Executive Summary

This preliminary assessment (PA) report of potential sources of per- and polyfluoroalkyl substances (PFAS) at the Naval Weapons Industrial Reserve Plant (NWIRP) Calverton has been prepared by Tetra Tech, Inc. (Tetra Tech) for the Department of the Navy (DON) under Contract N6247016D9008, Contract Task Order (CTO) WE05. The purpose of this PFAS PA of NWIRP Calverton is to:

- Identify all areas where known or suspect PFAS release to the environment occurred;
- For all known or suspect PFAS releases identified, determine if there is current exposure defined as a drinking water source 1 mile downgradient from the release;
- Eliminate from further consideration those areas where there is no evidence of a PFAS release or suspected release and document the rationale for their elimination;
- Identify areas requiring further PFAS evaluation; and
- Identify receptors and migration pathways (both on and off the facility).

While this PA was being prepared, private drinking water wells were identified downgradient and within 1-mile of the potential PFAS areas of concern. In September and October 2018, a separate off-site drinking water investigation was conducted to identify and test private drinking water wells for PFAS. This PA documents the research conducted before the off-site drinking water investigation.

The goal of the PA is to identify potential PFAS sources and receptors to give direction for further evaluation. Based on the results of this PA, it is anticipated that the Navy will recommend further assessment at select areas of NWIRP Calverton.

The methods for conducting the PFAS PA included four primary activities: Document searches, public database searches, interviews with former NWIRP Calverton staff, and site reconnaissance. Information on potential PFAS or AFFF storage, use, or release at NWIRP Calverton were gleaned from a variety of resources. Key word searches of historical documents from NIRIS and on-line resources were performed. Additionally, interviews were conducted with the former facility managers on historical activities that may have been associated with PFAS use or releases.

A review of historical records and the personnel interviews indicated that AFFF was stored and used or released at a small number of locations on NWIRP Calverton. The PFAS PA identified three categories of sites: sites that are currently undergoing a Site Inspection (SI) because a release of PFAS has been documented, sites that are

recommended for further PFAS evaluation because of the potential of historical PFAS use or releases; and sites that are recommended for no further PFAS evaluation because PFAS use or release was unlikely to have occurred.

Table 4-3 presents rationale and a summary of PFAS recommendations for each area. Table 5-1 lists the sites identified through the PFAS PA for further PFAS evaluation.

1.0 Introduction

This preliminary assessment (PA) report of potential sources of per- and polyfluoroalkyl substances (PFAS) at the Naval Weapons Industrial Reserve Plant (NWIRP) Calverton has been prepared by Tetra Tech, Inc. (Tetra Tech) for the Department of the Navy (DON) under Contract N6247016D9008, Contract Task Order (CTO) WE05.

This installation-specific PA for PFAS is part of a Navy-wide Installations Assessment of potential historical sources of PFAS releases. The DON issued a policy in October 2014 (DASN [IE&E] Policy Memo, 21 Oct 2014) requiring on-base drinking water sampling for perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS) for bases where groundwater was used as drinking water and PFAS could have been released nearby in the past. In 2014, there were no drinking water wells identified at NWIRP Calverton. Identification of off-base impacted drinking water at other facilities during the implementation of the October 2014 policy lead DON to issue another policy in June 2016 (DASN [E] Policy Memo, 20 Jun 2016). This 2016 policy required the Navy to identify and prioritize sites for investigation if drinking water resources, on- or off-installation, were thought to be vulnerable to PFAS contamination from past Navy/Marine Corps PFAS releases. Sites with drinking water sources within 1 mile downgradient from known or potential releases of PFAS were assigned the highest priority. These high priority sites, were directed to sample the off-base drinking water within Fiscal Year (FY)17. At NWIRP Calverton, one residential well was identified within 1 mile south of Site 2 – Former Fire Training Area. The residential well and groundwater monitoring wells were evaluated for PFAS in 2016. PFAS was present in the residential well but the result was below the United States Environmental Protection Agency (USEPA) Lifetime Health Advisory level. In addition, new plumbing and Teflon tape was observed at the sample port and most likely contributed to the low detection of PFAS. Sampling continued on a quarterly basis at the residential well, and the results were non-detect during five rounds of sampling. In 2017, a Site Inspection (SI) began at Site 2 – Former Fire Training Area.

Additionally, to limit future environmental releases of PFAS, the DON issued policy that prohibited the use of aqueous film-forming foam (AFFF) during training exercises (DON 17 JUN 2016). Although AFFF containing PFAS is still permitted for use during emergency response, the DoD's goal is to acquire and use a non-fluorinated AFFF formulation or equivalent firefighting agent to meet the performance requirements for DoD critical firefighting needs. Until alternatives are available, the DoD intends to

acquire and use AFFF with the lowest demonstrable concentrations of PFOS and PFOA (MIL-PRF-2438F(SH)).

NWIRP Calverton originally included over 6,000 acres. Most of the property contained within the perimeter fence has been conveyed to the Town of Riverhead. The Navy has retained three non-contiguous parcels of land (Parcels A, B, and Site 7 of Parcel C) totaling approximately 209 acres to continue ERP activities. There is no known current usage of AFFF at this facility.

The purpose of this PFAS PA of NWIRP Calverton is to:

- Identify all areas where known or suspect PFAS releases to the environment occurred;
- For all known or suspect PFAS releases identified, determine if there is current exposure defined as a drinking water source 1 mile downgradient from the release;
- Eliminate from further consideration those areas where there is no evidence of a PFAS release or suspected release and document the rationale for their elimination;
- Identify areas requiring further PFAS evaluation; and
- Identify receptors and migration pathways (both on and off the facility).

The PFAS PA will be applied to direct further evaluation for PFAS. The PA is developed within the context of a Conceptual Site Model (CSM) of identifying potential 1) sources of PFAS released at the NWIRP Calverton, with estimates of period of use; 2) release mechanisms and migration pathways, such as soil, surface water, groundwater; and 3) receptors for exposure. Therefore, the goal of the PA is to identify potential PFAS releases and potential receptors.

The methods for conducting the PFAS PA included three primary activities to address the CSM elements:

- Literature Searches: Naval Installation Restoration Information Solution (NIRIS) - search of NWIRP Calverton documents for PFAS-associated key words; Web-based searches for general information of PFAS use, regulations, and health effects, Site-specific history, and manufacturer information on AFFF formulations.

- Public database searches for potential receptors: Environmental Data Resources, Inc. (EDR); United States Environmental Protection Agency (USEPA) Third Unregulated Contaminant Monitoring Rule (UCMR3) database; State of New York well database, and property tax record databases. Appendix A provides a list of on-line resources that were reviewed for the PFAS PA.
- Site interviews and site reconnaissance: Interviews were conducted by Tetra Tech and included the former Resident Engineer/Facility Manager and the former Facility Manager for Northrop Grumman/Private Contractor. A site reconnaissance was conducted at potential sites identified through the interviews and literature searches. Appendix B presents photos from the site reconnaissance.

1.1 Report Organization

The PFAS PA Report for NWIRP Calverton is organized in five Sections:

Section 1 provides an introduction and the purpose of the PA.

Section 2 provides a general overview of PFAS usage, health effects, and regulation. This section also includes information on Navy policy to identify and prioritize sites for investigation if drinking water resources, on- or off-installation, are thought to be vulnerable to PFAS contamination from past Navy releases of PFAS.

Section 3 provides a description of a brief history of NWIRP Calverton and information related to the environmental setting, hydrogeology and potential drinking water receptors.

Section 4 provides information on the methodology of the literature search conducted to identify potential PFAS sites, public databases that were searched, and discusses interview procedures and summary of interview results. Section 4 also presents the results of the PFAS PA, identifying sites that are recommended for further PFAS evaluation or recommended for no additional PFAS evaluation.

Section 5 presents the PFAS PA Findings and Recommendations for NWIRP Calverton PFAS PA. For those sites recommended for further PFAS evaluation, migration and exposure potential for drinking water receptors is assessed and discussed.

2.0 PFAS BACKGROUND INFORMATION

PFAS have been identified by the United States (U.S.) Department of Defense (DoD) and the USEPA as “emerging contaminants”¹. PFAS are of environmental concern because of their persistence in the environment and in organisms, migration potential in aqueous systems (e.g., groundwater), historically ubiquitous use in commercial products, and their possible health effects at low levels of exposure. PFAS are anthropogenic compounds with multiple strong carbon-fluorine bonds.

2.1 General Uses of PFAS

The chemical properties of PFAS make them useful for many commercial products since they can repel oil, grease, and water. PFAS have been manufactured for use in a wide variety of products including fire-fighting foam, non-stick cookware, fiber and fabric stain protection, food packaging, and personal care products. The pervasive use of PFAS in commercial and industrial products has led to the discovery of PFAS in soil, air, and groundwater.

2.2 PFAS Sources at Naval Installations

PFAS have been used in a variety of military applications, including as a component in AFFF, which was routinely used at fire-fighting training areas and equipment test areas. In addition, current and historical AFFF storage and transfer areas are of potential concern for release to the environment. As such, a key element for identifying PFAS sources at DON facilities is to identify areas where AFFF was released to the environment in large quantities, either as repeated small releases or significant one-time releases.

PFAS from AFFF used in firefighting and fire suppression systems are considered to have the greatest potential for release of PFAS to the environment in terms of mass/concentration at DON installations. Other potential sources of PFAS to the environment include historical on-site land disposal areas/landfills of PFAS-containing

¹ DODI 4715.18 (2018) defines an “emerging contaminant” as a “contaminant that: has a reasonably possible pathway to enter the environment; presents a potential unacceptable human health or environmental risk, and does not have regulatory standards based on peer-reviewed science, or the regulatory standards are evolving due to new science, detection capabilities, or pathways.”

operations wastes (e.g., from electroplating), waste water treatment sludges and effluents, or PFAS materials themselves.

AFFF in Fire-fighting Training and Fire Suppression

AFFF containing PFAS were developed in the mid-1960s for use on Class B fires (i.e., fires in flammable liquids or vapors), and were put into routine use by the early 1970s. In November 1969, a military specification (MIL SPEC) was issued that described characteristics which AFFF needed to demonstrate in order to be used by the military. As such most AFFF used at military installations after the 1970's likely included some combination of PFAS. Typically, AFFF concentrate was proportionally mixed into water lines using in-line eductors or other proportioning devices to create the necessary foam solution ranging from 3% to 6% of the concentrate.

In June 2016, the Navy released a policy that prohibited the use of AFFF during training exercises (DON 17 JUN 2016). Although AFFF containing PFAS is still permitted for use during emergency response, the DoD's goal is to acquire and use a non-fluorinated AFFF formulation or equivalent firefighting agent to meet the performance requirements for DoD critical firefighting needs. Until alternatives are available, the DoD intends to acquire and use AFFF with the lowest demonstrable concentrations of two particular PFAS; specifically, PFOS and PFOA (MIL-PRF-2438F(SH)).

Areas of interest for this PFAS PA include those where AFFF may have been applied, released, or stored to extinguish Class B fires. These include current and former fire training areas, equipment test and cleanout areas, buildings with fire-fighting infrastructure (e.g., AFFF storage/handling areas, pump houses, etc.), unplanned release areas (e.g., crash sites), and fire suppression systems located at hazardous waste storage area(s).

Foam extinguishers are also used on Class A fires (i.e. fires involving solid materials such as wood, paper, and textiles.). However, fire-fighting foam for Class A fires do not contain PFAS. Therefore, Class A fire-fighting foams are not a concern for this PA. In addition, at NWIRP Calverton, water was reportedly used to extinguish grass and wood fires.

The following Classes of fire were also considered in this PA:

- Class C – fires involving gasses
- Class D – fires involving metals
- Class E – fires involving live electrical apparatus
- Class F – fires involving cooking oils

However, PFAS containing foam is not typically used to extinguish Class C, D, E, and F fires and are not a concern for this PA.

Electroplating

Electroplating, specifically hard chromium plating, is an industrial activity where PFAS-containing mist suppressants may have been used. Electroplating consists of creating an electrolytic cell that enables a thin layer of metal to be deposited onto an electrically conductive metal surface. PFAS were sometimes used during the chromium electroplating process as a surfactant in chromic acid baths. As a surfactant, PFAS lowered the surface tension (adhesion of materials) by creating a thin, foamy layer on the surface of the chrome bath for mist-suppression. This mist-suppressant reduced the formation of airborne chromium aerosols during the plating process, which are known to be carcinogenic and allergenic. Areas where non-chromium electroplating operations were carried out would not be expected to have used PFAS-containing mist suppressants.

Landfill Operations, Waste Disposal Areas, and Wastewater Treatment Plants

Historically, landfills received wastes generated from military installations, including waste streams from operational areas (machine shops, electroplating operations, etc.), housing areas, and/or homeported ships. These waste streams may contain industrial and/or consumer products that were either manufactured with PFAS or contain PFAS constituents that may leach out of the landfill.

Other Potential Sources

Due to the widespread use of PFAS, there may be activities other than the ones mentioned above where PFAS were used. PFAS have been included in some anti-fouling and stain-resistant paint formulations. It is possible that in significant amounts, these could be sources of PFAS to the environment.

2.3 Key PFAS Sources at Naval Installations

PFAS are a class of anthropogenic compounds characterized by carbon chains of varying lengths containing carbon-fluorine bonds. The strong electronegative force of the carbon-fluorine bond requires a large amount of energy to break, which makes PFAS extremely resistant to biodegradation, photo-oxidation, direct photolysis, and hydrolysis (ATSDR, 2015; OECD, 2002; OECD, 2007). In addition to their environmental persistence, PFAS are readily miscible in aqueous solution and therefore have potential for migration to groundwater from soil and with groundwater flow to off-

site locations. These qualities of persistence and mobility flag PFAS for potential concern if released into the environment.

