

2019 Annual Report

For

Groundwater Impacts

At

Naval Weapons Industrial Reserve Plant Bethpage, New York

JUNE 2019

The estimated cost of this report or study for the Department of Defense is approximately \$50,000 for the 2019 Fiscal Year. This includes \$49,000 in expenses and \$1,410 in DoD labor.

1.0 INTRODUCTION

This 2019 Annual Report is the third document since 2017 that addresses volatile organic compounds (VOCs) in groundwater downgradient of the former Navy-owned, Northrop Grumman-operated Naval Weapons Industrial Reserve Plant (NWIRP) Bethpage and the separate former Northrop Grumman-owned and Northrop Grumman-operated industrial facility adjacent to the former NWIRP Bethpage (Figures 1-1 and 1-2).

In 2017 and 2018, the Navy submitted its first and second reports, respectively, in response to Title IV, Section 5009 of the Water Infrastructure Improvements for the Nation Act of 2016 (2016 WIIN Act), which required the Secretary of the Navy to submit the initial Annual Report by June 14, 2017 and annual reports thereafter through 2021, to the United States Congress.

The requirements of the 2016 WIIN Act are as follows:

- “(1) a description of the status of the groundwater contaminants that are leaving the site [former NWIRP Bethpage and two former Northrop Grumman facilities] and migrating to a location within a 10-mile radius of the site, including -
 - (A) detailed mapping of the movement of the plume over time; and
 - (B) projected migration rates of the plume;
- (2) an analysis of the current and future impact of the movement of the plume on drinking water facilities; and
- (3) a comprehensive strategy to prevent the groundwater contaminants from the site from contaminating drinking water wells that, as of the date of the submission of the report, have not been affected by the migration of the plume.”

This 2019 Annual Report presents an updated evaluation of groundwater quality and migration. This report updates the information in the 2018 Annual Report about the status and strategy for what is known as the Operable Unit (OU) 2 Plume, which consists of impacted groundwater downgradient of the former NWIRP Bethpage and one of the two former Northrop Grumman facilities. The groundwater contaminants associated with the former NWIRP Bethpage and Northrop Grumman facilities are identified in the New York State Department of Environmental Conservation (NYSDEC) 2001 Record of Decision (ROD) for OU2 Groundwater – Northrop Grumman and Naval Weapons Industrial Reserve Plant Sites (Site Numbers 1-30-003A & B) and the Navy 2003 ROD for NWIRP Bethpage, New York OU2 – Groundwater (NYS Registry 1-30-003B). These documents list chlorinated VOCs in groundwater, primarily trichloroethene (TCE), that have migrated south of the former NWIRP Bethpage and Northrop Grumman facilities (NYSDEC, 2001 and Navy, 2003).

The Navy is currently conducting on-property investigations to determine whether some other chemicals such as 1,4-dioxane, per- and polyfluoroalkyl substances (PFAS), and radiological substances potentially were released at the former NWIRP facility and impacted groundwater quality. This evaluation is termed a Preliminary Assessment/Site Inspection (PA/SI) and is the first investigative step in the Comprehensive

Environmental Response, Compensation, and Liability Act (CERCLA) site evaluation sequence when contamination is possible. In addition to records review and personnel interviews, a total of five separate groundwater sampling events are to be completed as a component of a PA/SI. As of the date of this report, four sampling events have been conducted with validated results available for three events. A discussion of interim results of groundwater sampling is provided in Section 2.5.

There are other plumes adjacent to and within the footprint of the OU2 Plume that have sources other than NWIRP Bethpage and Northrop Grumman facilities. Hooker Ruco (a vinyl chloride, tetrachloroethene [PCE], and TCE plume Superfund Site) and some local dry cleaners and gasoline stations are likely contributing to the footprint of the OU2 Plume (Figure 1-3). In addition, NYSDEC issued the Bethpage Park – Former Grumman Settling Ponds and Adjacent Areas (Bethpage Community Park) 2013 OU3 ROD, Nassau County Site No. 1-30-003C to address VOCs (in particular TCE and its breakdown products) from another adjacent former Northrop Grumman property (NYSDEC, 2013). Investigations have also identified other chemicals in the OU2 Plume, including cadmium, chromium, and polychlorinated biphenyls in on-facility groundwater wells; however, there is no evidence that these other chemicals have migrated to off-facility groundwater; and therefore, these other chemicals are not discussed in this report.

The NYSDEC OU2 2001 ROD, Navy OU2 2003 ROD, and NYSDEC Bethpage Community Park OU3 2013 ROD provided strategies and identified response actions to mitigate offsite groundwater impacts to possible receptors, and to protect human health and the environment from actual or threatened releases of hazardous substances. These response actions include:

- Installation and continued operation of on-site containment systems consisting of groundwater extraction wells and treatment plants to capture and treat VOCs before they migrate off facility from the former NWIRP Bethpage and/or Northrop Grumman facilities (OU2 and OU3).
- Offsite groundwater capture and treatment of hotspots at the GM38 Area Hotspot (OU2) (in operation), the RW21 Area Hotspot (OU3) (under construction), and the RE108 Area Hotspot (OU2) (in design), with the objective of reducing contaminant mass in the plume and limiting its downgradient migration. In the OU2 ROD, a hotspot is defined as an area of groundwater with VOC concentrations greater than 1,000 micrograms per liter ($\mu\text{g/L}$).
- Continued monitoring and tracing of the plumes through the installation of vertical profile borings and monitoring wells, and the use of current and potential future upgradient outpost wells to protect public water supplies by supplying at least five-year warning of potential impact.
- Installation of wellhead treatment for impacted and prospectively-impacted public water supply wells.

The Navy and Northrop Grumman continue to work closely with NYSDEC in implementing the ROD remedies. Northrop Grumman and the Navy continue planning additional groundwater hotspot area extraction and treatment systems that will further reduce the off-facility plumes and limit their migration towards downgradient public water supply wells. As a result of these measures, the remedy for the off-facility groundwater is protective of human health and the environment.

The Navy holds Restoration Advisory Board meetings twice per year in Bethpage to inform the community of the progress of actions being taken by the Navy to clean up soil and groundwater contamination at and emanating from the former NWIRP Bethpage facility. The public as well as representatives of NYSDEC, New York State Department of Health (NYSDOH), Nassau County Department of Health (NCDOH), United States Environmental Protection Agency (U.S. EPA), Town of Oyster Bay, and the local water districts are invited to attend. Actions being conducted by the Navy to address groundwater contamination, including investigations, monitoring, and treatment are discussed at these meetings. The Navy, Northrop Grumman, NYSDEC, NYSDOH, U.S. EPA, and local water districts also participate in separate working meetings to facilitate progress of the OU2 and OU3 cleanups.

The Navy maintains a public repository, which includes supporting technical documents and correspondence related to NWIRP Bethpage, at the following location:

Bethpage Public Library
47 Powell Avenue
Bethpage, New York 11714
(516) 931-3907

A public web site with the Administrative Record can be accessed at the following web page:

<http://go.usa.gov/DyXF>

1.1 BACKGROUND

The Navy Environmental Restoration Program (ERP) is implemented pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act, 42 U.S.C. Secs. 9601-9675, and Defense Environmental Restoration Program (DERP), 10 U.S.C. Secs 2701 – 2711, to address Navy and Marine Corps facilities that were contaminated with hazardous substances or pollutants or contaminants.

1.2 REPORT ORGANIZATION

This report is organized as shown in the Table of Contents. Acronyms and abbreviations are presented after the Table of Contents. Graphs, figures, and appendices are provided at the end of the document.

This page intentionally left blank

2.0 SITE BACKGROUND

This section provides a summary of background information for the former NWIRP Bethpage and Northrop Grumman facilities, the surrounding area, and the OU2 and OU3 groundwater plumes.

2.1 NWIRP BETHPAGE FACILITY INFORMATION

The former NWIRP Bethpage is located in Nassau County on Long Island, New York; approximately 30 miles east of New York City (Figure 1-1). The facility that would later become NWIRP Bethpage was part of the facility owned and operated by Grumman for the research prototyping, testing, design engineering, fabrication, and primary assembly of military aircraft during World War II. At their peak, Grumman's operations at the former NWIRP Bethpage included four plants used for assembly and prototype testing, a group of quality control laboratories, two warehouse complexes (north and south), a salvage storage area, water recharge basins, an Industrial Wastewater Treatment Facility, and several smaller support buildings (Figure 1-2). The Navy acquired the property that became the NWIRP Bethpage in 1947.

NWIRP Bethpage was a government-owned facility operated by Northrop Grumman until 1996. As a result of Northrop Grumman's decision to terminate operations at NWIRP Bethpage, the U.S. Congress passed special legislation under Section 2852 of the National Defense Authorization Act of 1998 (P.L.105-85, 111 Stat. 1629), permitting conveyance of the Navy-owned real property at NWIRP Bethpage to Nassau County, New York for economic redevelopment. NWIRP Bethpage originally included a main parcel of approximately 105 acres and a separate parcel of approximately 4.5 acres located to the north of the main parcel.

In 2002, the Navy transferred the 4.5-acre parcel to Nassau County. On February 26, 2008, the Navy transferred 96 acres of the 105-acre main parcel to Nassau County and is leasing the remaining 9 acres to Nassau County. Two Navy Environmental Restoration sites located on the main parcel that were transferred, Site 2 – Recharge Basins and Site 3- Salvage Storage Area, require land use controls (LUCs) and Five-Year Reviews as a part of the selected remedy. These LUCs are in place and reviews are being conducted, as required. The 9-acre parcel the Navy retains for environmental investigation and remediation includes Navy Environmental Restoration Site 1 – the Former Drum Marshalling Area and Site 4 – Former Underground Storage Tank area. Upon successful remediation of the 9-acre parcel, it will also be transferred to Nassau County. The transfer and lease documents provide LUCs and notifications for the long-term management of the property.

From 1998 to 2011, activities occurring at the former 105-acre NWIRP Bethpage included facility maintenance (security and mowing), storage of Nassau County impounded vehicles, and environmental investigations and/or remediation of soil, groundwater, and soil vapor.

In 2011, Steel-Los III, L.P. bought 84 acres of the 96-acre property that the Navy had transferred to Nassau County and has been renovating the facility to attract new tenants. Nassau County has retained the remaining 12 acres for economic development. The Navy-owned 9-acre parcel being leased to Nassau

County was subleased to Steel-Los III in 2011. Steel-Los III currently utilizes the owned and leased properties for light industrial and commercial activities, miscellaneous outdoor storage, and as a movie production set. Steel-Los III maintains security for the facility. Since 2011, the Navy has continued environmental investigations and response activities on the 9-acre parcel.

Until the 1990s, Northrop Grumman owned approximately 500 acres of property that was adjacent to and surrounded much of the former NWIRP Bethpage (Figure 1-2). Since that time, Northrop Grumman has sold most of the 500 acres. Until 1962, Northrop Grumman also owned an additional 18-acre parcel of land described as the Former Grumman Settling Ponds and Adjacent Areas in NYSDEC's OU3 ROD. Northrop Grumman transferred this parcel to the Town of Oyster Bay in 1962 for construction of the Bethpage Community Park.

2.1.1 Surface Features

The former NWIRP Bethpage and Northrop Grumman facilities are located on a relatively flat, glacial outwash plain. The facilities and nearby vicinity are highly urbanized. Because of this, most of the natural physical features have been reshaped or destroyed. The topography at the former NWIRP Bethpage is relatively flat with a gentle slope toward the south. Elevations range from greater than 140 feet above mean sea level (msl) in the north to less than 110 feet above msl at the southwest corner. The dominant features at the NWIRP Bethpage facility are Plant 3 (the former manufacturing facility), North Warehouses, South Warehouses, and three groundwater recharge basins located at Site 2. The recharge basins are each approximately 1.5 to 2.5 acres in area and about 30 to 40 feet deep. Similar features were present at the former Northrop Grumman facility, including Plants 1 and 2, which are former manufacturing facilities and recharge basins along the southern and southwestern borders of the former Northrop Grumman facility. An airstrip was also present at the former Northrop Grumman facility.

