Final

Basewide Per- and Polyfluoroalkyl Substances Site Inspection Report

Naval Auxiliary Landing Field Fentress Chesapeake, Virginia

Contract Task Order WE01

October 2018

Prepared for

Department of the Navy
Naval Facilities Engineering Command
Mid-Atlantic

Under the

NAVFAC CLEAN 9000 Program
Contract N62470-16-D-9000

Prepared by

Virginia Beach, Virginia

Executive Summary

Historical use of aqueous film-forming foam (AFFF) at Naval Auxiliary Landing Field (NALF) Fentress in Chesapeake, Virginia during firefighting activities and disposal of AFFF prompted the Department of the Navy (the Navy) to conduct a per- and polyfluoroalkyl substances (PFAS) Site Inspection (SI) at the installation. The United States Environmental Protection Agency (USEPA) has described PFAS as "emerging contaminants," and established federal lifetime health advisories (L-HAs) for two PFAS compounds (perfluorooctanoic acid [PFOA] and perfluorooctane sulfonate [PFOS]). A Regional Screening Level (RSL) is also published for perfluorobutanesulfonic acid (PFBS). There are currently no legally enforceable federal or Virginia standards for PFAS constituents.

The objectives of the NALF Fentress SI were identified in the *Final Sampling and Analysis Plan, Basewide Perfluorinated Compound Site Investigation, Naval Auxiliary Landing Field Fentress, Chesapeake, Virginia* (CH2M, 2016e), hereinafter referred to as the "SAP." Objectives were to:

- Determine if PFAS[1] are present in the Base potable/non-potable water supply.
- Determine the groundwater flow direction, gradient, and velocity, to allow the better assessment of fate and transport at the site.
- Determine if PFAS are present in suspected source areas at NALF Fentress.
- Determine whether PFAS are present at levels posing potentially unacceptable human health risks in groundwater at NALF Fentress.
- Determine the potential for off-Base migration of PFAS at NALF Fentress.

Preliminary investigation activities included a desktop study and interviews with Base personal to determine potential source areas of PFAS. The field investigation was conducted between December 2015 and November 2017 and consisted of 1) on and off-Base monitoring well installation (screened in the Columbia/surficial and Yorktown/deep aquifers); 2) groundwater sampling of on-Base newly-installed and existing monitoring wells screened in both aquifers; and off-Base newly-installed monitoring wells screened in both aquifers; 3) on-Base drinking water sampling, 4) off-Base drinking water sampling, and 5) the collection of on-Base soil samples in potential source areas.

Results of the investigation measured against objectives specified above are as follows:

- PFAS was determined to be present in the Base potable/non-potable water supply at levels exceeding the L-HA.
- Groundwater flow in the Columbia/Surficial aquifer was determined to be radial from the approximate location of the original runway at the Base, with a stronger component of flow to the north and east toward the Intracoastal Waterway. Groundwater flow in the Yorktown/deep aquifer is primarily to the north and east toward the Intracoastal Waterway. The groundwater velocity in the Columbia/Surficial aquifer at NALF Fentress is estimated to be 0.0468 foot per day (ft/day) or approximately 17.07 feet per year (ft/year) and the groundwater velocity in the Yorktown aquifer at NALF Fentress is estimated to be 0.0778 ft/day or approximately 28.38 ft/year.
- PFAS were identified in groundwater at levels greater than the L-HA in samples from several of the potential source areas. PFAS were also detected in soils in all areas analyzed, including potential secondary source areas. While many soil concentrations were less than screening levels for direct exposure and potential unacceptable risks were not identified, there may be continuing impacts from the potential for leaching PFAS from the soil.

[1] In order to include a more comprehensive list of chemicals, the industry standard language for this class of chemicals has been modified from perfluorinated compounds (PFCs) to per- and polyfluorinated alkyl substances (PFAS). Consequently, the original objectives included in the SAP have been modified for this document to globally replace "PFCs" with "PFAS."

- Concentrations in groundwater pose a potential unacceptable risk across much of the site, including off-Base private drinking water wells. While risks are acceptable in many of the Yorktown aquifer perimeter wells, it is important to note that potential wells drilled through the confining unit into the deep Yorktown aquifer off-Base pose unacceptable risk, indicating preferential pathways are created during private well installation.
- PFAS were confirmed to have migrated off-Base at levels posing potential unacceptable risks.

An Expanded SI is recommended to refine understanding of the conceptual site model. This would include:

1. Installation of additional shallow and deep monitoring wells off-Base at NALF Fentress to better assess potential migration in both the Columbia/Surficial aquifer and Yorktown/deep aquifer; the wells should be focused to the north and east of the facility in the directions of groundwater flow.
2. Installation of additional Yorktown/deep monitoring wells in locations on-Base with L-HA exceedances in the Columbia/Surficial aquifer, but without existing deep wells (e.g., Site 17 [revised], UST 20B, and within the irrigation sprayfields), and at a deeper depth interval than existing well OF-MW8D to delineate the vertical extent of PFAS levels exceeding the L-HAs in the vicinity of the Crash Truck Test Area.
3. Collection of additional soil samples to assess potential source areas that were not evaluated during the initial sampling effort (e.g., Site 17 [revised]).
4. Continued refinement and monitoring of vertical and horizontal migration of PFAS in the Columbia and Yorktown aquifers.
5. Continued assessment of toxicity data for human and ecological receptors to complete an RI.

SECTION 1

Introduction

This Site Inspection (SI) report presents the data and findings obtained from field activities conducted to determine if a release of per- and polyfluoroalkyl substances (PFAS) occurred at Naval Auxiliary Landing Field (NALF) Fentress in Chesapeake, Virginia. This report was prepared for the Department of the Navy (Navy), Naval Facilities Engineering Command (NAVFAC) Mid-Atlantic, under the Comprehensive Long-term Environmental Action—Navy (CLEAN) 9000, Contract N62470-16-D-9000, Contract Task Order WE01, for submittal to NAVFAC Mid-Atlantic, the United States Environmental Protection Agency (USEPA) Region 3, and the Virginia Department of Environmental Quality (VDEQ). The Navy, USEPA, and VDEQ work jointly as the Naval Air Station (NAS) Oceana/NALF Fentress Tier 1 Partnering Team.

The field activities discussed in this report were conducted between December 2015 and June 2017 in accordance with the Uniform Federal Policy (UFP) – Sampling and Analysis Plan (SAP) titled *Final Sampling and Analysis Plan, Basewide Perfluorinated Compound Site Investigation, Naval Auxiliary Landing Field Fentress, Chesapeake, Virginia* (CH2M, 2016e) and the UFP-SAP addendum titled *Final Sampling and Analysis Plan Addendum 1, Basewide Per- and Polyfluoroalkyl Substances Site Investigation, Naval Auxiliary Landing Field Fentress, Chesapeake, Virginia* (CH2M, 2017). Field activities included monitoring well installation, groundwater sampling, soil sampling, on-Base potable water sampling, and off-Base private potable well sampling. Additionally, a desktop review of historical data and personnel interviews were conducted to determine potential source areas of PFAS on-Base. A summary of the technical approach for conducting these activities and the field and laboratory analytical results are detailed below.

1.1 Objectives and Approach

The objectives of this Basewide SI were as follows:

- To determine if PFAS are present in the Base potable/non-potable water supply
- To determine groundwater flow direction, gradient, and velocity to better allow for assessment of fate and transport at the site
- To determine whether PFAS are present in groundwater in and/or downgradient of likely source areas at the installation
- To determine whether PFAS are present at levels posing potentially unacceptable human health risks in groundwater at NALF Fentress
- To determine the potential for off-Base migration of PFAS and whether PFAS are present at levels posing potentially unacceptable human health risks in groundwater and drinking water

The activities completed to support the objectives of the SI activities at NALF Fentress were as follows:

- Installation of 22 shallow (Columbia aquifer) and 15 deep (Yorktown aquifer) monitoring wells
- Completion of a groundwater elevation survey and collection of groundwater samples from the 29 new treatment plant system
- Collection of off-Base potable water samples from 56 private drinking water wells
- Collection of soil samples in potential source areas
- Completion of slug tests in select shallow and deep wells to assess hydraulic conductivity and groundwater velocity
- Quantitative assessment of the potential human health with exposure to contaminated groundwater

1.2 Report Organization

The SI report is organized as follows:

- **Section 1** – Introduction
- **Section 2** – Site Background and Physical Characteristics
- **Section 3** – Investigation Methodology
- **Section 4** – Investigation Results
- **Section 5** – Human Health Risk Screening
- **Section 6** – Conclusions and Recommendations
- **Section 7** – References

Tables and figures are provided at the end of each respective section. Appendixes are included at the end of the report.

SECTION 2

Site Background and Physical Characteristics

This subsection provides background information on NALF Fentress, Site 14, Site 17, Underground Storage Tank (UST) 20B, other potential sources of PFAS at NALF Fentress, and relevant information on the physical and hydrogeologic setting at the site.

2.1 Site Background and Previous Investigations

2.1.1 NALF Fentress

NALF Fentress (**Figure 2-1**) is located in Chesapeake, Virginia and is a noncontiguous property under the command of NAS Oceana. Established in 1940, the installation encompasses just over 2,500 acres and approximately 8,700 acres in restrictive easements. The facility is primarily used by squadrons stationed at NAS Oceana or Naval Station Norfolk Chambers Field for field carrier landing practice operations. Neither storage nor maintenance of aircraft is routinely performed at NALF Fentress.

Previous environmental investigations indicated no further action was necessary at NALF Fentress. However, since that time certain PFAS, which were not previously evaluated at Navy sites, have been identified as emerging contaminants that could have been released historically as a result of aqueous film forming foam (AFFF) use during firefighting activities. Because PFAS are environmentally persistent, they can be present in environmental media long after a release. This, combined with recent research regarding potential toxicity from exposure to these compounds, is why these compounds were included in this investigation at NALF Fentress. In 2013, the USEPA added new PFAS sampling requirements to the Safe Drinking Water Act UCMR3, requiring all large potable water supply systems (supplying to more than 10,000 people) and 800 small public water supply systems to test for these chemicals before 2015.

In October 2014, the Assistant Secretary of the Navy, Energy, Installations and Environment issued a statement requiring evaluation of sites with the potential for PFAS to be present under the Defense Environmental Restoration Program and requiring sampling of PFAS in drinking water from finished water in Navy water supplies not included in the USEPA requirement, but where sources of PFAS upgradient (based on groundwater flow direction) are known or suspected. As a result of a review of sites, Site 14 and Site 17 at NALF Fentress were identified for further evaluation of PFAS.

2.1.2 Site 14 – Fentress Landfill

Site 14 (**Figure 2-2**) shows the location of the Fentress Landfill and was formerly known as Solid Waste Management Unit (SWMU) 23. The Fentress Landfill was in use from 1945 until 1970 (EarthTech, 1989). Site 14 was identified as a site requiring additional investigation in the Initial Assessment Study (NEESA, 1984). In 1986, groundwater, surface water, and sediment were sampled at Site 14 and the impacts were determined to be minor. However, a second round of monitoring for groundwater and surface water was recommended to confirm initial results. In 1989, the Resource Conservation and Recovery Act (RCRA) Facility Assessment identified Site 14 (referred to as SWMU 23 in that report) as requiring additional evaluation. The RFA noted that the landfill was unlined and used for the disposal of pesticides, construction materials, conductors, and solvents (EarthTech, 1989). A confirmation round of sampling was conducted at Site 14 in 1991, in response to the conclusions from the Round 1 Verification Step (CH2M, 1986). The report concluded that there were no unacceptable impacts to the environment from landfilling activities at Site 14 and recommended no further action (CH2M, 1991). A site inspection was completed at Site 14 in 1992 and results of previous investigations were confirmed. However, additional investigation was recommended to determine groundwater flow direction and to confirm groundwater data (Baker, 1992). In 1993, a Supplemental Site Investigation was completed and results of previous investigations for groundwater at Site 14 were confirmed and no additional action was recommended (Baker, 1993). PFAS constituents were not analyzed during these investigations.

In 2015, Site 14 at NALF Fentress was identified as requiring further evaluation of potential PFAS contamination as AFFF may have been disposed of in the Fentress Landfill.

2.1.3 Site 17 – Former Firefighter Training Area

Site 17 (**Figure 2-2**) is the location of the former Firefighter Training Area and was formerly known as SWMU 64. Site 17 consists of a burn pit with an earthen berm used to ignite fuel and other wastes for firefighter training exercises (CH2M, 1991). Site 17 was identified in the RCRA Facility Assessment, but was not recommended for additional evaluation (EarthTech, 1989). In 1991, soil and groundwater at Site 17 were analyzed for volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), total petroleum hydrocarbons (TPH), lead, and ignitability (soils only). Both soil and groundwater were determined to be contaminated with petroleum-related compounds and additional action was recommended to remove contaminated soils and monitor groundwater (CH2M, 1991). In 1992, an additional round of soil and groundwater sampling was completed and petroleum contamination was found in both soil and groundwater north of the runway intersection and in soil west of the runway intersection. Further delineation of petroleum-related contamination was recommended to support a soil removal action (Baker, 1992). In 1993, soil gas samples were analyzed in the field to determine additional soil sampling locations to better define the nature and extent of the petroleum-related contamination to support a soil removal action. A removal action of 7,400 cubic yards of contaminated soil was recommended. Installation of a downgradient well was also recommended to evaluate the effectiveness of the removal action in reducing groundwater contamination (Baker, 1993). Removal Action Alternatives were evaluated in the Engineering Evaluation/Cost Analysis and excavation and onsite treatment using bioremediation was identified as the recommended treatment alternative (FWI, 1994a). A decision document was finalized in 1994, selecting onsite bioremediation as the removal action for soil at Site 17 (FWI, 1994b). PFAS constituents were not analyzed from any of these investigations.

In 2015, Site 17 at NALF Fentress was identified as requiring further evaluation of potential PFAS contamination due to firefighting practices utilizing AFFF at the site.

During the initial evaluate of Site 17 to support the PFAS investigation, the site was located using previous documents. However, following the initial phase of investigation, historical air photos were reviewed and indicated an alternate site location based on ground discoloration. Both possible locations are shown on **Figure 2-2** and both were evaluated as part of this PFAS SI.

2.1.4 Underground Storage Tank 20B (Petroleum Oil Lubricant Program)

UST 20B (**Figure 2-2**) is the location of a former steel tank used to store gasoline. UST 20B was located south of Building 20 and has been removed. A site characterization was conducted for UST 20B in 1994 to determine the extent of contamination after the report of a release of gasoline. Soil and groundwater samples were collected and analyzed for TPH, benzene, toluene, ethylbenzene, and xylene (BTEX), toxicity characteristic leachate procedure (TCLP) lead (soil only), and total lead (groundwater only). Results indicated petroleum-related contamination was present in the soil and groundwater. Further delineation of groundwater contamination, followed by a remediation action was recommended, as well as limited remediation of soil (Baker, 1994). Based on recommendations from VDEQ, the NALF Fentress drinking water production wells were sampled for BTEX and TCE monthly for one quarter and quarterly until 1998, when new, deeper water production wells were put in use. In February 1995, an additional round of data was collected for TPH and BTEX from the monitoring wells installed during the site characterization. In 1998, the old water production wells were closed and new production wells were put into use (Navy, 1995, 1996a, 1996b, 1999, pers. comm.).

UST 20B was managed under the Petroleum Oil Lubricant (POL) program. During this NALF Fentress Basewide PFAS SI, the UST 20B monitoring wells were located and sampled to aid with characterization of the nature and extent of PFAS contamination in groundwater at NALF Fentress. The UST 20B monitoring wells are located near the former AFFF storage area.

2.1.5 Other Areas Identified for PFAS Evaluation

Additional areas at NALF Fentress were identified as requiring further evaluation of PFAS contamination based on historical activities or potential contaminant transport pathways (areas presented in **Appendix A**). The following areas were identified through desktop review and/or interviews with the NALF Fentress Fire Department:

- Crash Truck Test Area – This area was used to test AFFF spray nozzles on fire trucks by spraying AFFF directly onto the ground surface.
- Current and Former Irrigation Sprayfields – These areas were used to apply treated wastewater to the ground surface through spray irrigation. These were evaluated as secondary PFAS source areas because the water and wastewater treatment process at the Base was not designed to treat PFAS
- Perimeter Wells – Wells on the facility perimeter were evaluated for PFAS to assess off-Base migration potential (these wells included wells previously installed by State Water Control Board [SWCB]).

2.2 Physical Setting

This section describes the site setting, including geologic and hydrogeologic features to this investigation.

2.2.1 Climate

Chesapeake weather is typically very mild. This area experiences four distinct seasons with average temperatures of 77 degrees in the summer, 62 degrees in the fall, 41 degrees in the winter, and 57 degrees in the spring. Chesapeake receives about 45 inches of precipitation annually with a trace amount of snow during winter months (City of Chesapeake, 2017).

Coastal weather events in the form of severe thunderstorms, northeasters, and occasional hurricanes can have significant but temporary effects on the climate of the area. Winds are typically blown from a northerly direction from January through March and again in September and October. During the remaining months, winds generally blow from a southerly direction (Geo-Marine, Inc., 2001).