2.4 Health Effects

Additional research is needed to more clearly understand the potential health effects that may be caused by exposure to PFAS compounds. To date there is limited information on only a few out of the thousands of total PFAS. To date, there are no Tier 1 toxicity values for any PFAS. Tier 1 toxicity values are the preferred source for toxicity factors in Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) and Resource Conservation and Recovery Act (RCRA) human health risk assessments.

The USEPA's Superfund Health Risk Technical Support Center has estimated a Tier 2 noncarcinogenic toxicity value for perfluorobutanesulfonic acid PFBS (USEPA, 2014). The oral reference dose (RfD) is based on kidney effects observed in female rats. Due to a lack of information in the current literature, toxicity values for inhalation exposure and cancer endpoints could not be estimated for PFBS. The USEPA Office of Water developed a RfD for PFOA which is based on a developmental toxicity study using mice. The critical effects included reduced ossification in parts of the hand/feet and accelerated puberty in male pups following exposure during gestation and lactation (USEPA, 2016a). The USEPA Office of Water also determined that PFOA should be classified as "suggestive evidence of carcinogenic potential" and estimated an oral cancer slope factor (CSF) based on tumor development in rat testes.

The USEPA Office of Water estimated a RfD for PFOS based on a developmental toxicity study in rats; the critical effect was decreased pup body weight following exposure during gestation and lactation (USEPA, 2016b).

PFOA and PFOS are known to be transmitted to the fetus in cord blood and to the newborn in breast milk. Because the developing fetus and newborn seem particularly sensitive to PFOA- and PFOS-induced toxicity, the RfDs based on developmental effects also are protective of adverse effects in adults.

2.5 Regulatory Background/History on PFAS

2.5.1 PFOA Stewardship Program

In 2006, USEPA initiated the 2010/2015 PFOA Stewardship Program in which eight major companies in the United States committed to reduce facility emissions and product contents of PFOA and related chemicals on a global basis by 95% no later than

2010, and to work toward eliminating emissions and product content of these chemicals by 2015. All companies have met the program goals. To meet the program goals, most companies stopped the manufacture and import of long-chained PFAS, and then transitioned to alternative chemicals. On January 21, 2015, USEPA proposed a Significant New Use Rule under the Toxics Substances Control Act to require manufacturers (including importers) of PFOA and PFOA-related chemicals to notify USEPA at least 90 days before starting or resuming new uses of these chemicals in any process.

2.5.2 Unregulated Contaminant Monitoring Rule (UCMR3)

The USEPA issued the Third Unregulated Contaminant Monitoring Rule (UCMR3) in May 2012. The UCMR3 required monitoring, between 2013 and 2015, for 30 substances at all large public water systems (PWSs) serving more than 10,000 people and 800 representative PWSs serving 10,000 or fewer people. Six PFAS compounds were included in the UCMR3 contaminant list. Of these 6 PFAS, USEPA issued health advisory levels for only two, PFOA and PFOS. The UCMR3 results found these two chemicals were present in less than 1% of the nearly 5,000 public water systems that sampled per UCMR3.

In December 2016, the USEPA issued the fourth Unregulated Contaminant Monitoring Rule (UCMR4). UCMR4 requires all large PWSs serving more than 10,000 people and 800 representative PWSs serving 10,000 or fewer people to sample for 30 chemicals between 2018 – 2020. There are no PFAS included on the UCMR4 list of contaminants that require sampling and analysis.

2.5.3 USEPA Lifetime Health Advisories

In May 2016, the USEPA Office of Water issued a drinking water lifetime health advisory for PFOA and PFOS. Health advisories are not enforceable, regulatory levels; rather they are levels that would provide Americans, including sensitive populations, with a margin of protection from a lifetime of exposure to PFOA and PFOS from drinking water. The health advisory is 70 parts per trillion (ppt) (or nanograms per liter [ng/L]) for PFOA and 70 ppt for PFOS. When both PFOA and PFOS are found in drinking water, the combined concentrations of PFOA and PFOS should be compared with the 70 ppt health advisory level.

2.5.4 State Specific Action Levels

In January 2016, New York began regulating PFOA as a hazardous substance followed by the regulation of PFOS in April 2016. The regulation requires the proper storage of the substances and limited releases to the environment.

The Final Rule for PFOA and PFOS became effective on March 3, 2017. New York State Department of Environmental Conservation (NYSDEC) filed a Notice of Adoption for amendments to 6 New York Codes, Rules, Regulations (NYCRR) Part 597, Hazardous Substance Identification, Release Prohibition, and Release Reporting. The amendments finalized the addition to PFOA, PFOA-salt, PFOS-acid, and PFOS-salt were added to the list of hazardous substances to 6 NYCRR Section 597.3 (Section 597.3).

There are currently no specific criteria for any of the PFAS compounds for New York. However, the Maximum Contaminant Level (MCL) for PFAS compounds defaults to the unspecified organic contaminant of 50,000 ng/L (or ppt) under the NYSDOH Part 5, Subpart 5-1 Public Water Systems, Table 3 Organic Chemicals, MCL Determination.

2.6 Navy Policy

2.6.1 DASN (EI&E) Policy Memo, 21 Oct 2014

As a result of Navy releases impacting PWS tested under the UCMR3, the DON issued a policy requiring on-base drinking water sampling for PFOA and PFOS for bases where groundwater was used as drinking water and PFAS could have been released nearby in the past. Installations that were not required to sample finished drinking water under UCMR3 that produce drinking water from on-installation groundwater sources and have an identified or suspected PFAS release within approximately 1-mile up-gradient to the drinking water source were required to sample their finished drinking water by December 2015. No action was required because NWIRP Calverton is a closed facility.

2.6.2 DASN (E) Policy Memo, 14 Sept 2015

This policy memo largely echoed the requirements laid out in the October 2014 DASN (E) policy memo. However, this memo specified that if levels of PFOS and/or PFOA in drinking water exceeded the current USEPA health advisory (i.e., the 2009 provisional short-term health advisories), then alternative drinking water must be supplied until the PFOA and/or PFOS levels were reduced to below the USEPA health advisories. No action was required because NWIRP Calverton is a closed facility.

2.6.3 ASD Policy Memo 10 Jun 2016

This DoD policy memo specified that decisions regarding drinking water should be based on the lifetime health advisories issued by USEPA's Office of Water in May 2016, rather than the now outdated provisional short-term health advisories issued in 2009. No action was required because NWIRP Calverton is a closed facility.

2.6.4 DASN (E) Policy Memo, 14 Jun 2016

This policy expanded the sampling PFOA and PFOS at all DON installations where such sampling was not previously completed under USEPA's UCMR 3 or the DON's October 2014 policy. This memo also specified that for instances where drinking water from an installation is purchased from a public water system, but wasn't tested under UCMR3, that the installation must sample the finished drinking water to comply with this policy. Additionally, this policy included reporting requirements to the DASN (E) office for all PFOA and/or PFOS drinking water results. There is currently no drinking water supplied to the remaining parcels owned by the Navy. The Town of Riverhead supplies drinking water to the business on former NWIRP property. The Town of Riverhead sampled their drinking water supply wells under the UCMR3 program.

2.6.5 DASN (E) Policy Memo, 17 Jun 2016

This policy defines the DON's intention to remove, dispose, and replace legacy AFFF that contains PFOS and/or PFOA once environmentally suitable substitutes are identified and certified to meet MILSPEC requirements. This policy directs the following actions be taken until suitable replacements are certified:

Immediately cease the uncontrolled environmental release of AFFF for shoreside installations, with the exception of emergency responses.

Update and implement Navy and Marine Corps firefighting system requirements, as needed, to ensure fire and emergency service vehicles and equipment at DON installations and facilities are tested and certified in a manner that does not allow the release of AFFF to the environment.

By the end of FY2017, remove and dispose of uninstalled PFOS-containing AFFF in drums and cans from local stored supplies for shore installations and ships to prevent future environmental releases. In 1996, when NWIRP Calverton closed, all AFFF was reportedly removed from the facility and no action was required in regard to the 17 Jun 2016 policy.

2.6.6 **DASN (E) Policy Memo, 20 Jun 2016**

This policy required Navy to identify and prioritize sites for investigation if drinking water resources, on- or off-installation, are thought to be vulnerable to PFAS contamination from past Navy/Marine Corps PFAS releases. Sites with drinking water sources within 1 mile downgradient from known or potential releases of PFAS were assigned the highest priority. This policy directed the sampling of off-base drinking water at these high priority sites within FY17.

The primary mechanism to identify potential PFAS release sites/areas of concern (AOC), was review of Navy ER,N records. To ensure that all potential PFAS release mechanisms were identified, installations were directed to review installations to identify areas that are not already part of the ER,N program. The Navy has completed the sampling for all off-base potentially impacted drinking water sources that were identified as a result of this policy and currently known exposures have been addressed.

Sites identified in the initial query for the former NWIRP Calverton were Site 2 – Former Fire Training Area and two aircraft paint hangars (Buildings 168 and 318). Only Site 2 was identified as an area with PFAS environmental release (i.e., AFFF was released during fire training activities) with a potential drinking water well located 1-mile south of this area. The aircraft paint hangars were identified as potential sites because they were equipped with AFFF fire suppression systems that underwent “full dump” testing procedures. In a “full dump” test, the suppression systems were fully discharged, filling the hangars with AFFF. The aircraft hangars do not have a drinking water source located within 1 mile downgradient.

In 2016, the Navy conducted an initial Site Investigation at Site 2 and the Aircraft Paint Hangars. Testing was conducted at the residential drinking water well south of Site 2 and at groundwater monitoring wells on and off property at Site 2 and at monitoring wells downgradient of the Aircraft Paint Hangars. Results exceeded the USEPA Lifetime Health Advisory at one or more locations at Site 2 and the hangars. However, the drinking water sample results at the residential drinking water well were below the USEPA Lifetime Health Advisory. In response to the exceedances in groundwater monitoring wells, the Navy began conducting Site Inspections (SI) at Site 2 and the Aircraft Paint Hangars in 2017.

In 2018, while this PA was being prepared, private drinking water wells were identified within 1-mile of the potential PFAS areas of concern. In September 2018, an off-site drinking water investigation began to evaluate PFAS in these private drinking water wells. Results for these private drinking water wells were below the USEPA Lifetime Health Advisory.

The Navy is conducting this PFAS PA to ensure that all potential releases of PFAS to the environment are identified and to address and mitigate any potential for current exposure.

This page intentionally left blank

3.0 NWIRP Calverton Description

This section provides a description of a brief history and the setting of NWIRP Calverton, including a discussion of geological and hydrogeological setting. The local hydrogeology information is applied in the PFAS PA process to identify potential migration pathways to drinking water receptors for sites where environmental release of PFAS may have occurred.

3.1 NWIRP Calverton Physical Setting and History

NWIRP Calverton is located in east-central Suffolk County, Long Island, New York, approximately 50 miles east of New York City, see Figure 3-1. NWIRP Calverton was constructed in the early 1950s and closed in February 1996. The facility was leased and operated by Northrop Grumman Corporation as a Government-owned/Contractor-operated facility (Tetra Tech, 2011). Historical activities conducted at NWIRP Calverton primarily consisted of final assembly and flight acceptance testing of military aircraft (CF Braun, 1997a). The majority of the land within the developed section of NWIRP Calverton was transferred to the Town of Riverhead for economic redevelopment in September 1998, including most of the fenced area (Zone 1). The majority of the runway buffer areas (Zones 2, 3, and 5) were transferred to NYSDEC for conservation and public recreation, and one additional parcel of buffer land in Zone 4 was designated for transfer to the Veterans Administration that manages the adjacent Calverton National Cemetery (Tetra Tech, 2011).

3.2 Site Geological/Hydrogeological Setting

NWIRP Calverton lies within the Atlantic Coastal Plain Physiographic Province. Generally, this region can be characterized as an area of relatively undissected low-lying plains. The Atlantic Coastal Plain is underlain by a thick sequence of unconsolidated deposits. The surface topography has been created or modified by Pleistocene glaciation. The facility is underlain by approximately 1,300 feet of unconsolidated sediments that consist of four distinct geologic units. These units, in descending order, are the Upper Glacial Formation, the Magothy Formation, the Raritan Clay Member of the Raritan Formation, and the Lloyd Sand Member of the Raritan Formation.

Soil boring and sampling activities previously completed at NWIRP Calverton reveal that the sites are predominantly underlain by fine- to coarse-grained sediments of probable

glaciofluvial origin. Three distinct lithofacies were encountered during previous field investigations. The upper lithofacies represent a mixture of soil, fill, and glacial deposits and consist predominantly of silty, fine-grained sand with varying amounts of peat and clay. Fill material, where present, is always associated with the upper lithofacies. The middle lithofacies consist of predominantly fine-grained sand with varying amounts of medium- to coarse-grained sand and pebbles, and are probably representative of undisturbed glacial deposits. The lower lithofacies consist of micaceous, silty clay and may represent the Magothy Formation.

A number of small wetlands exist on the Calverton facility. The U.S. Department of the Interior (USDOI), Fish and Wildlife Department classifies the western half of the 2-acre Northeast Pond as palustrine, forested/scrub/shrub/emergent wetland.