2.1.2 Surrounding Land Use

Currently, the land surrounding the former NWIRP Bethpage is primarily a mixture of commercial and residential development. The residential development surrounding much of the former NWIRP Bethpage and Northrop Grumman facilities is located in the Hamlets of Bethpage and Plainedge, in the Town of Oyster Bay, and the Hamlets of Levittown and Hicksville, in the Town of Hempstead.

2.2 GEOLOGY

The former NWIRP Bethpage and Northrop Grumman facilities are underlain by approximately 1,100 feet of unconsolidated sediments that overlie crystalline bedrock (Isbister, 1966). The unconsolidated sediments consist of four distinct geologic units: Upper Glacial Formation; Magothy Formation; Raritan Clay; and Lloyd Sand Formations (McClymonds and Franke, 1972). The Upper Glacial Formation (glacial deposits) forms the surface deposits across the entire NWIRP Bethpage. This formation consists primarily of coarse sands and gravels and is approximately 30 to 45 feet thick. Variations in the thickness of the glacial deposits are common due to undulating contact with the underlying Magothy Formation. The Upper Magothy Formation consists primarily of coarse sands to a depth of approximately 100 feet, below which

finer sands, silts, and clay predominate. Individual clay units (also called “clay lenses”) significantly increase below subsurface depths of 100 feet but are laterally discontinuous; no individual clay horizon of regional extent underlies the facilities in the Magothy. The 100 to 150-foot thick Raritan Clay Formation underlies the Magothy Formation at a depth of approximately 700 to over 1,000 feet below the ground surface (bgs). The underlying Lloyd Sand Formation is approximately 300 feet thick.

2.3 HYDROGEOLOGY

Most of Long Island is bisected by an east-west-trending regional groundwater divide (see Section 4.0). The former NWIRP Bethpage and Northrop Grumman facilities occupy an area of recharge, lying south of the divide where regional groundwater flows southward toward South Oyster Bay and the Atlantic Ocean. Groundwater is in contact with the lower portion of the Upper Glacial and Upper Magothy Formations beneath the facilities. With limited distinction between the formations, groundwater may be considered a common unconfined aquifer. The glacial deposits underlying the facilities are characterized by a high porosity (in excess of 25 percent). Most of the glacial deposits are above the groundwater table in the former NWIRP Bethpage area; however, the high permeability of the glacial deposits allows for rapid recharge of the Magothy Formation from precipitation (Isbister, 1966; McClymonds and Franke, 1972). The number and thickness of clay lenses increase with depth in the Magothy Formation; however, these clay units are laterally discontinuous and do not function as a fully-developed confining unit within the aquifer.

The Magothy aquifer is used to supply large quantities of water for domestic, agricultural, commercial, and industrial uses on Long Island. Based on water level measurements in 2010 to 2018, groundwater across NWIRP Bethpage flows to the south-southeast and the elevation ranges from approximately 70 to 73 feet above msl at the facility. The groundwater ultimately discharges to South Oyster Bay, which is at sea level, approximately seven miles south of the NWIRP Bethpage facility. Higher groundwater velocities can occur locally in gravel zones and/or in response to pumping stresses. Subtle vertical hydraulic gradients occur in a downward direction. Groundwater in the Magothy Formation is considered a sole source aquifer (NYSDEC Class GA), and is the primary source of potable water for Nassau County. Groundwater is encountered at a depth of approximately 50 feet bgs at the facilities.

From the 1960s to the 1990s, Northrop Grumman operated 16 deep production wells (seven wells on the NWIRP Bethpage facility and nine wells on the Northrop Grumman facility). Extracted water from these production wells was used primarily for non-contact single-pass cooling for plant operations. The wells were screened within the Magothy Formation and each yielded approximately 1,200 gallons per minute (gpm). The majority of the wells were located along the western edge of the facilities. Based on the location and extraction rates, the pumping action of these production wells caused groundwater on the NWIRP Bethpage facility to locally flow predominantly west and southwest toward the production wells. In addition, the pumping action of these production wells would also be expected to cause groundwater further west of them to flow east and be captured by these wells.

The production wells extracted groundwater from depths of approximately 280 to 500 feet bgs. Water was discharged into nearby surficial recharge basins. The extraction from the production wells and near surface recharge resulted in vertical gradients across the facilities that would enhance the downward migration of chemicals that may have entered the groundwater. Most of the production wells on the former NWIRP Bethpage and Northrop Grumman facilities have been decommissioned. Currently, as part of the OU2 On-Site Containment (ONCT) System operated by Northrop Grumman, two of the Northrop Grumman production wells and three additional containment (response action) wells operate with a combined flow rate of approximately 3,800 gpm or 5.5 million gallons per day (mgd) (Figure 1-2). The OU2 ONCT system removes VOCs from the groundwater and limits the migration of VOC-impacted groundwater south of these extraction wells.

2.4 GROUNDWATER CONCEPTUAL SITE MODEL

To enhance the overall understanding of potential contaminant fate and transport with the aquifer, the Navy developed a conceptual site model for these facilities. The conceptual site model describes the migration of VOC-impacted groundwater from the various sources through the groundwater aquifer to potential receptors (i.e., public water supply wells). The VOCs in groundwater that may have migrated from the former NWIRP Bethpage and Northrop Grumman facilities are identified in the NYSDEC OU2 2001 ROD, Navy OU2 2003 ROD, and the NYSDEC Bethpage Community Park OU3 2013 ROD. The RODs also address residual VOC-impacted groundwater beneath the former Northrop Grumman and NWIRP Bethpage facilities. The VOC releases from these facilities form a 3,000-plus acre horizontal area of multiple VOC-impacted groundwater plumes that extend south of Hempstead Turnpike. The VOC-impacted groundwater extends to a depth of approximately 750 feet, though this contamination is not continuous throughout this area and is not present at all depths.

There are other groundwater plumes not associated with the former NWIRP Bethpage or Northrop Grumman facilities that are known or believed to be present in the area and are likely contributing to the footprint of the OU2 Plume. These other plumes include those emanating from the Hooker Ruco Superfund Site and some local dry cleaners and gasoline stations (Figure 1-3). Furthermore, there is evidence that additional plumes are present to the north and west of the facilities that may be impacting groundwater on or south/southwest of the former Northrop Grumman and NWIRP Bethpage facilities (Figure 1-3).

Figure 2-1 depicts the conceptual site model that identifies shallow, GM38 Area Hotspot (OU2), Deep Western (OU2), and Deep Eastern (OU3) plumes as the primary NWIRP Bethpage and Northrop Grumman VOC groundwater plumes.

Shallow Plumes - VOCs are located in the groundwater between approximately 50 and 300 feet bgs. The VOCs include a mixture of individual organics, including TCE, PCE, 1,1,1-trichloroethane (TCA), and 1,1-dichloroethane (DCA), and are generally found at concentrations of 0.5 to 10 micrograms per liter ($\mu\text{g/L}$) for each contaminant. There are multiple shallow plumes that result from a range of potential sources including the former NWIRP Bethpage and former Northrop Grumman facilities, as well as dry cleaners,

gasoline stations, and residential properties (i.e., septic systems) that in combination form a series of unique, layered, non-continuous plumes throughout the area. The higher concentrations of VOCs (greater than 10 µg/L) found on the former NWIRP Bethpage and former Northrop Grumman facilities have been mostly remediated through response actions conducted at the sources (e.g., NWIRP Bethpage Site 1 Air Sparge/Soil Vapor Extraction System) and/or by containment systems at the former facility boundaries (e.g., NWIRP Bethpage and Northrop Grumman OU2 and the Bethpage Community Park OU3 containment systems). Plumes that have migrated beyond these boundaries represent the other plumes described below.

GM38 Area Hotspot (OU2) - VOCs were located in the groundwater (between 300 to 500 feet bgs) approximately 1.6 miles southeast of the former NWIRP Bethpage. Groundwater from this hotspot is being treated by the GM38 Area Hotspot (OU2) Treatment System. Before the GM-38 Treatment System was installed in 2009, the hotspot encompassed an area of approximately 38 acres and contained a mixture of TCE, PCE, cis-1,2-dichloroethene (DCE), TCA, and DCA with concentrations ranging between 100 to 2,000 µg/L. Since 2009, groundwater concentrations have decreased by over 80 percent. In the OU2 ROD, a hotspot is defined as an area of groundwater with VOC concentrations greater than 1,000 µg/L.

Deep Western Plume (OU2) - VOCs are located in the groundwater (between 300 to 750 feet bgs) in the western portions of the former NWIRP Bethpage and Northrop Grumman facilities and at the Hooker Ruco Superfund Site. The plume continues south of Hempstead Turnpike. Although this plume likely resulted from multiple sources, including some other than the former NWIRP Bethpage and Northrop Grumman facilities, the apparent origin and depth of this plume appears to be associated with the extensive historic pumping of on-property and off-property production and public water supply wells in this area. TCE is the primary VOC in this groundwater plume. Other VOCs are present, but at lower concentrations. VOC concentrations typically range between 50 to 8,200 µg/L. North of Hempstead Turnpike, the vertical thickness of the plume is 100 to 200 feet and thins to the south.

- *RE108 Area Hotspot (OU2)* - In 2011, a potential hotspot was identified 1.5 miles south of the former NWIRP Bethpage. This hotspot is a subset of the Deep Western Plume (OU2). The hotspot is estimated to be approximately 195 acres and is present at a depth of approximately 520 to 720 feet bgs. This hotspot is predominately TCE, with lower concentrations of other VOCs. VOC concentrations range between 1,000 to 8,200 µg/L. A treatment system is currently being designed with the goal of treating to a discharge concentration of less than the drinking water standards.

Deep Eastern Plume (OU3) - VOCs are located in the groundwater (between 300 to 650 feet bgs) south and hydraulically downgradient of the Bethpage Community Park. The projected southern extent of the plume is near Hempstead Turnpike. This plume contains a mixture of primarily TCE and DCE, with concentrations ranging between 50 µg/L to over 13,200 µg/L.

- *RW21 Area Hotspot (OU3)* – The hotspot was identified in the 2013 NYSDEC Bethpage Community Park OU3 ROD as “presently located approximately 2,500 feet upgradient of and

approaching the Bethpage Water District No. 4 well field.” It is a subset of Deep Eastern Plume (OU3). This hotspot contains a mixture of primarily TCE and DCE, with concentrations ranging from approximately 1,000 µg/L to over 13,200 µg/L and is present at a depth of approximately 550 to 750 feet bgs. The RW21 Area Hotspot (OU3) and the Deep Eastern Plume (OU3) are deeper than the GM38 Area Hotspot (OU2) groundwater in this area, and therefore flow under and separate from the GM38 Area Hotspot (OU2). Northrop Grumman is currently constructing the RW21 Area Hotspot Treatment System.

2.5 EVALUATION OF RADIUM, PFAS, AND 1,4-DIOXANE

The Navy is currently conducting on-property investigations at the former NWIRP to determine whether some chemicals such as 1,4-dioxane, per- and polyfluoroalkyl substances (PFAS), and radiological substances have potentially been released at the former NWIRP facility and impact groundwater quality. This evaluation includes the sampling of approximately 55 on-property groundwater monitoring wells located at former NWIRP Bethpage. The evaluation of potential release and migration of radium, PFAS, and 1,4-dioxane is ongoing.

2.5.1 Interim Results for Radium

As a naturally-occurring radioactive element that is generally present at low levels in all soil, water, and rock, radium is produced from the decay of two other common naturally-occurring radioactive elements, uranium and thorium. As a component of the PA/SI, a review of past site operations indicated the past use of radium-based luminescent dials for aircraft instruments.

The U.S. EPA and State of New York have respectively established a maximum contaminant level (MCL) for total radium in drinking water of 5 picocuries per liter (pCi/L). For a public water supply to exceed this standard, the average value of four quarterly sample results must be greater than 5 pCi/L.