2.2.2 Topography and Surface Drainage Features

Topography at NALF Fentress is flat with relief varying by less than 5 feet across the entire installation (CH2M, 1992). Land surface elevations range between 10 and 15 feet above mean sea level. Surface runoff from the Base is directed to a system of drainage ditches and surface canals, which direct water north and east of the facility toward the Pocaty River and the marshland surrounding it. The Pocaty River is part of the Intracoastal Waterway (**Figure 2-1**).

2.2.3 Land Use

NALF Fentress is a noncontiguous property under the command of NAS Oceana. Established in 1940, the installation encompasses just over 2,500 acres and approximately 8,700 acres in restrictive easements. The facility is primarily used by squadrons stationed at NAS Oceana or Naval Station Norfolk Chambers Field for field carrier landing practice operations. Neither storage nor maintenance of aircraft is routinely performed at NALF Fentress. Land use surrounding the NALF Fentress is primarily residential and agricultural.

2.2.4 Water Use

The drinking water at NALF Fentress is supplied by two on-Base production wells that are pumped through a water treatment system (also located on-Base) that is owned and operated by the Navy Public Works Center (Malcolm Pirnie, Inc. 2008).

2.2.5 Geologic Setting

NALF Fentress is situated on the outer edge of the Atlantic Coastal Plan physiographic province. The Atlantic Coastal Plan is a broad wedge of unconsolidated sediments that dip and thicken to the east. The sediments consist of several thousand feet of unconsolidated sand, clay, silt, and gravels and are underlain by granite basement rock. From oldest to youngest, the five principal sedimentary units are the Potomac Formation, unnamed Upper Cretaceous deposits, the Pamunkey Group, the Chesapeake Group, and the Columbia Group (FWI, 1994b).

The Columbia Group sediments and the uppermost portion of the Chesapeake Group or the Yorktown aquifer, comprise one of the principal aquifers used locally for water supply. Regionally, a layer of silt and clay separates the Yorktown aquifer from the sediments of the Columbia Group. This clay layer has been designated as the Yorktown confining unit by Mend Harsh (1984), because of its role in the regional hydrogeology. At Fentress, the Yorktown confining unit was identified as being a layer of olive-gray clay and silty clay 0.5- to 15- feet thick, which was encountered at approximately 30 feet below the land surface. The Yorktown aquifer, was encountered at approximately 45 feet below the land surface, directly beneath the Yorktown confining unit. The aquifer consists primarily of gray, very fine to medium sand, and in some cases, coarse sand and gravel.

The sediments of the Columbia Group comprise the surface materials and consist of interbedded gravels, sands, silts, and clays. In the vicinity of Fentress, the thickness of these sediments is less than 30 feet, and typically the depth to groundwater is relatively shallow, less than 10 feet below the land surface. As a result, an unconfined aquifer with a saturated thickness of approximately 20 feet is present in the sediments beneath NALF Fentress.

2.2.6 Groundwater Flow

Local groundwater flow in the Columbia/Surficial aquifer is radial from the approximate location of the original runway at the Base with a higher component of flow to the northeast. Yorktown aquifer flow is toward the east. A downward vertical gradient exists between the Columbia and Yorktown aquifers. Flow characteristics observed during this investigation are discussed in more detail in **Section 3** of this report.

Groundwater at NAS Oceana is generally within 3 to 10 feet of the land surface. Aquifer conditions are unconfined in the Columbia Group and unconfined to semi-confined within the upper Yorktown Formation. In the southern portion of the facility, the confining unit (if present), is no more than 0.5 foot thick, possibly allowing the upper Yorktown and Columbia/Surficial act as a single, unconfined, hydrogeologic unit. Additionally, in some areas north of the facility, the confining unit is very sandy, possibly resulting in some hydraulic connection between the two aquifers.

SECTION 3

Investigation Methodology

3.1 Objectives and Approach

The field activities discussed in this report were performed in accordance with the SAP (CH2M, 2016e) and SAP Addendum (CH2M, 2017). The initial phase of field activities (Phase I) was conducted from December 2015 to January 2016 and included on-Base monitoring well installation, on-Base groundwater sampling, and on-Base drinking water sampling. Based on the results of Phase I, CH2M performed an additional investigation (Phase II) from May 2016 to June 2017 which included the on-Base monitoring well installation, on- Base groundwater sampling, on-Base drinking water sampling, and the collection of surface soil and subsurface soil samples. A summary of the technical approach for conducting SI activities is in the sections that follow.

Additional investigations were also completed to assess and plan PFAS treatment options at the on-Base water and wastewater treatment plants and in off-Base drinking water. However, the methods for completing these assessments and the results of those assessments are not included in this SI report because they were completed as separate evaluations. Information on these studies is available in the following:

- *Granular Activated Carbon Treatment Systems to Remove PFOA and PFOS – Design Testing Work Plan Potable Water and Wastewater Systems, Naval Auxiliary Landing Field Fentress, Chesapeake, Virginia* (CH2M, 2016a),
- *Bench-Scale Treatability Study Results: Granular Activated Carbon Testing to Remove PFOA and PFOS in Wastewater, Naval Auxiliary Landing Field Fentress, Chesapeake, Virginia* (CH2M, 2016b),
- *Bench-Scale Treatability Study Results: Granular Activated Carbon Testing to Remove PFOA and PFOS in Drinking Water, Naval Auxiliary Landing Field Fentress, Chesapeake, Virginia* (CH2M 2016c), and
- *Pilot Test Work Plan: Granular Activated Carbon System Installation on Residential Drinking Water Systems to Remove PFOA and PFOS, Naval Auxiliary Landing Field Fentress, Chesapeake, Virginia* (CH2M, 2016d).

3.2 Pre-investigation Activities

Prior to the 2015 field activities, a desktop review of historical documents was conducted to determine any potential AFFF release areas. In November 2015, an interview of the NALF Fentress Fire Department was conducted to discuss the use of AFFF and identify any additional potential AFFF release areas. The record of meeting from this interview is provided in **Appendix A**.

Prior to the 2015 monitoring well installation activities, Accumark of Chesapeake, Virginia, conducted an underground utility clearance at NALF Fentress. Additionally, Virginia Utility Protection Service (formerly known as Miss Utility of Virginia) was contacted to support locating operations.

3.3 Soil Borings and Monitoring Well Installation

Parratt-Wolff, Inc., of Hillsborough, North Carolina, provided hollow-stem auger (HSA) and rotary well drilling and installation services using a combination of 4.25-inch-inside-diameter (ID) HSA, 8.25-inch ID HSA, and 6-inch rotary drilling methods. During well installation, soil cores were collected continuously into 4-foot-long acetate sleeves. Soil descriptions were recorded, including grain size, color, moisture content, relative density, consistency, soil structure, mineralogy, and other relevant information, such as possible evidence of contamination. Soil boring logs are included in **Appendix B**.

Seventeen (17) on-Base shallow monitoring wells were installed within the Columbia/Surficial aquifer to depths up to 40 feet below ground surface (bgs) (**Figure 3-1**). Twelve (12) on-Base deep monitoring wells were installed within the Yorktown aquifer to depths up to 64 feet bgs (**Figure 3-1**). In addition, five (5) shallow monitoring wells were installed off-Base within the Columbia/Surficial aquifer to depths up to 30.5 feet bgs and three (3) deep

monitoring wells were installed off-Base within the Yorktown aquifer to depths up to 130.5 feet bgs (**Figure 3-1**). Each monitoring well was installed in accordance with the standard operating procedures (SOPs) titled *General Guidance for Monitoring Well Installation, Installation of Shallow Monitoring Wells, and Installation of Deep Monitoring Wells,* as applicable, provided in the SAP (CH2M, 2016e). The monitoring well construction details are provided in **Appendix C**.

The new monitoring wells were constructed with flush-threaded, 2-inch-ID Schedule 40 polyvinyl chloride (PVC) casing and 10 feet long with 0.010-inch slot sized well screen. A silica sand filter pack was placed within the annular space around the well screen from the bottom of the boring and well screen to a depth of approximately 2 feet above the top of the screen. A bentonite layer (approximately 2 to 3 feet) was placed at the top of the sand pack and hydrated with water. After the bentonite was allowed to hydrate for at least 24 hours, a cement-bentonite grout was placed in the remaining annular space to the surface. Deep (Yorktown aquifer) wells were constructed by first grouting a 6-inch steel casing into the clay confining unit and drilling to depth using rotary drilling methods, so as to avoid creation of a preferential pathway for migration of contaminants. All monitoring wells were completed with either steel stick-up protective casings and surrounded by four protective bollards or a boltless flush-mounted cover. A locking, watertight cap was placed on the top of each casing, and the well identification numbers were clearly marked on the well with etched well identification tags.

3.4 Monitoring Well Development

Prior to sampling, all new monitoring wells were developed to restore the permeability of the aquifer material immediately surrounding the well, which may have been reduced by the drilling operations, and to remove fine-grained materials that may have collected inside the well during installation. Monitoring well development was performed after the grout used to construct the new monitoring wells was allowed to adequately set (at least 24 hours or more) to prevent grout contamination of the screened interval. Monitoring wells were developed using a submersible pump and a combination of surging and pumping throughout the length of the well screen.

Between 45 and 200 gallons of water were evacuated from each well during the entire monitoring well development event. During monitoring well development, in accordance with the SOPs provided in the SAP (CH2M, 2016e), water quality parameters (pH, oxidation-reduction potential [ORP], temperature, conductivity, turbidity, and dissolved oxygen [DO]) were recorded approximately every 5 minutes using a YSI water-quality meter. The YSI instrument was calibrated daily, and calibration results were recorded in the field notebook.

Generally, development continued until at least three well volumes were removed and the water produced was free of turbidity, sand, and silt (to the maximum extent practicable). A YSI water-quality meter was used to determine when the turbidity was low (preferably less than 20 Nephelometric Turbidity Units [NTUs]). If turbidity continued to decrease after the removal of three well volumes, development was continued until turbidity readings stabilized (that is, until turbidity readings were within 10 percent of each other for three consecutive readings). In addition, development typically ended once three successive measurements of pH, specific conductivity, and temperature within 10 percent of each other were achieved.

3.5 Groundwater Elevation Measurement and Aquifer Testing

A groundwater elevation survey was conducted at all new and existing monitoring wells prior to sampling. An electronic water-level meter was used to measure the depth to water from the surveyed marking on the top of the well casing to the nearest 0.01 foot.

In September 2017, falling- and rising-head slug tests were conducted in monitoring wells OF-MW09, OF-MW09D, OF-MW13, OF-MW13D, OF-MW15, and OF-MW15D to quantify spatial variations of the hydraulic properties of the Columbia/Surficial and Yorktown aquifers at the site.

Three rising-head (slug-out) and three falling-head (slug-in) tests were performed in each monitoring well. The static depth to water was manually measured and recorded before each slug test. A digital data logger (Level Troll 700™) was installed in the well to a depth of several feet below the static water level. The data logger was

programmed to linearly record the depth of water above the sensor at 0.25 second intervals. The slug used for all test consisted of a 5-foot-long, 1.5-inch-diameter section of solid PVC.

For each falling-head test the slug was rapidly lowered into the well and held steady while the digital data logger measured the changing depth of water. The slug remained in place until the static water level recovered to 90 percent of the pre-test level.

A rising-head test was conducted by rapidly removing the slug while the digital data logger measured the changing depth of water. The test continued until the water level recovered to 90 percent of the pre-test level.

All equipment that entered the well was decontaminated before testing was started and before the equipment was moved to test a new well. After the six tests at each well, the data logger was downloaded and the test results were examined. The field team moved to the next well only after verifying that a minimum of two rising head (slug out) tests provided usable data.

3.6 Groundwater Sampling

Between December 2015 and November 2017, groundwater samples were collected from:

- 29 on-Base newly installed monitoring wells
- 11 existing monitoring wells at Sites 14, 17, and the irrigation sprayfields
- Six (6) UST 20B site wells
- Five (5) SWCB wells
- On-Base potable system from the water supply treatment system
- Eight (8) off-Base newly installed monitoring wells
- 56 off-Base residential potable wells

3.6.1 On- Base Non-Potable Groundwater Sampling

Groundwater samples were collected in accordance with the SOPs provided in the SAP (CH2M, 2016e, 2017). Cross-contamination of PFAS was considered during sampling in accordance with the Standard Operating Procedure (SOP) titled *OPNAV PFC Sampling Policy* provided in the SAP (CH2M, 2016e). Groundwater samples were collected from new and existing monitoring wells, POL wells, and SWCB wells (**Figure 3-2**). Prior to groundwater sample collection, monitoring wells were purged to remove any stagnant water that may have accumulated within the well. Groundwater samples were collected from monitoring wells using a peristaltic pump and disposable tubing. Groundwater quality parameters, including pH, ORP, temperature, conductivity, turbidity, and DO, were measured during the purging of each well using a YSI water-quality meter and a flow-through cell to prevent the purged groundwater from contacting the atmosphere during parameter measurement.

Purging continued until water quality readings collected 5 minutes apart stabilized to within 10 percent of one another. Following parameter stabilization, a CHEMet test kit was used to confirm DO readings measured by the water-quality meter (Model Numbers K-7501 for 0 to 1 part per million [ppm] and K-7512 for 1 to 12 ppm). Once DO confirmation was recorded, the flow-through cell was disconnected and samples were collected directly into laboratory-prepared, pre-preserved sample bottles.

Since on-base non-potable groundwater sampling was conducted before September 2017, the groundwater samples were analyzed for six PFAS listed in the UCM3: perfluorooctanesulfonic acid (PFOS), perfluorooctanoic acid (PFOA), perfluorononanoic acid (PFNA), perfluorohexanesulfonic acid (PFHxS), perfluoroheptanoic acid (PFHpA), and perfluorobutanesulfonic acid (PFBS). Groundwater for the analytical samples was pumped through the tubing directly into the appropriate laboratory-provided bottleware. To avoid cross-contamination of PFAS, Teflon tubing was not utilized during sampling. After collection in sampling containers, and at the end of each day, the samples were packed on ice and shipped via overnight service to the laboratory for analysis.

3.6.2 Off- Base Non-Potable Groundwater Sampling

Off-Base groundwater samples (**Figure 3-2**) were collected by the same method as the on-Base monitoring wells (as described in Section 3.6.1).

Since off-base non-potable groundwater sampling was conducted after September 2017, the groundwater samples were analyzed for 14 PFAS constituents listed in the Interim PFAS Site Guidance for NAVFAC RPMS/September 2017 Update: PFOS, PFOA, PFNA, PFHxS, PFHpA, PFBS, perfluorohexanoic acid (PFHxA), perfluorodecanoic acid (PFDA), n-methyl perfluorooctanesulfonamidoacetic acid (NMeFOSAA), Perfluoroundecanoic acid (PFUnA), n-ethylperfluoroctansulfonamid (NEtFOSAA), perfluorododecanoic acid (PFDoA), perfluorotridecanoic acid (PFTrDA), and perfluorotetradecanoic Acid (PFTA or PFTeDA). Groundwater for the analytical samples was pumped through the tubing directly into the appropriate laboratory-provided bottleware. To avoid cross-contamination of PFAS, Teflon tubing was not utilized during sampling. After collection in sampling containers, and at the end of each day, the samples were packed on ice and shipped via overnight service to the laboratory for analysis.

3.6.3 On-Base Potable Water Sampling

Influent samples were collected from the NALF Fentress drinking water treatment plant including one total oxidizable precursor sample, in accordance with the SOP titled *Potable Water Supply Sampling* provided in the SAP (CH2M, 2016). Cross-contamination of PFAS was considered during sampling in accordance with the SOP titled *OPNAV PFC Sampling Policy* provided in the SAP (CH2M, 2016e). Two on-Base water supply wells, screened at the deep well (Yorktown aquifer), alternately pump groundwater providing water to the treatment plant (**Figure 3-2**). Potable water samples were collected in December 2015 and in May 2016. The influent samples were collected from a spigot on a storage tank prior to treatment, where groundwater from both production wells is mixed.

Since on-base potable water sampling was conducted before September 2017, the production well samples were analyzed for six PFAS: PFOS, PFOA, PFNA, PFHxS, PFHpA, and PFBS. After collection in sampling containers, and at the end of each day, the samples were packed on ice and shipped via overnight service to the laboratory for analysis.

3.6.4 Off-Base Potable Well Sampling

Off-Base drinking water samples were collected from private residential potable wells within the designated sampling area (**Figure 3-3**). Samples were collected from 56 parcels, for which the property owner's requested sampling. Drinking water samples were collected in accordance with the SOP titled *Potable Water Supply Sampling* provided in the SAP (CH2M, 2016e). Cross-contamination of PFAS was considered during sampling in accordance with the SOP titled *OPNAV PFC Sampling Policy* provided in the SAP (CH2M, 2016e). Drinking water samples were collected prior to any treatment system, either at the well head or from a faucet inside of the residences if no treatment system was utilized. Prior to sample collection, drinking water wells were purged by allowing water to flow for 10 to 15 minutes to remove any stagnant water that may have accumulated within the pipes and to ensure that the sample was coming directly from the well. Drinking water samples were collected directly from the spigot or faucet into laboratory-prepared sample bottles.

