**TABLES**

**Table 1:      Underground Storage Tank to be Closed**

## **1.0 INTRODUCTION**

### **1.1 SITE LOCATION AND DESCRIPTION**

Thirty USTs and their distribution systems located at Naval Station Roosevelt Roads in Puerto Rico shall be permanently removed from service. Roosevelt Roads is located 45 miles southeast of San Jaun and two miles south of Ceiba, Puerto Rico. A map indicating the locations of the sites is presented in Figure 1. Table 1 lists the systems to be permanently closed and the remaining figures show the approximate UST system locations. The tanks and piping shall be permanently closed following the procedures outlined in Section 2.0.

### **1.2 PURPOSE AND SCOPE OF CLOSURE PLAN**

The purpose of this closure plan is to outline general procedures used during the permanent closure activities of the USTs and their underground fuel distribution systems (see Table 1). These procedures were prepared in accordance with 40CFR 280 Subpart G, and the Puerto Rico Environmental Quality Board (EQB) regulations for the control of underground storage tank Part VII.

## **2.0 TANK CLOSURE ACTIVITIES**

### **2.1 TANK AND PIPING CLOSURE**

Tank or piping closure activities shall be conducted by a contractor selected by the Navy. The Navy will provide the selected contractor with the tank or piping removal drawings and specifications. This closure is part of the specifications. Table 1 indicates the closure procedure for each UST area.

American Petroleum Institute (API) publications to be followed by the contractor during removal operations include "Removal and Disposal of Used Underground Petroleum Storage Tank" (API2015). Contractor personnel used during tank or piping removal operations shall have completed the 40 hour Health and Safety course and participate in a medical surveillance program as required by the Occupational Safety and Health Administration OSHA in 29CFR 1910.120. The contractor shall inform EQB at least 30 days prior to the intended permanent closure.

### **2.2 EMPTYING OF USTS**

The pavement/concrete overlying the tank, (if any) shall be sawcut and removed. The top of each of the tank shall be excavated to expose the top of the tank. The opening used to fill the tank shall be located. Product piping shall be drained into the tank. All possible fuel will be pumped or otherwise removed from the tank by the Contractor. The remaining contents shall be considered as contaminated fuel or waste fuel. Contents shall be pumped into 55 gallon drums or other suitable containers for disposal in accordance with approved procedures meeting local, and Federal regulations. Remaining fuel emulsions shall be disposed in accordance with applicable local, and Federal regulations. Drums or tank used for containerizing waste fuel shall be furnished by the Contractor. Contractor shall pump or otherwise remove water and/or sand from the tank. Drums or tanks used for containerizing water and sand shall be furnished by the Contractor. Waste fuel/sludge shall be containerized in clean 55 gallon drums or other suitable containers for proper disposal in accordance with Federal and local applicable regulations. Drainage of lines into the tank shall be conducted without spillage into the excavation area.

The tank shall be grounded to minimize the possibility of static electricity build-up. Electrical connections, if present, shall be removed. Fill pipe, gauge pipe, vapor recovery truck connection, submersible pumps and other tank fixtures (as applicable) except vent lines shall be removed using non-sparking tools. The atmosphere within the tank shall be checked with an explosimeter for flammability. All openings except the vent lines shall be temporarily plugged so that vapors shall exit through the vent lines during the degassing process. Liquids and residues shall be removed from the tank by using explosion-proof or air driven pumps. Pump motors and suction hoses shall be bonded to the tank or otherwise grounded to minimize the possibility of electrostatic ignition hazards. A hand pump shall be used, if necessary, to remove the last few inches of liquid from the bottom of the tank. Liquids and residues left in the tank shall be stored temporarily in clean 55 gallon drums or suitable containers. The containers shall be properly covered and labeled and shall be used later to store the water and sludge generated (if any) during the cleaning process.

All fuel storage shall have a temporary secondary containment that meets the requirements of 40 CFR 112.7.

### **2.3 DEGASSING ACTIVITIES**

Flammable vapors shall be purged following Section 4.2 "purging" of API 1604. Upon purging the tank of flammable vapors and before initiating any work in the areas in or on the tank, an explosimeter shall be used to assess vapor concentrations inside the tank and in the work areas. The contractor shall verify with the explosimeter that the areas are free from sources of ignition as described in Section 1.3.2 of API 1604.