The results of groundwater sampling to date indicate 94 percent of the samples had total radium concentrations below the U.S. EPA/State MCL. Ten individual samples exceeded the MCL with a range of concentrations from 5.1 to 9.5 pCi/L. The overall average concentration of total radium for all results is 2.2 pCi/L.

2.5.2 Interim Results for 1,4-Dioxane

1,4-Dioxane is a common additive to some chlorinated solvents similar to those found in the OU2 Plume. It is also used in many products, including paint strippers, dyes, greases, varnishes, and waxes. The U.S. EPA has not established a MCL for this compound in drinking water. The NYSDOH MCL for “unspecified organic contaminants” (UOC) is 50 µg/L. New York State has established a Drinking Water Quality Council to evaluate establishing specific MCLs for several chemicals. In December 2018, this council recommended an MCL for 1,4-dioxane of 1 µg/L, but no final regulatory action has been taken to establish this as an action level.

The results of groundwater sampling of NWIRP Bethpage onsite wells indicate no results above the current NYSDOH MCL. Seven well sample results were above the recommended MCL of 1 µg/L with an average concentration of these exceedances of 1.8 µg/L. Pending establishment of a new promulgated standard for 1,4 dioxane, the Navy will take steps necessary to ensure protection of human health and the environment.

2.5.3 Interim Results for PFAS

PFAS compounds were first introduced into commercial and consumer products in the 1940s and have been used for many years to make products that resist heat, stains, grease, and water. The PFAS compounds also have limited applications in some industrial processes similar to those used at NWIRP. The most common PFAS compounds are PFOA (perfluorooctanoic acid) and PFOS (perfluorooctane sulfonic acid). The U.S. EPA has not established a MCL for PFAS in drinking water; however it has established a drinking water lifetime health advisory (LHA) for PFOA and PFOS. The LHA specifies 70 parts per trillion [70 nanograms per liter (ng/L)] for PFOA and PFOS individually or the sum of PFOS and PFOA. Although the LHA is not a regulatory action level, the Navy is using it as a benchmark as opposed to the State's less stringent UOC MCL of 50 ug/L (50,000 ng/L). In December 2018, the New York Drinking Water Quality Council also recommended an MCL for PFOA and PFOS of 10 ng/L for each chemical, but no final regulatory action has been taken to establish this as an action level. The sampling results to date indicate 94 percent of the PFAS results are below the U.S. EPA LHA. For PFOA, the maximum concentration was 99 ng/L with a maximum concentration of PFOS of 147 ng/L. These compounds were detected in groundwater samples collected from wells near the upgradient boundary of NWIRP indicating a presence in groundwater prior to reaching the site.

The Navy will generate draft PA/SI reports for radium, PFAS, and 1,4 dioxane for review by NYSDEC. The reports will include all groundwater sample data, the results of a review of past site operations and personnel interviews. Conclusions from evaluation of all data will determine if additional investigation or other response action is warranted. Upon finalization of the documents, they will be publicly available.

3.0 GROUNDWATER PLUME STATUS

This section describes the current and historical understanding of the off-facility groundwater plumes and provides estimated migration rates. For discussion purposes, the regional groundwater system is separated into four depth-based intervals, as follows: (1) less than 300 feet bgs; (2) 300 to 500 feet bgs; (3) 500 to 700 feet bgs; and (4) greater than 700 feet bgs. These four depth intervals correspond to the predominant groundwater flow pathways and associated plume movements through the aquifer. These intervals cut through the Deep Eastern and Deep Western Plumes as described in Section 2.4.

The groundwater VOC concentrations are obtained from the vertical profile boring (VPB) and monitoring well water samples. The VPB program advances soil borings at strategic locations and collects groundwater samples for VOC laboratory analyses at specific intervals every 50 feet from the 50- to 200-foot depths and then every 20 feet below the 200-foot depth. This sampling provides a snapshot in time of the vertical profile of VOC concentrations from the water table down to over 1,000 feet bgs at an individual VPB. Based on the results from the VPB program, permanent monitoring wells are then installed at each location. The monitoring well screen depths are selected based on the location of permeable flow zones, and the current or potential future presence of VOCs within those flow zones. Although more limited in vertical coverage, the monitoring wells provide reproducible data that can be tracked over time. Additional details of the VPB and monitoring well program are described in Section 5.2.

TCE is the primary VOC in the off-facility groundwater. However, there are some areas of VOC-impacted (e.g., benzene, and methyl tert butyl ether) groundwater where TCE and its associated byproducts are not present. Benzene and methyl tert butyl ether are associated with gasoline spills. As a result, these plumes are not likely to be associated with the former NWIRP Bethpage or Northrop Grumman facilities and the source of these other VOCs and associated plumes is uncertain.

3.1 CURRENT CONDITIONS

The current estimates of the boundaries of TCE-impacted groundwater (TCE greater than the MCL of 5 µg/L) potentially associated with the former NWIRP Bethpage and Northrop Grumman facilities are presented in Figures 3-1 through 3-4, for the depth intervals of 0 to 300 feet bgs, 300 to 500 feet bgs, 500 to 700 feet bgs, and greater than 700 feet bgs, respectively. The development of these isoconcentration contour lines is based on analytical results and groundwater flow. In developing these lines, data from water samples collected most recently (2018) from permanent monitoring wells is given the greatest weight. Data from previous years and VPBs are used to supplement recent groundwater results.

Public water supply extraction wells are also shown on figures where the depth of the extraction well screen (i.e., groundwater intake point) coincides with the appropriate depth interval. For example, Bethpage Water District (BWD) well BWD-6-1 (BWD-3876) with a screened depth of 328 to 381 feet is shown on Figure 3-2 (300 to 500 feet bgs interval). The groundwater results discussed below represent the highest concentration measured at each location. For most of the locations and depth intervals, the vertical extent

of the contamination is found in only a portion of the depth interval (e.g., the plume may only be 20 to 50 feet thick in a depth interval of 200 feet). More detailed location- and depth-data are provided in Appendix A of this 2019 Annual Report, as well as in the 2017 and 2018 Annual Reports. Except as noted below, the current TCE isoconcentration contour lines presented in Figures 3-1 to 3-4 are similar to those in the 2018 Annual Report. For each of the four depth intervals in the 2001 to 2017 graphics, the northern boundaries of these plumes were depicted with open isoconcentration contours, indicating uncertainty with the exact origin or current extent of the plumes. This uncertainty was based primarily on the absence of definitive data in the area. In 2018, these contours are shown as being closed. This change results from the development of new graphics for presenting the relevant data, but interpretation of the northern boundaries of these plumes remains the same.

The following sections describe the current distribution of VOCs in groundwater, primarily TCE, at four depth intervals, each of which encompasses multiple plumes and/or hotspots.

Shallow VOC-Impacted Groundwater, 0 to 300 Feet bgs (Figure 3-1): The western edge of the shallow VOC-impacted groundwater is shown in Figure 3-1 as originating near the western edge of the former Northrop Grumman facility and extends 3.3 miles to the south-southeast. The eastern edge of the shallow VOC-impacted groundwater originates near the Bethpage Community Park and extends 3.6 miles to the southeast and south-southeast. Although illustrated as one overall area of contamination, there actually is a series of individual shallow plumes that are separated horizontally and vertically from each other due to the release point, migration, and vertical gradients. Within some of this area, it is difficult to accurately determine the source of the contamination (i.e., OU2, OU3, or another source). The VOC contaminants in these plumes can vary by chemical characteristics of the original source (e.g., TCE versus PCE) and aquifer conditions (other organics that may result in the formation of degradation products such as DCE). In addition, because of the operation of groundwater extraction and treatment systems and the discharge of treated water back into the shallow aquifer resulting in flushing of the aquifer, there are likely large portions of the water in the shallow aquifer that are compliant with Federal and State Drinking Water Standards that are not depicted on Figure 3-1. The interpreted, irregular shape of the southern portion of the VOC shallow plume likely results from combined releases from multiple locations (including OU2, OU3, and other sources) over time, variable migration rates, and attenuation within the aquifer.

In much of the shallow zone in the southern-most portion of the investigation area near Southern State Parkway, groundwater data from several VPBs demonstrated that TCE was either not present or was present at concentrations less than Federal or State Drinking Water Standards (i.e., MCLs).

Based on data from groundwater investigations conducted in 2018, the 2018 shallow plume configuration is similar to that presented in 2017, and no major modifications have been made to the 2018 Annual Report plume delineations presented in Figure 3-1. The presence of the greater than 100 to 1,000 µg/L plume illustration in the vicinity of Hempstead Turnpike was confirmed based on results from monitoring well RE132D1. The 5 to 100 µg/L plume illustration between the former Northrop Grumman property and

Hempstead Turnpike was modified to reflect an area south of the OU2 ONCT in which the TCE concentration is less than the MCL of 5 µg/L and which is anticipated to have benefited from the ongoing long-term discharge of MCL-compliant water into the shallow aquifer from the OU2 ONCT.

Intermediate-Depth VOC-Impacted Groundwater, 300 to 500 Feet bgs (Figure 3-2): The spatial distribution for TCE in this depth interval is less extensive than for the shallower depth interval described above. While the western and eastern TCE boundaries are similar to those of the shallower zone, the southern extent of the TCE detections is more limited.

The areal extent of TCE concentrations greater than 100 µg/L to 1,000 µg/L and greater than 1,000 µg/L are more extensive than those identified in the shallower depth interval. An area of elevated TCE concentrations in groundwater is present along the western boundary in this depth interval. Also, along the western boundary, there are TCE impacts in groundwater beyond the inferred northwestern boundary of the OU2 Plume (based on groundwater flow direction and strategically-placed monitoring wells and vertical profile borings demonstrating chemical profile shifts) suggests that other (non-Northrop Grumman or non-NWIRP Bethpage) sources may be impacting the plume. In 2017, the northwestern boundary was depicted with open isoconcentration contours to the northwest, whereas in 2018, these contours are shown as being closed. This revised depiction was used to improve graphics and does not change the likelihood that some or all of the VOCs along the western and northwestern edge of the plume may originate from another source. The source of this other contamination remains uncertain. As illustrated in Figure 1-3, there are several dry cleaners and other facilities that use solvents that could be the source of or among the contributors to the TCE contamination in this area.

The zone of residual TCE-impacted groundwater associated with the GM38 Area Hotspot (OU2) (greater than 100 µg/L contour line) depicted in Figure 3-2 remains vertically separate from the lower Deep Eastern Plume (OU3). Since 2009, the TCE concentrations in the GM38 Area Hotspot (OU2) have been significantly reduced through the operation of the associated extraction, treatment, and discharge system.

Upper Deep VOC-Impacted Groundwater, 500 to 700 Feet bgs (Figure 3-3): The spatial distribution for TCE in this depth interval is less extensive than for the shallower zones described above and the difference between the Deep Western (OU2) and the Deep Eastern (OU3) Plumes is more defined. This depth interval is estimated to contain the majority of contaminant mass in both the Deep Western (OU2) and the Deep Eastern (OU3) Plumes. Based on 2018 groundwater data, the southern extent of greater than 5 to 100 µg/L, the greater than 100 to 1,000 µg/L, and the greater than 1,000 µg/L areas have shifted southward. This shift is primarily a result of new data points collected in the area, but as discussed in Section 3.2, it also likely results from some evidence of plume migration in the area.