The unconsolidated sediments that underlie NWIRP Calverton are generally coarse-grained with high porosities and permeabilities. These factors create aquifers with high yields and transmissivities. The Upper Glacial Formation, the Magothy Formation, and the Lloyd Sand are the major regional aquifers. The Upper Glacial and Magothy aquifers are of principle importance in Suffolk County because of their proximity to the ground surface. The Raritan Clay of the Raritan Formation has a very low permeability and acts as a regional confining layer that is believed to minimize the local risk of contamination to the underlying Lloyd Sand aquifer (McClymonds and Franke, 1972). The Lloyd Sand has not been extensively developed due to its depth and the abundant water available in the overlying aquifers. The Upper Glacial aquifer is widely used as a source of groundwater in Suffolk County. The water table beneath the NWIRP Calverton lies within this aquifer. Porosities in excess of 30 percent have been calculated for the Upper Glacial aquifer in adjoining Nassau County. Hydraulic conductivity is estimated at 270 feet per day (ft/day).

The Magothy aquifer is also widely used as a source of groundwater in Suffolk County. The most productive units are coarser sand and gravel. The permeability of the Magothy is high, and hydraulic conductivity has been calculated in excess of 70 ft/day.

The Upper Glacial and Magothy aquifers are believed to be hydraulically interconnected and to function as a single unconfined aquifer. Logs from on-site monitoring wells, previous hydrogeologic investigations, and geologic mapping indicate that, although clay lenses may create locally confining and/or perched conditions in both aquifers, these lenses are not widespread and do not function as regional aquitards (McClymonds and Franke, 1972; Fetter, 1976).

NWIRP Calverton straddles a regional groundwater divide, with groundwater beneath the northern half of the facility flowing to the northeast, and the Long Island Sound is the probable discharge point for groundwater in the shallow aquifer zones. Groundwater beneath the southern half of the facility flows to the southeast, and the Peconic River basin is the likely discharge point. Groundwater on the divide, the location of which can fluctuate, flows to the east. The groundwater contours for shallow groundwater at the facility are presented on Figure 3-2.

The eastward-flowing Peconic River is located approximately 1,300 feet south of the facility at its closest point. The Peconic River receives flow from the facility as well as flow from the south (Figure 3-2) and discharges to Peconic Bay located 8.5 stream miles from the facility. Major surface water features near the facility include McKay Lake and Northeast Pond. McKay Lake is a man-made groundwater recharge basin located north of River Road, midway along the southern site border. Northeast Pond is located at the northeast corner of the facility. Several small drainage basins exist near ERP Site 6A - Fuel Calibration Area. All of these surface water features are land locked, with the exception of McKay Lake, which has an intermittent discharge to Swan Pond, located 1,500 feet to the south of NWIRP Calverton. Overflow from these drainage basins to the Peconic River may also occur periodically.

4.0 PFAS PA Summary

The methods for conducting the PFAS PA and site summary and recommendations for further PFAS evaluation are presented in this section. While this PA was being prepared, private drinking water wells were identified downgradient and within 1-mile of the potential PFAS areas of concern. In September and October 2018, a separate off-site drinking water investigation was conducted to identify and test private drinking water wells for PFAS. This PA documents the research conducted before the off-site drinking water investigation.

The methods for conducting the PFAS PA included three primary activities to identify potential PFAS sources and possible receptors: 1) document review, 2) public databases searches, and 3) interviews and site reconnaissance. Each of these is discussed below.

4.1 Expanded NIRIS Document Search

The document search entailed an expanded review of available Navy site files to identify where PFAS could have been used at NWIRP Calverton. The Navy documents reviewed include the Environmental Baseline Survey (EBS) and Remedial Investigation/Feasibility (RI/FS) reports, Decision Documents, and recent groundwater monitoring reports found in the NIRIS database. Appendix A lists the primary documents reviewed from NIRIS. The key-word list used to search the documents is presented in Table 4-1 and was developed based on the PFAS background information provided in Section 2.0.

4.2 Public Database Searches

4.2.1 USEPA UCMR3 Data

The USEPA has collected groundwater analytical results for PFAS in the vicinity of NWIRP Calverton as part of its Third Unregulated Contaminant Monitoring Rule (UCMR3) program. As documented in USEPA's Safe Drinking Water Act - UCMR3 Data Summary for PWS, all PWS serving more than 10,000 people and 800 randomly selected PWS serving less than 10,000 were sampled for UCMR3 contaminants including PFAS. The Riverhead Water District is the PWS serving former NWIRP Calverton. Eleven treatment plants / groundwater supply wells owned by Riverhead Water District were sampled as part of the UCMR3 program in 2013 and 2014. PFAS

were not detected in any of drinking water supply wells. Table 4-2 presents the UCMR3 data for the Riverhead Water District.

4.2.2 EDR Results – Receptor Characterization

An EDR report was prepared on March 20, 2018, which provided information such as nearby sites with potential hazardous chemical use or storage and the location of public supply wells within a four-mile radius search area for the Calverton facility, based on a search of available environmental records. The EDR report is included as Appendix C. Of note, PWS wells were found within the search radius, up to four miles from a polygon drawn along the former boundary of the facility. Figure 3-2 shows the public drinking water supply wells identified during the EDR search, review of historical documents, and meeting with the Riverhead Water District. Figure 3-2 also shows the general groundwater flow direction in the vicinity of NWIRP Calverton (groundwater flow direction is to the southeast and northeast due to the groundwater divide).

4.3 Interviews and Site Reconnaissance

A key element of the PFAS PA process is interviewing personnel with knowledge of NWIRP Calverton facility history to provide information on operations and practices that might have resulted in the use and release of PFAS-containing materials. As was described in Section 2, a major historical source of PFAS from military operations is AFFF used in fire suppression systems, firefighting, and fire training. The interview questions asked for recall and knowledge about NWIRPs historical operations in which AFFF could have been used or stored (e.g., fire training areas, crash sites, buildings with fire suppression systems, and fire stations). For NWIRP Calverton, the people interviewed for the PFAS PA were the former Resident Engineer/Facility Manger and the former Facility Manager for Northrop Grumman/Private Contractor.

4.3.1 Interview Process

The interview process involved providing the interview questions in advance so that interviewees were aware of the type of historical information needed for the PFAS PA. Tetra Tech interviewed the former Resident Engineer/Facility Manger, who has knowledge of NWIRP historical fire protection systems, use of AFFF at the facility, and major historical fire incidents for which AFFF may have been used. Additionally, the former Facility Manager for Northrop Grumman/Private Contractor was also interviewed who has knowledge of training activities and general operations at NWIRP Calverton. The interviews were conducted with former Resident Engineer/Facility Manager and

former Facility Manager for Northrop Grumman/Private Contractor on September 12, 2017.

4.3.2 Interview and Site Reconnaissance Summary

Some key historical events or operations were noted by more than one interviewee, while other information came from individual interviews. The former Resident Engineer/Facility Manager also conducted site visits. Photographs are presented in Appendix B.

Upon completion of the September 12, 2017 interviews, Tetra Tech and the former Resident Engineer/Facility Manager conducted site reconnaissance in the industrial area of NWIRP Calverton. Many areas could not be accessed because they are currently in use by private industries. The site reconnaissance began at Site 10A / Building 230. The majority of the area surrounding the building is concrete and asphalt. Areas further to the west are wooded. The manager of United Metro Energy escorted the group to nearby Building 327. Building 327 houses a fire protection system for the bulk storage tanks as well as the fuel station that was added after the Navy transferred the property to the Town of Riverhead. Building 327 consists of two rooms; one with a tank and associated piping (Photo 1) and the second that housed the controls to the system. The tank contained NF Aer-O-Foam XL-3, which is a film-forming fluoroprotein (FFFP). Documentation of this material and results from the annual testing were displayed in front of the tank (Photo 2). A drum of this material was also stored along the wall in the same room as the tank (Photo 3). The manager of Metro Energy confirmed that this was a closed deluge system with a bladder tank. Piping extended from the tank to the bulk fuel storage area (red piping shown in Photo 4) and to the fuel station. A dike has been constructed around the storage tanks and would most likely contain releases of foam and fuel, if they were to occur.

The site visit continued to Site 7 – Former Fuel Depot (Photo 5), which is located east of Site 10A. All structures, with the exception of a concrete pad, have been removed from this area, which is undergoing environmental remediation.

The next visit was to Buildings 81-1, 2, 3, 4, and 5 – ASTF/Hangars. These buildings are currently occupied by private industries and could not be accessed at the time. While in the parking lot, the former Resident Engineer/Facility Manager pointed out the adjoining rooms between the individual buildings that housed the foam rooms, where the tanks containing AFFF were staged (Photo 6). These hangars are surrounded by concrete parking areas.

The site visit continued onto the northern part of the facility and the approximate area of the Equipment Training Area where the former Facility Manager of Northrop Grumman recalled discharging AFFF foam onto the concrete pad one time between 1996 and 1998. Since this time, the concrete pad has been removed and a paved road has been constructed through the Equipment Training Area (Photo 7).

Building 07-04 / 283 – The Fire House (Photo 8) was visited next. Due to the steel fabrication activities being conducted, the group was unable to gain access inside the building. The building was surrounded by concrete and / or gravel parking lot on all sides except for the east side, which was a grassy area.

The site visit continued to Buildings 06-15 (168) and 06-66 (318) - Aircraft Paint Hangars (Photos 9 and 10). The buildings were enclosed in a fence and the gates were closed, limiting access to these buildings. Areas of concrete were observed on the western side of the building. The site visit continued to ERP Site 6A – Former Fuel Calibration Area, where the Aircraft Paint Hangars could be viewed on the other side of the fence. Site 6A consists of a relatively flat, lightly vegetated field and is surrounded by woodlands. A drainage swale with a maximum depth of approximately 2 feet crosses the site.

The site visits concluded at Site 10B and Building 06-79 – Noise Suppression Hush House (Photos 11 and 12). The structures have been demolished, and the area consists of a relatively flat, lightly vegetated field and remnants of a concrete pad.

4.4 Recommendations Regarding Further PFAS Evaluation

This section summarizes the results of the PFAS PA. All sites identified in the document search and from interviews were considered in the evaluation and are included in Table 4-3. Sites were recommended for Further PFAS Evaluation or for No Further Action (NFA) for PFAS Evaluation based on the likelihood of PFAS use and potential for environmental release. Figures 4-1 and 4-2 show the locations on NWIRP Calverton of the Sites evaluated in the PFAS PA.

4.4.1 Implemented PFAS SI

This section describes the sites that are already in the SI stage. These sites and the rationale for including them in an SI are as follows:

4.4.1.1 ERP Site 2 – Fire Rescue Training Area

ERP Site 2 is shown on Figure 4-1 located on the south central area of Zone 1 (Halliburton NUS, 1992a). Site 2 was used as a fire rescue training area from the early 1950s through the mid 1990's. AFFF, gaseous Halon 1301, water, and dry chemical extinguishers were reportedly used to extinguish fires set on a pit filled with fuels. Jet fuels may have been among the fuel types burned. An aboveground storage tank (AST) was located north of the training area at one time, and an underground storage tank (UST) was near that location prior to 1982. Oil / fuel oil spills were also noted at this site (Rogers, Golden, and Halpern, 1986).

Site 2 is included in Table 4-3 and is undergoing PFAS SI because historical documents state that AFFF was used at the Site. During the 2016 Site Investigation and 2017 SI, on-property and off-property monitoring wells and one residential water supply well were sampled and analyzed for PFAS. The higher concentrations were found in on-property monitoring wells. Concentrations of PFAS on-property were observed as high as 1,500 ng/L exceeding the USEPA Lifetime Health Advisory of 70 ng/L. Concentrations of PFAS in off-property monitoring wells were observed as high as 120 ng/L. PFAS was present in the residential well but the result was below the USEPA Lifetime Health Advisory. In addition, new plumbing and Teflon tape was observed at the sample port and most likely contributed to the low detection of PFAS. Sampling continued on a quarterly basis at the residential well, and the results were non-detect during five rounds of sampling.

4.4.1.2 Building 06-15 (168) – Aircraft Paint Hangar

Building 06-15 (shown as "168" on Figure 4-2) is in Zone 1 in the Process Area in the central area of the Site. It was constructed in the early 1950s and used until the mid-1980s. Painting and paint stripping of aircraft occurred here. Prior to 1978 the stripping and washing chemicals and paint residues entering the floor drains went to holding tanks and were then transported to NWIRP Bethpage for treatment at Plant 02 IWTP. An outside underground sump located north of the old paint shop was used to collect the wastewater from this building's floor drain and from the trench drains in each bay of the paint shop (Rogers, Golden, and Halpern, 1986). An AFFF system may have been tested in the 1980-1981 timeframe by a full dump of water and AFFF inside the structure. The residual AFFF / water reportedly was not captured. Interview information confirmed that this building had a suppression system with AFFF, and that a full dump was initiated during a test of the suppression system (the former Resident Engineer/Facility Manager Interview, 09/12/17).

Building 06-15 is included in Table 4-3 for further PFAS evaluation and is undergoing a PFAS SI. Information indicates that a full dump of the fire suppression system that contained AFFF was conducted here.