Since the off-base potable well sampling was conducted before September 2017, the drinking water samples were analyzed for six PFAS: PFOS, PFOA, PFNA, PFHxS, PFHpA, and PFBS. In rare instances, drinking water for the analytical samples was purged through a hose connected to the spigot. To avoid cross-contamination of PFAS, the hose was disconnected during sampling. After collection in sampling containers, and at the end of each day, the samples were packed on ice and shipped via overnight service to the laboratory for analysis.

3.7 Soil Sampling

In February 2017 surface soil and subsurface soil samples were collected in accordance with SOPs provided in the SAP (CH2M, 2016e, 2017) to evaluate the presence of soil sources onsite. Sample locations are presented in **Figure 3-4**. Cross-contamination of PFAS was considered during sampling in accordance with the SOP titled *OPNAV PFC Sampling Policy* provided in the SAP (CH2M, 2016e). Soil samples were collected using stainless steel augers or trowels and placed into laboratory-prepared sample containers.

Since the soil sampling was conducted before September 2017, the soil samples were analyzed for six PFAS: PFOS, PFOA, PFNA, PFHxS, PFHpA, and PFBS. After collection in sampling containers, and at the end of each day, the samples were packed on ice and shipped via overnight service to the laboratory for analysis.

3.8 Quality Assurance and Quality Control

Samples collected for this field investigation were analyzed using USEPA approved methods with Level IV quality assurance (QA)/quality control (QC), as identified in the SAP (CH2M, 2016e). For definitive data, samples were reported by the laboratories with the equivalent of USEPA Contract Laboratory Program Level IV QA/QC.

Field QA/QC samples were collected during the sampling program. These samples were obtained to:

- Ensure that disposable and reusable sampling equipment were free of contaminants
- Evaluate field methodology
- Establish ambient field background conditions
- Evaluate whether cross-contamination occurred during sampling and/or shipping

Several types of field QA/QC samples were collected and analyzed in accordance with the SAP (CH2M, 2016e). They are defined as follows:

- **Equipment Rinsate Blank (decontaminated equipment):** Equipment blanks were collected at the frequency noted in Worksheets #12-1 and #12-2 of the SAP (one per medium per day of sampling). These samples were obtained by running laboratory-grade deionized (DI) water over or through sample collection equipment after the decontamination procedures had been conducted. These samples were used to determine whether decontamination procedures for reusable equipment were adequate.
- **Equipment Rinsate Blank (disposable equipment):** Equipment blanks were collected at the frequency noted in Worksheets #12-1 and #12-2 of the SAP (once per lot). These samples were obtained by running laboratory-grade DI water over or through sample collection equipment prior to the equipment's use. These samples were used to determine whether disposable, one-time-use equipment was contaminant free prior to use.
- **Field Blank:** Field blanks were collected at the frequency noted in Worksheets #12-1 and #12-2 of the SAP (one per week for groundwater and soil sampling and one per sample for drinking water and effluent sampling). These samples were obtained by pouring laboratory-grade DI water directly into laboratory-prepared sample bottles. These samples were used to determine whether cross-contamination occurred during sampling or shipping.
- **Duplicate Sample:** Duplicate samples were collected at the same time and under identical conditions as their respective associated sample at the frequency noted in Worksheets #12-1 and #12-2 of the SAP (one per 10 field samples of similar matrix). These samples were collected to evaluate the field and laboratory reproducibility of sample results and are one way to evaluate field methodology.

In addition to samples collected to monitor field QC, samples were also collected to monitor quality within the laboratory. These included the following:

- **Matrix Spike (MS):** An aliquot of a matrix (that is, soil, surface sediment, subsurface sediment, surface water, groundwater, and so forth) was spiked with known quantities of analytes of interest and subjected to the

entire analytical procedure. By measuring the recovery of these spiked quantities, the appropriateness of the method for the matrix was demonstrated.

- **Matrix Spike Duplicate (MSD):** These samples were collected as second aliquots of the same matrix as the MS to determine the precision of the method.

One MS sample and one MSD sample were collected for every 20 environmental samples collected (or greater than or equal to 5 percent of the samples collected) per medium, per site.

3.9 Decontamination Procedures

All decontamination activities were conducted in accordance with the SOPs titled *Decontamination of Drilling Rigs and Equipment* and *Decontamination of Personnel and Equipment* provided in the SAP, as applicable (CH2M, 2016e). Disposable sampling equipment and personal protective equipment, such as Masterflex tubing and nitrile gloves, were not decontaminated after use and instead were disposed of as non-hazardous solid waste. After use, disposable equipment was placed in plastic contractor bags and disposed of in an onsite trash dumpster. Non-disposable sampling equipment, such as hand augers, were decontaminated prior to each use.

Reusable heavy equipment, such as drilling rods and augers, was decontaminated before and in between the collection of each sample using a high-pressure steam cleaner with potable-grade water. Pressure washing was conducted at the temporary decontamination pad, which had been constructed prior to the start of drilling activities. The decontamination pad consisted of a raised wood frame lined with a high-density polyethylene tarp, which acted as a basin to collect fluids. These fluids were then pumped into approved 55-gallon drums to await characterization and disposal. All heavy equipment decontamination procedures were conducted in accordance with the SOP titled *Decontamination of Drilling Rigs and Equipment* provided in the SAP (CH2M, 2016e).

Water generated during decontamination of sampling equipment was collected and transferred to an approved 55-gallon drum to await characterization and disposal.

3.10 Surveying

Miller Stephenson and Associates, and Pennoni Associates, of Virginia Beach, Virginia (both Virginia-licensed and registered surveyors), conducted a survey of the monitoring wells installed during Phase I and II investigations, respectively. Each of the monitoring wells was surveyed for vertical and horizontal control to an accuracy of ±0.01 foot and ±0.1 foot, respectively (**Appendix D**). Monitoring wells were surveyed at the top of the PVC casing (where marked) and at the ground surface. The vertical elevations were referenced to National American Vertical Datum of 1988 (NAVD 88) to remain consistent with the coordinate system and datum currently in use on the project site. Horizontal coordinates were referenced to the Virginia State Plane Coordinate System, South Zone, North American Datum 1983 (NAD83)/94 HARN.

3.11 Investigation-derived Waste Management

Investigation-derived waste (IDW) generated during the SI included drill cuttings from the soil borings for monitoring well installation, purge water (from well development and groundwater sampling), as well as decontamination rinse-water from all non-disposable sampling equipment and heavy equipment. The IDW was containerized in approved 55-gallon drums that were properly labeled and stored within secondary containment at the site. A total of 83 drums of solid IDW and 58 drums of aqueous IDW were generated during the SI field activities.

Prior to disposal, CH2M field staff collected one composite sample from all aqueous IDW drums and one composite sample from all solid IDW drums per round. All IDW samples were analyzed for full Toxicity Characteristic Leachate Procedure analyses (VOCs, SVOCs, pesticides, and inorganic constituents), ignitability, reactive cyanide, reactive sulfide, and corrosivity. Additionally, aqueous IDW generated in April 2017 and May 2017 was sampled for PFAS in accordance with Navy policy. IDW generated prior to April of 2017, was identified

as non-hazardous and disposed of by Clearfield, MMG within 90 days of generation at the company's approved disposal facility located in Chesapeake, Virginia. Aqueous IDW generated in 2017 exceeded the (lifetime health advisory) L-HA for PFOA and PFOS and was disposed of through high temperature incineration.

An analytical summary for the IDW samples is provided in **Tables 3-1** through **Table 3-5**. All IDW handling and disposal information is included in **Appendix E.**

3.12 Data Quality Evaluation

The data quality evaluation and validation is a multi-tiered approach. The process begins with an internal laboratory review, continues with an independent review by a third-party validator, and ends with an overall review by the CH2M project chemistry team. The results of data quality evaluation are included as **Appendix F**.

SECTION 4

Investigation Results

This section presents the results of the investigation described in Section 3.

4.1 Hydraulic Characteristics of Aquifers

Water levels collected in September 2016 and May 2017 are provided as **Table 4-1**. Contour maps based on these water levels are provided as **Figures 4-1** and **4-2** for the Columbia/Surficial aquifer and Yorktown aquifer, respectively. Groundwater flow in the Columbia/Surficial aquifer at NALF Fentress is radial with a higher component of flow to the northeast. Groundwater flow in the Yorktown aquifer is toward the east. There is generally a downward vertical gradient between the Columbia/Surficial and Yorktown aquifers. Columbia/Surficial aquifer groundwater at NALF Fentress is generally within 3 to 10 feet of the land surface.

Aquifer conditions are unconfined in the Columbia Group and unconfined to semi-confined within the upper Yorktown Formation. When the clay confining unit overlying the Yorktown is very thin or absent (in the southern portion of the facility), the upper Yorktown and Columbia/Surficial aquifers may act as a single, unconfined, hydrogeologic unit (See cross section layout on **Figure 4-3,** cross sections on **Figures 4-4** and **4-5**, and confining unit soil types on **Figure 4-6**)**.** This phenomenon occurs in the southern portion of the Base. North of the facility, the confining unit is sandy, which may also allow for some hydraulic connection between the Columbia/Surficial and Yorktown aquifers. On NALF Fentress, groundwater flow in the Surficial/Columbia aquifer is to the north, northeast, east, and southeast from the approximate location of the original runway, with a higher component of flow to the northeast. However, there are smaller components of flow to the west and southwest. Yorktown aquifer flow is toward the east.

The slug test data sets collected in accordance with procedures described in **Section 3.5** were analyzed by AQTESOLV™ using the Bouwer-Rice solution method. The graphical AQTESOLV™ analysis sheets are presented in **Appendix G**, and the hydraulic conductivity estimates are summarized in **Table 4-2**. The Bouwer-Rice solution was developed to accommodate the analysis of slug tests in unconfined aquifers and is theoretically appropriate for these slug tests (Bouwer and Rice, 1976). The measured hydraulic conductivity for the Columbia aquifer ranged from 1.45×10^{-3} feet per minute (ft/min) to 1.14×10^{-2} ft/min or 7.4×10^{-4} centimeters per second (cm/s) to 5.8×10^{-3} cm/s. The measured hydraulic conductivity for the Yorktown aquifer ranged from 4.99×10^{-3} ft/min to 3.70×10^{-2} ft/min or 2.53×10^{-3} cm/s to 1.87×10^{-2} cm/s. Values for both aquifers are consistent with a silty to clean sand (Freeze and Cherry, 1979).

Groundwater flow velocity was calculated for each aquifer using the following equation:

$$V=Ki/N_e$$

Where:

V= the estimated groundwater flow velocity
K= the average hydraulic conductivity
i = the groundwater gradient
N_e = the estimated effective porosity, as a decimal fraction

Site-specific input parameters for the Columbia/Surficial aquifer are as follows:

K = 6.04×10^{-3} ft/min (average of values calculated during slug tests)
i = 0.00152 ft/ft (based on the May 2017 groundwater levels)
N_e = 0.30 (estimated effective porosity of silty to clean sand)

In consideration of these parameter, the groundwater velocity in the Columbia/Surficial aquifer at NALF Fentress is estimated to be 0.0468 ft/day or approximately 17.07 ft/year.

Site-specific input parameters for the Yorktown aquifer are as follows:

$K = 1.62 \times 10^{-2}$ ft/min (average of values calculated during slug tests)
i = 0.0010 (based on the May 2017 groundwater levels)
$N_e = 0.30$ (estimated effective porosity of silty to clean sand)

In consideration of these parameters, the groundwater velocity in the Yorktown aquifer at NALF Fentress is estimated to be 0.0778 ft/day or approximately 28.38 ft/year.

4.2 Groundwater Chemistry and Analytical Results

4.2.1 General Groundwater Geochemistry

Measurements of DO, ORP, pH, temperature, conductivity, salinity, and turbidity were collected at each monitoring well following purging and immediately prior to sampling (**Table 4-3**). The DO readings collected during purging activities, which provide an indication of the potential for aerobic or anaerobic biodegradation of some contaminants, ranged between 0.02 milligrams per liter (mg/L) and 2.25 mg/L. Values were generally less than 0.5 mg/L in both the Columbia/Surficial and Yorktown aquifers, indicating anaerobic conditions. Temperature readings ranged between 15.4 degrees Celsius (°C) and 28.1°C. The ORP values ranged between -371.2 millivolts (mV) and 240.4 mV and were generally indicative of reducing to mildly oxidizing conditions. The pH values were generally neutral, with an average of 6.13, but outliers ranged from 1.7 to 9.43. Conductivity values, which provide an indication of the concentration of total dissolved solids within groundwater, ranged between 0.023 milliSiemen per centimeter (mS/cm) and 0.55 mS/cm, which is indicative of freshwater conditions. Salinity values ranged between 0.03 and 0.26 part per thousand, also indicating freshwater conditions. In general, turbidity "refers to solids and organic matter that do not settle out of water" (Driscoll, 1986) and is caused by suspended and colloidal matter in water. Turbidity measurements were generally low (below 20 NTU) with an average of 11.73 NTU, although outliers ranged from 0.02 NTU to 152 NTU.

4.2.2 On- Base PFAS Groundwater Analytical Results

Analytical results from non-potable on-Base groundwater samples collected are presented in **Table 4-4** and **Figures 4-7** and **4-8** for the Columbia/Surficial aquifer, and in **Table 4-5** and **Figures 4-9** and **4-10** for the Yorktown aquifer. Groundwater analytical data for PFOS and PFOA (Individually and combined detected value) were screened against the USEPA L-HA screening criteria of 70 nanograms per liter (ng/L) (based on comparison to PFOA, PFOS, or the sum of PFOA plus PFOS concentration), and the tap water USEPA Regional Screening Level (RSL) calculated using the RSL calculator with a hazard quotient (HQ) of 0.1 (40 ng/L) and analytical data for PFBS were screened against the tap water RSL from the RSL summary table using an HQ of 0.1 (40,000 ng/L). Determination of exceedances were only made based on PFAS with screening criteria, which include PFBS, PFOS, and PFOA. Analysis was also conducted for PFAS which do not have screening criteria (PFNA, PFHxS, PFHpA), the results of which may be consulted in the future, if criteria are established. A summary of the results is presented below:

Columbia/Surficial Aquifer

Analysis of the groundwater samples collected from the Columbia/Surficial aquifer indicate the following:

- Twenty-three (23) samples indicated combined PFOS or PFOA concentrations exceeding the L-HA screening criteria of 70 ng/L.
- Ten (10) samples indicated detections of PFOS or PFOA with detected concentrations below the L-HA.
- Three (3) samples indicated no detection of PFOS or PFOA.
- Exceedances of the L-HA were observed in the northern portion of the Base with the higher detected concentrations in the vicinities of UST 20B and Site 17 Revised.

- Concentrations were the highest in the sample from station OFPOL-MW-7 with a PFOS concentration of 49,300 ng/L, PFOA concentration of 3,600 ng/L, and total PFOS/PFOA concentration of 52,900 ng/L and at Site 17 Revised (OF17-MW04), with PFOS concentration of 44,500 ng/L, PFOA concentration of 3,400 ng/L, and Total PFOS/PFOA concentration of 47,900 ng/L.
- None of the samples indicated detections for PFBS greater than the RSL.
- Other PFAS without current screening values (PFHxS, PFHpA, or PFNA) were detected in most (33) samples.

Yorktown Aquifer

Analysis of the groundwater samples collected from monitoring wells screened in the Yorktown aquifer indicated the following:

- One sample (OF-MW08D; adjacent to Site 17 Revised) indicated PFOS and Total PFOS/PFOA concentrations of 6,880 and 6,941.1 ng/L, respectively, exceeding the USEPA L-HA screening criteria of 70 ng/L.
- Twelve (12) samples indicated detections for PFOS or PFOA but with concentrations below L-HA.
- One sample in the southernmost portion of the facility (OF-MW34D) indicated no detections of PFOS or PFOA.
- PFBS was detected in three samples, all located adjacent to Site 17 Original and Revised with concentrations below the RSL.