### **2.4 REMOVAL OF TANK AND ASSOCIATED PIPING**

After the tanks are freed of vapors and before they are removed from their respective excavations, all accessible holes shall be plugged or capped. One plug shall have an 1/8-inch vent hole to prevent the tank from being subjected to excessive differential pressure caused by the temperature changes.

Excavations shall occur around the tank as required by the specifications to uncover them for removal. Place soil removed from the excavation in a temporary containment area. The excavated soils removed from the excavation area shall be placed over a 6 mil thick

(minimum) polyethylene liner and covered with 6 mil polyethylene sheeting for protection against rain. The tank shall be removed from the excavation and placed on a level surface.

Associated piping (if any is found) shall also be excavated and removed as indicated by the applicable drawings & specifications. Excessive dirt shall be removed from around the tank. Tank sides, bottom and ends shall be visually inspected. A scribe (small metal instrument shaped like a pencil) or similar instrument shall be used to flake away corroded layers of metal and to press against metal to check for perforations. Photographs showing the condition of the tank shall be taken. After visual inspection of the tank the cleaning procedures will proceed.

## **2.5 TANK CLEANING**

The contractor shall ensure that properly trained personnel are used for tank cleaning operations. The contractor shall assign a supervisor who is competent to handle the tank cleaning operations. The supervisor shall ensure that the hazards normally encountered while cleaning petroleum storage tank are controlled by proper planning, training of crew, and conducting the required inspections (tank, equipment and working area). Tank cleaning operations shall be conducted following the general guidelines of API 2015 "Cleaning Petroleum Storage Tanks". Test the tank atmosphere and the excavation area for flammable or combustible vapor concentrations with a combustible gas indicator until the tank is removed from the excavation and from the site.

Some of the major steps that shall be followed by the removal contractor during this operation are:

- External inspection of tank and visual assessment of immediate area;
- Training of crew and inspection of equipment;
- Determination that the work area is free of flammable materials before personnel are permitted to enter the area;
- Controlling sources of ignition in, around, and on the tank;
- Emptying of the tank;
- Blinding of the tank and de-energizing electrical circuits attached to the system;

- **Degassing of the tank;**
- **Periodic testing of the tank for flammable vapors using an explosimeter;**
- **Opening of the tank for entry and removal of sludge; and**
- **Removal and collection of any free product found.**

### **3.0 MANAGEMENT OF AFFECTED MATERIALS**

#### **3.1 STORAGE AND DISPOSAL OF PRODUCT AND SLUDGE**

Product and sludge generated during the emptying and cleaning of the tank shall be accumulated in 55 gallon drums or appropriate containers. The drums shall be properly labeled and temporarily stored at the facility until proper disposal by the contractor. The contractor will ensure that characterization and disposal shall be conducted by an EQB approved disposal facility. The contractor shall obtain proper certification/manifesting from the disposal facility.

#### **3.2 CUTTING AND DISPOSAL OF TANK**

After degassing and cleaning the tank the contractor shall render the tank unsuitable for future use as storage tank by puncturing, cutting, or drilling numerous holes in all sections of the tank. The contractor shall dispose of the tank as scrap metal. The contractor shall obtain proper certification (Bill of Sale) from the disposal facility and shall provide a copy to the designated ROICC Officer.

#### **3.3 PROTECTION OF EXCAVATION SITE**

The excavation site shall be protected from the rain with a polyethylene liner (as allowed by excavation size) and against run-on by placing berms around the excavated site. The berms will be made of sand packs and polyethylene liners. This protection shall be maintained from the time the USTs or piping are removed until such time as appropriate materials are backfilled into the excavation site. If appropriate, absorbent materials shall be used in the excavation site to collect residual concentrations of petroleum hydrocarbons

present (if any). Hydrocarbon affected absorbent material shall be disposed with other hydrocarbon affected materials in accordance with applicable Federal and local regulations.

### **3.4 STORAGE AND DISPOSAL OF EXCAVATED SOILS**

Excavated soils as described in Section 2.4 shall be temporarily stored over a polyethylene liner. A second liner shall be used to cover the soil for protection against rain. Excavated soils shall be sampled as described in Section 4.0 of this plan. If excavated soils are determined to have a total petroleum hydrocarbons (TPH) concentration greater than or equal to 100 milligrams/kilogram (mg/kg) or benzene, toluene, ethylbenzene, xylene (BTEX) concentrations greater than 10 mg/kg, the soils shall be disposed at a disposal facility approved by the Puerto Rico EQB.