4.4.1.3 Buildings 06-66 (318) – New Aircraft Paint Hangar

Building 06-66 (shown as “318” on Figure 4-2) is in Zone 1 in the Process Area in the central area of the Site. It is adjacent to Building 06-15 (Aircraft Paint Hangar). The New Aircraft Paint Hangar was constructed in the early 1980s and used for painting operations for aircraft and chemical storage (CF Braun, 1997a). No paint storage or mixing occurred. Paint overspray was drawn to the north wall where air filters trapped it and exhausted fumes were vented to the outer air (Geraghty & Miller, 1995). Based on interview information, an AFFF system was tested in 1980-1981 by a full dump of water and AFFF inside the structure. The residual AFFF / water was captured. Interview information indicated that this building had a suppression system with AFFF, and a full dump was initiated during a test of the suppression system (the former Resident Engineer/Facility Manager Interview, 09/12/17).

Building 06-66 is included in Table 4-3 for further PFAS evaluation and is undergoing a PFAS SI because AFFF was dumped as a test of the fire suppression system.

During the 2016 Site Investigation and 2017 SI, on property monitoring wells located downgradient of Buildings 06-15 (168) and 06-66 (318) were sampled and analyzed for PFAS. Concentrations were observed to be as high as 360 ng/L, exceeding the USEPA Lifetime Health Advisory of 70 ng/L.

4.4.2 Further PFAS Assessment Recommended

This section describes areas and buildings for which some key words from the document search were identified, and a review of their site history supports Further PFAS Evaluation. These areas or buildings and the rationale for including them for further PFAS Evaluation are as follows:

4.4.2.1 Site 1, Northeast Pond Disposal Area

Site 1 (shown on Figure 4-1) is located in the northeast area of Zone 1 near Zone 5, and this area was used by the Navy from 1947 to 1984 as a landfill for nonhazardous materials (Rogers, Golden, and Halpern, 1986). The disposal area was estimated to measure 400 feet by 200 feet (Navy and NYSDEC, 2002). It is estimated that approximately 7,500 cubic yards of debris and fill were disposed of here. Reportedly, debris included an aircraft fuselage of aluminum and metal components, concrete

columns, asphalt macadam, plywood, framing lumber, rusting metal parts, paint pails/paint residue (Rogers, Golden, and Halpern, 1986). Undocumented materials may have included: petroleum, oils, lubricants, asphalt, and halogenated and non-halogenated solvents. Remedial investigations conducted from 1991 to 2002, indicated that VOCs, SVOCs, pesticides, PCBs and inorganics were detected in site media. From 2002 to 2004, approximately 50,000 cubic yards of contaminated material were excavated and disposed off property.

Site 1 is included in Table 4-3 for further PFAS evaluation because undocumented material was disposed in the landfill. As indicated by the results of previous remedial investigations, it is possible that soils excavated as a result of fuel spills that occurred at the facility may have been disposed at this landfill. This soil may have potentially contained PFAS if AFFF was used during these spills.

4.4.2.2 Building 06-75 – Paint Stripper Building

Building 06-75 (shown on Figure 4-2) is in Zone 1 in the Process Area in the central area of the Site. This building was constructed in 1988 and was demolished in 1995. Paint stripping activities were conducted here (CF Braun, 1997a). Additionally, interview information notes that the building was equipped with an AFFF suppression system, but there is no knowledge of a dump at this building (the former Resident Engineer/Facility Manager Interview, 09/12/17).

Building 06-75 is included in Table 4-3 for further PFAS evaluation because the building contained an AFFF fire protection system. While large releases of AFFF were not noted in the interview or document review process, occasional testing of foam specifications is likely to have occurred over the years of operation, with the potential for multiple small releases of AFFF samples to the environment from this activity.

4.4.2.3 Building 06-78 [327] – Aircraft Fuel Storage Terminal

Building 06-78 (shown as “327” on Figure 4-2) is in Zone 1 in the West Cantonment Area in the central area of the facility. This building was constructed in 1983 and was used for fuel storage. There were two 500,000 gallon Jet A Fuel ASTs (06-12-16 and 06-12-17) associated with operations at the terminal. A spill at the dispensing point was reported on March 29, 1992 to NYSDEC. Approximately 75 gallons of fuel had leaked out of the dispensing valve and had overflowed the sump and entered adjacent soil. Approximately 30 cubic yards of soil were removed as part of a remedial action (CF Braun, 1997a). According to interview information, this terminal was equipped with an AFFF system 800-gallon AFFF tank [CF Braun, 1997a]), and there is no knowledge of dumps at this terminal (the former Resident Engineer/Facility Manager Interview,

09/12/17). This terminal is currently in use by United Metro Energy. Site visit information indicated that there is still an active suppression system, but the AFFF has been replaced with FFFP foam (confirmed during the site visit).

Building 06-78 is included in Table 4-3 for further PFAS evaluation because the building contained an AFFF fire protection system. Occasional testing of foam specifications is likely to have occurred over the years of operation, with the potential for multiple small releases of AFFF samples to the environment from this activity.

4.4.2.4 Building 06-79 – Noise Suppression Hush House

Building 06-79 (shown on Figure 4-2) is in Zone 1 in the Process Area in the central area of the Site. This building was an aircraft hangar constructed in 1985 and demolished in 1995. It was used for testing aircraft engines at various power outputs. Two 500-gallon ASTs containing 3% AFFF were located in the equipment room. Also, this building contained 340-lb cylinders of Halon 1301 (ERM-Northeast, 1995). Interview information indicates that this building was equipped with two suppression systems: Halon and AFFF, but there is no knowledge of a dump at this building (the former Resident Engineer/Facility Manager Interview, 09/12/17).

Building 06-79 is included in Table 4-3 for further PFAS evaluation because the building contained an AFFF fire protection system. Occasional testing of foam specifications is likely to have occurred over the years of operation, with the potential for multiple small releases of AFFF samples to the environment from this activity.

4.4.2.5 Building 07-04 [283] – Flight Emergency Shelter (Fire House)

Building 07-04 (shown as “283” on Figure 4-2) is in Zone 1 in the Plant 7 Area in the central area of the facility. This building was constructed in 1968 and was used for housing fire-fighting and emergency rescue vehicles and personnel (CF Braun, 1997a). The fire protection system at this building consisted of a wet system and one stand pipe (Navy, 1995). There is no knowledge of discharge of AFFF around the former fire station but buckets of AFFF was stored inside the building (former Facility Manager for Northrop Grumman/Private Contractor Interview, 09/27/17).

Building 07-04 is included in Table 4-3 for further PFAS evaluation because it was used for storage of AFFF and as a material handling area for AFFF. Occasional testing of foam specifications is likely to have occurred over the years of operation, with the potential for multiple small releases of AFFF samples to the environment from this activity.

4.4.2.6 Buildings 81-01 (ASTF Building) and 81-02 through 81-05 (Hangars 5, 6, 7, and 8)

Building 81-01 and its associated hangars (shown on Figure 4-2) were constructed in 1985 through 1987 and are located in Zone 1 in the Plant 7 Area in the central area of the facility. The ASTF Building contains office space and mechanical equipment rooms. Four 1,600-gallon ASTs of a fire-fighting chemical were located in the mechanical rooms, as reported by the Phase I EBS (CF Braun, 1997a). The Phase I Environmental Assessment for Area 3 (ERM-Northeast, 1995) noted that four 1,600-gallon AFFF storage tanks, and eight 55-gallon drums of AFFF to replenish the tanks were located in this building. According to interview information, the hangar buildings were equipped with AFFF systems, and there is no knowledge of dumps at these buildings; these buildings are currently in use from a private industry (the former Resident Engineer/Facility Manager Interview, 09/12/17).

Building 81-01 and the associated hangars are included in Table 4-3 for further PFAS evaluation because the building contained an AFFF fire suppression system. Occasional testing of foam specifications is likely to have occurred over the years of operation, with the potential for multiple small releases of AFFF samples to the environment from this activity.

4.4.2.7 Jet Fuel Spill Site – Side of Northwest Calverton Runway

On June 6, 1985, AFFF foam was used to address a fuel spill from an aircraft due to tire blowout during takeoff. This incident occurred on the side of the northwest runway (see Figures 4-1 and 4-2). Reportedly, five gallons of jet fuel oil from an EF-111 aircraft spilled on the ground in this area. The liquid from the spill was removed by Grumman and Marine Pollution Control (Halliburton NUS, 1992c).

The Jet Fuel Spill Site on the side of the northwest Calverton runway was included in Table 4-3 for further PFAS evaluation because AFFF was released in this area.

4.4.2.8 Equipment Training Area

The Equipment Training Area (shown on Figure 4-2) is located northeast of Plant 7. According to interview information, this area was used between 1981 and 1996 for training with fire equipment. AFFF was discharged on a concrete pad; at the time, this area was designated as the Aircraft Parking Area. Fires were not set in this area. But AFFF was discharged, and water was used to dilute and wash away the foam (former Facility Manager for Northrop Grumman/Private Contractor Interview, 09/12/17).

The Equipment Training Area northeast of Plant 7 is included in Table 4-3 for further PFAS evaluation because AFFF was discharged in this area.

4.4.2.9 Aircraft Crash Sites

The historical NIRIS documents search identified three aircraft crashes that occurred after the mid-1960s, which is when PFAS was manufactured. Figure 4-1 shows the approximate locations of the crash sites.

- In 1967, an F-111 crashed at the 6,000 foot mark on Runway 32-14 (Zone 1), and the plane burned on the runway without a fuel release.
- In 1983, an EF-111 crashed midway on Runway 32-14, with a resulting fuel spill that was immediately cleaned up by NYSDEC.

The Phase I EBS (CF Braun, 1997a), which reports these crashes, did not state whether AFFF was used as part of the emergency response for any of these crashes.

The F-111 and EF-111 aircraft crash sites are included in Table 4-3 for further PFAS evaluation because these areas were accessible for emergency response vehicles that were equipped with AFFF and it is possible that the AFFF was used as part of the emergency response for aircraft crashes.

4.4.3 No Further PFAS Assessment Needed

This section describes areas and buildings for which a review of their site history supports No Further PFAS Evaluation. These areas/buildings and the rationale for no further PFAS Assessment are as follows:

4.4.3.1 Aircraft Crash Sites

The historical NIRIS documents search identified three aircraft crashes at the facility. Figure 4-1 shows the approximate locations of the crash sites.

- In 1956, an F-11 aircraft crashed in the southeast buffer area, just south of the Long Island Railroad and north of the Long Island Expressway on the approach to Runway 32-14; reportedly, the aircraft burned at the crash site.
- In the early 1960s, a C-54 crash occurred in the Northeast Pond Disposal Area (Zone 1), resulting in a fuel release. The C-54 was reportedly buried in the Northeast Pond Disposal Area.

- In 1970, an F-14 crashed in the southeast buffer just south of the Long Island Railroad, north of the Long Island Expressway on the approach to Runway 32-14, with the aircraft burning at the crash site.

The F-11 and C-54 aircraft crash sites are not recommended for further action because PFAS were not manufactured until the mid-1960s and it is unlikely that AFFF was used in response to the earlier crashes (i.e., the crashes in 1956 and the early 1960s). The F-14 aircraft crash site is not recommended for further action because the area of the crash was in a heavily vegetated area that most likely could not have been accessed by crash crews.

4.4.3.2 ERP Site 3 – Ammunition Demolition Area

Site 3 (shown on Figure 4-2) is located in Zone 1, in western area of the facility, approximately 1,600 feet northwest of Runway 5-23. The Site was used from 1957 to 1985 for demolition of ammunition-related wastes. Residues of fuel oil (JP-4 and JP-5) were used to destroy the explosive components (Rogers, Golden, and Halpern, 1986) by dumping them into a kettle fire that was set in a 55-gallon drum placed in an unlined pit (Halliburton NUS, 1992b).

Site 3 is included in Table 4-3 for no further PFAS evaluation because even though fires were set at this area using waste fuel, it was a contained, controlled burn that most likely smoldered out on its own, so the use of AFFF is unlikely at this Site.

4.4.3.3 ERP Site 4 – Picnic Grounds Disposal Area

Site 4 (shown on Figure 4-1) is located in Zone 1 in the western area of the facility, approximately 500 feet west of Site 3. Site 4 was used as a disposal area from the mid-1950s through the mid-1980s. The site consists of a single trench-style landfill of approximately 60 feet by 40 feet where materials such as framing lumber, snow fencing, steel wall studs, steel stairways and ladders, tubular tow bars, tubular steel supports, foam billets, a plastic nosecone, a card table, stainless steel fabrications, plastics, carpeting, metal fabrications were disposed. No cans, barrels, or other containers which may have held liquid wastes were observed during the IAS (Rogers, Golden, and Halpern, 1986).

Site 4 is included in Table 4-3 for no further evaluation for PFAS because this site was used primarily as a construction debris landfill, and PFAS-containing materials are unlikely to have been disposed of at this site.

4.4.3.4 ERP Site 5 – 1950s Gun Range Ammunition Disposal Area

Site 5 (shown on Figure 4-1 and Figure 4-2) is located in the central area, east of the Process Area. Site 5 was in use from the early 1950s to 1957. Guns and airborne cannon were tested. Ammunition disposal area was immediately west of the test range (Rogers, Golden, and Halpern, 1986).

Site 5 is included in Table 4-3 for no further evaluation for PFAS because the types of material disposed of at Site 5 (i.e., ammunition) are not anticipated to be sources of PFAS.

4.4.3.5 ERP Site 6A – Fuel Calibration Area

Site 6A including Building 06-16 is located in the Process Area in the central area within Zone 1. The building was not equipped with a fire protection system (Navy, 1995). The Site was used for testing of aircraft fuel and engines from the 1950s through the mid-1990s (NAVFAC MIDLANT, 2012). The old and new fuel calibration pads are included in this area. At the old fuel calibration pad, pre-flight testing was performed, so fuel spillage may have occurred. The new fuel calibration pad and the associated apron were also used for the same activities. A spill of an unknown quantity of oil/water mixture occurred on November 28, 1984; contaminated soil was removed (Rogers, Golden, and Halpern, 1986). A Record of Decision (ROD) was signed in May 2012 to address groundwater under this Site for volatile organic compounds (NAVFAC MIDLANT, 2012).