4.2.3 Off- Base PFAS Groundwater Analytical Results

Analytical results from non-potable off-Base groundwater samples collected are presented in **Table 4-6** and **Figure 4-11** for the Columbia/Surficial aquifer, and in **Table 4-7** and **Figure 4-12** for the Yorktown aquifer. Groundwater analytical data for PFOS and PFOA (individually and combined detected value) were screened against the USEPA L-HA screening criteria of 70 ng/L (based on comparison to PFOA, PFOS, or the sum of PFOA plus PFOS concentration), and the tap water USEPA RSL calculated using the RSL calculator with a HQ of 0.1 (40 ng/L) and analytical data for PFBS were screened against the tap water RSL from the RSL summary table using an HQ of 0.1 (40,000 ng/L). Determination of exceedances were only made based on PFAS with screening criteria, which include PFBS, PFOS, and PFOA. Analysis was also conducted for PFAS which do not have screening criteria (PFNA, PFHxS, PFHpA, PFHxA), PFDA, NMeFOSAA, PFUnA, NEtFOSAA, PFDoA, PFTrDA, and PFTeDA), the results of which may be consulted in the future, if criteria are established. A summary of the results is presented below:

Columbia/Surficial Aquifer

Analysis of the groundwater samples collected from the off-Base Columbia/Surficial aquifer indicate the following:

- Two (2) samples (OF-MW21 and OF-MW22) indicated combined PFOS or PFOA concentrations exceeding the L-HA screening criteria of 70 ng/L.
- One (1) sample (OF-MW19) indicated detections of PFOS or PFOA with detected concentrations below the L-HA.
- Two (2) samples (OF-MW20 and OF-MW33) indicated no detection of PFOS or PFOA.
- Exceedances of the L-HA were observed north of the Base with the highest detected concentrations in OF-MW22, northeast of UST 20B.
- Concentrations were the highest in the sample from station OF-MW22 with a PFOS concentration of 829 ng/L, PFOA concentration of 126 ng/L, and total PFOS/PFOA concentration of 955 ng/L.
- None of the samples indicated detections for PFBS greater than the RSL.
- Of the other PFAS without current screening values only PFHxS, PFHpA, PFNA, and PFHxA were detected in the shallow off-Base monitoring wells.

Yorktown Aquifer

Analysis of the groundwater samples collected from the off-Base monitoring wells screened in the Yorktown aquifer indicated the following:

- No samples indicated detection for PFOS or PFOA exceeding the USEPA L-HA screening criteria of 70 ng/L.
- One sample north of the facility (OF-MW22D) indicated detections for PFOS or PFOA but with concentrations below L-HA.
- Two (2) samples southeast (OF-MW33D) and north (OF-MW19D) of the facility indicated no detections of PFOS or PFOA.
- PFBS was not detected in any of the deep off-Base monitoring wells.
- Other PFAS without current screening values (PFNA, PFHxS, PFHpA, PFHxA), PFDA, NMeFOSAA, PFUnA, NEtFOSAA, PFDoA, PFTrDA, and PFTeDA) were not detected in any of the deep off-Base monitoring wells.

4.2.4 PFAS Potable Water Analytical Results

On-Base potable water samples were collected from water treatment plant influent, which consists of water from two water supply wells at NALF Fentress (**Figures 4-9** and **4-10**). Off-Base potable well samples were collected from 59 private residential wells (**Figure 4-13**). Laboratory analytical results for on-Base potable groundwater samples collected from water treatment plant influent at NALF Fentress and off-Base potable drinking samples collected from residential wells are summarized in **Tables 4-8** and **4-9**, respectively. A summary of results is presented below.

On-Base Potable Water

Results conducted on the on-Base potable well samples indicate the following:

- The influent samples from station OF-INF01 indicated exceedances of PFOS and PFOA L-HA both times sampled.
- The detected concentrations of PFOS and PFOA from the influent samples increased between December 2016 to May 2016. This is likely due to the intermittent pumping of the two production wells and the closer proximity of one of the wells to the UST 20B source area.
- One total oxidizable precursor sample was collected during the May 2016 round of monitoring. This sample indicated higher concentrations of PFOA and PFOS than were observed in the unoxidized sample collected at the same time, indicating the potential for presence of precursors, which may degrade to PFOA and PFOS when oxidized.
- PFAS without current screening values (PFHxS, PFHpA, or PFNA) were detected in both samples.

Off-Base Private Potable Wells

Results conducted on the potable residential well samples indicate the following:

- Seven (7) private potable wells at six (6) residential properties detected Total PFOS/PFAS at concentrations above the L-HA of 70 ng/L. These samples were collected from residential areas north of the NALF Fentress boundary.
- Fifteen (15) potable water sample locations detected PFOS or PFOA at concentrations below the L-HA of 70 ng/L. These samples were collected from residential areas west and north of the NALF Fentress boundary.
- The remaining 35 potable water sample locations were showing no detections for PFOS or PFOA. This included all the samples collected south of the NALF Fentress boundary and most of the samples collected northwest of the Base.
- None of the samples exceeded the RSL for PFBS.

- Two samples which did not have detections of PFOA, PFOS, or PFBS, had detections of one or more other PFAS constituents without current screening values (PFHxS, PFHpA, or PFNA).

Well depths are not available for most for the residential wells.

4.2.5 PFAS Soil Analytical Results

Soil data were collected to evaluate the potential for PFAS sources to remain in soil at the site. Laboratory analytical results for soil samples collected are summarized and presented in **Table 4-10 and Figure 4-14**.

Surface and subsurface soil analytical data for PFOS and PFOA were screened against the residential soil RSL calculated using the USEPA RSL calculator with an HQ of 0.1 (130 micrograms per kilogram [µg/kg]) and analytical data for PFBS were screened against the residential soil RSL from the RSL summary table using an HQ of 0.1 (130,000 µg/kg).

Analysis of the soil samples collected at NALF Fentress indicate the following:

- PFOS was detected in surface soil samples at a concentration greater than the soil RSL of 130 µg/kg in samples in the vicinity of UST 20B (OFPOL-SS04) and in the Crash Truck Test Area (OF-SS05).
- PFOS was detected in both surface and subsurface soil at a concentration greater than the soil RSL of 130 µg/kg approximately 105 feet southeast of the southern production well (OF-SS03 and OF-SB03).
- While other PFOA and PFOS concentrations were less than the soil RSL values, they may still indicate potential for leaching to groundwater. Concentrations exceed the conservative USEPA soil screening levels (SSLs) for protection of groundwater (0.172 µg/L for PFOA and 0.378 µg/L for PFOS) in most samples collected.
- PFAS without current screening values (PFHxS, PFHpA, or PFNA) were detected in all 16 samples.

Notes:
Orange label indicates well installed in the shallow Columbia/Surficial aquifer.
Purple label indicates well installed in the deep Yorktown aquifer.
White label and * indicate wells for which analytical data were collected after the time frame included in the report but are included for the purpose of completeness in mapping the confining unit.
** Boring was completed to a depth of 70 ft bgs and clay was present from 50-70 ft bgs. Because this depth interval is significantly deeper than the depth at which clay was encountered further north (typically 30 ft bgs), these wells were not included in the extent of contouring, as it is possible that the confining unit in these locations is pinched out and the unit encountered is the Chickahominy confining unit, which lies below the Yorktown aquifer in this portion of Virginia.
NA - Confining Unit Not Encountered

SECTION 5

Human Health Risk Screening

A human health risk screening (HHRS) evaluation was performed to assess potential human health risks associated with exposure to PFAS in groundwater and soil at NALF Fentress. The results of the HHRS provide a preliminary indication of potential risks from exposure to PFAS in groundwater and soil and are used to help evaluate whether future unrestricted use of the site is acceptable (i.e., residential, including potable use of groundwater), or if the site requires further evaluation. Human health risk-based levels based on potable use of groundwater and residential exposure to soil were used for the screening evaluation.

5.1 Data Evaluation

The groundwater samples collected at each of the potential PFAS source areas at NALF Fentress were assessed separately in the HHRS. The off-Base residential water supplies were evaluated together as one exposure area. Groundwater samples collected from Columbia/Surficial aquifer and Yorktown aquifer wells were evaluated separately. The following areas were evaluated in the HHRS:

- Crash Truck Test Area (Columbia/Surficial and Yorktown aquifer)
- Perimeter Wells North (Columbia/Surficial and Yorktown aquifer)
- Perimeter Wells South (Columbia/Surficial and Yorktown aquifer)
- Perimeter Wells East (Columbia/Surficial and Yorktown aquifer)
- Perimeter Wells West (Columbia/Surficial and Yorktown aquifer)
- UST 20B Site (Columbia/Surficial aquifer)
- Site 14 (Columbia/Surficial and Yorktown aquifer)
- Site 17 Original Columbia/Surficial and Yorktown aquifer)
- Site 17 Revised (Columbia/Surficial aquifer)
- New Irrigation Sprayfield (Columbia/Surficial aquifer)
- Old Irrigation Sprayfield (Columbia/Surficial aquifer)
- Off-Base Non-Potable Groundwater (Columbia/Surficial and Yorktown aquifer)
- Off-Base Residential Drinking Water
- On-Base Potable Water
- On-Base Soil

The groundwater evaluated as part of the HHRA are presented in **Figure 5-1**. All of the soil samples collected at the site were evaluated together as one exposure area (**Figure 4-13**). The PFAS data evaluated in the HHRS were validated. Validation of the data identified the following criteria for data usability:

- Estimated values flagged with a J qualifier were treated as unqualified detected concentrations.
- Values flagged with a B qualifier (indicating blank contamination) were considered non-detected values.
- Values flagged with a U qualifier indicate an analyte was not detected.

The maximum concentration between a primary and a duplicate sample was used as the sample concentration. If the analyte was only detected in one of the samples, the detected concentration was used as the sample concentration.

5.2 Human Health Risk Screening Methodology

The HHRS was conducted in two steps using the risk ratio technique described in *Overview of Screening, Risk Ratio, and Toxicological Evaluation. Procedures for Northern Division Human Health Risk Assessments* (Navy, 2000).

Step 1

The maximum detected PFAS concentrations in groundwater within each area were compared to the USEPA tap water RSLs from the current RSL table (USEPA, 2017) and the maximum detected PFAS concentrations in soil were compared to the USEPA resident soil RSL (USEPA, 2017). RSLs based on noncarcinogenic effects were based on an HQ of 0.1 to account for exposure to multiple constituents with the same target organ/target effect. RSLs based on carcinogenic endpoints were based on a carcinogenic risk of 1×10^{-6}. The tap water and resident soil RSLs for PFOA and PFOS were calculated using the USEPA Risk Screening Level Calculator (USEPA, 2017) since they are not included in the most recent RSL table (USEPA, 2017). RSL values are included in HHRS screening tables for PFBS, PFOA, and PFOS, the only PFAS with available toxicity values. As discussed in previous sections of the SI report, three additional PFAS (PFNA, PFHxS, PFHpA) were also analyzed for in the groundwater samples, however, as there are no current screening values or toxicity values for these PFAS they are not compared to human health risk-based concentrations. They were analyzed for comparison to screening levels that may be developed in the future.

If the maximum detected concentration exceeded the RSL, the constituent was identified as a Step 1 chemical of potential concern (COPC) and carried forward to Step 2. In addition to comparing the maximum detected concentration of PFOA and PFOS to the RSL, if the sum of the PFOA and PFOS concentrations exceeded the RSL, they were both identified as COPCs. This was done following the PFOA and PFOS drinking water health advisories (USEPA, 2016a, 2016b, 2016c) which indicate that the combined concentration of PFOA and PFOS should be compared to the health advisory.

The drinking water health advisories for PFOA and PFOS are also included on the Step 1 groundwater screening tables. The toxicity values presented in the PFOA and PFOS health advisories are those used in the RSL calculator to calculate the tap water RSL for PFOA and PFOS. Drinking water health advisories provide information on pollutants that can affect drinking water quality, but that are not regulated under the Safe Drinking Water Act. The health advisory levels are developed to provide a margin of protection against adverse health effects to the most sensitive population (fetuses during pregnancy and breastfed infants). The health advisory levels for PFOA and PFOS are calculated based on drinking water intake of lactating women and are based on exposure from drinking water ingestion only, and do not consider exposure from dermal contact or inhalation. The health advisory also factors in other sources of exposure (for example, food and soil). The toxicity values presented in the health advisories are those used in the RSL calculator to calculate the drinking water RSL for PFOA and PFOS. The difference between the tap water RSL values and the health advisory values for PFOA and PFOS are due to the different exposure assumptions used to calculate each, and the incorporation of the relative source contribution factor used in the calculation of the health advisory.

Step 2

A risk level was calculated for the constituents identified as COPCs in Step 1 following the approach discussed in *Overview of Screening, Risk Ratio, and Toxicological Evaluation. Procedures for Northern Division Human Health Risk Assessments* (Navy, 2000):

For carcinogenic chemicals identified as COPCs in Step 1, carcinogenic risk was calculated using the following equation:

$$\textit{Carcinogenic risk} = \frac{\textit{MDC x acceptable risk level}}{\textit{RSL}}$$

Where:

MDC = Maximum detected concentration (ng/L)
acceptable risk level = $1x10^{-6}$ (unitless)
RSL = USEPA Regional Screening Level based on carcinogenic risk of $1x10^{-6}$ (ng/L)

For non-carcinogenic chemicals identified as COPCs in Step 1, a hazard index (HI) was calculated using the following equation:

$$HI = \frac{MDC \times acceptable\ HI}{RSL}$$

Where:

MDC = Maximum detected concentration (ng/L)
acceptable HI = 1 (unitless)
RSL = USEPA Regional Screening Level based on HI of 1 (ng/L)

Both carcinogenic risk and non-carcinogenic HI were calculated for COPCs that act through carcinogenic and non-carcinogenic effects. The carcinogenic risks for each chemical within an area were summed to calculate the cumulative carcinogenic risk and the HIs for each area were summed to calculate the cumulative HI. A cumulative HI was also calculated for each target organ/effect. If the cumulative HI for a target organ/effect was greater than 0.5, or the cumulative carcinogenic risk was greater than 5×10^{-5} (the target hazard and risk levels presented in the Navy risk ratio guidance document [Navy, 2000]), the chemicals contributing to these values were identified as COPCs.

5.3 Human Health Risk Screening Results

The human health risk screening results for each area and media evaluated in the HHRS are presented in this section.

5.3.1 Crash Truck Test Area

Both Columbia/Surficial aquifer and Yorktown aquifer groundwater samples were collected at the Crash Truck Test Area (**Figure 5-1**).

Tables 5-1 and **5-1a** present the HHRS for Columbia/Surficial aquifer groundwater. The maximum detected concentration of PFOA and PFOS exceed the RSL, and therefore, PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were identified as COPCs.

Tables 5-2 and **5-2a** present the HHRS for the Yorktown aquifer groundwater. The maximum detected concentration of PFOA and PFOS exceed the RSL, and therefore, PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were identified as COPCs.

Potable use of groundwater from the Columbia/Surficial aquifer and Yorktown aquifer at the Crash Truck Test Area may result in potential unacceptable human health risks associated with PFOA and PFOS.

5.3.2 Perimeter Wells North

Both Columbia/Surficial aquifer and Yorktown aquifer groundwater samples were collected at the North Perimeter Wells (**Figure 5-1**).

Tables 5-3 and **5-3a** present the HHRS for the Columbia/Surficial aquifer groundwater. The maximum detected concentrations of PFOA and PFOS exceed the RSL, and therefore, PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were identified as COPCs.

Table 5-4 presents the HHRS for Yorktown aquifer groundwater. The maximum detected concentrations of the PFAS are below the RSLs.

Potable use of groundwater from the Columbia/Surficial aquifer at the North Perimeter Wells may result in potential unacceptable human health risks associated with PFOA and PFOS. Potable use of the groundwater from the Yorktown aquifer at the North Perimeter Wells would not result in unacceptable human health risks associated with PFAS. It should be noted that the concentrations detected in the Columbia/Surficial aquifer

groundwater are two orders of magnitude higher than the concentrations detected in the Yorktown aquifer groundwater.

5.3.3 Perimeter Wells South

Both Columbia/Surficial aquifer and Yorktown aquifer groundwater samples were collected at the South Perimeter Wells (**Figure 5-1**).

Tables 5-5 and **5-5a** present the HHRS for Columbia/Surficial aquifer groundwater. The maximum detected concentrations of PFOA and PFOS exceed the RSL, and therefore, PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were identified as COPCs.

Tables 5-6 and **5-6a** present the HHRS for Yorktown aquifer groundwater. The maximum detected concentration of PFOS and the combined maximum detected concentration of PFOA and PFOS exceed the RSL, and therefore, PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were not identified as COPCs.

Potable use of groundwater from the Columbia/Surficial aquifer at the South Perimeter Wells may result in potential unacceptable human health risks associated with PFOA and PFOS. Potable use of the groundwater from the Yorktown aquifer at the South Perimeter Wells would not result in unacceptable human health risks associated with PFAS. It should be noted that the concentrations detected in the Columbia/Surficial aquifer groundwater are one to two orders of magnitude higher than the concentrations detected in the Yorktown aquifer groundwater.

5.3.4 Perimeter Wells East

Both Columbia/Surficial aquifer and Yorktown aquifer groundwater samples were collected at the East Perimeter Wells (**Figure 5-1**).

Tables 5-7 and **5-7a** present the HHRS for Columbia/Surficial aquifer groundwater. The maximum detected concentration of PFOA and the combined maximum detected concentration of PFOA and PFOS exceed the RSL, and therefore, both PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were not identified as COPCs.

Table 5-8 presents the HHRS for Yorktown aquifer groundwater. The detected concentrations of the PFAS are below the RSLs.

Potable use of groundwater from the Columbia/Surficial aquifer and the Yorktown aquifer at the East Perimeter Wells would not result in unacceptable human health risks associated with PFAS.