The Deep Western (OU2) Plume, depicted in Figure 3-3, extends further south than the intermediate-depth zone described above, to a distance of approximately one mile south of Hempstead Turnpike. Additional evaluation of the migration of VOCs in this area is provided in Section 3.2. There also is evidence of a relatively pure Freon-113 plume along and under the western edge of the Deep Western Plume (OU2) that

does not appear to be associated with the former NWIRP Bethpage or Northrop Grumman facilities. In this Freon-113 plume, TCE and other chlorinated VOCs are present in minor amounts relative to the Freon-113 (less than 20%). This other plume is evidenced by Freon-113 found in BPOW4-2R (18.1 µg/L), RE124D3 (62 µg/L), RE131D3 (190 µg/L), RE134D4 (80 µg/L) that is running parallel to the OU2 plume and the source(s) for which appear(s) to be shallower plumes further north and west of the former NWIRP Bethpage and Northrop Grumman facilities (Appendix A and the 2018 Annual Report). The plumes associated with the former NWIRP Bethpage and Northrop Grumman facilities have TCE as the primary component of the total VOCs present, whereas Freon-113 is only a minor component. Investigations conducted in 2018 provided information to further support the estimated western edge of the Deep Western Plume.

The RE108 Area Hotspot (OU2) (a subset of the Deep Western Plume) and the RW21 Area Hotspot (OU3) (a subset of the Deep Eastern Plume) depicted in Figure 3-2 also extend to this depth interval. The TCE concentrations in the RE108 Area Hotspot (OU2) range from 1,000 to 8,200 µg/L and the TCE concentrations in the RW21 Area Hotspot (OU3) range from 1,000 to 13,200 µg/L.

Lower Deep VOC-Impacted Groundwater, Greater than 700 Feet bgs (Figure 3-4): The spatial distribution for TCE in this depth interval generally follows the footprint of the 500 to 700 feet bgs depth interval (see Figure 3-3); however, the TCE concentrations in this zone are present at a maximum concentration of 1,800 µg/L, which is substantially lower in concentration than the 500 to 700 feet bgs depth interval. For the Deep Western Plume (OU2), the presence of TCE at concentrations greater than 1,000 µg/L continues to be influenced by the operation of a nearby public water supply well (BWD Well 6-2, screened from 700 to 770 feet bgs) pulling groundwater from the 500 to 700 feet bgs depth interval downward and eastward. Based on 2018 groundwater data, the extent of greater than 5 to 100 µg/L area shifted southward. This shift is primarily a result of new data points collected in the area, but as discussed in Section 3.2, it also likely results from some evidence of plume migration in the area. For the Deep Eastern Plume (OU3), there were a few TCE MCL exceedances noted below 700 feet bgs.

3.2 MAPPING OF VOC PLUMES OVER TIME

Since 2001, characterization and definition of the OU2 Northrop Grumman and NWIRP Bethpage and OU3 Bethpage Community Park plumes has developed and evolved significantly based on data collected from new VPBs and groundwater monitoring wells installed during this time period. While migration of TCE-impacted groundwater to the south would be expected during this time period, pumping and natural attenuation processes that decrease concentrations also occur.

Figures 3-5 through 3-8 depict temporal mapping of TCE in groundwater for the four depth intervals of: less than 300 feet bgs (Figure 3-5); 300 to 500 feet bgs (Figure 3-6); 500 to 700 feet bgs (Figure 3-7); and greater than 700 feet bgs (Figure 3-8). Each of the figures identifies the TCE plumes for the years 2001, 2006, 2011, and 2018. The TCE contour lines were developed using available groundwater data for those years. Additional details for each of the maps for TCE are presented in Appendix B and data for the other

VOCs are presented in Appendix A of this 2019 Annual Report, as well as the 2017 and 2018 Annual Reports.

Major changes to the TCE plumes for the four depth intervals from 2001 through 2018 are discussed below. As discussed in Section 3.1, the northern boundaries of the plumes previously were depicted with open isoconcentration contours, indicating uncertainty with the exact origin or current extent of the plumes. This uncertainty was based primarily on the absence of data in the area. In 2018, these contours are shown as being closed. This change results from the development of better graphics for presenting the relevant data, but interpretation of the northern boundaries of these plumes remains the same.

Shallow VOC-Impacted Groundwater, 0 to 300 Feet bgs (Figure 3-5): With the exception of the groundwater south of the Bethpage Community Park (OU3) and the GM38 Area Hotspot (OU2), the extent of the shallow TCE-impacted plume exhibits some relatively minor variations in the boundaries depicted in Figure 3-5 that result primarily from inclusion of new data and refinement of the edges over time. In 2001, the shallow TCE-impacted plume was depicted as extending south of Hempstead Turnpike; and there were two isolated areas of higher TCE concentrations (TCE greater than 100 or 1,000 µg/L), one near Hempstead Turnpike and one associated with the GM38 Area Hotspot (OU2).

Between 2001 and 2006, several VPBs were installed south of the Bethpage Community Park that identified TCE (and other VOCs) at concentrations greater than 100 and 1,000 µg/L in that area. Between 2006 and 2018, additional investigations south of the Bethpage Community Park were used to refine the boundaries of the greater than 100 to 1,000 µg/L and the greater than 1,000 µg/L areas. In addition, TCE in groundwater samples collected from a monitoring well south of the Bethpage Community Park was less than 1,000 µg/L, and the corresponding shaded area for TCE greater than 1,000 µg/L was removed. This reduction is likely associated with the operation of the Bethpage Community Park groundwater containment system (OU3).

The GM38 Area Hotspot (OU2) (TCE greater 1,000 µg/L) is shown on both the 2001 and 2006 maps. As a result of the startup of the GM38 Area Hotspot (OU2) Treatment System in 2009, the groundwater concentrations in this area are less than 100 µg/L in this depth interval in 2011 and 2018.

The southernmost plume boundaries depicted for 2001 and 2006 are nearly equivalent because limited new data was available (one new well was added in that area during this time). Between 2006 and 2011, additional VPBs were installed in the southern portion of the plume area, confirming the absence or low (less than MCL) concentrations of TCE.

By 2018, results from several new VPBs further refined the southern extent of the plume boundary, indicating the presence of two distinct lobes. Also, the shallow groundwater south of the Northrop Grumman ONCT and north of Hempstead Turnpike was reevaluated. The 5 to 100 µg/L plume illustration south of the former Northrop Grumman property and north of Hempstead Turnpike was modified to reflect an area

in which the TCE concentration is less than the MCL of 5 µg/L and which is anticipated to similarly benefit from long-term discharge of MCL-compliant water into the shallow aquifer from the OU2 ONCT.

Intermediate-Depth VOC-Impacted Groundwater, 300 to 500 Feet bgs (Figure 3-6): With the exception of the Deep Eastern Plume (OU3) and the GM38 Area Hotspot (OU2), the variations in the plume boundaries depicted in Figure 3-6 result primarily from new data that was collected over time. In 2001, the TCE groundwater plume is depicted as extending south of Hempstead Turnpike; and there were three isolated areas of higher TCE concentrations near: Hempstead Turnpike, the GM38 Area Hotspot (OU2), and BWD Plant 6.

Between 2001 and 2006, several VPBs were installed south of the Bethpage Community Park that identified TCE (and other VOCs) greater than 100 to 1,000 µg/L and the greater than 1,000 µg/L areas in the Deep Eastern Plume (OU3). Between 2006 and 2018, the boundaries of the greater than 100 to 1,000 µg/L and the greater than 1,000 µg/L areas south of the Bethpage Community Park were better defined.

The GM38 Area Hotspot (OU2) (greater 1,000 µg/ area) is shown on both the 2001 and 2006 maps. As a result of the startup of the GM38 Area Hotspot (OU2) Treatment System in 2009, the corresponding greater than 1,000 µg/L area contour line in that area is no longer present by 2011. By 2017, the greater than 100 to 1,000 µg/L area remains, but the TCE and other VOC concentrations in the area continue to decrease.

Before 2006, there was only limited data to support the delineation of the Deep Western Plume (OU2) for this depth interval. Between 2001 and 2006, one well in this area had a TCE concentration greater than 1,000 µg/L (the basis for the greater than TCE 1,000 µg/L area), but concentrations quickly decreased to less than 1,000 µg/L by December 2003. The extent of the Deep Western Plume (OU2) was then identified and refined through subsequent investigations in the area. Also, investigations along the western boundary indicate that the Deep Western Plume (OU2) may result from multiple sources, not all of them definitively associated with former NWIRP Bethpage and Northrop Grumman facilities.

Between 2001 and 2006, four monitoring wells were present in the southern portion of the plume areas. The 2006 TCE concentrations for the four wells ranged up to 1.4 µg/L and were similar to TCE concentrations in nearby VPBs (up to 2 µg/L) (Appendix B). Between 2006 and 2018, additional VPBs were installed in the southern portion of the plume areas, confirming the absence or low level concentrations of TCE (Appendix B).

Upper Deep VOC-Impacted Groundwater, 500 to 700 Feet bgs (Figure 3-7): In 2001, the western portion of the TCE groundwater plume is depicted in Figure 3-7 as extending south of Hempstead Turnpike (Deep Western Plume (OU2)). There also was one isolated area of higher TCE concentrations, extending from near the southwestern corner of the former Northrop Grumman facility south toward Hempstead Turnpike.

Between 2001 and 2006, two new wells were installed and sampled in the south of the Deep Western Plume (OU2). The 2006 results from the two wells reported an absence of TCE and confirmed the results

of nearby VPBs (an absence of TCE) (Appendix B). Between 2006 and 2018, additional VPBs and wells were sampled throughout the Deep Western Plume (OU2). Subsequent investigations found higher concentrations of TCE in a portion of the Deep Western Plume (OU2) which was identified as the RE108 Area Hotspot (OU2) (depicted in the 2018 map in Figure 3-7).

TCE concentrations in groundwater near the northern edge of the Deep Western Plume appear to be decreasing (Graph 3-1). TCE concentrations for groundwater samples from monitoring well GM75D2 (screened depth of 505 to 525 feet bgs) have decreased from approximately 40 µg/L in 2013 to approximately 21 µg/L in 2018. In 2003, groundwater samples from this well were measured to contain over 1,000 µg/L of TCE. The decrease in TCE concentrations in this area is likely attributable to the operation of OU2 ONCT Treatment System.

TCE concentrations in groundwater near the southern edge of the Deep Western Plume appear to be increasing (Graph 3-1). TCE concentrations for groundwater samples from monitoring well BPOW 3-4 (screen depth of 640 to 690 feet bgs) have increased from approximately 50 µg/L in 2013 to approximately 192 µg/L in 2018. This trend indicates that the Deep Western Plume (OU2) Plume is migrating southward in this area. As discussed in Section 4.1, two water supply plants located in proximity to this monitoring well are equipped with treatment to remove VOCs. In addition, planned groundwater response activities north of this monitoring well are expected to further mitigate the plume migration.

As of 2006, there was limited evidence regarding the Deep Eastern Plume (OU3) at this interval depth. Between 2006 and 2018, supplemental investigations in the Deep Eastern Plume (OU3) identified and then refined the RW21 Area Hotspot (OU3). There is currently limited data available to monitor the migration of the Deep Eastern Plume (OU3).

Lower Deep VOC-Impacted Groundwater, Greater than 700 Feet bgs (Figure 3-8): In 2001, the TCE groundwater plume in this depth interval is depicted in Figure 3-8 as a relatively small area near Hempstead Turnpike that resulted from one detection of TCE at a concentration of 120 µg/L and one detection of TCE at a concentration of 2 µg/L. Additional data collected through 2018, resulted in expansion of the areal extent of this area, and also identified the presence of more contaminated groundwater (TCE greater than 1,000 µg/L) in the area south of BWD Plant 6. This more contaminated groundwater is referred to as the RE108 Area Hotspot (OU2).

As evidenced by TCE concentrations in groundwater samples from monitoring well RE103D3 (screen depth of 715 to 730 feet bgs) and RE120D2 (screen depth of 690 to 710 feet bgs) located near the center of the RE108 Area Hotspot, VOC concentrations in this area have decreased over the past five years (Graph 3-2).