Site 6A is included in Table 4-3 for no further evaluation for PFAS because the building did not contain a fire protection system and there is no known historical use of AFFF at this Site.

4.4.3.6 ERP Site 6B – Discontinued Engine Run-Up Area

The Site 6B (shown on Figure 4-1) is located on the south side of Runway 32-14. Pre-flight testing was performed at this location. (CF Braun, 1997a). On February 24, 1983 a spill of 30 gallons of JP-5 fuel washed onto the ground; contaminated soil was removed by NG personnel (Rogers, Golden, and Halpern, 1986).

Site 6B is included in Table 4-3 for no further evaluation for PFAS because no supporting documentation found that a fire protection system was present at this site and there are no reports that AFFF was used to address the fuel spills.

4.4.3.7 ERP Site 6C – South End of Runway 32-14

Site 6C (shown on Figure 4-1) was located at the south end of Runway 32-14. This location was noted as a potential fuel spill/leakage area (CF Braun, 1997a).

Site 6C is included in Table 4-3 for no further evaluation for PFAS because there are no documented reports of AFFF use at this Site.

4.4.3.8 ERP Site 7 – Fuel Depot

Site 7 (shown on Figure 4-1 and 4-2) is located in Zone 1 in the West Cantonment Area/central area of the Site, adjacent to Site 10A. Site 7 includes Building 06-12 (179) and several USTs and an AST. The building was not equipped with a fire protection system (Navy, 1995). The Fuel Depot was constructed in 1953 and used as one of the main buildings for storage of jet fuel, gasoline, and other aircraft and motor fuels, along with the Aircraft Fuel Storage Terminal (06-78; 327) (CF Braun, 1997a). JP-4 and JP-5 jet fuel were stored in USTs, and fuel was received and dispensed in this area (Halliburton NUS, 1992b). The Fuel Depot fuel storage tanks were either removed or taken out of service as reported by the Phase I EBS (CF Braun, 1997a). A spill of an unknown quantity of jet fuel occurred on April 4, 1986, with subsequent soil removal (CF Braun, 1997a). A pump house was located at western edge and a maintenance garage at the southeastern corner (Halliburton NUS, 1995a).

Site 7 is included in Table 4-3 for no further evaluation for PFAS because the building did not contain a fire protection system. Water based and CO₂ portable fire extinguishers were reportedly stage at Building 06-12 (Navy, 1995). There is no known historical use of AFFF at this Site.

4.4.3.9 ERP Site 8 – Coal Storage Pile

Site 8 (shown on Figure 4-1 and Figure 4-2) is the location of a coal pile that was stored to the west of the Steam Plant in order to supply that building with fuel. Site 8 is located in the West Cantonment Area. Coal was used by the steam plant prior to 1971. Waste solvents and jet fuel were sprayed on the coal prior to burning. The nearby Steam Plant (see section 4.4.3.17) contained large water pumps used for fire suppression in buildings throughout NWIRP Calverton. Hydrants were present in the area of the coal pile and were most likely used to extinguish fires if one occurred. The coal pile was partially removed by 1996 (CF Braun, 1997a).

Site 8 is included in Table 4-3 for no further evaluation for PFAS because, while jet fuel was sprayed here, it is unlikely that this area is a source of PFAS. The steam plant

(Building -06-05) was equipped with large water pumps for fire suppression and these pumps would likely be used to suppress fires at the coal pile (see section 4.4.3.17).

4.4.3.10 ERP Site 9 – Electronic Counter Measure (ECM) Area

Site 9 (shown on Figure 4-1) is located in the northeast area of the Calverton facility area, near the Zone 1 perimeter. This area was used beginning in the 1970s and was a 10-acre clearing used for testing and evaluating ECM equipment. 1,1,1-Trichloroethane was used in activities here (CF Braun, 1997a).

Site 9 is included in Table 4-3 for no further evaluation because the ECM area would unlikely use PFAS in its operations.

4.4.3.11 ERP Site 10 – Cesspools/Leach Fields

Site 10 (shown on Figure 4-1 and 4-2) is made up of former cesspool/leach field areas at various locations throughout Zone 1 of the facility. The Resource Conservation and Recovery Act (RCRA) Facility Assessment Sampling Visit (Halliburton NUS, 1995b) noted that these areas were used for sanitary purposes, but some (8 out of 22) of the areas were evaluated due to their proximity to industrial sites and the potential for industrial wastewater discharge. The report noted that potential fuel and related contamination may be present in the areas of the Jet Fuel Systems Lab (Building 06-11 [230]) and the Engine Test House (Building 06-18 [211]) (Halliburton NUS, 1995b).

Site 10 is included in Table 4-3 for no further evaluation for PFAS because the cesspools/leach fields are associated with buildings that are not considered a source of PFAS.

Leachpool areas listed in Table 4-3 include the following:

- East of Fuel Calibration Area/Building 06-73 [325]
- North of Anechoic Chamber (07-05 [284])
- South of Plant 7, associated with Sewage Pump Station (07-03 [177])
- Overflow pools to the north of Sewage Pump Station (06-17 [178])
- Associated with Jet Fuel Systems Lab (06-11 [230])
- Associated with Engine Test House (06-18 [211])
- Associated with Facilities Maintenance Building (06-13 [283])
- Associated with Vehicle Transportation Building (06-42 [285])
- Associated with Steam Plant (06-05 [167])

4.4.3.12 ERP Site 10A – Jet Fuel Systems Laboratory

Site 10A (shown on Figures 4-1 and 4-2) is located in Zone 1 in the West Cantonment Area in the central area of the facility. The Jet Fuel Systems Laboratory (Building 06-11 [230]) is a 12,300 square foot building that was constructed in 1957, and 3 USTs containing waste and calibration oil associated with the operation. These tanks were removed prior to February 1996. The fire protection systems consisted of one deluge system (water), CO₂ at the control rooms, and a wet system (Navy, 1995). Aircraft fuel systems testing occurred at this site (CF Braun, 1997a). This area had a concrete apron to the south that was used for anchoring aircraft, and it was noted that possible fuel/oil contamination could exist in this area. Petroleum products, solvents, Freon, trichloroethene, and methylene chloride were stored here. A spill related to the laboratory operations was reported in 1992 (CF Braun, 1998).

Site 10A is included in Table 4-3 for no further evaluation for PFAS because the building did not contain a fire protection system with AFFF.

4.4.3.13 ERP Site 10B – Engine Test House

Site 10B (shown on Figure 4-1 and Figure 4-2) is located in Zone 1 in the Cantonment Area, Process Area in the central portion of the Site. The Engine Test House (Building 06-18 [211]) contained two engine test bays, a control room, and utility rooms. Pre-flight testing was performed, so fuel spillage may have occurred, and fuel/oil contamination was possible. It was noted that this building had a red colored tank and pump on the second floor, presumably for fire suppression and that the upstairs control room contained fire suppression equipment. The fire protection system consisted of CO₂ Cardox System (Cells A&B) (Navy, 1995). The Engine Test Pump House (06-37 [212]; discussed separately) is also located nearby (CF Braun, 1997a).

Site 10B is included in Table 4-3 for no further evaluation for PFAS because the building did not contain a fire protection system with AFFF.

4.4.3.14 Building 06-01 [166] – Main Operations Building

Building 06-01 (shown as “166” on Figure 4-2) was constructed in 1952 and is approximately 300,000 square feet, and is located in the Plant 6 area in the central portion of the facility. The Plant 6 Main Operations Building staged aircrafts in order to perform operations relating to aircraft assembly (CF Braun, 1997a). Photo processing materials and wastes were handled here, as well as paints and alodine. The engine shop used significant quantities of liquid materials including jet fuel, solvents, and oil. Large hangar-type doors allowed access for aircraft, large equipment, and machinery of

the high bay manufacturing area. Aircraft generator test shop housed significant quantities of hydraulic fluid and other hazardous substances (CF Braun, 1997a). The fire protection systems consisted of eighteen sprinklers and a Halon system (Navy, 1995). Interview information indicated that a small plating operation (small tank line) was present at Plant 6, but it is not known if it was chromium plating, and the interview does not specify if this was in the Plant 6 main operations building or another building in the Plant 6 area (the former Resident Engineer/Facility Manager Interview, 09/12/17).

Building 06-01 is included in Table 4-3 for no further evaluation for PFAS because this building did not contain an AFFF fire protection system.

4.4.3.15 Building 06-02T – Former Location of Fire Guard Trailer

Building 06-02T (not shown) was located in Zone 1, southwest of McKay Lake, northwest of Building 06-77 (Emergency Vehicle Shelter). This building was a temporary structure used as office space and a work shop. The structure is no longer present (CF Braun, 1997a).

Building 06-02T was included in Table 4-3 for no further evaluation for PFAS because, although its name suggests that this building may have been associated with fire-fighting activities, available historical information indicates this building's use was not related to fire-fighting.

4.4.3.16 Building 06-04 [169] – (also known as Warehouse 5-7)

Building 06-04 (shown as "169" on Figure 4-2) was located in Zone 1 in the West Cantonment Area in the central part of the Site. This building was built in 1953 and stored aircraft parts for assembly. The building consisted of a packaging area with a wood working shop. There was a solvent based foam packaging system and Freon cylinders (CF Braun, 1997a).

Building 06-04 was included in Table 4-3 for no further evaluation for PFAS because, although PFAS may be associated with some materials used for packaging, the quantities are likely to be low for concern of environmental release.

4.4.3.17 Building 06-05 [167] – Steam Plant

Building 06-05 (shown as "167" on Figure 4-2) was built in 1954 and located in Zone 1 the central area of the Calverton facility. The steam plant was operated using coal from 1954 to 1971 and using fuel oil starting in 1972. On the first floor of this building, there were large water pumps used for fire suppression in buildings throughout NWIRP Calverton (closed-loop system). Seven petroleum storage tanks are associated with

operations at the Steam Plant. Two 275 gallon diesel fuel ASTs on the west side of the building were used for fire suppression pumps. There was a fly ash suppression system which used a water medium adjacent to the plant. Wastewater discharged to cesspool/leach field (CF Braun, 1997a).

Building 06-05 was included in Table 4-3 for no further evaluation for PFAS because the fire protection system consisted of water tanks and pumps and a sprinkler system.

4.4.3.18 Building 06-13 [282] – Facilities Maintenance Building

Building 06-13 (shown as “282” on Figure 4-2) was constructed in 1966 and is in Zone 1 in the West Cantonment Area in the central area of the facility. Building 06-13 was previously used as vehicle maintenance bays. A hazardous waste/materials storage locker was present, and adhesives and glues were noted in the wood shop (CF Braun, 1997a). The fire protection system consisted of a one riser wet system (Navy, 1995).

Building 06-13 was included in Table 4-3 for no further evaluation for PFAS because this building did not contain an AFFF fire suppression system.

4.4.3.19 Building 06-17 [178] – Sewage Pump Station

Building 06-17 (shown as “178” on Figure 4-2) is located in the Process Area in the central area of the facility. The sewage pump station, adjacent to the industrial wastewater treatment plant (WWTP) (Building 06-64 [316]), was constructed in the early 1980s, and was part of the original sanitary waste system for the old paint shop, the original main assembly building, and other buildings in the area. Emergency overflow leaching pools were located to the north (Geraghty & Miller, 1995).

Building 06-17 is included in Table 4-3 for no further evaluation for PFAS because the building was a part of the sanitary waste system and used to handle sewage. There is no known releases of PFAS containing material to the sewage system.

4.4.3.20 Building 06-28 [213] – (also known as EF-111 Thrust Stand/Thrust Stand Shack)

Building 06-28 is located in Zone 1 in the Airfield Area, just east of Site 6B. The Thrust Stand Shack was used to store and handle hydrazine (CF Braun, 1997a). In 1984, 40 gallons of JP-4 fuel spilled on the Thrust Stand Apron and ran off into the dirt. This was cleaned up and soil was excavated by Marine Pollution Control (Halliburton NUS, 1992c). This building did not have a fire protection system (Navy, 1995).

Building 06-28 was included in Table 4-3 for no further evaluation for PFAS because the building did not have a fire protection system nor an indication that AFFF was used following the reported jet fuel spill.

4.4.3.21 Former Building 06-29 – Old Exterior AMMO Storage Shed

Building 06-29 was located in Zone 1 east of the Ammunition Storage Bunkers. This building was built in 1952 and demolished prior to 1995. Building 06-29 was used for the storage of explosives (CF Braun, 1997a). There is no documentation that this building was equipped with an AFFF system.

Building 06-29 was included in Table 4-3 for no further evaluation for PFAS because there is no documentation that an AFFF system was at this building and it was more likely to be hooked up to the closed-loop fire suppression system at Calverton, which used water.

4.4.3.22 Building 06-30 – Exterior AMMO Storage Shed

Building 06-30 (not shown) was located in Zone 1 east of the Ammunition Storage Bunkers. This building was built in 1962 and used for storage of explosives; later stored packaging materials and an explosion-proof fork lift (ERM-Northeast, 1995). There is no documentation that this building was equipped with an AFFF system.