5.3.5 Perimeter Wells West

Both Columbia/Surficial aquifer and Yorktown aquifer groundwater samples were collected at the West Perimeter Wells (**Figure 5-1**).

Tables 5-9 and **5-9a** present the HHRS for Columbia/Surficial aquifer groundwater. The maximum detected concentrations of PFOA and PFOS exceed the RSL, and therefore, PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were identified as COPCs.

Table 5-10 presents the HHRS for Yorktown aquifer groundwater. The detected concentrations of the PFAS are below the RSLs.

Potable use of groundwater from the Columbia/Surficial aquifer at the West Perimeter Wells may result in potential unacceptable human health risks associated with PFOA and PFOS. Potable use of the groundwater from the Yorktown aquifer at the West Perimeter Wells would not result in unacceptable human health risks associated with PFAS. It should be noted that the concentrations detected in the Columbia/Surficial aquifer groundwater are one to two orders of magnitude higher than the concentrations detected in the Yorktown aquifer groundwater.

5.3.6 UST 20B Site

Columbia/Surficial aquifer groundwater samples were collected at the UST 20B Site (**Figure 5-1**).

Tables 5-11 and **5-11a** present the HHRS for the Columbia/Surficial aquifer groundwater. The maximum detected concentrations of PFOA and PFOS exceed the RSL, and therefore, PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were identified as COPCs.

Potable use of groundwater from the Columbia/Surficial aquifer at the UST 20B Site may result in potential unacceptable human health risks associated with PFOA and PFOS.

5.3.7 Site 14

Both Columbia/Surficial aquifer and Yorktown aquifer groundwater samples were collected at Site 14 (**Figure 5-1**).

Tables 5-12 and **5-12a** present the HHRS for the Columbia/Surficial aquifer groundwater. The maximum detected concentrations of PFOA and PFOS exceed the RSL, and therefore, PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were identified as COPCs.

Table 5-13 presents the HHRS for Yorktown aquifer groundwater. The maximum detected concentration of PFOA, the only PFAS detected, is below the RSL.

Potable use of groundwater from the Columbia/Surficial aquifer at Site 14 may result in potential unacceptable human health risks associated with PFOA and PFOS. Potable use of the groundwater from the Yorktown aquifer at Site 14 would not result in unacceptable human health risks associated with PFAS.

5.3.8 Site 17 Original

Both Columbia/Surficial aquifer and Yorktown aquifer groundwater samples were collected at Site 17 Original **(Figure 5-1).**

Tables 5-14 and **5-14a** present the HHRS for the Columbia/Surficial aquifer groundwater. The maximum detected concentrations of PFOA and PFOS exceed the RSL, and therefore, PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were identified as COPCs.

Table 5-15 presents the HHRS for the Yorktown aquifer groundwater. The detected concentrations of the PFAS are below the RSLs.

Potable use of groundwater from the Columbia/Surficial aquifer at Site 17 Original may result in potential unacceptable human health risks associated with PFOA and PFOS. Potable use of the groundwater from the Yorktown aquifer at Site 17 Original would not result in unacceptable human health risks associated with PFAS. It should be noted that the concentrations detected in the Columbia/Surficial aquifer groundwater are one to two orders of magnitude higher than the concentrations detected in the Yorktown aquifer groundwater.

5.3.9 Site 17 Revised

Columbia/Surficial aquifer groundwater samples were collected at Site 17 Revised **(Figure 5-1).**

Tables 5-16 and **5-16a** present the HHRS for Columbia/Surficial aquifer groundwater. The maximum detected concentrations of PFOA and PFOS exceed the RSL, and therefore, PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were identified as COPCs.

Potable use of groundwater from the Columbia/Surficial aquifer at Site 17 Revised may result in potential unacceptable human health risks associated with PFOA and PFOS.

5.3.10 New Irrigation Sprayfield

Columbia/Surficial aquifer groundwater samples were collected at the New Irrigation Sprayfield **(Figure 5-1).**

Tables 5-17 and **5-17a** present the HHRS for Columbia/Surficial aquifer groundwater. The maximum detected concentration of PFOS and the combined maximum detected concentration of PFOA and PFOS exceed the RSL, and therefore, both PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were not identified as COPCs.

Potable use of groundwater from the Columbia/Surficial aquifer at the New Irrigation Sprayfield would not result in unacceptable human health risks associated with PFAS.

5.3.11 Old Irrigation Sprayfield

Columbia/Surficial aquifer groundwater samples were collected at the Old Irrigation Sprayfield **(Figure 5-1).**

Tables 5-18 and **5-18a** present the HHRS for Columbia/Surficial aquifer groundwater. The maximum detected concentration of PFOA and PFOS exceed the RSL, and therefore, PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were identified as COPCs.

Potable use of groundwater from the Columbia/Surficial aquifer at the Old Irrigation Sprayfield may result in potential unacceptable human health risks associated with PFOA and PFOS.

5.3.12 Off-Base Non-Potable Groundwater Wells

Both Columbia/Surficial aquifer and Yorktown aquifer groundwater samples were collected at off-Base non-potable groundwater wells in November 2017 **(Figure 5-1).**

Tables 5-19 and **5-19a** present the HHRS for the Columbia/Surficial aquifer groundwater. The maximum detected concentrations of PFOA and PFOS exceed the RSL, and therefore, PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were identified as COPCs.

Tables 5-20 and **5-20a** present the HHRS for the Yorktown aquifer groundwater. The maximum detected concentration of PFOS and the combined maximum detected concentration of PFOA and PFOS exceed the RSL, and therefore, both PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were not identified as COPCs.

Potable use of groundwater from the Columbia/Surficial aquifer from the non-potable off-Base groundwater wells may result in potential unacceptable human health risks associated with PFOA and PFOS.

5.3.13 Off-Base Residential Wells

All residential well groundwater samples were collected from residential wells located off-Base **(Figure 4-12)**.

Tables 5-21 and **5-21a** present the HHRS for the residential wells. The detected concentrations of PFOA and PFOS exceeded the RSL, and therefore, PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were identified as COPCs.

Potable use of groundwater from off-Base residential wells may result in potential unacceptable human health risks associated with PFOA and PFOS. Concentrations of PFAS at six of the residences sampled exceed the RSL for PFOA and /or PFOS. However, it is important to note that this risk was driven by a select few properties. Properties with exceedances of the L-HA, which drove unacceptable risk findings are being supplied with bottled water and/or have granular activated carbon systems in place for treatment.

5.3.14 On-Base Potable Water

On-base potable water samples were collected in December 2015 and in May 2016. The influent samples were collected from a spigot on a storage tank prior to treatment, where groundwater from both water supply wells is mixed.

Tables 5-22 and **5-22a** present the HHRS for the on-Base potable water. The detected concentrations of PFOA and PFOS exceeded the RSL, and therefore, PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were identified as COPCs.

Potable use of groundwater from the influent to the water treatment plant prior to treatment would result in potential unacceptable human health risks associated with PFOA and PFOS. It is important to note that this risk is based on influent to the treatment plant, not the effluent from the plant.

5.3.15 On-Base Soil

Soil samples were collected across the Base in February 2017.

Tables 5-23 and **5-23a** present the HHRS for the soil. The maximum detected concentration of PFOS and the combined maximum detected concentration of PFOA and PFOS exceed the RSL, and therefore, both PFOA and PFOS were evaluated in Step 2. Based on Step 2, PFOA and PFOS were not identified as COPCs.

Exposure to soil would not result in unacceptable human health risks associated with PFAS.

5.4 Human Health Risk Screening Findings

The HHRS identified potential unacceptable risks associated with PFAS in groundwater for the following areas:

- Crash Truck Test Area, Columbia/Surficial aquifer and Yorktown aquifer
- Perimeter Wells North, Columbia/Surficial aquifer
- Perimeter Wells South, Columbia/Surficial aquifer
- Perimeter Wells West, Columbia/Surficial aquifer
- UST 20B Site, Columbia/Surficial aquifer
- Site 14, Columbia/Surficial aquifer
- Site 17 Original, Columbia/Surficial aquifer
- Site 17 Revised, Columbia/Surficial aquifer
- Old Irrigation Sprayfield, Columbia/Surficial aquifer
- Off-Base Non-Potable Wells, Columbia/Surficial aquifer
- Residential Wells

SECTION 6

Conclusions and Recommendations

This section summarizes the major conclusions of the Basewide PFAS SI conducted at NALF Fentress, which have been drawn from the findings and results presented and evaluated in earlier sections of this report. It also presents proposed recommendations to address the PFAS occurrence at the installation.

6.1 Conclusions

Table 6-1 provides the conclusions of the investigation as measured against the objectives:

Table 6-1. Fentress PFAS SI Investigation Objectives and Conclusions

Primary Objective	Secondary Objective (as applicable)	Conclusion
Determine if PFAS are present in the Base water supply.	--	PFAS were determined to be present in the Base water supply at levels exceeding the L-HA.
Determine the groundwater flow direction, gradient, and velocity, to allow the better assessment of fate and transport at the site.	--	Groundwater flow in the Columbia/Surficial aquifer was determined to be radial, with a stronger component of flow to the north and east toward the Intracoastal Waterway. Groundwater flow in the Yorktown aquifer is primarily to the north and east toward the Intracoastal Waterway. The groundwater velocity in the Columbia/Surficial aquifer at NALF Fentress is estimated to be 0.0468 ft/day or approximately 17.07 ft/year. The groundwater velocity in the Yorktown aquifer at NALF Fentress is estimated to be 0.0778 ft/day or approximately 28.38 ft/year.
Determine if PFAS are present in suspected source areas at NALF Fentress.	Determine the possible presence of soil contamination remaining on-Base if PFAS are detected in groundwater at levels of concern and summarize the conclusions	PFAS were identified at levels greater than the L-HA in samples from Site 14, Site 17 (original) and Site 17 (Revised), the Current Crash Truck Test Area, the UST 20B site, and both irrigation sprayfields. While no deep monitoring wells were installed in some of the identified source areas (e.g., UST 20B site, Site 17 [Revised], or either irrigation sprayfields), exceedances of the L-HA occurred in the vicinity of the Current Crash Truck Test Area and in water supply wells in the Yorktown aquifer, which are near the UST 20B Site, indicating migration into the deeper aquifer has occurred in some source areas. PFAS were also detected in soils in all areas analyzed, including potential secondary source areas, such as irrigation sprayfields and area in the vicinity of the water supply wells where fire-fighting water may have been discharged to the ground surface. While many soil concentrations were less than screening levels for direct exposure and potential unacceptable risks were not identified, there may be continuing impacts from potential for leaching to groundwater at levels of concern. Soil concentrations were highest in the UST 20B area and near the Current Crash Truck Test Area. The soil sampling data set is limited and some potential source areas were not evaluated (e.g., Site 17 [Revised]).
Determine whether PFAS are present at levels posing potentially unacceptable human health risks in groundwater at NALF Fentress.	--	Concentrations in groundwater pose potential unacceptable risk across much of the site, including off-Base private drinking water wells. While risks are acceptable in many of the Yorktown aquifer perimeter wells, it is important to note that wells drilled through the confining unit into the Yorktown aquifer off-Base pose unacceptable risk, indicating preferential pathways are created during private well installation.

Table 6-1. Fentress PFAS SI Investigation Objectives and Conclusions

Primary Objective	Secondary Objective (as applicable)	Conclusion
Determine the potential for off-Base migration of PFAS at NALF Fentress.	--	Contaminants were confirmed to have migrated off-Base at levels posing potential unacceptable risks.

6.2 Recommendations

An Expanded SI is recommended to refine understanding of the conceptual site model. Specifically, the following actions are proposed:

1. Installation of additional shallow and deep monitoring wells off-Base at NALF Fentress to better assess potential migration in both the Columbia/Surficial aquifer and Yorktown/ deep aquifer; these wells should be focused to the north and east of the facility in the directions of groundwater flow.
2. Installation of additional deep monitoring wells in locations on-Base with L-HA exceedances in the Columbia/Surficial aquifer, but without existing deep wells (e.g., Site 17 [revised], UST 20B, and within the irrigation sprayfields), and at a deeper depth interval than existing well OF-MW08D to delineate the vertical extent of PFAS levels exceeding the L-HAs in the vicinity of the Crash Truck Test Area.
3. Collection of additional soil samples to assess source areas which were not evaluated during the initial soil sampling effort (e.g., Site 17 [revised]).
4. Continued refinement and monitoring of vertical and horizontal distribution and migration of potential PFAS in the Columbia and Yorktown aquifers including installation of additional wells around identified source areas (e.g., Site 17 and the Crash Truck Test Area).
5. Continued assessment of toxicity data for human and ecological receptors to complete an RI.

NALF Fentress Fire Department Interviews

RECORD OF MEETING

Interview to Evaluate Use of Aqueous Film-Forming Foam Use at NALF Fentress

MEETING DATE: November 2, 2015

In November, 2015, NAVFAC and CH2M interviewed Captain of Naval Auxiliary Landing Field (NALF) Fentress and Assistant Fire Chief of Naval Air Station (NAS) Oceana about use of Aqueous Film-Forming Foams (AFFFs) in firefighter training and emergency operations at NALF Fentress.

AFFF Use at NALF Fentress

Firefighter training activities at NALF Fentress are currently conducted only using water; no AFFF is currently used in training. AFFF is currently used only in crash trucks at Fentress in preparation for emergency use; no automated fire suppression systems are charged with AFFF.

AFFF is ordered at NAS Oceana following current military specifications. Only 3-percent AFFF is used. 3M and Ansul brands have been used previously, but headquarters is using primarily Chemguard brand now. At NALF Fentress, AFFF was stored in Building 20 until recently; it is now stored in Building 106 (**Figure 1**). A maximum of 540 gallons is stored in 108 five-gallon cans. To load the crash trucks, the trucks are brought to Building 20 (previously and now Building 106), AFFF is replenished by hand from the 5-gallon cans, and empty AFFF cans are disposed of as Hazardous Materials (at Building 1114 at NAS Oceana).

In addition to the five-gallon cans in storage, three 200-gallon tanks of AFFF (600 gallons total) are kept filled at NALF Fentress – two are loaded in trucks and one spare tank is kept in Building 106. The trucks are parked in the fire station. Tanks are not cleaned out when AFFF is expended. Vehicles are washed at the fire station. Valves are only cleaned if there is a problem with the metering valve; this maintenance, which is rare, is performed by the Public Works and Transportation Department at NAS Oceana.

Spray tests are performed at the current crash truck equipment test area (**Figure 1**). This site has been approved for spray testing and has been in use since about 2010. The spray test involves checking the roof turret, pumper turret, and hand lines under the truck nozzles to ensure the foam is the right consistency and to test the distance and width of the spray pattern. Plans for spray testing are coordinated in advance, and spray testing is not conducted if it is raining or if rain is predicted within the new few days.

AFFF has not been used at NALF Fentress for emergencies in the recent past. Captain and Chief did not believe that AFFF has been sprayed at NALF Fentress in the past 20 years for any emergency, including fuel releases, historical crashes or fires, or emergency runway landings.

3.1.4 Fire Extinguishing Agent Supply Requirements

Each ARFF organization shall maintain a minimum ready stock of one vehicle/equipment load of AFFF, PKP, and Halon 1211 (total tank capacity) for each manned ARFF vehicle assigned. The minimum ready stock shall exclude the initial load of agent in the tank and agent necessary to satisfy firefighting training requirements. Supply departments for air activities should maintain an equal amount of agent.

* Does not include hangars
Kinetik is the hangar contractor.

