected by the migration of the plume.

The contaminants are VOCs identified in the RODs issued by the Navy or NYSDEC that have migrated from the former NWIRP and Northrop Grumman facilities southward. The VOC releases from these facilities form a 3,000-acre plus area of VOC-impacted groundwater that extends south of Hempstead Turnpike. The groundwater impacts extend to a depth of approximately 750 feet, but are not continuous throughout this area and are not present at all depths. There are other nearby known or suspected sources that have contributed to regional groundwater impacts including Hooker Ruco Superfund Site, and various current and former dry cleaners and gasoline stations in the area. Plume migration rates may vary from the groundwater flow rates due to non-uniform flow pathways, chemical dispersion, area-wide pumping by supply wells, and targeted VOC mass removal from groundwater by remedial wells.

VOCs from the former NWIRP and Northrop Grumman facilities have impacted groundwater quality at public water supply well fields operated by Bethpage Water District and New York American Water and are anticipated to impact public water supply well fields operated by South Farmingdale Water District in the near future. Wellhead treatment systems to remove VOCs to comply with Federal and State MCLs have been installed at impacted or soon to be impacted well fields. Outpost monitoring wells, quarterly groundwater sampling, monthly public water supply testing and an ongoing and extensive VPB groundwater sampling program are currently used to continuously monitor and alert nearby water districts and the Navy of the detection of site-related VOCs.

Northrop Grumman reports that the OU2 ONCT System captures known impacted groundwater associated with the former NWIRP and Northrop Grumman facilities and that the Bethpage Community Park OU3 containment system captures impacted groundwater from the former Northrop Grumman facility. For VOC-

impacted groundwater that has migrated past the containment systems, the following actions are being taken:

- The Navy is operating the GM38 Area Hotspot (OU2) Treatment System.
- The Navy is designing Phase I of the RE108 Area Hotspot Treatment System to be located north of Hempstead Turnpike and is planning Phase II, both of which will address areas with elevated VOC-impacted groundwater.
- Northrop Grumman is designing and constructing the RW21 Area Hotspot (OU3) Treatment System.
- Exposure to VOC-impacted groundwater is limited by NCDOH regulations that require monitoring and treatment of the public water supplies, and the public is not exposed to VOC-impacted groundwater due to its depth and wellhead treatment implemented at Bethpage Water District Plants 4, 5, and 6, South Farmingdale Water District Plants 1 and 3, and at New York American Water on Seaman's Neck Road.
- A groundwater monitoring/detection program and additional VPB/well installations are being conducted to continue assessing groundwater quality and identifying any additional actions that may be required.

The Navy continues to implement the remedy selected in its 2003 OU2 ROD for this complex site to protect human health and the environment. The Navy will continue working closely with NYSDEC, NYSDOH, local water districts, and other stakeholders, to coordinate ongoing and future remedial actions. Through implementation of this comprehensive remedial strategy, the drinking water in the area complies with all Federal and State drinking water standards, and is therefore safe to drink.

Dear Mr. Scharf:

On behalf of Northrop Grumman Systems Corporation (NGC), ARCADIS is providing the NYSDEC with the validated results of groundwater monitoring performed in accordance with the approved groundwater monitoring plan (ARCADIS Geraghty & Miller, 2001; ARCADIS G&M, Inc. 2004; 2006) for the First Quarter 2006 for Operable Unit 2. Tables 1 and 2 provide the complete results of monitoring for volatile organic compounds (VOCs) and cadmium and chromium (Cd/Cr), respectively, for this period.

Please contact us if you have any questions or comments.

Sincerely,

ARCADIS G&M, Inc.

David E. Stern

Dear Mr. Scharf:

On behalf of Northrop Grumman Systems Corporation (NGC), ARCADIS is providing the NYSDEC with the validated results of groundwater monitoring performed in accordance with the approved groundwater monitoring plan (ARCADIS Geraghty & Miller, Inc. 2001; ARCADIS G&M, Inc. 2004; 2006) for the Third Quarter 2006 for Operable Unit 2. Table 1 provide the complete results of monitoring for volatile organic compounds (VOCs) for this period. Figure 1 shows the site plan with well locations.

Please contact us if you have any questions or comments.

Sincerely,

ARCADIS G&M, Inc.

David E. Stern

Dear Mr. Scharf:

On behalf of Northrop Grumman Systems Corporation (Northrop Grumman), ARCADIS is providing the NYSDEC with the validated results of Operable Unit 2 (OU2) groundwater monitoring, performed in accordance with the approved groundwater monitoring plan (ARCADIS G&M, Inc. 2006) and the Public Water Supply Contingency Plan (PWSCP) (ARCADIS G&M, Inc. 2003) for the Third Quarter of 2010. Table 1 provides OU2 remedial system performance operational data and water balance. Tables 2, 3 and 4 provide the validated analytical results of monitoring for this period. Figure 1 shows the site plan with well locations.