Building 06-30 was included in Table 4-3 for no further evaluation for PFAS because there is no documentation that an AFFF system was at this building and it was more likely to be hooked up to the closed-loop fire suppression system at Calverton, which used water.

4.4.3.23 Building 06-37 [212] – Engine Pump House

Building 06-37 (shown as “212” on Figure 4-2) is located in the Process Area in the central area of the site. This building was constructed in 1955 and contained a fuel filtering system and pumps. Four USTs, including one with JP-4/5, were located immediately to the north of the pump house. A spill reportedly occurred in 1982, when 200 gallons of JP-4 fuel spilled; absorbent was used to address the spill, and contaminated soil was removed (CF Braun, 1997a).

This building did not contain a fire suppression system (Navy, 1995); therefore, Building 06-37 was included in Table 4-3 for no further evaluation for PFAS.

4.4.3.24 Building 06-42 [285] – Vehicle Transportation Building (Transportation Storage Area)

Building 06-42 (shown as “285” on Figure 4-2) was located in the west Cantonment Area in the central area of the facility. This building was constructed in the 1960s and used until at least 1995. Maintenance of vehicles and storage of fuels, solvents, oils, antifreeze, and batteries were observed in this area. A leach field was also located in this area (Halliburton NUS, 1995).

This fire protection system consisted of one wet system (Navy, 1995); therefore, Building 06-42 was included Table 4-3 for no further evaluation for PFAS.

4.4.3.25 Building 06-43 [286] – Sewage Treatment Plant

Building 06-43 (shown as “286” on Figure 4-2) was constructed in 1969 and is in Zone 1 in the Process Area in the central area of the Site. Building 06-43 received effluent material consisting of sanitary wastes, oil-water blow-down and floor drain discharge from industrial activities, and treated waste from Building 06-64 (316). Waste sludge generated was disposed of off-site, and treated effluent was discharged to McKay Lake (CF Braun, 1997a). This building did not contain a fire protection system (Navy, 1995).

Building 06-43 was included Table 4-3 for no further evaluation for PFAS because this building there are no know releases of PFAS containing material into the sewage system.

4.4.3.26 Building 06-46 – Quonset Hut (Maintenance Facility)

Building 06-46 (not shown) was located in Zone 1 in the West Cantonment Area in the central area of the Site. This building was a small (approximately 7,680 square feet in area) support building that was used for vehicle maintenance, and hydraulic fluid was also stored here (Dvirka and Bartilucci, 1995a). This building was demolished in 1995 (CF Braun, 1997b).

Building 06-46 was included in Table 4-3 for no further evaluation relative to PFAS because it is unlikely that a fire protection system was located here based on the small size and operations performed in the building.

4.4.3.27 Former Building 06-48 – Aircraft Shelter

Building 06-48 (shown on Figure 4-2) is in Zone 1 in the Plant 6 area. This building was adjacent to the southeastern corner of the Main Operations Building (CF Braun, 1997b). Building 06-48 was used for paint stripping from the early 1970s to early 1980s (Dvirka

and Bartilucci, 1995a). This building also housed an x-ray booth and developing process area. Building 06-48 was demolished in 1995 (CF Braun, 1997b).

Building 06-48 was included in Table 4-3 for no further evaluation relative to PFAS because it is unlikely that a fire protection system was located here based on the small size and operations performed in the building.

4.4.3.28 Building 06-49 – Aircraft Shelter (Two-Bay)

Building 06-49 (Figure 4-2) is in Zone 1 in the Process Area in the central area of the facility. This building was constructed in the mid-1980s. Building 06-49 was used for the storage and maintenance of aircraft. This building was also constructed over an underground settling tank and leaching pool formerly used to collect and discharge paint spillage from the old paint shop (Geraghty & Miller, 1995).

Building 06-49 is included in Table 4-3 for no further evaluation for PFAS because the building is unlikely to have a fire protection system

4.4.3.29 Buildings 06-52, 53, and 54 – Aircraft Shelter (Three-Bay)

Buildings 06-52, 53, and 54 (shown on Figure 4-2) are in Zone 1 in the Process Area in the central area of the facility. These areas were constructed in the mid-1980s and used for final preparation, storage, and maintenance of aircraft. No manufacturing, assembly, testing, or painting occurred here (Geraghty & Miller, 1995). This building had a fire protection system that consisted of two deluge and one wet system (Navy, 1995).

Buildings 06-52, 53, and 54 are included in Table 4-3 for no further evaluation for PFAS because these buildings were not equipped with AFFF fire suppression systems.

4.4.3.30 Building 06-51 [315] – Hydraulic Equipment Building

Building 06-15 (shown as “315” on Figure 4-2) was constructed in 1973 and is in Zone 1 in the Plant 6 Area in the central area of the facility. Building 06-15 is a 3,300 square foot structure and is adjacent to Building 06-01, the Main Operations Building for Plant 6. Building 06-15 was used for the storage of hydraulic equipment and also contained hydraulic pumps in concrete secondary contaminant (CF Braun, 1997a). The fire suppression system consisted of one wet system that was tied to Building 06-01 (Navy, 1995).

Building 06-15 is included in Table 4-3 for further evaluation for PFAS because the building did not contain an AFFF fire suppression system.

4.4.3.31 Building 06-63 [296] – A/C Engine Run-In Building

Building 06-63 (shown as “296” on Figure 4-2) is in Zone 1 in the Process Area in the central area of the Site. This building was constructed in 1970 and was a hangar that allowed aircraft to enter and exit. Aircraft engines were tested at different power outputs. When aircraft entered the hangar and engines were shut down, it was necessary to discharge the fuel remaining in the system (CF Braun, 1997b).

Building 06-63 is included in Table 4-3 for no further evaluation for PFAS because this building did not contain a fire protection system.

4.4.3.32 Building 06-64 [316] – Industrial Wastewater Treatment Plant

Building 06-64 (shown as “316” on Figure 4-2) is in Zone 1 in the Process Area in the central area of the Site. This building was constructed in the late 1970s and treated industrial wastes include wasted from the photo lab and paint shops/paint stripping areas. This building did not have a fire protection system (Navy, 1995).

Building 06-64 is included in Table 4-3 for no further evaluation for PFAS because there is currently no confirmation that AFFF-containing waste waters were treated in the WWTP. However, if further evaluation of other buildings and / or areas determine that AFFF was handled at this treatment plant, investigations will be conducted to evaluate potential migration pathways from these operations to the WWTP.

4.4.3.33 Building 06-67 [319] – New Chemical Storage Building

Building 06-67 (shown as “319” on Figure 4-2) is in Zone 1 in the Process Area in the central area of the Site. This building was constructed in the early 1980s and used for chemical storage (Geraghty & Miller, 1995). This building did not have a fire protection system (Navy, 1995).

Building 06-67 is included in Table 4-3 for no further evaluation for PFAS because this building did not contain a fire suppression system.

4.4.3.34 Building 06-73 [325] – New Fuel Calibration Area

Building 06-73 (shown as “325” on Figure 4-2) is in Zone 1 in the Process Area in the central area of the Site. High volumes of jet fuel, hydraulic fluid, and other petroleum products were handled at this location. A leach field was located nearby (Halliburton NUS, 1995b). This building did not contain a fire protection system (Navy, 1995).

Building 06-73 is included in Table 4-3 for no further evaluation for PFAS because this building did not contain a fire suppression system.

4.4.3.35 Building 06-74 [326] – Machine Shop Building

Building 06-74 (shown as “326” on Figure 4-2) is in Zone 1 in the Plant 6 area in the central area of the Site, west of Building 06-01 (166). This building was constructed in the early 1980s and included a hydraulic test lab, welding shop, and hydraulic wash area. Drums of waste paint and solvents as well as waste oil and hydraulic fluid were found in this area (CF Braun, 1997a). The fire protection system consisted of one wet system (Navy, 1995).

Building 06-74 is included in Table 4-3 for no further evaluation for PFAS because a fire suppression system.

4.4.3.36 Building 06-77 – Emergency Vehicle Shelter

Building 06-77 is in Zone 1 in the South Central Perimeter Area, South of the Plant 6 Area. This building was constructed in the mid-1970s and was used as a service garage for ambulance and other general emergency equipment and also had gasoline and other petroleum products for vehicles. A container of Metal X Powder (compound to fight metal fires) was observed here (ERM-Northeast, 1995). This building did not contain a fire protection system (Navy, 1995).

Building 06-77 is included in Table 4-3 for no further evaluation for PFAS because this building did not contain a fire suppression system.

4.4.3.37 Building 06-82 [329] – Hazardous Waste Storage Building

Building 06-82 (shown as “329” on Figure 4-2) was located in Zone 1 in the Process Area in the central area of the site. It was constructed in the mid-1980s and used to temporarily store drummed hazardous waste prior to removal by a contractor (Geraghty & Miller, 1995). This building did not contain a fire protection system (Navy, 1995).

Building 06-82 is included in Table 4-3 for no further evaluation for PFAS because this building did not contain a fire suppression system.

4.4.3.38 Building 07-01 [165] – Final Assembly Aircraft Building

Building 07-01 (shown as “165” on Figure 4-2) is in Zone 1 in the Plant 7 Area in the central area of the facility. This building was 160,000 square feet in size and included four aircraft hangars. This building contained areas designated for various industrial operations including a photo processing department on the third floor and maintenance areas. The Automatic Telemetry System (ATS) area, adjacent to Hangar 3, was inspected and Halon and carbon dioxide (CO₂) fire protection systems were identified. A hazard waste/material storage area between Hangars 1 and 2 was previously used as

a vehicle maintenance facility. Adhesives waste were among the wastes handled in this building. Storm water from this area was discharged to East Cantonment Pond (CF Braun, 1997a). The fire protection systems consisted of a thirty-one sprinkler system, CO₂ at ATS (outside) - for under floor fire protection, and a liquid nitrogen tank (outside) (Navy, 1995).

Building 07-01 is included in Table 4-3 for no further evaluation for PFAS because the building did not contain an AFFF fire suppression system.

4.4.3.39 Building 07-03 [177] – Sewage Lift Station (Pump House) and Settling Tanks/Leach Pools

Building 07-03 (shown as “177” on Figure 4-2) is in Zone 1 in the Plant 7 Area in the central area of the facility. This building received wastewater from Building 07-01 (165). This building was used to pump sanitary waste from Building 07-01 to the Sewage Treatment Plant (Building 06-43 [286]). Prior to 1969, sanitary waste was discharged to the settling tanks and then to cesspools/leach fields to the south of Plant 7 (CF Braun, 1997a). This building did not contain a fire protection system (Navy, 1995).

Building 07-03 is included in Table 4-3 for no further evaluation for PFAS because the building was used to handle sanitary waste and did not have a fire suppression system.

4.4.3.40 Building 07-05 [284] – Anechoic Chamber

Building 07-05 (shown as “284” on Figure 4-2) is in Zone 1 in the East Cantonment Area in the central area of the facility. This building was constructed in 1959 (CF Braun, 1997b). A 5,000 gallon carbon dioxide tank was located on the south side of the building for fire-fighting purposes (CF Braun, 1997a). The Fire Protection Systems consisted of a wet system in the service wing, CO₂ and refrigerated tank in the chamber, and a deluge in the chamber (Navy, 1995).

Building 07-05 is included in Table 4-3 for further evaluation for PFAS because the building did not contain an AFFF fire suppression system.

4.4.3.41 Building 07-19 – Picnic Maintenance Storage Shed G

Building 07-19 (not shown) was located in Zone 1 in the Picnic Grounds Area. The building was used starting in the 1960s for storage and contained fire extinguishers as well as multiple propane gas grill tanks and grills (ERM-Northeast, 1995).

Building 07-19 was included in Table 4-3 for no further evaluation for PFAS because, although some fire-fighting equipment (i.e., fire extinguishers) were stored here, it is unlikely that AFFF was included.

4.4.3.42 Building 07-30 – Former Location of Aircraft Shelter – Temporary

Building 07-30 (shown on Figure 4-2) was located in Zone 1 in the Plant 7 Area in the central area of the facility. It had been “recently used” according to the 1997 Phase I EBS (CF Braun, 1997a) as a helicopter hangar.

Building 07-30 is included in Table 4-3 for no further evaluation for PFAS because this building was a small temporary shelter that most likely did not contain an AFFF fire suppression system.

4.4.3.43 Building 07-33 [311] – Equipment Building Flight Line #2

Building 07-33 (shown as “311” on Figure 4-2) is located in Zone 1 in the Plant 7 Area in the central area of the Site. The Phase I EBS (CF Braun, 1997a) stated that observations at this facility indicated it may have been used as a satellite accumulation point for hazardous materials and wastes. This building did not contain a fire protection System (Navy, 1995).

Building 07-33 was included in Table 4-3 for no further evaluation for PFAS because the building did not contain a fire protection system.

4.4.3.44 Building 07-36 [299] – Flight Development Hangar (Hangar 5)

Building 07-36 (shown as “299” on Figure 4-2) is in Zone 1 in the East Cantonment Area in the central area of the facility. This building was constructed in 1974. It was an aircraft hangar consisting of a large bay area and equipment rooms (CF Braun, 1997a). The fire protection system included one wet system and four deluge systems (Navy, 1995).

Building 07-36 is included in Table 4-3 for no further evaluation for PFAS because the building did not contain an AFFF fire suppression system.

4.4.3.45 Building 80-01– Avionics Noise Check Building

Building 80-01 (Figure 4-2) is in Zone 1 in the East Cantonment Area in the central area of the facility. This building was one of the hangar structures included in Area 5 as evaluated in the Phase II EBS (CF Braun, 1997b). The fire protection system included one wet system and two deluge systems (Navy, 1995).