As evidenced by TCE concentrations in groundwater samples from monitoring well TT101D2 (screen depth of 740 to 760 feet bgs) located near the southern edge of the RE108 Area Hotspot, VOCs concentrations appear to be increasing (Graph 3-2). TCE concentrations have increased from approximately 450 µg/L in

2013 to approximately 830 µg/L in 2018. This trend indicates that the hotspot is migrating southward. As discussed in Section 5.2, the Navy is installing a Hotspot Treatment System south of monitoring well TT101D2 to intercept this groundwater.

In addition, in 2015, the Navy installed several monitoring wells near the Southern State Parkway. Most of the wells are used as outpost locations to provide advance notice for water supply wells in the area. While the outpost wells remain free of site-specific VOCs, one monitoring well (RE117D1 screened depth of 730 to 755 feet bgs) installed near the Southern State Parkway had TCE concentrations greater than the MCLs measured in several associated groundwater samples. TCE concentrations ranged from approximately 8 to 33.5 µg/L, with a general trend of increasing concentrations in that monitoring well (Graph 3-3). In 2018, based on the results from RE117D1 and VPB173, TCE in this well and VPB were interpreted to be connected to the Deep Western Plume (OU2).

3.3 VOC PLUME MIGRATION RATES

Groundwater and the associated VOC plume migration rates are estimated using hydrogeological data collected from Northrop Grumman and NWIRP Bethpage wells and values of aquifer hydraulic conductivities from recent field studies. Calculated plume migration rates may vary from the groundwater flow rates due to non-uniform flow pathways, dilution, area-wide pumping by supply wells, and targeted VOC mass removal from groundwater by remedial wells. In 2018, the Navy continued its evaluation of groundwater flow. This evaluation is summarized below and more detail is provided in Appendix C.

Two comprehensive rounds of groundwater level measurements were performed during 2018. The rounds were collected in July 2018 and October 2018. In addition, as discussed below, data loggers that provide near continuous readings were installed and operated in several of the monitoring wells.

The water levels were converted to elevation and plotted on regional maps to develop groundwater potentiometric contour maps. Using these data, groundwater elevation contour maps were developed for two subsurface depth intervals of 500 to 700 feet bgs and greater than 700 feet bgs. Potentiometric contour maps are used to estimate flow direction and calculate groundwater flow rates. These two depth intervals represent the location of the majority of the VOC plumes and the public water supplies.

The migration of VOCs in groundwater is dependent on several factors. On a microscopic scale, groundwater (and groundwater contaminants) moves through open pore spaces in saturated aquifer sediments comprising gravel, sand, silt, and clay in response to elevation and/or pressure-head differences (i.e., hydraulic gradients) between two locations. Over large areas, the “average linear velocity” provides an estimate of how long it would take groundwater (and a non-reactive chemical) to move in an aquifer. Average linear velocity is computed using hydraulic conductivity (a property of the formation), hydraulic gradient (determined from a groundwater contour map), and effective porosity (i.e., void space).

Representative hydraulic gradients for the area south of Hempstead Turnpike based on 2018 data are presented in Figures 3-9 through 3-12. Figures 3-9 and 3-10 are based on the July 2018 measurements

and Figures 3-11 and 3-12 are based on the October 2018 measurements. The results indicate that groundwater flow rates and directions can vary locally based on depth within the aquifer and location relative to pumping water wells. Overall, groundwater flow is to the south-southeast near Hempstead Turnpike and then appears to shift to the south and then to the south- southwest near Southern State Parkway. Deflections are likely in response to pumping at a local water supply well.

Evaluation of groundwater level measurements provides valuable regional groundwater flow data and support groundwater flow rates. However, this evaluation is complicated because the manual groundwater level measurements are not truly synoptic (taken exactly at the same time). Operation of public water supply wells in the area vary throughout the day. As a result, measurements for some monitoring wells may represent “water supply pump off” conditions (high water), while the elevations in other monitoring wells may represent “water supply pump on” conditions and be lower. Consequently, supplemental investigations are being conducted using continuous (one reading every five minutes) in-well data logger. The use of the data loggers was initiated in 2012 and is continuing to be expanded as new monitoring wells are installed. Preliminary findings are discussed below.

Several maps were constructed to interpret the effects of groundwater withdrawal on both the regional and local groundwater flow directions and patterns (Appendix C). Data from 2015 to 2018 used to construct these maps were obtained either during the two rounds of manual groundwater measurements, or as recorded by the data logger placed in selected wells.

Figures 3-13 and 3-14 were developed based on the regional groundwater flow maps and illustrates the seasonal change in groundwater levels in the area south of Hempstead Turnpike. These maps were constructed by contouring the drawdown (or difference) in groundwater elevations measured during the July 2018 round and the October 2018 round. The drawdown is an indication of the local effects of pumping from water supply wells on groundwater flow.

The major features on the resulting maps are the two regional groundwater sinks, or areas of more significant drawdown. These sinks are interpreted to primarily represent zones of groundwater capture or influence. Groundwater will either naturally flow or be drawn into or toward these sinks. The larger sink in the maps results from the combined pumping of the South Farmingdale Water District (SFWD) Well 3-1, 6-1, and 6-2 and New York American Water (NYAW) Well Nos. 3A and 4S. The smaller sink to the northwest results from the pumping of the Levittown Water District (LWD) well LWD-13. Based on the magnitude of the pumping by the water supply wells, some or all of the groundwater will be removed from the aquifer. Water that is not removed from the aquifer will continue to flow south, but in a slightly altered flow path. Note that Figure 3-13 and 3-14 show groundwater sinks which are seasonal variations in the groundwater potentiometric surface. These sinks are not indicative of groundwater plumes that are shown on other figures.

3.4 USGS GROUNDWATER FLOW MODEL

The United States Geological Survey (USGS) constructed a groundwater flow model for the Navy to simulate the zones of groundwater contribution to several of the water supply wells that are addressed in this report (USGS, 2018). The USGS model identifies three relatively large zones of contribution that intercept or are in the path of OU2 Plume in the 500 to 700 feet bgs depth interval that result from pumping operations at NYAW Nos. 3A and 4S, SFWD No. 3-1, and SFWD Nos. 6-1 and 6-1. The modeling results suggested that the NYAW and SFWD well pumping may intercept a portion of the VOC-impacted groundwater from the OU2 Plume, or if impacted, higher levels of VOCs within the next five to ten years. Note that NYAW Nos. 3A and 4S currently have detectable concentrations of TCE and the water is being treated to remove the VOCs. SFWD 3-1 does not have detectable concentrations of VOCs, but treatment for VOCs is in place. The modeling effort did not predict whether SFWD Nos. 6-1 and 6-2, or further downgradient wells would be impacted by groundwater from the OU2 Plume.

4.0 CURRENT AND FUTURE IMPACTS TO DRINKING WATER FACILITIES

This section discusses well fields currently impacted or that may be impacted by VOCs associated with the former Northrop Grumman and NWIRP Bethpage facilities. This section also identifies those well fields with treatment systems in place to remove the VOCs migrating or potentially migrating from the former Northrop Grumman and NWIRP Bethpage facilities.

Figure 4-1 shows the former Northrop Grumman and NWIRP Bethpage facilities, the 2018 estimated extent of VOC groundwater plumes potentially associated with those facilities, and nearby public water supply well fields. The light blue east-west line north of the former Northrop Grumman and NWIRP Bethpage facilities represents the regional Long Island groundwater divide, groundwater north of this line flows northward toward Long Island Sound and groundwater south of this line flows southward towards the Atlantic Ocean (Como, et al., 2015). As shown on Figure 4-1, the former Northrop Grumman and NWIRP Bethpage facilities are south of the line, so groundwater flow is to the south; therefore, only well fields south of the groundwater divide are relevant to discussions in this section.

Shown on Figure 4-1 are public water-supply well fields with VOC treatment systems (red or yellow stars), and other public water-supply well fields south and potentially hydraulically downgradient of the former Northrop Grumman and NWIRP Bethpage VOC plumes that do not have treatment (green triangles) and are near or within the potential groundwater flow path (red dashed line). Locations represented by the green triangles are well fields that might be affected if VOC-impacted groundwater were to travel from the former Northrop Grumman and NWIRP Bethpage facilities without significant attenuation, at the depth of the extraction well screen. Because of attenuation, horizontal and vertical limits on capture zones, it is unlikely that all of these well fields would be impacted by former Northrop Grumman and NWIRP Bethpage VOC plumes. The area depicted within the red dashed lines near South Oyster Bay is widened to reflect uncertainty with the groundwater flow path in that area.

4.1 CURRENT IMPACTS

Due to current or projected (i.e., by use of outpost wells) VOC impacts to the groundwater, as discussed more fully below, wellhead treatment systems have been placed at certain public water supply well fields operated by BWD, SFWD, and NYAW to ensure that MCL-compliant water (i.e., water that meets or exceeds Federal and State drinking water quality standards) is provided to their customers. In addition, quarterly groundwater monitoring of wells is conducted to evaluate whether or not additional upgrades or new treatment would be required. These public water supply wells have been providing safe, MCL-compliant water for over 25 years.

Bethpage Water District

Between 1990 and 1996, the United States and Northrop Grumman funded treatment systems that were installed at the three impacted well fields operated by the BWD Plants 4, 5, and 6 (Figure 1-2, BWD Well Nos. 4-1, 4-2, 5-1, 6-1, and 6-2). At Plant 4, due to increasing concentrations of VOCs associated with the

Deep Eastern Plume (OU3), BWD implemented an upgrade of the treatment system in 2010. At Plant 5, the treatment system is continuing to effectively treat the VOCs in groundwater. BWD recently added liquid-phase granular activated carbon (GAC) polishing. At Plant 6, due to increasing VOC concentrations, BWD installed liquid-phase GAC polishing in 2011, the cost of which the United States reimbursed. BWD is also in the process of constructing another upgrade of the treatment system for Plant 6, for which the United States has provided advanced funding.

South Farmingdale Water District

Pursuant to an agreement with SFWD in 2011, based on the measurement of low-level VOCs in outpost monitoring wells, the United States funded SFWD's design, construction, operation, and maintenance of a VOC treatment system for two of the three wells at Plant 1 (Figure 1-2, SFWD Well Nos. 1-2 and 1-3). In order to provide advance warning of potential contamination at the third (deeper) well, in 2008, the Navy installed additional outpost wells to monitor the quality of the water that may be captured by the third well.

Pursuant to an agreement with SFWD in 2013, based on the measurement of VOCs in outpost monitoring wells, the United States funded SFWD's design, construction, operation, and maintenance of a VOC treatment system at Plant 3 (Figure 1-2, SFWD Well No. 3-1).

New York American Water (formerly AQUA New York)

As a result of increasing concentrations of low-level (less than MCL) TCE in wells at the NYAW (formerly AQUA New York) supply wells located at the Seaman's Neck Road Facility, the Navy constructed VOC treatment for an interim system in 2012 and completed the permanent system in 2015 (Figure 1-2, NYAW Nos. 3A and 4S).

4.2 POSSIBLE FUTURE IMPACTS

In the area of the former Northrop Grumman and NWIRP Bethpage facilities, and other nearby facilities that may also be contributing to the VOC-impacted plumes, groundwater regionally flows to the south and southeast. As a result, possible future impacts would be limited to those areas. The current TCE plume boundaries are presented in Figures 3-1 to 3-4. There are other plumes adjacent to and/or within the footprint of the OU2 Plume that have sources other than former NWIRP Bethpage and Northrop Grumman facilities. Hooker Ruco (a Superfund Site) and some local dry cleaners and gasoline stations (Figure 1-3) are likely contributing to the footprint of the OU2 Plumes or are in such close proximity to the OU2 Plumes as to be confused with the OU2 Plumes.

The following discussion focuses on a portion of the Deep Western Plume that is located generally south of Hempstead Turnpike, as current impacts to water supply wells located north of this area are addressed in Section 4.1. This discussion focuses on the 500 to 700 feet bgs and the greater than 700 feet bgs depth intervals, because these deeper intervals correspond to location of the VOC plumes and public water supply wells.