6- Type/slot/size of screen	0.010" Machine slotted 10 ft PVC screen
7- Type screen filter	#1 Sand pack
a) Quantity used	3 - 50 lb bags
8- Type of seal	Bentonite chips
a) Quantity used	1 - 50 lb bag
9- Grout	
a) Grout mix used	Portland cement type I/II
b) Method of placement	Tremie pipe
c) Vol.of surface casing grout	63 gallons
d) Vol. of well casing grout	63 gallons
Development method	Surge with submersible pump
Development time	112 minutes
Estimated purge volume	110 gallons

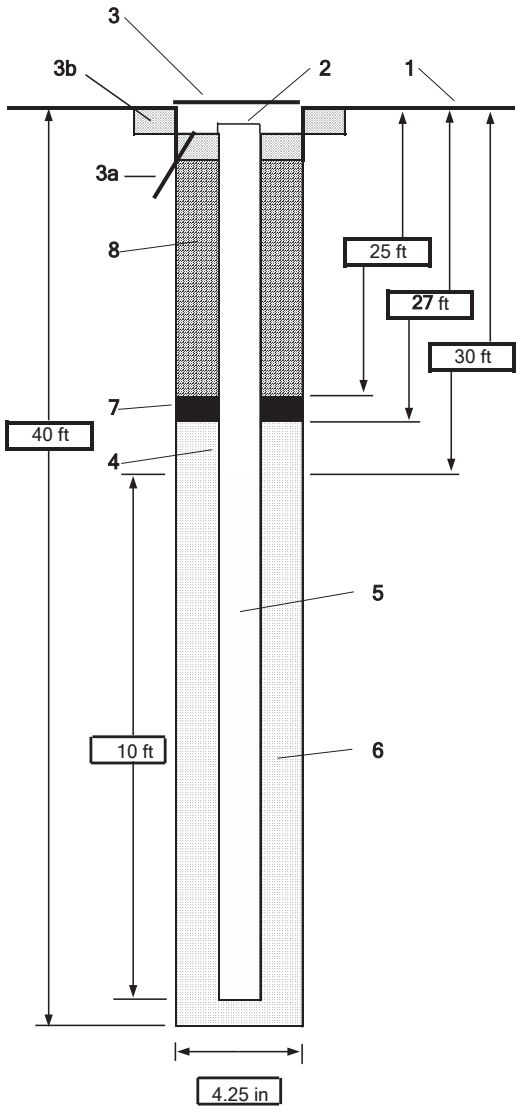
WATER LEVELS : 1.83 ft START : 7/10/16 11:30 END : 7/10/16 18:15 LOGGER : B. Rahe



1- Ground elevation at well: 10.66 ft

2- Top of casing elevation: 10.31 ft

3- Wellhead protection cover typ: Flush mount
- a) drain tube?: No
- b) concrete pad dimensions: 12" Diameter circle

4- Dia./type of well casing: 2" Diameter PVC

5- Type/slot size of screen: 0.010" Machine slotted PVC

6- Type screen filter: #1 Sand pack
- a) Quantity used: 5 - 50 lb bags

7- Type of seal: Bentonite chips
- a) Quantity used: 1/2 - 50 lb bag

8- Grout
- a) Grout mix used: Portland cement type I/II
- b) Method of placement: Tremie pipe
- c) Vol. of well casing grout: 145 gallons

Development method: Surge with submersible pump

Development time: 300 minutes

Estimated purge volume: 15 gallons

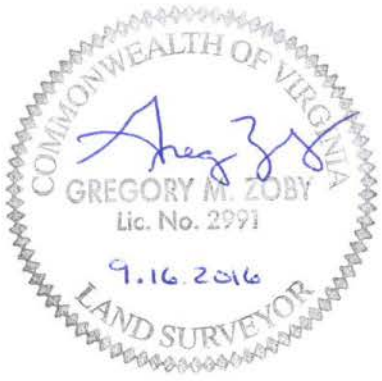
Appendix D
Professional Land Survey Reports



CLEAN 9000 CTO WE01

Site Naval Air Landing Field Fentress

Chesapeake, Virginia

MSA Project #16127A

Survey Report

MSA, P.C. provided surveying support for the monitoring of groundwater wells at Naval Air Landing Field (NALF) Fentress located in Chesapeake, Virginia.

This report summarizes the work completed at NALF Fentress to recover e3xisting horizontal and vertical control, establish horizontal and vertical control on site and locate and map the vertical and horizontal locations of thirteen (13) new groundwater monitoring wells.

All horizontal control work complied with Third Order Class I (1:10,000), as outlined in the FDGC Geospatial Positioning Accuracy Standards, Part 4: Standards for Architecture, Engineering, Construction (A/E/C) and Facility Management. See the attached spread sheet for the averages of the on-site control that were established using GPS.

Vertical control work complies with Third Order (0.050√ miles) Residual differences shown on the attached spread sheet using GPS observations show the maximum vertical error as 0.017'

FIELD OPERATION DATES

MSA conducted surveying work at NALF Fentress on August 31, 2016 and completed the work on September 2, 2016. The field crew consisted of Preston Lawrence and Stephen Moran. On August 31, 2016 the weather conditions were cloudy with a high temperature of 95° Fahrenheit. September 2nd was clear and windy with temperatures in the low 80's Fahrenheit.

NGS CONTROL

Horizontal control for the above referenced survey is based upon City of Chesapeake Station 057 and was verified utilizing RTK-Net GPS, a Leica 1200GPS was used in conjunction with the Leica SpiderNet CORS system to obtain the coordinates for the on-site control points numbered 54 and 57. Once the GPS established control points were in place, a traverse and differential level loop were run around the site and additional control points numbered 58, 59, 82 and were set using traditional survey methods. Control points 54, 57, and 82 are #5 rebar set at ground level. The relative precision of the traverse for NALF was (5,622.65/0.001 = 1/1,778,500). Coordinates are based on the Virginia State Plane Coordinate System, South Zone NAD 83/94 HARN.

Project Description

Site Name:	Naval Auxiliary Landing Field Fentress
Site Address:	Naval Auxiliary Landing Field Fentress, 2500 Lockheed Avenue, Chesapeake, VA 23322
Source of Contamination:	Aqueous Film Forming Foam (AFFF)
Waste Generating Activity:	Monitoring well installation and purging activities

Waste Description

Applicant must complete the following information and attach all laboratory analyses and / or MSDS utilized to characterize the material as non-hazardous and acceptable for receipt by Clearfield MMG.

General Description: Decon and purge water

Matrix: [ ] Soil [ ] Sludge [X] Water [ ] Debris / Absorbents

Petroleum Type: *(Check all that apply)*
[ ] Virgin (un-used) [ ] Non-Virgin (used) [X] None
[ ] Gas [ ] Diesel / # 2 [ ] Motor / Hydraulic Oil [ ] # 4, 5, or 6 Oil

Other Contaminants: see analysis

Volume: (4) 55 gallon Drums **Lab Analysis Completed:** [X] YES [ ] NO

Generator Certification

I hereby certify, based upon my diligent inquiry into the activities and processes generating the waste described on this form, that these materials are not classified as listed or characteristic hazardous waste as regulated by the Commonwealth of Virginia or the state of origin of this waste; that the materials do not contain 50.0 parts per million or more of polychlorinated biphenyls (PCB's); that the analytical results, completed M*aterial Characterization Form* and attached documentation are a representative, true, and accurate description of these materials; that no deliberate or willful omissions have been made in the preparation of this form; and that all known or suspect hazards have been disclosed herein. I further acknowledge that I am aware it is the duty of all persons to dispose of their solid waste in a legal manner (Va.Code ' 10.1-1418.1.A).

Introduction

The following data validation report discusses the data validation process and findings for TestAmerica Laboratories for SDG 320-16572-1.

Samples were analyzed using the following analytical method:

- WS-LC-0025 Perfluorinated Hydrocarbons

The samples included in this SDG are listed in the table below.

Sample Name	Matrix
OF14-MW07S-1215	Water
OF14-MW06S-1215	Water
OF-MW16-1215	Water
OF-MW16P-1215	Water
OF-MW17-1215	Water
OF14-MW07D-1215	Water
OF14-MW06D-1215	Water
OF-MW15-1215	Water
OF-MW09-1215	Water
OF-MW10-1215	Water
OF-EB122315	Water
OF-MW08-1215	Water

Sample Name	Matrix
OF-MW08P-1215	Water
OF-MW12-1215	Water
OF-MW11-1215	Water
OF-MW14-1215	Water
OF-MW13-1215	Water
OF-EB122815	Water
OF-FB01-123015	Water
OF-INF01-1215	Water
OF-INF01P-1215	Water
OF-EFF01-1215	Water
OF-EFF01P-1215	Water
OF-MW12D-1215	Water
OF-FB02-123015	Water
OF14-MW07S-1215	Water

Data Evaluation

Data was evaluated in accordance with the analytical methods and with the criteria found in the following guidance documents: Sampling and Analysis Plan Perfluorinated Compound Investigation, Naval Auxiliary Landing Field Fentress, Chesapeake, Virginia Contract Task Order WE44 (December 2015) and National Functional Guidelines for Organic Data Review (2014) as applicable. The samples were evaluated based on the following criteria:

- Data Completeness
- Technical Holding Times
- Tuning Instrument
- Initial/Continuing Calibrations
- Blanks
- Internal Standards
- Laboratory Control Samples
- Isotope Dilution Analyte
- Field Duplicates
- Identification/Quantitation
- Reporting Limits

Overall Evaluation of Data/Potential Usability Issues

Specific details regarding qualification of the data are addressed in the sections below. If an issue is not addressed there were no actions required based on unmet quality criteria. When more than one qualifier is associated with a compound/analyte, the validator has chosen the qualifier that best indicates possible bias in the results and qualified these data accordingly.

Data Completeness

The SDG was received complete and intact.

Technical Holding Times

According to the chain of custody records, sampling was performed on the days of 12/21-23, 28, and 30/2015. Samples were received at the laboratory on the days of 12/22, 23, 24, 29 and 31/2015. All sample preparation and analyses were performed within holding time requirements.

Blanks

Several compounds were detected in the equipment blanks as listed below. Affected data are summarized in **Attachment 1**.

Blank ID	Compound	Conc.	Units
OF-EB122315	Perfluorohexanesulfonic acid (PFHxS)	0.0012	UG_L
OF-EB122815	Perfluorohexanesulfonic acid (PFHxS)	0.00080	UG_L
OF-EB122815	Perfluorooctanesulfonic acid (PFOS)	0.0012	UG_L
OF-FB01-123015	Perfluorohexanesulfonic acid (PFHxS)	0.00089	UG_L
OF-FB01-123015	Perfluorooctanesulfonic acid (PFOS)	0.0029	UG_L

Field Duplicate Precision

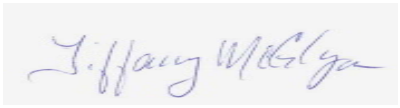
Perfluorooctanoic Acid (PFOA) did not meet required precision criteria in native sample OF-MW16-1215 and field duplicate OF-MW16P-1215. Affected data are summarized in **Attachment 1**.

Conclusion

These data can be used in the project decision-making process as qualified by the data quality evaluation process.

Please do not hesitate to contact us about this validation report.

Sincerely,



Tiffany McGlynn

Qualification Flags

Exclude	More appropriate data exist for this analyte.
R	Data were rejected for use.
UL	Analyte not detected, quantitation limit is potentially biased low.
UJ	Analyte not detected, estimated quantitation limit.
U	Analyte not detected.
B	Not detected substantially above the level reported in laboratory or field blanks.
L	Analyte present, estimated value potentially biased low.
K	Analyte present, estimated value potentially biased high.
N	Analyte identification presumptive; no second column analysis performed or GC/MS tentative identification.
J	Analyte present, estimated value.
NJ	Analysis indicates the presence of an analyte that was "tentatively identified" and the associated value represents its approximate concentration.
None	Placeholder for calculating quality control issues that do not require flagging.
=	Analyte was detected at a concentration greater than the quantitation limit.

Qualifier Code Reference

Value	Description
%SOL	High Moisture content
2C	Second Column – Poor Dual Column Reproducibility
2S	Second Source – Bad reproducibility between tandem detectors
BD	Blank Spike/Blank Spike Duplicate(LCS/LCSD) Precision
BRL	Below Reporting Limit
BSH	Blank Spike/LCS – High Recovery
BSL	Blank Spike/LCS – Low Recovery
CC	Continuing Calibration
CCBL	Continuing Calibration Blank Contamination
CCH	Continuing Calibration Verification – High Recovery
CCL	Continuing Calibration Verification – Low Recovery
DL	Redundant Result – due to Dilution
EBL	Equipment Blank Contamination
EMPC	Estimated Possible Maximum Concentration
ESH	Extraction Standard - High Recovery
ESL	Extraction Standard - Low Recovery
FBL	Field Blank Contamination
FD	Field Duplicate
HT	Holding Time
ICB	Initial Calibration – Bad Linearity or Curve Function
ICH	Initial Calibration – High Relative Response Factors
ICL	Initial Calibration – Low Relative Response Factors
IR15	Ion ratio exceeds +/- 15% difference
ISH	Internal Standard – High Recovery
ISL	Internal Standard – Low Recovery
LD	Lab Duplicate Reproducibility
LR	Concentration Exceeds Linear Range
MBL	Method Blank Contamination
MDP	Matrix Spike/Matrix Spike Duplicate Precision
MI	Matrix interference obscuring the raw data

Value	Description
MSH	Matrix Spike and/or Matrix Spike Duplicate – High Recovery
MSL	Matrix Spike and/or Matrix Spike Duplicate – Low Recovery
OT	Other
PD	Pesticide Degradation
RE	Redundant Result - due to Reanalysis or Re-extraction
SD	Serial Dilution Reproducibility
SSH	Spiked Surrogate – High Recovery
SSL	Spiked Surrogate – Low Recovery
TBL	Trip Blank Contamination
TN	Tune

Data Evaluation

Data was evaluated in accordance with the analytical methods and with the criteria found in the following guidance documents: Sampling and Analysis Plan Perfluorinated Compound Investigation, Naval Auxiliary Landing Field Fentress, Chesapeake, Virginia Contract Task Order WE44 (December 2015) and National Functional Guidelines for Organic Data Review (August 2014) with Region 3 Modification (Use of 'B' qualifier) as applicable. The samples were evaluated based on the following criteria:

- Data Completeness
- Technical Holding Times
- Tuning Instrument
- Initial/Continuing Calibrations
- Blanks

- Internal Standards
- Laboratory Control Samples
- Isotope Dilution Analyte
- Field Duplicates
- Identification/Quantitation
- Reporting Limits

Overall Evaluation of Data/Potential Usability Issues

Specific details regarding qualification of the data are addressed in the sections below. If an issue is not addressed there were no actions required based on unmet quality criteria. When more than one qualifier is associated with a compound/analyte, the validator has chosen the qualifier that best indicates possible bias in the results and qualified these data accordingly.

Data Completeness

The SDG was received complete and intact.

Technical Holding Times

According to the chain of custody records, sampling was performed on 2/3/16 through 2/16/16. Samples were received at the laboratory 2/4/16 through 2/17/16. All sample preparation and analyses were performed within holding time requirements with the exception of the samples listed below. Affected data are summarized in **Attachment 1**.

Sample Name	SDG
OF-RW42B-0216	320-17150
OF-RW08-0216	320-17185
OF-RW08P-0216	320-17185

Sample Name	SDG
OF-RW59-0216	320-17241
OF-FB50-0216	320-17241
OF-RW50-0216	320-17241
OF-FB34-0216	320-17241

Blanks

Several compounds were detected in the field blanks and method blanks as listed below. Affected data are summarized in **Attachment 1**.

SDG	Blank ID	Compound	Conc.	Units
320-17183	OF-FB49-0216	Perfluorohexanesulfonic acid (PFHxS)	0.00068	UG_L
320-17183	OF-FB36A-0216	Perfluorooctane Sulfonate (PFOS)	0.00042	UG_L
320-17185	OF-FB51-0216	Perfluorobutanesulfonic acid (PFBS)	0.00063	UG_L
320-17190	OF-FB12-0216	Perfluorohexanesulfonic acid (PFHxS)	0.00079	UG_L
320-17190	OF-FB57-0216	Perfluorohexanesulfonic acid (PFHxS)	0.00083	UG_L
320-17190	OF-FB25-0216	Perfluorobutanesulfonic acid (PFBS)	0.00092	UG_L
320-17190	OF-FB16-0216	Perfluorobutanesulfonic acid (PFBS)	0.0011	UG_L
320-17190	MB 320-100277/1-A	Perfluorobutanesulfonic acid (PFBS)	0.00103	UG_L
320-17190	MB 320-100277/1-A	Perfluorohexanesulfonic acid (PFHxS)	0.00102	UG_L
320-17190	MB 320-100277/1-A	Perfluorooctane Sulfonate (PFOS)	0.00144	UG_L
320-17859	MB 320-104553/1-A	Perfluorooctanoic acid (PFOA)	0.00217	UG_L

Field Duplicate Precision

Perfluoroheptanoic acid (PFHpA) did not meet required precision criteria in native sample OF-RW51-0216 and field duplicate OF-RW51P-0216. Affected data are summarized in **Attachment 1**.

Matrix Spike/Spike Duplicate

For spiked sample OF-RW56-0216 in SDG 320-17185, perfluorobutanesulfonic acid (PFBS) exhibited high recoveries in the MS/MSD. Affected data are summarized in **Attachment 1**.

Surrogates

Surrogates for the samples listed below exhibited low recoveries. Affected data are summarized in **Attachment 1**.

Sample Name	SDG
OF-RW67-0216	320-17154
OF-RW47-0216	320-17219
OF-RW70-0216	320-17236

Sample Name	SDG
OF-RW24-0216	320-17278

Internal Standards

Internal standards exhibited low recoveries for the samples listed below. Affected data are summarized in **Attachment 1**.

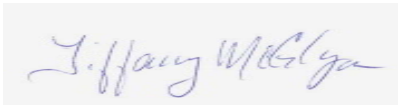
Sample Name	SDG
OF-RW37-0216	320-17154
OF-FB56-0216	320-17185

Conclusion

These data can be used in the project decision-making process as qualified by the data quality evaluation process.

Please do not hesitate to contact us about this validation report.

Sincerely,



Tiffany McGlynn

J	Analyte present, estimated value.
NJ	Analysis indicates the presence of an analyte that was "tentatively identified" and the associated value represents its approximate concentration.
None	Placeholder for calculating quality control issues that do not require flagging.
=	Analyte was detected at a concentration greater than the quantitation limit.