Building 08-01 is included in Table 3-2 for no further evaluation for PFAS because the building did not contain an AFFF fire suppression system.

4.4.3.46 Flight Line Number 1

Flight Line Number 1 (shown on Figure 4-1 and 4-2) is located in Zone 1, south of the central portion of Runway 32-14. This area was used for the parking and servicing of aircraft (CF Braun, 1997b).

Flight Line Number 1 was included in Table 4-3 for no further evaluation for PFAS since it is unlikely that PFAS containing material was used in this area.

4.4.3.47 Uncurbed Area North of Building G23

The uncurbed area north of Building G23 was located in Zone 1 in the Process Area in the central area of the Site. This area was used from 1980 to store fifty-five gallon drums of waste material such as methyl ethyl ketone, paints, phenolics, and 1,1,1-trichloroethene. The drums were placed on the concrete aprons immediately outside generating shops and then transported by personnel prior to removal from the site by a contractor (Rogers, Golden, and Halpern, 1986).

The Uncurbed Area North of Building G23 was included in Table 4-3 for no further evaluation for PFAS because, although potential PFAS-containing materials (e.g., paints) may have been stored in drums at this site, the quantities of PFAS are likely to have been low.

4.4.3.48 Tire Burn Site

The tire burn site (shown on Figure 4-1) was located in Zone 3 in the southwest buffer zone in the woods south of a former quarry. Evidence of a former tire/debris burning site was found there (CF Braun, 1997a).

The Tire Burn Site was included in Table 4-3 for no further evaluation for PFAS because it was a controlled burn that would not have been extinguished. Rather the tires would continue to burn until they were reduced to debris and the fire would smoldered out on its own.

4.4.3.49 Grass Fire Areas

According to personnel interviews, two grass fires have occurred at or nearby the Calverton facility. The first grass fire occurred within the 1996-1998 timeframe in Zone 1, inside the fence at the end of the western runway (approximate location on Figure 4-1). The interviewee noted that water was used to extinguish the fire. Additionally, a

second grass fire occurred in approximately 2012 southwest of Navy property, by Wading River Road (exact location undetermined). It is unknown what material was used to extinguish the second grass fire (the former Resident Engineer/Facility Manager Interview, 09/12/17).

The grass fire areas are both included in Table 4-3 for no further evaluation for PFAS because water was likely to have been used.

4.4.3.50 Helicopter Pad

A helicopter pad (shown on Figure 4-2) was located in Zone 1, northeast of the Paint Stripping Building (Building 06-75). A UST containing JP-5 fuel and possibly gasoline was present, along with underground piping. The UST was installed in 1975 and removed in 1987 (Geraghty & Miller, 1995).

The helicopter pad area is included in Table 4-3 for no further evaluation for PFAS because there was no documented reason that AFFF was used at the helicopter pad.

4.4.3.51 Two Parcels (1.5 and 5 acre area) Leased for Fire Training

According to the Phase I EBS (CF Braun, 1997a), two parcels (5 acres and 1.5 acres) located in the Zone 5 area (Figure 4-1) were leased by the Navy to Wading River Fire Department between 1975 and 1980 and 1976 and 1981, respectively, for use in conducting fire-fighting training activities on Thursday evenings. As reported on the Phase I EBS, a representative for the Wading River Fire Department stated that the training activities likely consisted of driving fire trucks to the area and spraying water. He did not believe fire-fighting chemicals were sprayed there (CF Braun, 1997a).

The two parcels leased for fire training are included in Table 4-3 for no further PFAS evaluation because fire-fighting chemicals were not believed to have been used at these areas. In addition, the fire training activities were conducted by Wading River Fire Department.

5.0 PA FINDINGS AND RECOMMENDATIONS

As part of the PA, information on potential PFAS or AFFF storage, use, or release at NWIRP Calverton were gleaned from a variety of resources. These included key word searches of historical documents from NIRIS and on-line resources, personnel interviews, site reconnaissance, and an EDR search. A review of historical records and the personnel interviews indicated that AFFF was stored and used or released at a number of locations on the NWIRP Calverton facility. Based on the results of this PA, it is anticipated that the Navy will recommend further assessment at a number of these areas. Of these areas, the Navy has already begun investigations for the potential presence of PFAS at ERP Site 2 – Former Fire Training Area and in groundwater downgradient of the Aircraft Paint Hangars (Buildings 168 and 318).

5.1 Areas Recommended for Further PFAS Assessment

Areas were recommended for further PFAS assessment if findings indicated that PFAS or PFAS-containing materials may have been used or stored and released at these areas. These are shown on Figure 5-1. Table 5-1 summarizes these ten potential PFAS sites that were identified in the PA.

- **Site 1 – Northeast Disposal Pond** - Site 1 was a landfill that contained waste paint and paint residue. Undocumented materials may have included: petroleum, oils, lubricants, asphalt, and halogenated and non-halogenated solvents. Material containing AFFF may have been disposed at this site as well but there are no documented use of this material.
- **Building 6-75 - Paint Stripper Building** – This building had an AFFF suppression system but there are no known releases to the environment. Paint stripping activities, which are a potential source of PFAS, also occurred at this building.
- **Building 6-78 (327) - Aircraft Fuel Storage Terminal** - This building had an AFFF suppression system but there are no known releases to the environment. Site visit/interview information indicated that there was an AFFF system, but that the system has been replaced with FFFP by the current tenant.
- **Building 6-79 - Noise Suppression Hush House** - This building had an AFFF suppression system but there are no known releases to the environment. AFFF storage tanks were located in the equipment room at this building.

- **Building 07-04 (283) - The Flight Emergency Shelter (Fire House)** – This building was used to store AFFF. Interview information indicated that containers (greater than 5 gallons but less than 55 gallons) were lined up along the wall of fire house. It was assumed that the containers were used to top off the crash crew trucks and / or fire suppression storage tanks but the interviewee was not involved in these activities and could not confirm how material in the containers were handled.
- **Buildings 81-01 (ASTF Building) and 81-02 through 81-05 (Hangars 5, 6, 7, and 8)** - These buildings had an AFFF suppression system but there are no known releases to the environment.
- **Jet Fuel Spill Site – Side of Northwest Calverton Runway** - Historical information indicated that AFFF was used to address a fuel spill that occurred due to a tire blowout during takeoff in 1985.
- **Equipment Training Area** - AFFF was discharged on a concrete pad as part of a training exercise. This was reportedly a onetime event that occurred sometime between 1996 and 1998. The AFFF was reportedly washed away to the nearby grass with water.
- **F-111 Crash Site** – In 1967, an aircraft crash occurred at the 6,000 foot mark on Runway 32-14. Use of AFFF was not documented. However, emergency response vehicles were equipped with AFFF and this material may have been used to address these crashes.
- **EF-111 Crash Site** – In 1983, an aircraft crash occurred midway on Runway 32-14. Use of AFFF was not documented. However, emergency response vehicles were equipped with AFFF and this material may have been used to address these crashes.

5.2 Potential Receptor Characterization

PFAS released to soil can leach into groundwater through dissolution and infiltration by rainfall. Groundwater flow direction beneath the northern half of the facility flows to the northeast, and groundwater beneath the southern half of the facility flows to the southeast. Groundwater on the divide, the location that can fluctuate, flows to the east. The groundwater flow directions are shown on Figures 3-2 and 5-1.

On April 17, 2018, Tetra Tech and the Navy met with the Riverhead Water District to confirm the locations of the PWS wells and the areas that the water district services. There is a potential for PFAS to migrate into drinking water within 1-mile of the areas of concern in Section 4. The Riverhead Water District noted that it is possible that private drinking water or irrigation wells may be present in the areas that they service. The majority of the land to the east and south east of the facility is farm land and is not serviced by the water district. Figure 5-1 shows a 1-mile buffer around areas recommended for further evaluation, the PWS wells, and the area that the Riverhead Water District currently supplies.

One public water supply well (RWD 12-1) is located on the former facility and north of the Aircraft Fuel Storage Terminal (Building 06-78 [327]). The groundwater flow direction is most likely to the east but may fluctuate to the north east and south east in this area. In 2013 and 2014, RWD 12-1 was evaluated for PFAS under the UCMR3 program and was not detected in the drinking water well. The Riverhead Water District confirmed that RWD 12-1 was previously used as a Northrop Grumman production well, and that it is now used by the water district during times of high demand. The Riverhead Water District confirmed that the depth of RWD 12-1 is 140 feet below ground surface and is installed in the Magothy Formation, which is typically separated from the shallow groundwater in the Upper Glacial Formation by a clay layer.

Four private drinking water supply wells (not shown on figures) have been identified within 1-mile downgradient of the facility. One is located south of Swan Pond and has been evaluated for PFAS during the Site 2 – Former Fire Training Area. This residential drinking water well did not contain PFAS during the past five rounds of sampling.

Two private drinking water wells were identified in the 1992 SI (Haliburton, 1992a). The SI did not have information regarding the construction details of these wells. Current research (e.g. EDR and interviews with the Riverhead Water District as of May 2018) did not identify these wells, and it is unknown if they are still in use. One well is located northeast along Middle Country Road. The location of the well appears to be side-gradient to Site 1 – Northeast Pond Disposal Area. Other areas recommended for further evaluation (Equipment Training Area, Building 283 - Flight Emergency Shelter, and Building 81-01 - ASTF Building and associated hangars (81-02 through 81-05) are over a mile away from the private well located along Middle Country Road.

The second well identified in 1992 is located southeast of the facility along River Road. During site reconnaissance, residential homes were identified along River Road and one or more of these homes may have a private drinking water well. Depending on the exact location of the F-111 crash site along Runway 32-14, the homes along River

Road may be within half mile of this area of concern. There are no reports of the use of AFFF.

The Suffolk County Department of Health Services (SCDHS) reported that a drinking water well was located on former NWIRP Property even though the area is serviced by the Town of Riverhead Water District. The well is reportedly located approximately 75 feet from Building 80-01 – Former Avionics Noise Check Building, where Skydive Long Island operated business from approximately 2008 to 2015. In 2008, Skydive Long Island contacted SCDHS and requested that the well be sampled to determine if it could be used for drinking water. There is no information regarding the date of installation or construction of the well. In 2015, Skydive Long Island at Calverton closed, and it is unknown if a new tenant is occupying Building 80-01. The drinking water well appears to be side gradient of Building 81-01 - ASTF Building and associated hangars 81-02 through 81-05, but is near to the groundwater divide so groundwater flow may fluctuate in this area.

5.3 Areas Recommended for No Further Action

Several other areas/buildings were noted during the NIRIS historical document keyword search and interview process, but were not recommended for further PFAS assessment due to various reasons indicated in Section 4.4.2 and Table 4-3. The conclusions of NFA for PFAS for any of these sites can be reevaluated if additional information and/or documentation become available.

The follow are the sites that are recommended for no further PFAS evaluation:

F-11 Crash Site

F-14 Crash Site

C-54 Crash Site

Site 3	Ammunition Demolition Area
Site 4	Picnic Grounds Disposal Area
Site 5	1950s Gun Range Ammunition Disposal Area
Site 6A	Fuel Calibration Area
Site 6B	Discontinued Engine Run-Up Area
Site 6C	South End of Runway 32-14

Site 7	Fuel Depot
Site 8	Coal Storage Pile
Site 9	Electronic Counter Measure Area
Site 10	Cesspools / Leach Field
Site 10A	Jet Fuel Systems Laboratory
Site 10B	Engine Test House
Building 06-01 (166)	Main Operations Building
Building 06-02T	Former Location of Fire Guard Trailer
Building 06-04 (169)	Warehouse 5-7
Building 06-05 (167)	Steam Plant
Building 06-13 (282)	Facilities Maintenance Building
Building 06-17 (178)	Sewage Pump Station
Building 06-28 (213)	EF-111 Thrust Stand
Building 06-29	Old Exterior AMMO Storage Shed
Building 06-30	Exterior AMMO Storage Shed
Building 06-37 (212)	Engine Pump House
Building 06-42 (285)	Vehicle Transportation Building
Building 06-43 (286)	Sewage Treatment Plant
Building 06-46	Quonset Hut (Maintenance Facility)
Building 06-48	Aircraft Shelter
Building 06-49	Aircraft Shelter (Two-Bay)
Building 06-51 (315)	Hydraulic Equipment Building
Building 06-52, 53, 54	Aircraft Shelter (Three – Bay)

Building 06-63 (296)	A/C Engine Run-In Building
Building 06-64 (316)	Industrial Wastewater Treatment Plant
Building 06-67 (319)	New Chemical Storage Building
Building 06-73 (325)	New Fuel Calibration Area
Building 06-74 (326)	Machine Shop Building
Building 06-77	Emergency Vehicle Shelter
Building 06-82 (329)	Hazardous Waste Storage Building
Building 07-01 (165)	Final Assembly Aircraft Building
Building 07-03 (177)	Sewage Lift Station
Building 07-05 (284)	Anechoic Chamber
Building 07-19	Picnic Maintenance Storage Shed G
Building 07-30	Former Location of Aircraft Shelter
Building 07-33 (311)	Equipment Building Flight Line #2
Building 07-36 (299)	Flight Development Hangar
Building 08-01	Avionic Noise Check Building
Flightline #1	Aircraft Parking/Service Area
Area N of G23	Drum Storage Area
Tire Burn Site	Tires/Debris Burn Area
Grass Fire	Grass fire event once within 1996-1998
Helicopter Pad	
Grass Fire	Grass fire occurrence in approx. 2012
Leased Parcels for Fire Training	

5.4 Final Recommendations

An SI for further investigation of PFAS is recommended for the areas/buildings identified as potential PFAS sources (Table 5-1). Objectives of future investigations may include:

- Development of a conceptual site model for PFAS contamination to support a potential future investigation, remediation (if necessary), and long-term monitoring decisions for the site.
- Consideration of information regarding potential non-Navy sources (if any) and Navy sources in developing an overall strategy for addressing PFAS impacts to on-site and off-site environmental media (soil, groundwater, surface water, and sediment) and potential receptors.
- Evaluation of analytical data to determine if additional action is warranted for each of these areas.