If excavated soils are determined to have a TPH concentration of less than 100 mg/kg and BTEX concentration less than 10 mg/kg, then the soil shall be disposed of as non-contaminated material by the contractor or used as backfill material. If soils are disposed of, the contractor shall be responsible for obtaining any necessary regulatory permits to dispose of the hydrocarbon affected material and obtain the corresponding manifests.

### **3.5 EXCAVATION BACKFILLING**

The pit areas shall be backfilled with suitable material. Backfill material shall be placed in thin lifts and compacted with conventional equipment until pre-removal surface grade is attained. The excavated layer shall be finished according to specifications.

## **4.0 SOIL SAMPLING**

### **4.1 SAFETY AND DECONTAMINATION PROCEDURES**

Prior to initiating soil sampling activities,, three safety zones shall be established at the project site. The purpose of these zones will be to provide a proper Quality Assurance/Quality Control (QA/QC) mechanism at the site during sampling activities. This mechanism will help minimize possible cross-contamination between sampling locations.

The three safety zones shall be identified in the field. These areas will be defined as follows:

- **Sampling Location:** The sampling locations are the tank pit areas and pipe trench excavations where sampling and QA/QC procedures are to be followed.
- **Decontamination Zone:** Area where most decontamination activities will be performed (i.e. sampling equipment, personnel and safety equipment).
- **Field Analysis and Support Zone:** Area where necessary field analysis (surrogate screening) will be performed and support personnel and equipment will be located.

All sampling equipment shall be decontaminated by the following procedure (decontamination should not have been performed more than 48 hours from the time of sampling):

- First wash with Alconox (phosphate free detergent)
- Successive rinse with clean tap water
- Rinse with distilled water
- Rinse with isopropanol
- Air dry

Basic safety personnel equipment shall consist of hard hat, safety glasses or goggles, boots and latex gloves (gloves are to be changed prior to each sample collection). Each member of the sampling team must use this basic equipment. This equipment will not only serve for personnel protection, but also be part of the QA/QC procedures to minimize the possibility of cross-contamination between sampling points.

## **4.2 SOIL SAMPLING**

The contractor shall use qualified personnel to conduct sampling activities. Before beginning to obtain the soil samples, the necessary safety and decontamination procedures described in Section 4.1 shall be followed. Necessary containers and equipment shall be at hand before sampling. The guidelines provided below shall be followed:

### **4.2.1 Removed Tank Pits Sampling**

If tank is 20 feet or less in length, two samples shall be taken. Each sample shall be collected 2 feet from each end of the tank and 2 feet below the bottom of the excavation. If the tank is greater than 20 feet, three samples shall be taken. Two samples shall be taken 2 feet from each end of the tank and 2 feet below the bottom of the excavation. A third sample shall be taken from the middle of the tank area and 2 feet below the bottom of the excavation. A minimum of one sample per excavation wall shall also be collected. Samples shall be analyzed for TPH following Method 418.1 and BTEX following SW846 Method 8020. Soils with concentrations greater than 100 mg/kg TPH or greater than 10 mg/kg BTEX are considered contaminated materials. Soils with concentrations of less than 100 mg/kg TPH or 10 mg/kg BTEX, may be used as clean fill. Results shall be furnished to the Contracting Officer within 24 hours after the results are obtained. Along with the

results, a sketch showing underground tank, sampling location, and extent of excavations shall be furnished.

#### **4.2.2 Stockpiled Soils Sampling**

For stockpiled soils, a minimum of one test shall be provided for every 100 cubic yards or for each excavation whichever is less, for TPH and BTEX. Soils with concentrations greater than 100 mg/kg TPH or 10 mg/kg BTEX are considered contaminated materials. Soils which are less than the above may be used as clean fill. Results shall be furnished to the Contracting Officer within 24 hours after the results are obtained. Contaminated soils shall be disposed of in accordance with Federal and local regulations.