The public water supplies that are currently not impacted by the former Northrop Grumman and NWIRP Bethpage groundwater plumes, but are relatively closer to the downgradient edge of the plume, are SFWD Well 1-4 and SFWD Well Nos. 6-1 and 6-2 (Figure 1-2). These wells do not currently have treatment systems in place, but outpost monitoring wells were installed to provide early indication of whether and when treatment might be necessary for each of these well fields (Figures 3-2 to 3-4). The outpost monitoring wells are placed at depths associated with the public water supply wells and are located between the plumes and the public water supply wells such that site-related VOCs would have to flow through outpost monitoring wells several years prior to entering the public water supply wells. The advance notice of VOCs will provide early warning that an action is needed.

As the various groundwater plumes move to the south and southeast, they are undergoing dilution and are affected by pumping and the VOC mass removal systems that serve to weaken them. In addition, portions of the plumes are being intercepted by water supply wells with treatment that would further hinder migration. Each of these actions reduces the intensity of the concentration of contaminants in the plumes. The result is that water districts and many of the water supply wells further south may never be impacted, or if they might be impacted decades from now, there will be sufficient time to install additional outpost monitoring wells to prevent potential drinking water impacts from the plumes.

The effects on groundwater flow rates and directions caused by the pumping of the water supply wells located south of Hempstead Turnpike are presented and discussed in Section 3.0. Figures 4-2 and 4-3 depict the OU2 Plume and groundwater sinks identified south of Hempstead Turnpike. The OU2 Plume extension into the southern groundwater sink results from the pumping of water supply wells SFWD Well 3-1 and NYAW Well Nos. 3A and 4S. These water supply wells are already equipped with treatment systems to remove the VOCs. A portion and potentially all of the OU2 Plume is being removed from the aquifer before it can migrate any further to the south. However, the data collected to date is currently insufficient to determine whether complete capture of the OU2 Plume will occur within the southern sink or whether (and how far to the south) the plume may migrate beyond the sink during the spring and winter seasons, when pumping rates are reduced. Additional drawdown occurs in the vicinity of SFWD Nos. 6-1 and 6-2 (which do not have a treatment system). The potential exists for groundwater within this sink (including some portion of the Deep Western Plume) to be intercepted by these wells.

For SFWD Plant 6, based on site-specific hydrogeological calculations presented in Appendix C, groundwater in this area could travel from the currently known edge of the OU2 Plume to SFWD Wells 6-1 and 6-2 (a distance of 2,500 feet) in approximately 6 years. However, because plume migration in this area would be hindered by the operation of SFWD Well 3-1 and NYAW Wells 3A and 4S (all with VOC treatment), it is unclear whether or not the plume would ever reach SFWD Wells 6-1 and 6-2. Because of uncertainty inherent in this type of calculation, outpost wells are in place to provide five-year advance notice so that installation of treatment at these supply wells can be initiated, if necessary.

As to Massapequa Water District (MWD) Wells 4 and 5, it is unclear whether the VOC plume could reach these wells due to the intervening groundwater sinks caused by the pumping of the supply wells discussed above. There is uncertainty as to whether the pumping of the MWD Wells 4 and 5 contribute to and/or become part of the large groundwater sink located near Southern State Parkway. There are insufficient empirical data at this time to confirm either interpretation, and this wellfield is not part of the USGS flow simulation model. In addition, operation of the RE108 Area Hotspot Treatment System would be expected to further limit mass flow of VOCs toward the SFWD and NYAW plants, and thereby further limit VOC mass flow toward MWD.

VOCs in the 0 to 300 feet bgs plumes are not expected to impact the SFWD and MWD wells since the VOC concentrations in the Shallow Plumes are low, and movement of VOCs from the shallow aquifer zone to deep water supply wells is inhibited by the presence of low-permeability, clay-rich layers and substantially lower vertical hydraulic conductivities.

5.0 COMPREHENSIVE STRATEGY FOR OFFSITE GROUNDWATER

5.1 OVERVIEW AND REMEDIAL ACTION OBJECTIVES

There are several RODs that address groundwater impacted by VOCs beneath both former NWIRP Bethpage and Northrop Grumman facilities and also address groundwater impacted by VOCs that migrated beyond both facilities into the surrounding community. In 2001, NYSDEC issued its OU2 ROD to select a groundwater remedy and set forth a public water supply protection program.

Under its CERCLA and DERP authority, the Navy evaluated and adopted significant portions of the NYSDEC OU2 2001 ROD that would be implemented by the Navy in its federal cleanup program. Other portions are being implemented by Northrop Grumman (e.g., ONCT and groundwater monitoring). The Navy OU2 ROD (2003) selected cleanup actions to address contamination at and from the NWIRP Bethpage. The Navy OU2 remedial program implements a remedy for groundwater that is protective of human health and the environment, is permanent and cost-effective, and complies with Applicable or Relevant and Appropriate Requirements (ARARs). The primary goal of the remedy is to effectively mitigate significant threat to public health and the environment through the proper application of scientific and engineering principles.

The Navy ROD addresses onsite and offsite OU2 VOC-contaminated groundwater, and specifies the following remedial action objectives to protect human health and the environment:

- Eliminate, to the extent practicable, site-related contaminants from the affected public water supplies and to prevent, to the extent practicable, the future contamination of public water supplies through the implementation of the offsite groundwater remediation.
- Eliminate, to the extent practicable, exposures to contaminated groundwater.
- Eliminate, to the extent practicable, off-site migration of contaminated groundwater and, where practicable, to restore the groundwater to pre-disposal conditions.
- Eliminate, to the extent practicable, exceedances of applicable environmental quality standards related to releases of contaminants to the waters of the state.
- Eliminate, to the extent practicable, detections of site-related VOC contamination for affected drinking water supplies using U.S. EPA Method 502.2 to a detection limit of 0.5 µg/l.

5.2 COMPREHENSIVE STRATEGY AND REMEDIAL ACTIONS

The Navy and Northrop Grumman have implemented multiple response actions as part of their groundwater cleanup programs to achieve the Remedial Action Objective (RAOs) in the off-facility groundwater. RAOs are site-specific goals based on the chemicals of concern (COCs), the impacted media, COC fate and transport, potential exposure routes, and receptors. RAOs provide a clear and concise description of what the remedial action should accomplish. The remedial programs, implemented by NG under the NYSDEC OU2 ROD and by the Navy under its CERCLA ROD, address offsite groundwater contamination by including the following:

- The OU2 ONCT System to minimize migration of VOC impacted water downgradient, thus weakening the offsite plumes.
- An active remedial program including design, implementation, and operation and maintenance (O&M) of an extraction well system near the GM38 location (operating since 2009) that further weakens the plume. The extraction wells have removed significant VOC mass from the aquifer.
- Development and implementation of a Public Water Supply Contingency Plan (PWSCP) (ARCADIS, 2003) that provides for the use of VPB and monitoring well data along with groundwater modeling to target outpost monitoring well locations and trigger values.
 - Installation of outpost monitoring wells that can provide early notice of any threatened impacts to public water supplies from the VOC plume.
 - A provision for wellhead treatment for public water supply systems or alternative approach pursuant to the PWSCP.
- Installation of VPBs and monitoring wells to continue identification and monitoring of the spatially and temporally evolving VOC plumes and to determine the need for future outpost monitoring wells.
- Detailed reviews conducted every five years to evaluate the continued effectiveness of the offsite groundwater remedial program and confirm the remedy continues to be protective of human health and the environment in accordance with CERCLA standards.
- Implementation of wellhead treatment at public water supply wells.
- An optimization study to re-evaluate the effectiveness of the groundwater remedial program.
- Ongoing evaluation of the site-related groundwater plumes to identify hotspots for further response.

The Navy, with review and input from NYSDEC and U.S. EPA, continues to work to optimize the remedy, as required. For example, in response to the discovery of the RE108 Area Hotspot (OU2), the Navy is designing an extraction, treatment, and discharge system for VOC mass removal. This RE108 Area Hotspot (OU2) System will further weaken the plume and limit its southward migration.

5.2.1 Northrop Grumman Onsite Containment System

Northrop Grumman operates the OU2 ONCT system at the south-southwestern border of the former Northrop Grumman and NWIRP Bethpage facilities as a component of the NYSDEC OU2 2001 ROD. The OU2 ONCT system was originally constructed as an Interim Remedial Measure consisting of four extraction wells and two treatment systems that started operation in 1998. In 1998, approximately 3,375 gpm of VOC-impacted groundwater were treated. Later a fifth well was added, and the system currently treats 3,800 gpm of VOC-impacted groundwater. From 1998 to present, the OU2 ONCT system has removed more than 200,000 pounds of VOCs from the aquifer. By containing the portion of the plume(s) that is (are) onsite, the potential VOC load to the downgradient public water supplies has been reduced.

The OU2 ONCT data, as reported and evaluated by Northrop Grumman, indicate that the onsite portion of the OU2 groundwater remedy is an effective hydraulic barrier that controls the offsite migration of VOC-impacted groundwater to depths of approximately 600 feet bgs. The concentration of VOCs in downgradient monitoring wells screened to a depth of approximately 500 feet bgs or less have been decreasing as would be expected based on the operation of the OU2 ONCT System. Similarly, for example, the influent concentrations of VOCs into the BWD Well 6-1 (screened from 328 to 381 feet bgs) treatment system are decreasing as expected, from approximately 200 µg/L in 2001 to 27 µg/L in 2018.

5.2.2 GM38 Area Hotspot (OU2) Treatment System Design, Implementation, and Operation and Maintenance

In 2009, the Navy started operation of the GM38 Area Hotspot (OU2) Treatment System, which is approximately 8,500 feet south-southeast and hydraulically downgradient of NWIRP Bethpage (Figure 1-2). The system includes two recovery wells. Extracted groundwater is treated to remove VOCs and is then returned to the groundwater by discharge through Nassau County Recharge Basin #495. Groundwater samples are collected from eight monitoring wells to determine the effectiveness of treatment. From 2009 to December 2018, approximately 4.4 billion gallons of groundwater containing 11,400 pounds of VOCs were effectively extracted and treated. Quarterly and Annual Reports on the operation and maintenance of the GM38 Area Hotspot (OU2) Treatment System are submitted to NYSDEC.

5.2.3 Public Water Supply Contingency Plan

The PWSCP provides for installation and monitoring of outpost (or sentinel wells) (ARCADIS, 2003). These wells are proximal to water supply wells, and trigger values (or action levels) were established in certain wells that would identify the need for discussions between the Navy, Northrop Grumman, and the affected water districts about wellhead treatment or other alternatives. The trigger values provide an approximate five-year warning prior to an expected VOC detection of 0.5 µg/L in the public water supply wells. In 2015, additional preliminary trigger values were established for SFWD Plant 6 and MWD (Resolution, 2015).

5.2.4 Installation of Vertical Profile Borings, Monitoring Wells, and Long-Term Monitoring

The Navy program of installing VPBs and associated monitoring wells has been ongoing since 2001. Additionally, Northrop Grumman has installed its own VPBs and monitoring wells and provides reporting for its own monitoring well program. The Navy and Northrop Grumman share the results of their monitoring programs with NYSDEC and other parties, including the affected and potentially affected water districts. These investigations are also used to identify potential new hotspots, and if found, to delineate the extent of the impacts.

A Long Term Monitoring (LTM) program is ongoing to further define the configuration of the groundwater plumes and to determine effectiveness of remedial measures implemented to date. In the LTM program, over 200 wells are sampled quarterly, semiannually, or annually by Northrop Grumman and Navy, and the verified results are shared on a quarterly and annual basis.

5.2.5 Five-Year Review

In accordance with CERCLA requirements for sites where chemicals remain at concentrations above unrestricted levels, the Navy most recently conducted a five-year review in 2014 in consultation with NYSDEC (Resolution, 2014). The review evaluated the effectiveness of the groundwater remedy in protecting human health and the environment. The detailed study concluded that the response actions implemented to meet RAOs are still valid for offsite groundwater and ensure continued protectiveness by limiting exposure potential to contaminated groundwater.