Please contact us if you have any questions or comments.

Sincerely,

ARCADIS of New York, Inc.

David E. Stern

Note: Outpost wells OW2-1 and OW2-2 were not sampled by Northrop Grumman this round, due to ongoing Navy activities related to detection of non-site related VOCs (benzene and methyl tertiary butyl ether) detected in these wells.

(1) Site-related VOCs were established in the Public Water Supply Contingency Plan (PWSCP) (ARCADIS G&M, Inc. 2003).

(2) TVOC Trigger Values were established in the PWSCP (ARCADIS G&M, Inc. 2003).

(3) The TVOC Trigger Value for Cluster 1 was initially exceeded on April 23, 2004; confirmatory sampling and reporting was conducted as per the 2003). PWSCP (ARCADIS G&M, Inc.)

ENVIRONMENT

Subject:
Results of Third Quarter 2011 Groundwater Monitoring,
Operable Unit 2, Northrop Grumman Systems Corporation and Naval Weapons Industrial Reserve Plant (NWIRP) Sites, Bethpage, New York.
(NYSDEC Site #s 1-30-003A and B)

Date:
November 21, 2011

Dear Mr. Scharf:

On behalf of Northrop Grumman Systems Corporation (Northrop Grumman), ARCADIS is providing the NYSDEC with the validated results of Operable Unit 2 (OU2) groundwater monitoring, performed in accordance with the approved groundwater monitoring plan (ARCADIS G&M, Inc. 2006) and the Public Water Supply Contingency Plan (PWSCP) (ARCADIS G&M, Inc. 2003). Table 1 provides OU2 remedial system performance operational data and water balance. Tables 2 and 3 provide the validated analytical results of monitoring for this period. Figure 1 shows the site plan with well locations.

Please contact us if you have any questions or comments.

Sincerely,

ARCADIS of New York, Inc.

Notes:

(1) Site-related VOCs were established in the Public Water Supply Contingency Plan (PWSCP) (ARCADIS G&M, Inc. 2003). Results adjusted to two signficant figures.

(2) TVOC Trigger Values were established in the PWSCP (ARCADIS G&M, Inc. 2003).

(3) The TVOC Trigger Value for Cluster 1 was initially exceeded on April 23, 2004; confirmatory sampling and reporting was conducted as per the PWSCP (ARCADIS G&M, Inc. 2003).

(4) Benzene, which is not a site-related VOC, was detected in Outpost Well OW 2-1 at 0.21 ug/L.

**Notes:**

[1] Standards, Criteria, and Guidance (SCG) values based on documents referenced in the Groundwater Feasibility Study Report (ARCADIS Geraghty & Miller, Inc. 2000) that are based on the NYSDEC TOGs (NYSDEC 1998); most stringent value listed.

**Bold value indicates a detection**

Results rounded to two significant figures.

Constituent exceeds SCG value

NYSDEC New York State Department of Environmental Conservation
TOGs Technical and Operational Guidance Series
ug/L Micrograms per liter
VOCs Volatile Organic Compounds
J Value is estimated
D Value is from secondary dilution

Notes:

[1] Standards Critieria and Guidance (SCGs) values based on the Groundwater Feasibility Study Report (ARCADIS Geraherty & Miller, Inc. 2000) are based on the NYSDEC TOGs (NYSDEC 1998); most stringent values listed.

[2] Site-related VOCs were established for the wells identified above in the Public Water Supply Contingency Plan (PWSCP) (ARCADIS G&M, Inc. 2003).

[3] The TVOC Trigger Value for Cluster 1 was initially exceeded on April 23, 2004; confirmatory sampling and reporting was conducted as per the PWSCP (ARCADIS G&M, Inc. 2003).

[4] TVOC Trigger Values were established for Wells BPOW1-1, BPOW1-2, BPOW1-3, BPOW3-1, BPOW3-2, BPOW4-1, and BPOW4-2 in the PWSCP (ARCADIS G&M, Inc. 2003).

[5] Wells BPOW1-4, BPOW1-5, BPOW1-6, BPOW3-3, and BPOW3-4 screen intervals were selected by the Navy based on data obtained from vertical profile borings VP-127 (BPOW-1 cluster) and VP-128 (BPOW-3 cluster)..

Results rounded to two significant figures.