#### **4.2.3 Piping Trench Sampling**

For every 25 linear feet of product delivery piping, for every change in direction, and at every mechanical joint one soil sample shall be collected and analyzed for TPH and BTEX.

All sampling results shall be furnished to the Contracting Officer within 24 hours after the results are obtained. Along with the results, a sketch shall be furnished showing the underground tank, sampling locations, and extent of excavations.

### **4.3 CHAIN-OF-CUSTODY CONTROL**

The following procedures shall be followed to provide adequate sample traceability. Sample containers shall be pre-labeled before sample collection. The pre-labeled information shall include sample identification number, name of collector, date and time of collection, phase of collection and parameters requested. A chain of custody record shall

be completed by sampling personnel and others handling the sample between the time the sample is taken and the time it is delivered to the laboratory for analysis. The chain of custody record shall include necessary information for traceability of the samples.

#### **4.4 FIELD QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)**

Improper sample handling may alter the analytical results of the sample. Consequently, the samples to be collected shall be obtained by using disposable latex gloves. At each sampling point, new pairs of gloves shall be worn by the sampling personnel. Samples shall be carefully transferred in the field from the sampling equipment directly into the containers provided by the laboratory. QA/QC procedures shall be used to increase the reliability and validity of field and analytical laboratory data. Field QA/QC will consist of obtaining trip blanks, and instrument blanks. Any contaminants found in the trip blanks or instrument blanks could be attributed to:

- Interaction between the sample and the container;
- Contaminated rinse water, or;
- A handling procedure that may alter the samples analysis.

The concentration level of any contaminants found in the blank samples shall not be used to correct the collected sample data reported by the laboratory. Trip blanks shall be provided by the contractor selected laboratory. A one liter amber glass bottle shall be filled with deionized water originated from the laboratory. This sample shall be transported to the site, and returned to the laboratory for analysis. Trip blanks are not to be opened during sampling or transportation. For this project, one trip blank for each shipment of samples sent to the laboratory shall be analyzed.

To verify the effectiveness of sampling equipment cleaning procedures, the sampling equipment shall be flushed with deionized water. This water shall be collected in the approximate laboratory containers and sent to the laboratory for analyses. For this project, one instrument blank shall be obtained from each of the five excavation site areas.

#### **4.5 LABORATORY ANALYSIS**

Samples and QA/QC blanks shall be sent to the laboratory to be analyzed for TPH following EPA Method 418.1 and BTEX following SW846 Method 8010. All chemical analyses shall be certified as per Puerto Rico UST Regulation Part X, Rule 1002B.

If test results indicate the presence of hydrocarbons in the soils in excess or equal to 100 mg/kg TPH, or 10 mg/kg BTEX, or free product is discovered, the contractor shall notify the Contracting Officer in writing within 24 hours of this knowledge. Along with the results, a sketch shall be furnished showing the underground tank, sampling location, and extent of excavations.