Qualifier Code Reference

Value	Description
%SOL	High Moisture content
2C	Second Column – Poor Dual Column Reproducibility
2S	Second Source – Bad reproducibility between tandem detectors
BD	Blank Spike/Blank Spike Duplicate(LCS/LCSD) Precision
BRL	Below Reporting Limit
BSH	Blank Spike/LCS – High Recovery
BSL	Blank Spike/LCS – Low Recovery
CC	Continuing Calibration
CCBL	Continuing Calibration Blank Contamination
CCH	Continuing Calibration Verification – High Recovery
CCL	Continuing Calibration Verification – Low Recovery
DL	Redundant Result – due to Dilution
EBL	Equipment Blank Contamination
EMPC	Estimated Possible Maximum Concentration
ESH	Extraction Standard - High Recovery
ESL	Extraction Standard - Low Recovery
FBL	Field Blank Contamination
FD	Field Duplicate
HT	Holding Time
ICB	Initial Calibration – Bad Linearity or Curve Function
ICH	Initial Calibration – High Relative Response Factors
ICL	Initial Calibration – Low Relative Response Factors
IR15	Ion ratio exceeds +/- 15% difference
ISH	Internal Standard – High Recovery
ISL	Internal Standard – Low Recovery
LD	Lab Duplicate Reproducibility
LR	Concentration Exceeds Linear Range
MBL	Method Blank Contamination
MDP	Matrix Spike/Matrix Spike Duplicate Precision
MI	Matrix interference obscuring the raw data

Value	Description
MSH	Matrix Spike and/or Matrix Spike Duplicate – High Recovery
MSL	Matrix Spike and/or Matrix Spike Duplicate – Low Recovery
OT	Other
PD	Pesticide Degradation
RE	Redundant Result - due to Reanalysis or Re-extraction
SD	Serial Dilution Reproducibility
SSH	Spiked Surrogate – High Recovery
SSL	Spiked Surrogate – Low Recovery
TBL	Trip Blank Contamination
TN	Tune

Introduction

The following data validation report discusses the data validation process and findings for TestAmerica Laboratories in the Sample Delivery Groups (SDGs) listed in the table below.

Samples were analyzed using the following analytical methods:

- WS-LC-0025 Perfluorinated Hydrocarbons
- SW6010C Iron, total & dissolved

The samples included in these SDGs are listed in the table below.

SDG	Sample_Name	Matrix
320-18704-1	OF-RW44-0516	Water
320-18704-1	OF-FB44-0516	Water
320-18704-1	OF-RW42B2-0516	Water

Data Evaluation

Data was evaluated in accordance with the analytical methods and with the criteria found in the following guidance documents: Sampling and Analysis Plan Perfluorinated Compound Investigation, Naval Auxiliary Landing Field Fentress, Chesapeake, Virginia Contract Task Order WE44 (December 2015), National Functional Guidelines for Organic Data Review

(August 2014), and National Functional Guidelines for Inorganic Data Review (August 2014), with Region 3 Modification (Use of 'B' qualifier) as applicable. The samples were evaluated based on the following criteria:

- Data Completeness
- Technical Holding Times
- Tuning Instrument
- Initial/Continuing Calibrations
- Blanks
- Internal Standards
- Laboratory Control Samples
- Matrix Spike/Spike Duplicate
- Serial Dilution
- Isotope Dilution Analyte
- Field Duplicates
- Identification/Quantitation
- Reporting Limits
- Total vs. Dissolved

Overall Evaluation of Data/Potential Usability Issues

Specific details regarding qualification of the data are addressed in the sections below. If an issue is not addressed there were no actions required based on unmet quality criteria. When more than one qualifier is associated with a compound/analyte, the validator has chosen the qualifier that best indicates possible bias in the results and qualified these data accordingly.

Data Completeness

The SDGs were received complete and intact.

Technical Holding Times

According to the chain of custody records, sampling was performed on 5/4/16 through 5/19/16. Samples were received at the laboratory 5/6/16 through 5/20/16. All sample preparation and analyses were performed within holding time requirements.

Blanks

Several compounds were detected in the field blanks and method blanks as listed below. Affected data are summarized in **Attachment 1**.

Blank ID	Compound	Conc.	Units
OF-FB42C-0516	Perfluorohexanesulfonic acid (PFHxS)	0.0011	UG_L
OF-FB44-0516	Perfluorooctane Sulfonate (PFOS)	0.0037	UG_L
OF-FB42B2-0516	Perfluorohexanesulfonic acid (PFHxS)	0.00097	UG_L
OF-FB42A-0516	Perfluorooctane Sulfonate (PFOS)	0.0029	UG_L
OF-FB78-0516	Perfluorooctane Sulfonate (PFOS)	0.011	UG_L
OF-FB78-0516	Perfluorooctanoic acid (PFOA)	0.0040	UG_L
OF-FB78-0516	Perfluorohexanesulfonic acid (PFHxS)	0.0016	UG_L
MB 280-325382/1-A	Iron	23.7	UG_L
MB 320-109334/1-A	Perfluorooctane Sulfonate (PFOS)	0.00149	UG_L
MB 320-109334/1-A	Perfluorooctane Sulfonate (PFOS)	0.00149	UG_L
MB 320-109640/1-A	Perfluorooctane Sulfonate (PFOS)	0.00136	UG_L
MB 320-109640/1-A	Perfluorooctane Sulfonate (PFOS)	0.00136	UG_L

Lab Control Sample/Sample Duplicate

Perfluorohexanesulfonic acid (PFHxS) did not meet RPD criteria between the LCS and LCSD in SDGs 320-18719-1 and 320-18704-1. Affected data are summarized in **Attachment 1**.

Isotope Dilution Analyte

Internal standards exhibited low or high recoveries for the samples listed below. Affected data are summarized in **Attachment 1**.

SDG	Sample_Name
320-18794-1	OF-INF01-0516
320-18794-1	OF-EFF01-0516
320-18794-1	OF-RW78-0516
320-18796-1	OF-STORLAG-0516
320-18796-1	OF-POLLLAG-0516
320-18796-1	OF-CLTANK-0516
320-18796-1	OF-BACKWASH-0516

SDG	Sample_Name
320-18918-1	OF-RW83-0516
320-18918-1	OF-FB83-0516
320-19022-1	OF-INF01-PT-0615

Total vs. Dissolved

Iron did not meet criteria for total and dissolved for sample OF-STORLAG-0516. Affected data are summarized in **Attachment 1**.

Conclusion

These data can be used in the project decision-making process as qualified by the data quality evaluation process.

Please do not hesitate to contact us about this validation report.

Sincerely,

Tiffany McGlynn

Qualification Flags

Exclude	More appropriate data exist for this analyte.
R	Data were rejected for use.
UL	Analyte not detected, quantitation limit is potentially biased low.
UJ	Analyte not detected, estimated quantitation limit.
U	Analyte not detected.
B	Not detected substantially above the level reported in laboratory or field blanks.
L	Analyte present, estimated value potentially biased low.
K	Analyte present, estimated value potentially biased high.
N	Analyte identification presumptive; no second column analysis performed or GC/MS tentative identification.
J	Analyte present, estimated value.
NJ	Analysis indicates the presence of an analyte that was "tentatively identified" and the associated value represents its approximate concentration.
None	Placeholder for calculating quality control issues that do not require flagging.
=	Analyte was detected at a concentration greater than the quantitation limit.

MEMORANDUM CH2MHILL

Data Validation Summary

Oceana CTO-WE44, NALF Fentress

TO: Tiffany Hill/CVO

Anita Dodson/VBO

FROM: Tiffany McGlynn/GNV

CC: Herb Kelly/GNV

DATE: September 9, 2016

Introduction

The following data validation report discusses the data validation process and findings for Vista Analytical in the Sample Delivery Groups (SDGs) listed in the table below.

Samples were analyzed using the following analytical methods:

- 537 MOD Perfluorinated Hydrocarbons

The samples included in these SDGs are listed in the table below.

SDG	Sample_Name	Matrix
1600783	OFPOL-MW-7-0616	Water
1600783	OFPOL-MW-4-0616	Water
1600783	OFPOL-MW-8-0616	Water
1600783	OFPOL-MW-6-0616	Water
1600783	OFPOL-MW-3-0616	Water
1600783	OFPOL-MW-3P-0616	Water
1600783	OFPOL-MW-2-0616	Water
1600783	OF-MW13-0616	Water
1600783	OF-MW11-0616	Water
1600818	OF14-MW07S-0616	Water
1600818	OF14-MW07D-0616	Water
1600818	OF-MW14-0616	Water

Data Evaluation

Data was evaluated in accordance with the analytical methods and with the criteria found in the following guidance documents: Sampling and Analysis Plan Basewide Perfluorinated Compound Site Investigation, Naval Auxiliary Landing Field Fentress, Chesapeake, Virginia

Contract Task Order WE44 (August 2016) and National Functional Guidelines for Organic Data Review (August 2014) with Region 3 Modification (Use of 'B' qualifier) as applicable. The samples were evaluated based on the following criteria:

- Data Completeness
- Technical Holding Times
- Tuning Instrument
- Initial/Continuing Calibrations
- Blanks
- Internal Standards
- Laboratory Control Samples
- Isotope Dilution Analyte
- Field Duplicates
- Identification/Quantitation
- Reporting Limits

Overall Evaluation of Data/Potential Usability Issues

Specific details regarding qualification of the data are addressed in the sections below. If an issue is not addressed there were no actions required based on unmet quality criteria. When more than one qualifier is associated with a compound/analyte, the validator has chosen the qualifier that best indicates possible bias in the results and qualified these data accordingly.

Data Completeness

The SDG was received complete and intact.

Technical Holding Times

According to the chain of custody records, sampling was performed on 6/17/16 through 7/14/16. Samples were received at the laboratory 6/18/16 through 7/15/16. All sample preparation and analyses were performed within holding time requirements.

Conclusion

These data can be used in the project decision-making process as qualified by the data quality evaluation process.

Please do not hesitate to contact us about this validation report.

Sincerely,

Tiffany McGlynn

Qualification Flags

Exclude	More appropriate data exist for this analyte.
R	Data were rejected for use.
UL	Analyte not detected, quantitation limit is potentially biased low.
UJ	Analyte not detected, estimated quantitation limit.
U	Analyte not detected.
B	Not detected substantially above the level reported in laboratory or field blanks.
L	Analyte present, estimated value potentially biased low.
K	Analyte present, estimated value potentially biased high.
N	Analyte identification presumptive; no second column analysis performed or GC/MS tentative identification.
J	Analyte present, estimated value.
NJ	Analysis indicates the presence of an analyte that was "tentatively identified" and the associated value represents its approximate concentration.
None	Placeholder for calculating quality control issues that do not require flagging.
=	Analyte was detected at a concentration greater than the quantitation limit.

Qualifier Code Reference

Value	Description
%SOL	High Moisture content
2C	Second Column – Poor Dual Column Reproducibility
2S	Second Source – Bad reproducibility between tandem detectors
BD	Blank Spike/Blank Spike Duplicate(LCS/LCSD) Precision
BRL	Below Reporting Limit
BSH	Blank Spike/LCS – High Recovery
BSL	Blank Spike/LCS – Low Recovery
CC	Continuing Calibration
CCBL	Continuing Calibration Blank Contamination
CCH	Continuing Calibration Verification – High Recovery
CCL	Continuing Calibration Verification – Low Recovery
DL	Redundant Result – due to Dilution
EBL	Equipment Blank Contamination
EMPC	Estimated Possible Maximum Concentration
ESH	Extraction Standard - High Recovery
ESL	Extraction Standard - Low Recovery
FBL	Field Blank Contamination
FD	Field Duplicate
HT	Holding Time
ICB	Initial Calibration – Bad Linearity or Curve Function
ICH	Initial Calibration – High Relative Response Factors
ICL	Initial Calibration – Low Relative Response Factors
IR15	Ion ratio exceeds +/- 15% difference
ISH	Internal Standard – High Recovery
ISL	Internal Standard – Low Recovery
LD	Lab Duplicate Reproducibility
LR	Concentration Exceeds Linear Range
MBL	Method Blank Contamination
MDP	Matrix Spike/Matrix Spike Duplicate Precision
MI	Matrix interference obscuring the raw data

Value	Description
MSH	Matrix Spike and/or Matrix Spike Duplicate – High Recovery
MSL	Matrix Spike and/or Matrix Spike Duplicate – Low Recovery
OT	Other
PD	Pesticide Degradation
RE	Redundant Result - due to Reanalysis or Re-extraction
SD	Serial Dilution Reproducibility
SSH	Spiked Surrogate – High Recovery
SSL	Spiked Surrogate – Low Recovery
TBL	Trip Blank Contamination
TN	Tune

A full data validation was performed on the analytical data for seven water samples, one aqueous equipment blank sample and one aqueous field blank sample collected on March 8, 2017 by CH2M HILL at the NALF Fentress site in Chesapeake, Virginia. The samples were analyzed under the EPA Method "Determination of Selected Perfluorinated Alkyl Acids in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS)".

Specific method references are as follows:

Analysis	*Method References*
PFCs	USEPA Method 537 Modified

The data have been validated according to the protocols and quality control (QC) requirements of the analytical method, and the U.S. Department of Defense (DoD) Quality Systems Manual (QSM), Version 5.0 (July 2013) and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratories Program National Functional Guidelines for Superfund Organic Methods Data Review," August 2014;
- and the reviewer's professional judgment.

The following data quality indicators were reviewed for this report:

Organics

- Date Completeness, Case Narrative & Custody Documentation
- Holding times
- Liquid Chromatography/Mass Spectrometry (LC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field QC blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Field Duplicate sample precision

A full (Level IV) data validation was performed with this review including a recalculation of 10% of the detected results in the samples.

Data Usability Assessment

There were no rejections of data.

Overall the data is acceptable for the intended purposes as qualified for the data quality indicator criteria as detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Perfluorinated Compounds (PFCs)

Data Completeness, Case Narrative & Custody Documentation

- The case narrative and chain-of-custody documentation were included in the data package as required. All criteria were met.

Holding Times

- All samples were extracted within 14 days for water samples and analyzed within 28 days.

LC/MS Tuning

- All criteria were met.

Initial Calibration

- All relative standard deviation (%RSD) and/or correlation coefficients criteria were met.

Continuing Calibration

- All percent difference (%D) and RRF criteria were met.

Method Blank

- The method blanks were free of contamination.

Field QC Blank

- The field blank samples exhibited the following contamination.

Blank ID	Compound	Conc. ng/L	Qualifier	Affected Samples
OF-EB030817	PFOS	1.54	None	See FB
OF-FB030817	PFOS	1.67	U	1, 8

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD samples exhibited acceptable percent recoveries (%R) and RPD values.

Laboratory Control Samples

- The LCS samples exhibited acceptable percent recoveries (%R).

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria except for the following.

Sample ID	Internal Standard	%R	Qualifier
2	13C3-PFBS	186%	J
	13C4-PFHpA	175%	J
3	13C3-PFBS	192%	J
	13C4-PFHpA	173%	J
	13C8-PFOS	299%	J
6	13C3-PFBS	178%	J
	13C4-PFHpA	163%	J
	13C8-PFOS	165%	J

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below. The precision was acceptable.

Compound	OF-SOW-091D-0317 ng/L	OF-SOW-091DP-0317 ng/L	RPD	Qualifier
PFBS	91.4	83.1	10%	None
PFHpA	47.5	48.1	1%	
PFHxS	2260	2300	2%	
PFOA	701	740	5%	
PFOS	1940	1650	16%	
PFNA	4.77	7.09	39%	None - <5X LOQ

Please contact the undersigned at (757) 564-0090 if you have any questions or need further information.

Signed: Nancy Weaver Dated: 7/17/17

Nancy Weaver
Senior Chemist

Data Qualifier	Definition
U	The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
J	The analyte is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
NJ	The analysis has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the samples.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the samples.

3	OF-MW32DP-0417	1700458-03	Water
4	OF-EB041417	1700458-04	Water
5	OF-FB041417	1700458-05	Water

A full data validation was performed on the analytical data for three water samples, one aqueous equipment blank sample and one aqueous field blank sample collected on April 14, 2017 by CH2M HILL at the NALF Fentress site in Chesapeake, Virginia. The samples were analyzed under the EPA Method "Determination of Selected Perfluorinated Alkyl Acids in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS)".

Specific method references are as follows:

Analysis	*Method References*
PFCs	USEPA Method 537 Modified

The data have been validated according to the protocols and quality control (QC) requirements of the analytical method, and the U.S. Department of Defense (DoD) Quality Systems Manual (QSM), Version 5.0 (July 2013) and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratories Program National Functional Guidelines for Superfund Organic Methods Data Review," August 2014;
- and the reviewer's professional judgment.

The following data quality indicators were reviewed for this report:

Organics

- Date Completeness, Case Narrative & Custody Documentation

- Holding times
- Liquid Chromatography/Mass Spectrometry (LC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field QC blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Field Duplicate sample precision

A full (Level IV) data validation was performed with this review including a recalculation of 10% of the detected results in the samples.