The review proposed these follow-up actions for offsite groundwater:

- Continue to install VPBs and wells to further delineate the extent of the plume, monitor plume migration and attenuation, and serve as sentry points for public water supply wells. Establish trigger values for the new outpost wells and update the PWSCP.
- Continue to investigate capture by the OU2 ONCT system.
- Complete the delineation of the RE108 Areas Hotspot (OU2) with concentrations greater than 1,000 µg/L of VOCs in the area of Bethpage Water District Plant 6 and pursue implementation of a mass removal system in this area.

The Navy has either implemented or is currently pursuing these actions. The next Five-Year Review is scheduled for completion in 2019.

5.2.6 Wellhead Treatment of Public Water Supplies

Wellhead treatment systems were installed and are operating at BWD Plants 4, 5, and 6, SFWD Plants 1 and 3, and NYAW facility at Seamans Neck Road (Figure 4-1). NYSDOH's contaminant-specific Water Quality Regulations continue being met at these water supply wells through air stripping and/or GAC treatment technologies. The water that is distributed to the community is tested at least monthly to ensure that the drinking water standards promulgated by the NYSDOH are met. The water supplied by these facilities meets all the applicable drinking water standards.

5.2.7 Remedy Optimization

In addition to its CERCLA five-year reviews, the Navy has reassessed the OU2 groundwater remedy to review its effectiveness on two occasions since the implementation of the OU2 remedy. The first assessment was detailed in the Remedy Optimization Team Report for the Bethpage Groundwater Plume Remedy (Gavaskar, et al., 2011). For this study, the Navy convened a team of independent nationally-recognized experts to evaluate the effectiveness of the ongoing remedy for the plumes and recommend potential future steps for optimizing the remedy. In addition to the Navy, this team consisted of third-party technical experts from H2M Group, USGS, GSI Environmental Inc., Battelle Memorial Institute, and Virginia Polytechnic Institute and State University. The Optimization Report developed by this team recommended the following:

- Installation of VPBs and monitoring wells to evaluate contamination in the deeper portion of the OU2 aquifer.
- Installation of monitoring wells/clusters midway between the leading edge of the plume and MWD supply wells to monitor plume progress.
- Evaluation of technical/economic feasibility of plume containment at the current leading edge.
- Enhance the outpost monitoring well network to improve early detection of potential impacts to downgradient public water supply wells.
- Enhance the use of existing infrastructure, such as enhanced pumping at public water supply wells with VOC treatment in place, to increase the capture of VOC-impacted groundwater and reduce associated migration.

To optimize performance of the outpost wells, the Navy has been implementing a robust outpost well program upgradient of each public water supply well field and conducting connectivity testing between the wellfield and the outpost wells. The Navy is also conducting discussions with the water districts and appropriate regulators to evaluate the possibility of enhanced pumping which could reduce plume migration.

Based on the recommendations in the Optimization Team Report, the Navy developed the Study of Alternatives for Management of Impacted Groundwater at NWIRP Bethpage (Tetra Tech, 2012) to evaluate the technical and economic feasibility of alternatives for management of impacted groundwater downgradient of the former Northrop Grumman facility, former NWIRP Bethpage facility, and other sources. The study concluded that the OU2 ROD remedy remains protective of the public water supplies in the area (i.e., that considerable plume capture is ongoing via the OU2 ONCT, hot spot treatment, and capture in treatment systems for potentially impacted public water supply wells). NYSDEC and U.S. EPA concurred with these conclusions. This report also identified several disadvantages associated with attempting to implement plume or hydraulic containment including:

- Reducing, but not eliminating, potential impacts to downgradient public water supply wells, i.e., treatment would still be required on public water supply wells.
- Potential adverse impacts to the operation of supply wells located near new extraction wells.
- Extensive use of resources that provide little or no benefit to reduce risk.
- Disruption of transportation, commerce, and residents during construction.

Since 2011, the Navy has carried out or is carrying out the following activities for OU2 Groundwater:

- Continued operation of the GM38 Area Hotspot (OU2) Treatment System and sampling of GM38 monitoring wells.

- Strategic installation and sampling of approximately 40 VPBs, 13 outpost wells, and 70 monitoring wells throughout the area.
- Construction and operation of the NYAW Interim and Final Wellhead Treatment Systems. The final system is operating in compliance with the ROD and the NCDOH permit.

In addition, the United States has provided:

- Funding for the SFWD Plant No. 1 Wellhead Treatment System. The system is operating in compliance with the NCDOH permit.
- Funding for the SFWD Plant No. 3 Wellhead Treatment System. The system is operating in compliance with the NCDOH permit.
- Funding for the BWD Plant No. 6 Wellhead Treatment System GAC polishing unit and the upgrade of the treatment system. The current treatment system is operating in compliance with the NCDOH permit.
- Advance funding for the BWD Plant No. 6 Wellhead Treatment System. Although the existing treatment system is operating in compliance with the NCDOH permit, the equipment is nearing the end of its functional life and requires replacement. The new system will also include controls to limit air emissions.

5.2.8 Evaluation of Potential Hotspots

The Navy OU2 ROD anticipated that new hotspots may be identified in the future. The potential presence of the RE108 Area Hotspot was initially identified in 2011, based on sustained concentrations of TCE in BWD Well 6-2. The concentration of TCE in BWD Well 6-2, (screened from 700 to 770 feet bgs) prior to treatment, increased from less than 50 µg/L prior to 2006 to approximately 400 µg/L in 2007 to 2009, to 800 µg/L in 2010, and approximately 1,000 to 1,200 µg/L in 2011 to 2013, respectively, and under sustained pumping, remained greater than 1,000 µg/L since 2013. In 2016, the pre-treatment TCE concentration in this well was 1,280 µg/L. In 2011, in response to the higher concentrations of TCE in Well 6-2, liquid phase GAC was added to the treatment system to ensure effective treatment of the groundwater prior to distribution (i.e., comply with MCLs) and reduce the migration of VOC impacted groundwater. In 2013, the United States entered into a CERCLA settlement with BWD to reimburse its costs for construction of this augmented treatment system. Pursuant to a 2017 modification of the 2013 CERCLA agreement, the United States provided advance funding for an additional upgrade to the treatment system.

The RE108 Area Hotspot (OU2) is defined by the greater than 1,000 µg/L shaded area, as shown on Figures 3-3 and 3-4. A VOC mass removal treatment system for this groundwater is being designed as has been discussed in other sections of this Report.

5.3 BETHPAGE COMMUNITY PARK OU3 ROD

The NYSDEC Bethpage Community Park OU3 ROD selected as the remedy the operation of an onsite containment system (OU3) and a system to capture and treat the RW21 Area Hotspot (OU3) groundwater to the maximum extent practicable. Northrop Grumman's operation of the Bethpage Community Park OU3 onsite containment system is a continuation of an Interim Remedial System that started operation in 2009. The extraction wells are located along the southern border of the Bethpage Community Park (Figure 1-2). The OU3 onsite containment system captures VOC-impacted groundwater to a depth of approximately 145 feet bgs (ARCADIS, 2016)

The RW21 Area Hotspot represents the area of higher concentrations within the Deep Eastern Plume (OU3). Northrop Grumman is in the process of designing and constructing the RW21 Area Hotspot (OU3) Treatment System.

5.4 OTHER STRATEGIES CONSIDERED

It has been suggested that full plume containment could be implemented as a potential remedy to prevent future impacts to public water supplies south of the former Northrop Grumman and NWIRP Bethpage facilities. This potential response action was evaluated by NYSDEC in a 2016 Remedial Options Report (HDR [Henningson, Durham, and Richardson Architecture and Engineering P.C.], 2016) and more recently proposed Amended Record of Decision Sites No. 130003A and 130003B) and (NYSDEC, 2019) and Feasibility Study Report (NYSDEC Site # 130003A and 130003B). As identified in comments on the 2016 Remedial Options Report, the Navy, Northrop Grumman, and other parties who reviewed this report did not agree with its conclusions. The Navy continues to believe that full hydraulic containment of the plume, as presented in the 2016 HDR report, is not practicable because the plumes have evolved into a large, deep, fragmented, and complex collection of groundwater impacts, which continue to evolve. A hydraulic containment remedy would waste enormous amounts of potable water and could severely damage Long Island's sole-source aquifer. In addition, as discussed above in Section 4.0, it is unclear whether or not many of the downgradient supply wells will even be impacted by the plumes in the future. The Navy is currently reviewing the 2019 proposed Amended Record of Decision and associated Feasibility Study.

Strategies for clean-up of the plumes have been carefully chosen based upon input from a group of highly qualified engineers and scientists, including personnel from U.S. EPA, U.S. Army Corps of Engineers (USACE), NYSDEC, NYSDOH, USGS, and NCDOH, as well as technical representatives from affected and potentially effected water districts. In 2012, the Navy (with concurrence from NYSDEC, U.S. EPA, USACE, and USGS) completed an analysis of remediation technologies, including an evaluation of full plume containment. Full containment was found to be technically and practicably infeasible due to the highly porous nature of Nassau County's geology and the tremendous amount of groundwater pumping that occurs in the region. A full containment approach could create significant negative effects including saltwater intrusion, adverse impacts to sensitive environmental receptors, and reduction of groundwater in the aquifer for drinking water consumption without improving human health protection.

In addition, a full containment approach would interfere with remedies being implemented by Navy and NG, which are effective. In the NYSDEC full containment approach, there would be extensive pumping of groundwater from various depths throughout the aquifer. This pumping would alter the horizontal and vertical migration of groundwater and the associated VOC plumes, potentially rendering operating and planned Navy and NG treatment systems ineffective. The current remedies were carefully selected to maximum removal of VOC contaminated groundwater while minimizing impacts on the community and potential unintended impacts to water supplies in the area.

The Navy is also working with several water districts to ensure protection of the public water supplies from VOCs in the Navy and NG plumes. The current system of groundwater monitoring and public water supply treatment is based on the well-established groundwater migration direction and VOCs that could impact these systems. There are other groundwater plumes in the area which contain contaminants that are not associated with the former NWIRP Bethpage and NG properties. Some contaminants, such as Freon from dry cleaners and methyl tert-butyl ether from gasoline stations, would not be effectively treated by the existing VOC equipment on the public water supplies. If these other contaminants impact the public water supplies, additional upgrades would be required.

6.0 SUMMARY

On June 15, 2018, the Navy submitted the second Annual Report in response to Title IV, Section 5009 of the Water Infrastructure Improvements for the Nation (WIIN) Act of 2016, which requires the Secretary of the Navy to submit annual reports through 2021 to the United States Congress. This 2019 Annual Report presents an updated evaluation of groundwater quality and migration in the vicinity of the former NWIRP Bethpage, NY.

In accordance with requirements of the 2016 WIIN Act, this report provides the following:

- A description of the status of the groundwater contaminants that are leaving the site and migrating to a location within a 10-mile radius of the site, including:
 - detailed mapping of the movement of the plume over time, and
 - projected migration rates of the plume;
- An analysis of the current and future impact of the movement of the plume on drinking water facilities; and
- A comprehensive strategy to prevent the groundwater contaminants from the site from contaminating drinking water wells that, as of the date of the submission of the report, have not been affected by the migration of the plume.

The contaminants are VOCs identified in the RODs issued by the Navy or NYSDEC that have migrated from the former NWIRP Bethpage and Northrop Grumman facilities southward. The VOC releases from these facilities form a 3,000 plus -acre area of VOC-impacted groundwater that extends south of Hempstead Turnpike. The groundwater impacts extend to a depth of approximately 750 feet, but are not continuous throughout this area and are not present at all depths. There are other nearby known or suspected sources that have contributed to regional groundwater impacts including Hooker Ruco Superfund Site and various current and former dry cleaners and gasoline stations in the area. Plume migration rates may vary from the groundwater flow rates due to non-uniform flow pathways, chemical dispersion, area-wide pumping by supply wells, and targeted VOC mass removal from groundwater by remedial wells.