#### **4.6 LABORATORY QA/QC**

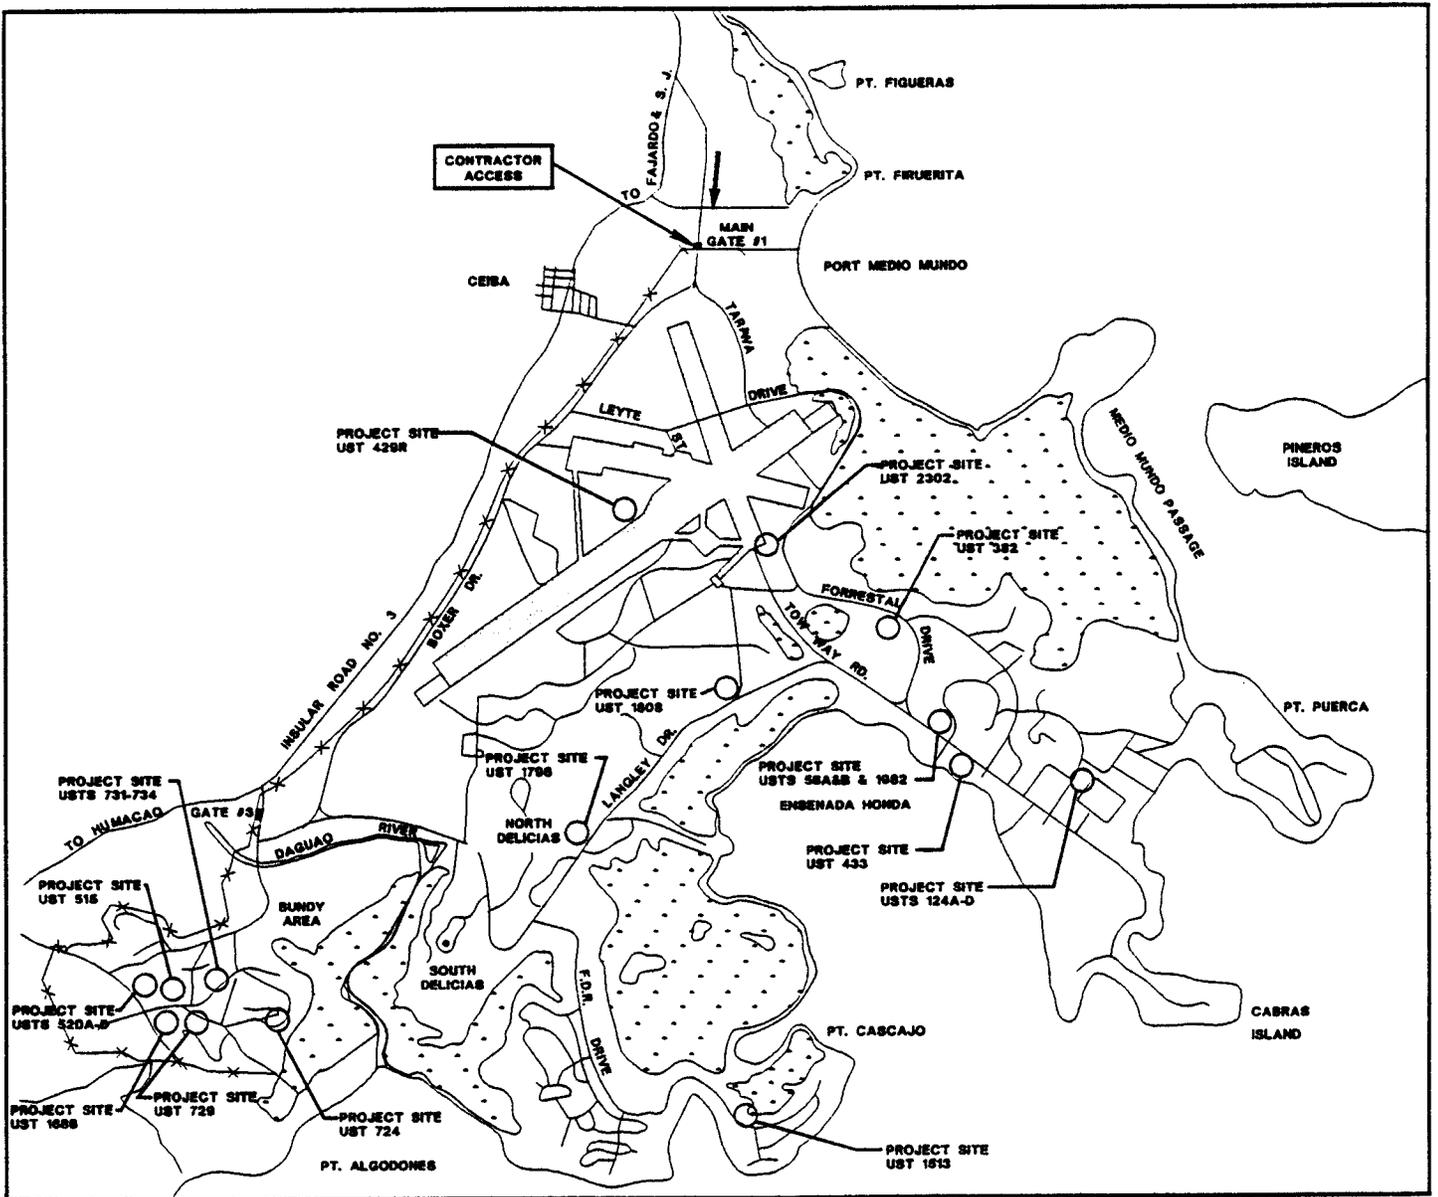

Reliability and validity of laboratory analysis shall be increased by using standard and duplicate samples. Results from a standard sample and duplicate samples shall be used as a measure of the laboratory performance or as an indicator of potential sources of cross-contamination. Ten percent of the soil samples selected for laboratory analysis shall be split to obtain duplicate samples for laboratory QA/QC verification.