No Further Evaluation Relative to PFAS (Continued)					
Zone 1	South of the central portion of Runway 32-14	NA	Flight line Number 1	Undetermined	<u>Property Use/Purpose</u> <ul style="list-style-type: none"> Used for the parking and servicing of aircraft Jet Fuel was observed under Flight line Number 2, when parts of the concrete were removed in the 1980s with contaminated soil <u>Current Status</u> <ul style="list-style-type: none"> Property Transferred <u>Rationale for No Further PFAS Evaluation Recommendation</u> <ul style="list-style-type: none"> No evidence of use or release of material containing PFAS
Process Area	Process Area - Central Area	NA	Uncurbed Area North of Building G23	At least 1980 to undetermined	<u>Property Use/Storage</u> <ul style="list-style-type: none"> Fifty-five gallon drums of some types of waste material such as methyl ethyl ketone, paints, phenolics, and 1,1,1,-trichloroethene were placed in barrels on the concrete aprons immediately outside generating shops and then carried by personnel to this uncurbed area north of Building G23 for storage prior to removal from the site by a contractor <u>Current Status</u> <ul style="list-style-type: none"> Property Transferred <u>Rationale for No Further PFAS Evaluation Recommendation</u> <ul style="list-style-type: none"> No evidence of use or release of material containing PFAS
Zone 3	Southwest Buffer Zone	NA	Tire Burn Site	Undetermined	<u>Property Use/Storage</u> <ul style="list-style-type: none"> Tires and other debris were burned <u>Current Status</u> <ul style="list-style-type: none"> Property Transferred <u>Rationale for No Further PFAS Evaluation Recommendation</u> <ul style="list-style-type: none"> None
Zone 1	Inside the fence, at the end of the western runway	NA	Grass Fire	Within the 1996-1998 timeframe	<u>Property Use/Storage</u> <ul style="list-style-type: none"> Grass fire occurred onsite within the 1996-1998 time frame; water was used to extinguish the fire <u>Current Status</u> <ul style="list-style-type: none"> Property Transferred <u>Rationale for No Further PFAS Evaluation Recommendation</u> <ul style="list-style-type: none"> No evidence of use or release of material containing PFAS
Zone 1	Northeast of Paint Stripping Building (06-75)	NA	Helicopter Pad	UST installed in 1975 and removed in 1987.	<u>Potential Use/Storage</u> <ul style="list-style-type: none"> Helicopter pad equipped with piping, UST containing JP-5 fuel and possibly gasoline <u>Current Status</u> <ul style="list-style-type: none"> Continues as non-Navy property <u>Rationale for No Further PFAS Evaluation Recommendation</u> <ul style="list-style-type: none"> None
North East Approach Zone	5-acre parcel	NA	Leased for Fire Training	Leased by the Navy to Wading River Fire Department between 1975 and 1980	<u>Property Use/Purpose</u> <ul style="list-style-type: none"> Parcel leased to the Wading River Fire Department for conducting fire fighting training activities on Thursday evenings Representative for the Wading River Fire Department stated that the training activities likely consisted of driving fire trucks to the area and spraying water, and he did not believe fire fighting chemicals were sprayed Lease noted that the restoration shall include removal of "junked" automobiles used in training fires <u>Current Status</u> <ul style="list-style-type: none"> Property has been transferred <u>Rationale for No Further PFAS Evaluation Recommendation</u> <ul style="list-style-type: none"> Activity was not conducted by the Navy; interviews indicate that water was used during training operations

**Table 4-3
Inventory of Areas Identified
NWIRP Calverton, New York**

Geographic Area	Specific Location	Building Number	Building or Area Name	Years of Operation	Summary and Rationale
No Further Evaluation Relative to PFAS (Continued)					
Zone 5	1.5 acres parcel	NA	Leased for Fire Training	Leased by the Navy to Wading River Fire Department between 1976 and 1981	<u>Property Use/Purpose</u> <ul style="list-style-type: none"> Parcel leased to the Wading River Fire Department for conducting fire fighting training activities on Thursday evenings Representative for the Wading River Fire Department stated that the training activities likely consisted of driving fire trucks to the area and spraying water, and he did not believe fire fighting chemicals were sprayed <u>Current Status</u> <ul style="list-style-type: none"> Property has been transferred <u>Rationale for No Further PFAS Evaluation Recommendation</u> <ul style="list-style-type: none"> Activity was not conducted by the Navy; interviews indicate that water was used during training operations
Undetermined	By Wading River Road, southwest of Navy property	NA	Grass Fire	Approximately 2012	<u>Property Use/Storage</u> <ul style="list-style-type: none"> It was not known what material was used to extinguish the fire Navy did not have involvement in this fire <u>Current Status</u> <ul style="list-style-type: none"> Continues as non-Navy property <u>Rationale for No Further PFAS Evaluation Recommendation</u> <ul style="list-style-type: none"> Area is south of NWIRP Calverton. AFFF is not typically used on grass fires.

Additional notes:

According to former NWIRP Calverton Facility Manager, wet and deluge systems contained water only.

All AFFF tanks were drained prior to the turnover of the NWIRP property to the town of Riverhead. The AFFF was donated to the local fire departments.

Two 350,000 gallon water storage tanks were utilized in support of the facility's fire protection system.

AFFF - aqueous film-forming foam

NFA - No Further Action

PFAS - per- and polyfluoroalkyl substances

SI - Site Inspection

**TABLE 5-1
Potential PFAS Areas for Further Evaluation
NWIRP Calverton, New York**

Potential PFAS Areas	Location	Site Description
PFAS Site Inspection Already Implemented		
Site 2	Zone 1	Fire Rescue Training Area
Building 06-15 (168)	Process Area	Aircraft Paint Hangar
Building 06-66 (318)	Process Area	New Aircraft Paint Hangar
Further PFAS Assessment Recommended		
Jet fuel spill site	Zone 1 - On the side of the northwest Calverton runway	AFFF foam was used to deal with spill from aircraft due to tire blowout during takeoff
Equipment training area	Plant 7 Area	AFFF was discharged on a concrete pad; fires were not set in this area. Water was used to dilute and wash away the foam.
Building 06-75	Process Area	Paint Stripper Building
Building 06-78 (327)	W Cantonment	Aircraft Fuel Storage Terminal
Building 06-79	Process Area	Noise Suppression Hush House
Buildings 81-01, -02, -03, -04, -05	Plant 7 Area	ASTF/Hangars
Building 07-04 (283)	Plant 7 Area	Flight Emergency Shelter (Fire House)
Site 1	Zone 1	Northeast Pond Disposal Area
F-111 crash site	Zone 1 - 6,000 foot mark on Runway 32-14	Plane burned on runway; fuel was not released
EF-111 crash site	Zone 1 - Midway on Runway 32-14	Fuel spill immediately cleaned up

AFFF - aqueous film-forming foam

PFAS - Per- and polyfluoroalkyl substances

NEW YORK GOVERNMENT WELL RECORDS SEARCHED

PWS: Public Water Systems

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)

This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

State Wetlands Data: Freshwater Wetlands

Source: Department of Environmental Conservation

Telephone: 518-402-8961

New York Public Water Wells

Source: New York Department of Health

Telephone: 518-458-6731

Oil and Gas Well Database

Department of Environmental Conservation

Telephone: 518-402-8072

These files contain records, in the database, of wells that have been drilled.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

Summary Details:

Conditions at proposal July 14, 1989): Brookhaven National Laboratory (BNL) covers 5,265 acres in Upton, Brookhaven Township, Suffolk County, New York, approximately at the center of Long Island, about 60 miles east of New York City. Much of the area is wooded, although commercial and residential development is underway. Used by the Army as Camp Upton during World Wars I

and II, BNL has been operated since 1947 by Associated Universities, Inc., under contract first to the Atomic Energy Commission and now to the U.S. Department of Energy (USDOE). BNL is involved in design, construction, and operation of large facilities such as particle accelerators and nuclear reactors used for research in high energy nuclear physics, energy-related life and environmental sciences, and material, chemical, and biological sciences. Most of the principal facilities are near the center of the site. Outlying facilities occupy about 550 acres. Among them are the Hazardous Waste Management Facility (HWMF), current landfill, former landfill/chemical holes area, sewage treatment plant, and a former ash fill area near an old incinerator. Areas where some accidental contamination has occurred include the Building 650 sump, HWMF, and the Central Steam Facility. Soil in several small areas contains low levels of radioactivity resulting from past landscaping activities, according to BNL. An estimated 3 tons per day of wastes were deposited in the former landfill, of which a small percentage was radioactive (including tritium) or hazardous waste. Among wastes were laboratory debris, unreclaimable partially decontaminated equipment, contaminated clothing, radioactive animal carcasses, and sanitary wastes. Sewage sludge was disposed of periodically. Since the landfill ceased operating in 1966, chemical wastes have been hauled off-site. The current landfill began operating in 1967, accepting putrescible, nonputrescible, and building materials. Since 1981, putrescible waste has been hauled to a municipal landfill. Limited quantities of low-level radioactive materials were accepted until 1978. At HWMF, drum rinsing and spills of 1,1,1-trichloroethane and other volatile organic compounds resulted in a plume of contaminated ground water that is now being treated with an aeration process. In 1960, approximately 5 curies of radioactive slurry were pumped into a drinking water well near HWMF instead of into the fill pipe of a nearby underground tank. Monitoring indicates that the leading edge of this plume remains well within the site. On-site monitoring wells contain strontium-90, tritium, chloroform, aromatic hydrocarbons, and 1,1,1-trichloroethane, according to BNL. An estimated 15,400 people obtain drinking water from BNL wells and Suffolk County Water Authority wells within 3 miles of BNL. The nearest fresh water wetland is the headwaters of the Peconic River, which is on BNL property about 1,500 feet upgradient of the former landfill. Surface water within 3 miles downstream of BNL is used for recreational activities. Status November 21, 1989: Investigations and cleanup projects are included in USDOE's 5-year plan for Waste Management and Environmental Restoration.

RCRA-TSDF:

Date form received by agency: 05/26/2016
Facility name: BROOKHAVEN NATIONAL LABORATORY - WASTE MANAGEMENT FACILITY
Facility address: 53 BELL AVE
UPTON, NY 11973
EPA ID: NY7890008975
Mailing address: BELL AVE
UPTON, NY 11973
Contact: FARANK CRESCENZO
Contact address: BELL AVE
UPTON, NY 11973
Contact country: US
Contact telephone: 631-344-3427
Contact email: FRANK.CRESCENZZO@SCIENCE.DOE.GOV
EPA Region: 02
Land type: Federal
Classification: TSDF
Description: Handler is engaged in the treatment, storage or disposal of hazardous waste
Classification: Large Quantity Generator
Description: Handler: generates 1,000 kg or more of hazardous waste during any calendar month; or generates more than 1 kg of acutely hazardous waste

Site name: BROOKHAVEN NATIONAL LABORATORY

Classification: Large Quantity Generator

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Amount (Lbs): 11931

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Amount (Lbs): 7258

Waste code:	D003
Waste name:	A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

RCRA-LQG:

Date form received by agency: 05/26/2016
Facility name: BROOKHAVEN NATIONAL LABORATORY - WASTE MANAGEMENT FACILITY
Facility address: 53 BELL AVE
UPTON, NY 11973

EPA ID: NY7890008975
Mailing address: BELL AVE
UPTON, NY 11973

Contact: FARANK CRESCENZO
Contact address: BELL AVE
UPTON, NY 11973

Contact country: US
Contact telephone: 631-344-3427
Contact email: FRANK.CRESCENZO@SCIENCE.DOE.GOV
EPA Region: 02
Land type: Federal
Classification: TSDF
Description: Handler is engaged in the treatment, storage or disposal of hazardous waste

Classification: Large Quantity Generator
Description: Handler: generates 1,000 kg or more of hazardous waste during any calendar month; or generates more than 1 kg of acutely hazardous waste during any calendar month; or generates more than 100 kg of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month; or generates 1 kg or less of acutely

Date form received by agency: 12/31/1979

Site name: BROOKHAVEN NATIONAL LABORATORY

Classification: Large Quantity Generator

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Amount (Lbs): 11931

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Amount (Lbs): 7258

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

EPA Region: 02
Land type: Private
Classification: Small Small Quantity Generator
Description: Handler: generates more than 100 and less than 1000 kg of hazardous waste during any calendar month and accumulates less than 6000 kg of hazardous waste at any time; or generates 100 kg or less of hazardous waste during any calendar month, and accumulates more than 1000 kg of hazardous waste at any time

Handler Activities Summary:

U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

FINDS:

Registry ID: 110024833652

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

AIR SYNTHETIC MINOR

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Environmental Interest/Information System
 RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

AIR SYNTHETIC MINOR

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Environmental Interest/Information System

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Registry ID: 110002442312

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans

Environmental Interest/Information System

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