Data Usability Assessment

There were no rejections of data.

Overall the data is acceptable for the intended purposes. There were no qualifications.

Perfluorinated Compounds (PFCs)

Data Completeness, Case Narrative & Custody Documentation

- The case narrative and chain-of-custody documentation were included in the data package as required. All criteria were met.

Holding Times

- All samples were extracted within 14 days for water samples and analyzed within 28 days.

LC/MS Tuning

- All criteria were met.

Initial Calibration

- All relative standard deviation (%RSD) and/or correlation coefficients criteria were met.

Continuing Calibration

- All percent difference (%D) and RRF criteria were met.

Method Blank

- The method blanks were free of contamination.

Field QC Blank

- The field blank samples were free of contamination.

Blank ID	Compound	Conc. ng/L	Qualifier	Affected Samples
OF-EB041417	None - ND	-	-	-
OF-FB041417	None - ND	-	-	-

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD samples exhibited acceptable percent recoveries (%R) and RPD values.

Laboratory Control Samples

- The LCS samples exhibited acceptable percent recoveries (%R).

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- All criteria were met.

Field Duplicate Sample Precision

- Field duplicate results are summarized below. The precision was acceptable.

Compound	OF-MW32D-0417 ng/L	OF-MW32DP-0417 ng/L	RPD	Qualifier
PFOS	1.97	2.10	6%	None

Please contact the undersigned at (757) 564-0090 if you have any questions or need further information.

Senior Chemist

Data Qualifier	Definition
U	The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
J	The analyte is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
NJ	The analysis has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the samples.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the samples.

- and the reviewer's professional judgment.

The following data quality indicators were reviewed for this report:

Organics

- Date Completeness, Case Narrative & Custody Documentation
- Holding times
- Liquid Chromatography/Mass Spectrometry (LC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field QC blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Field Duplicate sample precision

A full (Level IV) data validation was performed with this review including a recalculation of 10% of the detected results in the samples.

Data Usability Assessment

There were no rejections of data.

Overall the data is acceptable for the intended purposes as qualified for the data quality indicator criteria as detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Perfluorinated Compounds (PFCs)

Data Completeness, Case Narrative & Custody Documentation

- The case narrative and chain-of-custody documentation were included in the data package as required. All criteria were met.

Holding Times

- All samples were extracted within 14 days for water samples and analyzed within 28 days.

LC/MS Tuning

- All criteria were met.

Initial Calibration

- All relative standard deviation (%RSD) and/or correlation coefficients criteria were met.

Continuing Calibration

- All percent difference (%D) and RRF criteria were met.

Method Blank

- The method blanks were free of contamination.

Field QC Blank

- The field blank samples were free of contamination.

Blank ID	Compound	Conc. ng/L	Qualifier	Affected Samples
OF17-EB060117	None - ND	-	-	-
OF17-FB060117	None - ND	-	-	-

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD samples exhibited acceptable percent recoveries (%R) and RPD values except for the following.

MS/MSD Sample ID	Compound	MS %R/MSD %R/RPD	Qualifier	Affected Samples
2	PFBS	66%/228%/110	None	4X Rule Applies
	PFHpA	-11.2%/263%/218	None	
	PFHxS	1480%/6220%/123	None	
	PFOA	219%/-172%/1660	None	
	PFOS	1930%/-405%/306	None	
	PFNA	53.9%/OK/31.3	None	

Laboratory Control Samples

- The LCS samples exhibited acceptable percent recoveries (%R).

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria except for the following.

Sample ID	Internal Standard	%R	Qualifier
2	18C2-PFHxS	162%	J
3	13C3-PFBS	158%	J
4	13C3-PFBS	157%	J
6	13C3-PFBS	164%	J

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- EDS Sample ID #6 exhibited a high concentration of PFOS over the calibration range of the instrument and was flagged (E) by the laboratory. The sample was not diluted and reanalyzed and the PFOS result has been qualified as estimated (J).

Field Duplicate Sample Precision

- Field duplicate results are summarized below. The precision was acceptable.

Compound	OF17-MW01-0617 ng/L	OF17-MW01P-0617 ng/L	RPD	Qualifier
PFBS	181	184	2%	None
PFHpA	1390	1500	8%	
PFHxS	4590	3640	23%	
PFOA	1840	1710	7%	
PFOS	14000	13000	7%	
PFNA	403	388	4%	

Please contact the undersigned at (757) 564-0090 if you have any questions or need further information.

Nancy Weaver
Senior Chemist

Data Qualifier	Definition
U	The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
J	The analyte is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
NJ	The analysis has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the samples.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the samples.

A full data validation was performed on the analytical data for nineteen soil samples, one aqueous equipment blank sample and one aqueous field blank sample collected on February 28, 2017 by CH2M HILL at the NALF Fentress site in Chesapeake, Virginia. The samples were analyzed under the EPA Method "Determination of Selected Perfluorinated Alkyl Acids in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS)".

Specific method references are as follows:

Analysis	*Method References*
PFCs	USEPA Method 537 Rev 1.1 Modified

The data have been validated according to the protocols and quality control (QC) requirements of the analytical method, and the U.S. Department of Defense (DoD) Quality Systems Manual (QSM), Version 5.0 (July 2013) and the USEPA National Functional Guidelines for Organic Data Review as follows:

- The USEPA "Contract Laboratories Program National Functional Guidelines for Superfund Organic Methods Data Review," August 2014;
- and the reviewer's professional judgment.

The following data quality indicators were reviewed for this report:

Organics

- Date Completeness, Case Narrative & Custody Documentation
- Holding times
- Liquid Chromatography/Mass Spectrometry (LC/MS) Tuning
- Initial and continuing calibration summaries
- Method blank and field QC blank contamination
- Surrogate Spike recoveries
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries
- Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) recoveries
- Internal standard area and retention time summary forms
- Target Compound Identification
- Compound Quantitation
- Field Duplicate sample precision

A full (Level IV) data validation was performed with this review including a recalculation of 10% of the detected results in the samples.

Data Usability Assessment

There were no rejections of data.

Overall the data is acceptable for the intended purposes as qualified for the deficiencies detailed in this report.

Please note that any results qualified (U) due to blank contamination may be then qualified (J) due to another action. Therefore, the results may be qualified (UJ) due to the culmination of the blank contaminations and actions from other exceedences of QC criteria.

Perfluorinated Compounds (PFCs)

Data Completeness, Case Narrative & Custody Documentation

- The case narrative and chain-of-custody documentation were included in the data package as required. All criteria were met.

Holding Times

- All samples were extracted within 14 days for water and soil samples and analyzed within 28 days.

LC/MS Tuning

- All criteria were met.

Initial Calibration

- All relative standard deviation (%RSD) and/or correlation coefficients criteria were met.

Continuing Calibration

- All percent difference (%D) and RRF criteria were met.

Method Blank

- The method blanks were free of contamination.

Field QC Blank

- The field and equipment blank samples were free of contamination.

Surrogate Spike Recoveries

- All samples exhibited acceptable surrogate %R values.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

- The MS/MSD samples exhibited acceptable %R and RPD values except for the following.

MS/MSD ID	Surrogate	MS %R/MSD %R/RPD	Qualifier
3	PFOS	-82%/59%/OK	None - 4X Rule Applies

Laboratory Control Samples

- The LCS samples exhibited acceptable percent recoveries (%R).

Internal Standard (IS) Area Performance

- All internal standards met response and retention time (RT) criteria.

Target Compound Identification

- All mass spectra and quantitation criteria were met.

Compound Quantitation

- Nine samples exhibited high concentrations of PFOS. The samples were diluted and reanalyzed and the dilution results for PFOS should be used for these samples.
- EDS Sample #10 was analyzed at a 10X dilution due to high concentrations of target compounds. The reporting limits were adjusted according. No action was required.

Field Duplicate Sample Precision

- Field duplicate results are summarized below. The precision was unacceptable for four compounds in samples OFPOL-SB07-0102-0217 and OFPOL-SB07P-0102-0217 and these results have been qualified as estimated (J).

Compound	OFPOL-SB07-0102-0217 ug/kg	OFPOL-SB07P-0102-0217 ug/kg	RPD	Qualifier
PFHxS	2.9	1.7	52%	J
PFHpA	5.3	3.9	30%	None
PFOA	7.9	5.4	38%	J
PFOS	57	32	56%	J
PFNA	9.2	5.7	47%	J

Compound	OF-SS01-0217 ug/kg	OFL-SS01P-0217 ug/kg	RPD	Qualifier
PFHxS	0.92	0.95	3%	None
PFHpA	0.15	0.12	22%	
PFOA	0.51	0.49	4%

Signed: Nancy Weaver Dated: 4/4/17

Nancy Weaver
Senior Chemist

Data Qualifier	Definition
U	The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
J	The analyte is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
NJ	The analysis has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the samples.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the samples.

WELL TEST ANALYSIS

Data Set: C:\...\MW09 SLUG IN 1_2017_09-15_19-07.aqt
Date: 09/19/18 Time: 11:00:33

PROJECT INFORMATION

Company: CH2M
Client: NAVY CLEAN
Location: FENTRESS
Test Well: OF-MW09
Test Date: 9-15-17

AQUIFER DATA

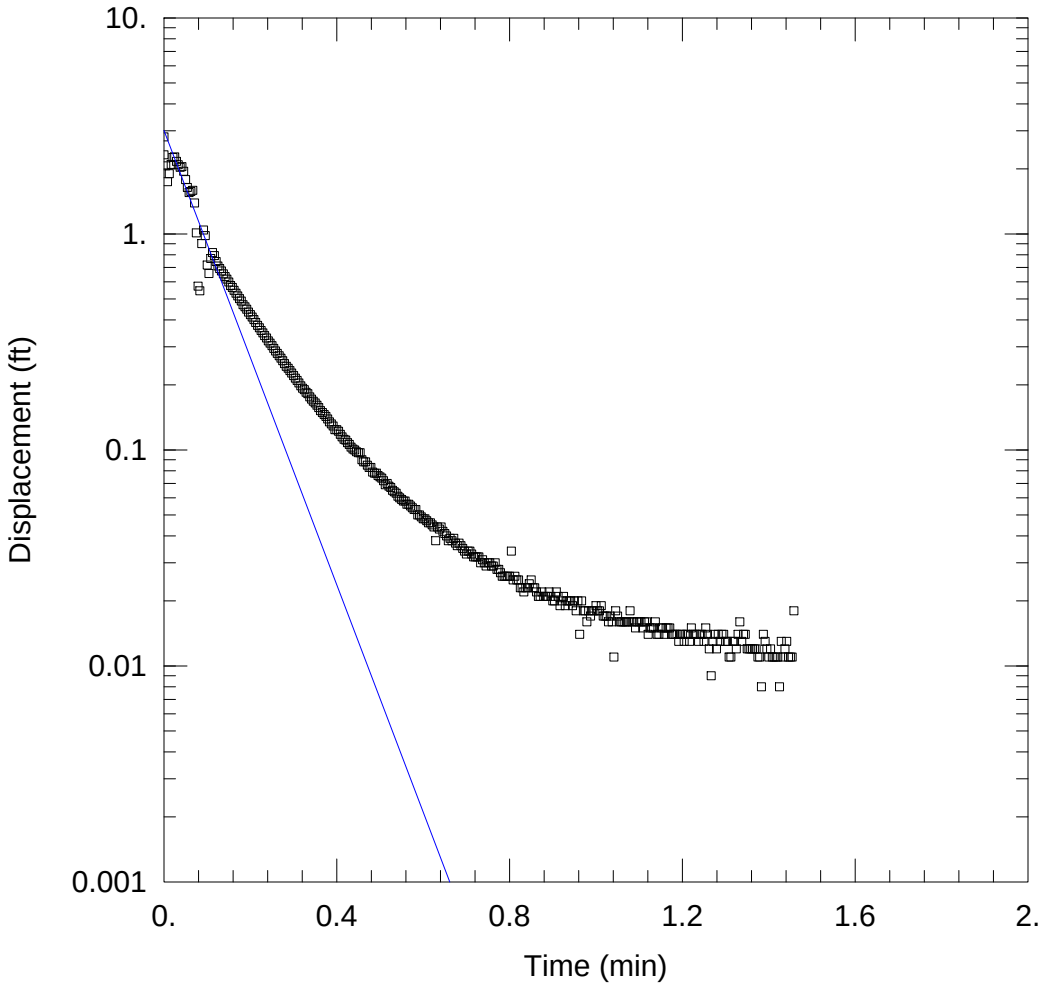
Saturated Thickness: 18.84 ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (New Well)

Initial Displacement: 2.813 ft
Total Well Penetration Depth: 18.84 ft
Casing Radius: 0.083 ft
Static Water Column Height: 18.84 ft
Screen Length: 10. ft
Well Radius: 0.083 ft

SOLUTION

Aquifer Model: Confined
Solution Method: Bouwer-Rice
K = 0.007215 ft/min
y0 = 2.497 ft



WELL TEST ANALYSIS

Company: CH2M
Client: NAVY CLEAN
Location: FENTRESS
Test Well: OF-MW09D
Test Date: 9-15-17

AQUIFER DATA

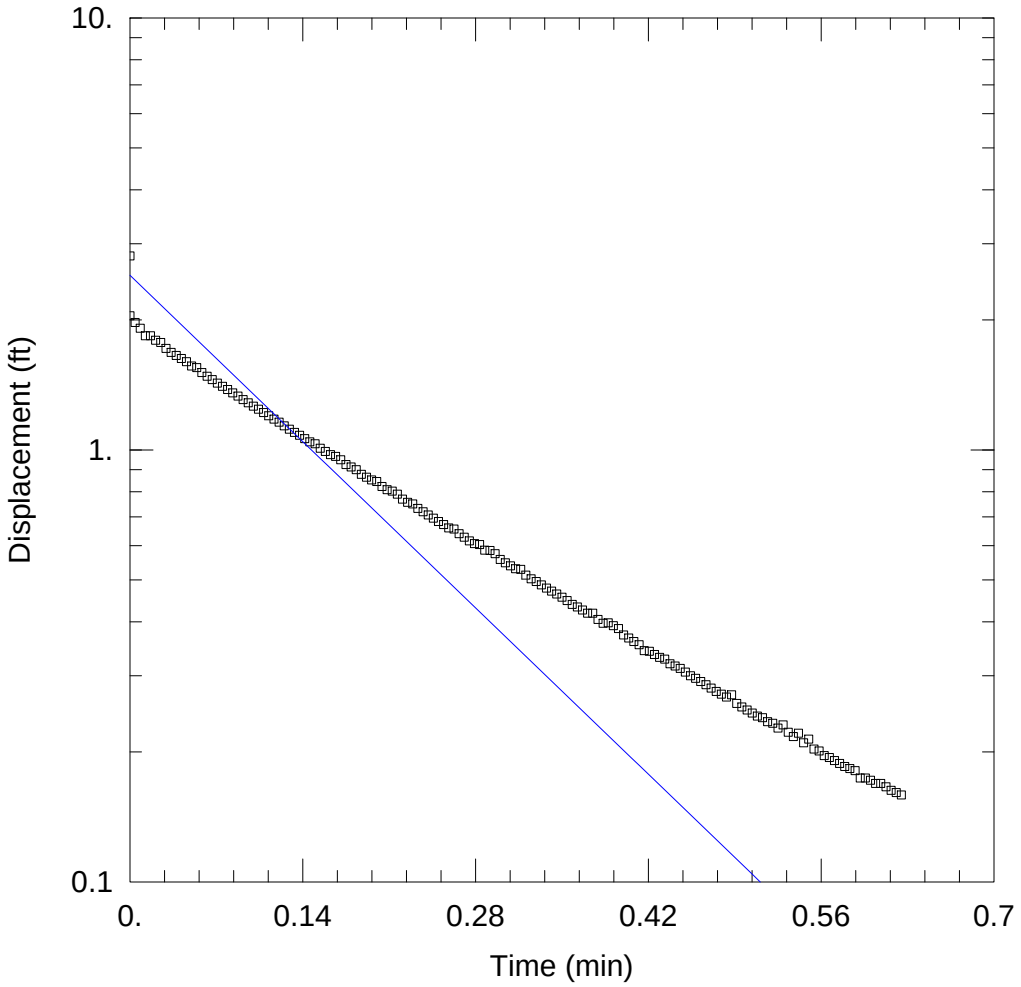
Saturated Thickness: 36.47 ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (New Well)

Initial Displacement: 2.813 ft
Total Well Penetration Depth: 16.48 ft
Casing Radius: 0.083 ft
Static Water Column Height: 16.48 ft
Screen Length: 10. ft
Well Radius: 0.083 ft

SOLUTION

Aquifer Model: Confined
Solution Method: Bouwer-Rice
K = 0.002806 ft/min
y0 = 2.569 ft



WELL TEST ANALYSIS

Data Set: C:\...\MW09D SLUG OUT 3_2017-09-15_19-07-32-341.aqt
Date: 09/19/18 Time: 11:10:34