## **5.0 CLOSURE/SITE ASSESSMENT REPORT**

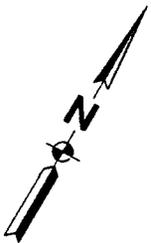

The contractor shall prepare a "Closure/Site Assessment Report" which shall contain a collection of all reports, records, inspections, documentation and data such as the following:

- a. Executive Summary with a summary of the test results for each UST in tabular form.
- b. General location and description of the facility;
- c. General USTs site locations and description of work including removal procedures, number of tank removed, cubic yards of excavated soil, location of disposal sites, dates of excavation, linear feet of piping, etc. UST site location shall be clear enough to identify main roads, drainage, buildings and structures near the site;
- d. Soil sampling procedures and laboratory analyses reports; including QA/QC data;
- e. Description of excavation site backfilling activities;
- f. Description of management of affected materials;
- g. Photographs documenting different phases of closure activities;
- h. Disposal manifests of affected materials and tank; (disposal documents and manifests for disposal of tank, contaminated soil and contaminated water);
- i. Conclusions and recommendations;
- j. Permits, notifications, and inspection reports;
- k. Completed UST Notification Form sent to EQB, receipt of fees paid to EQB correspondence between contractor and EQB if any; and
- l. Certifications required by regulatory agency.