VOCs from the former NWIRP Bethpage and Northrop Grumman facilities have impacted groundwater quality at the intakes for public water supply well fields operated by Bethpage Water District and New York American Water (which are treated to meet all Federal and State drinking water standards) and are anticipated to impact public water supply well fields operated by South Farmingdale Water District SFWD Plant 3. Outpost monitoring wells, quarterly groundwater sampling, monthly public water supply testing and an ongoing and extensive VPB groundwater sampling program are currently used to continuously monitor and alert nearby water districts and the Navy of the detection of site-related VOCs. The Navy will continue to monitor SFWD outpost well data to ensure that timely action is taken to maintain protection of the SFWD Wells 6-1 and 6-2 water supply.

Northrop Grumman reports that the OU2 ONCT System effectively captures known impacted groundwater associated with the former NWIRP Bethpage and Northrop Grumman facilities and that the Bethpage Community Park OU3 containment system effectively captures impacted groundwater from that former Northrop Grumman facility. For VOC-impacted groundwater that has migrated past the containment system locations before they were installed, the following actions are being taken:

- The Navy is operating the GM38 Area Hotspot (OU2) Treatment System.
- The Navy is obtaining property access agreements for Phase I of the RE108 Area Hotspot Treatment System to be located north of Hempstead Turnpike and is designing and obtaining property for Phase II of the RE108 Area Hotspot Treatment System (to be located south of Hempstead Turnpike), both of which will address areas with elevated VOC-impacted groundwater. Pending access agreements, the Phase I System is anticipated to be online in 2019 and the Phase II System is anticipated to be online in 2022.
- Northrop Grumman is designing and constructing the RW21 Area Hotspot (OU3) Treatment System.
- Wellhead treatment at BWD Plants 4, 5, and 6, SFWD Plants 1 and 3, and NYAW on Seaman's Neck Road ensures that the public is not exposed to VOC-impacted groundwater.
- A groundwater monitoring/detection program and additional VPB/well installations are being conducted to continue assessing groundwater quality and identifying any additional actions that may be required.

The Navy continues to implement the remedy selected in its OU2 ROD for contamination at and from the former NWIRP Bethpage, in a manner that is protective of human health and the environment. The Navy will continue working closely with NYSDEC, NYSDOH, local water districts, and other stakeholders (including the community Restoration Advisory Board), to coordinate and seek input into the Navy's ongoing remedial actions and future remedial action proposals. Through implementation of this comprehensive remedial strategy, the drinking water in the area complies with all Federal and State drinking water standards, and therefore continues to be safe to drink.

Table 1
Concentrations of Volatile Organic Compounds and
1,4-Dioxane in Monitoring Wells Installed by the Navy
Second Quarter 2018, Operable Unit 2 (Groundwater)
Bethpage, New York.

Notes and Abbreviations:

- (1) Samples were analyzed for the TCL VOCs using USEPA Method 8260C.
- (2) Total VOCs are rounded to two significant figures.
- (3) Samples were analyzed for 1,4-Dioxane using USEPA Method 8270D SIM

Results validated following protocols specified in OU2 Groundwater Monitoring Plan (ARCADIS 2016).

Bold	Constituent detected
D	Concentration is based on a diluted sample analysis
J	Constituent value is estimated
REP	Blind Duplicate Sample
SIM	Selected Ion Monitoring
TCL	Target Compound List
USEPA	United States Environmental Protection Agency
VOC	Volatile Organic Compound
µg/L	Micrograms per liter
<0.50	Compound not detected above its laboratory detection limit

Concentrations of Constituents in Remedial Wells and
Treatment System Effluents, Second Quarter 2018, Operable Unit 2,
Northrop Grumman Systems Corporation,
Bethpage, New York

Notes and Abbreviations:

- (1) Results for the program are validated at 20% frequency, per protocols specified in OU2 Groundwater Monitoring Plan (Arcadis 2016c).
 - (2) VOC samples analyzed using USEPA Method 8260C. 1,4-dioxane samples analyzed using USEPA Method 8270D-SIM.
 - (3) Total VOC results rounded to two significant figures.
- 2.7** Bold value indicates a detection.
< 5.0 Compound is not detected above its laboratory quantification limit.
J Constituent value is estimated.
µg/L micrograms per liter
OU2 Operable Unit 2

Table 3
Vapor Sample Analytical Results for Treatment Systems,
Second Quarter 2018,
Northrop Grumman Systems Corporation,
Operable Unit 2, Bethpage, New York

Notes and Abbreviations:

- (1) Vapor samples collected by Arcadis on the dates shown and submitted to a NYSDOH ELAP certified laboratory for VOC analyses per Modified USEPA Method TO-15.
- (2) Total VOCs represents the sum of individual concentrations of compounds detected rounded to the nearest whole
- Not Analyzed
- 3.4** bold value indicates a detection
- J Compound detected below its reporting limit; value is estimated.
- µg/m³ micrograms per cubic meter
- ELAP Environmental Laboratory Approval Program
- NYSDOH New York State Department of Health
- USEPA United States Environmental Protection Agency
- VOC Volatile Organic Compound

Table 6
Concentrations of Volatile Organic Compounds
and 1,4 Dioxane in Monitoring Wells,
Second Quarter 2018, Operable Unit 2,
Northrop Grumman Systems Corporation,
Bethpage, New York

Notes and Abbreviations:

- (1) Samples were analyzed for VOCs using USEPA Method 8260C; samples were analyzed for 1,4-Dioxane using USEPA Method 8270D -SIM.
- (2) Results for the program are validated at 20% frequency, per protocols specified in OU2 Groundwater Monitoring Plan (Arcadis 2016).
- (3) Total VOCs rounded to two significant figures.
- (4) HN-24I and FW-03 could not be sampled during Second Quarter 2018 due to NAVY PFAS sampling activities.

Bold	Constituent detected
J	Constituent value is estimated
D	Concentration is based on a diluted sample analysis
REP	Blind Replicate Sample
µg/L	Micrograms per liter
VOCs	Volatile Organic Compounds
<1.0	Compound not detected above its laboratory quantification limit.

Table 7
Concentrations of Metals and 1,4-Dioxane in Monitoring Wells⁽¹⁾
Second Quarter 2018, Operable Unit 2
Northrop Grumman Systems Corporation
Bethpage, New York.

Table 8
Concentrations of Volatile Organic Compounds and 1,4 Dioxane in Outpost Wells ⁽¹⁾
Second Quarter 2018, Operable Unit 2,
Northrop Grumman Systems Corporation
Bethpage, New York

Notes and Abbreviations:

- (1) These outpost wells have been recently repurposed for use as plume monitoring wells per the June 2015 Groundwater Monitoring Plan Addendum (ARCADIS of New York, Inc., 2015) as conditionally approved by the NYSDEC (August 25, 2015). Therefore, TVOC trigger levels that may have been previously established are no longer shown
- (2) Samples were analyzed for VOCs using USEPA Method 524.2; samples were analyzed for 1,4-Dioxane using USEPA Method 522 -SIM
- (3) The NAVY abandoned original Wells BPOW4-1 and BPOW4-2 and installed replacement Wells BPOW4-1R and BPOW4-2R between August, 2014 and October, 2014
- (4) Results for the program are validated at 20% frequency, per protocols specified in OU2 Groundwater Monitoring Plan (Arcadis 2016)
- (5) TVOCs are rounded to two significant figures
- Bold** Value indicates constituent detected
- REP Blind Replicate Sample
- TVOCs Total Volatile Organic Compounds
- USEPA United States Environmental Protection Agency
- VOC Volatile Organic Compounds
- µg/L micrograms per liter
- <0.5 Compound not detected above its laboratory quantification limit.
- J Value is estimated concentration

U = Not Detected

LOQ = Limit of Quantitation

MDL = Method Detection Limit

LOD = Limit of Detection

E = Value Exceeds Calibration Range

Q = indicates LCS control criteria did not meet requirements

M = MS/MSD acceptance criteria did not meet requirements

J = Estimated Value

B = Analyte Found in Associated Method Blank

N = Presumptive Evidence of a Compound

* = Values outside of QC limits

D = Dilution

() = Laboratory InHouse Limit

A = Aldol-Condensation Reaction Products

Notes:

- J - Estimated result between laboratory method detection limit and reporting limit
- NA - Not Applicable
- NS - Not Sampled. RW-3 sampling frequency has been reduced from monthly to semi-annually.
- ND - Not detected above laboratory method detection limit. Limit of detection (LOD) given in parentheses.
- NS - Not Sampled
- gpm - gallons per minute

- (1) Wastewater discharge equivalence permit renewed on 18 August 2017. Discharge limits established for 10 years. Chloroform, 1,4-dioxane and 1,1,2-trichlorotrifluoroethane are now monitored under the new permit.
- (2) On 11 January 2018, the GM38 GWTP was shut down to allow Nassau County Basin NC#495 to drain for maintenance activities. On 24 January 2018, the GWTP was placed back on line with a reduced flowrate at RW-1. At the beginning of March 2018, the GWTP continued to operate at a reduced flowrate of approximately 135 gpm with its effluent discharge diverted into injection well IW-1 in order to accommodate rehabilitation of Nassau County Basin #495. On 9 March 2018, the GM38 GWTP effluent discharge was redirected to Nassau County Basin #495 at an initial flowrate of 350 gpm. On 12 March, the flowrate was increased to 700 gpm, and on 15 March, the GM38 GWTP was return to its normal flowrate of 1,000 gpm.
- (3) Well RW-3 was turned on for a total of approximately 3 hours this period to collect the Semi-Annual groundwater samples.
- (4) Influent concentrations presented are the weighted average concentrations of RW-1 and RW-3.

NS = Not Sampled

(1) Samples were analyzed for TCL VOCs (including tentatively identified compounds [TICs]). Only those VOCs detected are presented above.

(2) RW-3, previously an active extraction well sampled on a monthly basis, was taken off-line on 7/1/15. RW-3 is now sampled semi-annually, in conjunction with the semi-annual LTM events.

Notes:

- (1) Pilot System Monitoring Well
- (2) Remainder of System Monitoring Well
- (3) Black colored water prevented reading on colorimetric meter
- (4) Orange colored water prevented reading on colorimeter meter
- (5) Insufficient sample volume to obtain measurement/reading
- (6) Sample from replacement well 3R
- (7) Sample collected from vertical profile boring at depth 439 ft bgs
- NA - Not analyzed
- NM - Not measured (insufficient sample volume for all samples subsequent to 11/30/2011)
- NR - Not reported by Northrop
- NS - Not Sampled
- U - Not detected at associated value
- J - Estimated concentration

Notes:

- J - Estimated concentration
- U - Not detected at the associated reporting limit
- UJ - Not detected; associated reporting limit is estimated
- - Not applicable

NYAW - New York American Water (O&M)

Discussion of Operational / System Maintenance

- Over 78.5 million gallons of water were treated in February 2019, bringing the total cumulative volume of water treated since startup to over 4.10 billion gallons.
- No backwash was conducted in February 2019. The last backwash event was performed on 10, 11, 12, 15, 16 and 17 October 2018.

Upcoming Planned Maintenance/Tasks

- Potential carbon changeout during the Spring months (April to May 2019).
- 2/14/2019, Tyco was onsite to fix the key box for the alarm.
- 2/25/2019, the alarm generator for the battery charge failed. GenServe will be contracted for the replacement of the backup generator batteries

Sampling / Fieldwork:

- TCE detection was reported in the effluent sample for February 2019 (0.50 ug/L) Effluent Duplicate was ND.
- March sampling event:
 - VOCs will be collected from influent 3A, 4S, and effluent locations (03/12).
 - 1,4-dioxane will be collected from influent 3A, 4S, and effluent locations (03/12).
 - BACT will be collected from influent 3A, 4S, all 6 GACs, and effluent locations (03/12 -03/13).