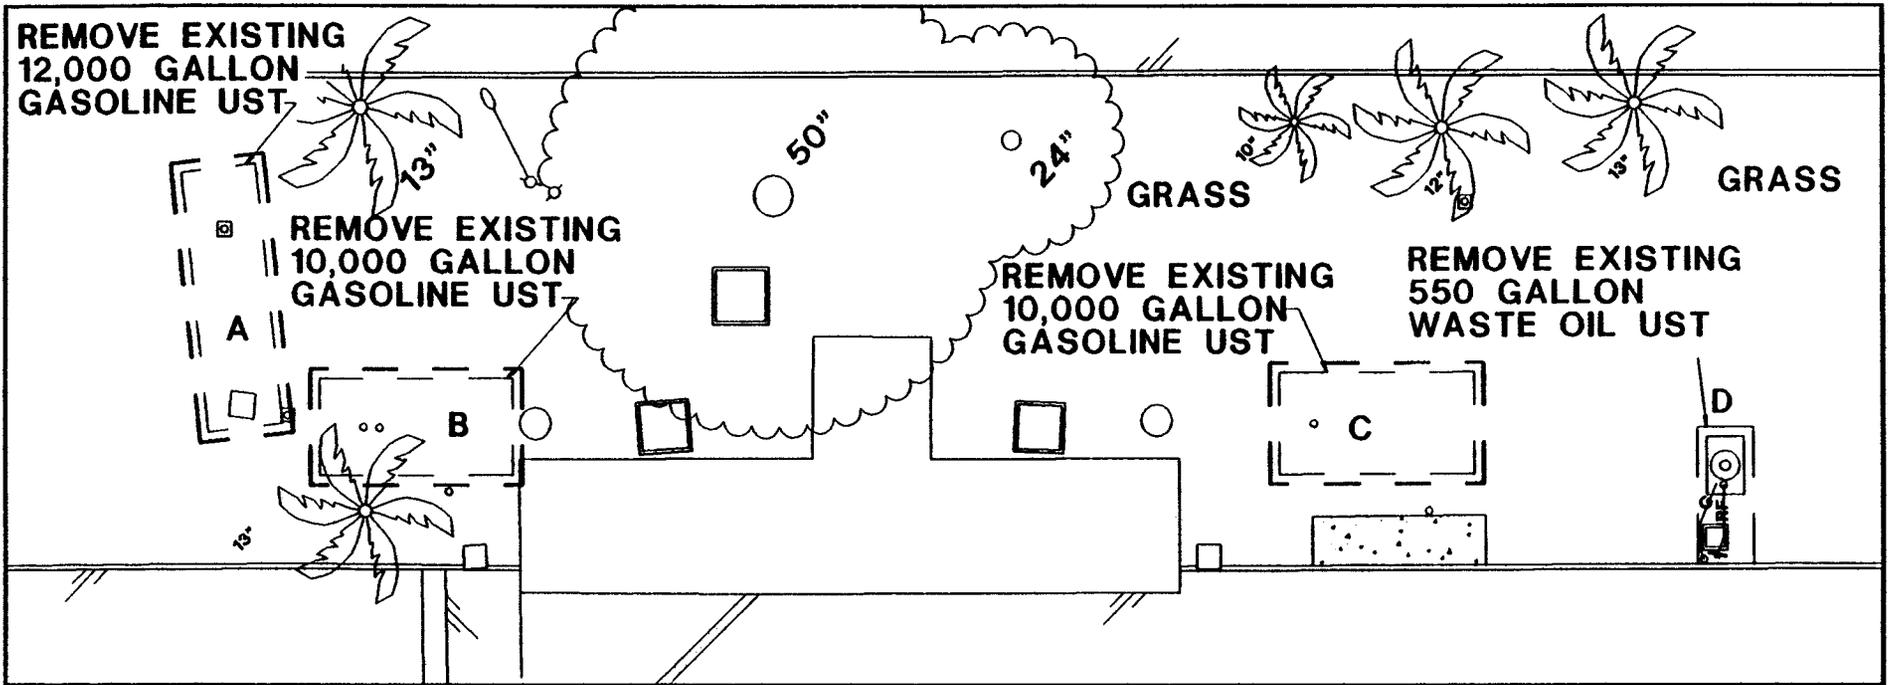

The report shall have a table of contents and shall be tabbed for easy following. Three copies of the closure report will be provided to the ROICC Officer, Navy Engineer in charge (EIC) and the Navy activity.

Apartado 1148S  
Santurce, P.R. 00911

Attn: Directora L. Ghigliotty

Subject: Closure report of area 2016, registration #02-86-1935

Dear Ms. Ghigliotty:

I wish to submit the following information and documents concerning this underground tank closure at the U.S. Naval Station, Roosevelt Roads, Ceiba, P. R.:

1. a. History: The U.S. Navy has been the only owner of this area for at least 40 years. The U.S.T. located at Building 2016 is being replaced by a Concrete Vaulted A.S.T.  
b. Testing and Repair: Records are on file at Mason Technology Inc. located on the Naval Station at Roosevelt Roads, P.R.
2. Closure narrative
3. Maps
  - a. Area location
  - b. Site location
  - c. Tank location
4. Registration of U.S.T.
5. Chain of custody
  - a. Waste products
  - b. Tanks and piping disposal
  - c. Contaminated soil
6. Laboratory results from T.E.G. Labs, Box 29030, Caguas, P.R.
  - a. Soil sampling location
  - b. Soil sample results
  - c. Waste water sample results
  - d. Certification of contaminated soil and water treatment

7. Tank and piping disposal
  - a. Steel tanks - Recovery and Recycling Export Co., Ponce De Playa, P.R.
  - b. Fiberglass tanks - Browning Ferris Landfills, Ponce, P.R.

## CLOSURE NARRATIVE - 2016

This 500 gallon U.S.T. was located underground outside of the building and was filled by a 3" remote fill line from a concrete spill containment. Both the remote fill and fuel supply lines have been removed and the soil sampled.

The U.S.T. was emptied by transferring the waste oil into a 55 gallon drum for disposal by On Site Environmental Corp.

Contaminated soil excavated during tank removal was placed upon diked plastic to be transferred to B.F.I. landfill. Other contaminated soil remained in excavation for future disposal by others. The new 500 gallon A.S.T. has electronic overfill protection, leak detection and gauging with audible alarms when filling to 90% capacity.

Ken Thickstun  
Project Superintendent  
Reliable Mechanical Inc.  
13035 Middletown Rd.  
Louisville, Ky. 40223

CHAIN OF CUSTODY - 2016

A. Tank Contents - Tank waste oil transferred to 55 gallon drum for disposal by on Site Environmental.

B. Fiberglass tank - Tank removed from ground, cleaned, capped and transported to R.S. Oil Equipment Ponce yard by R.S. Oil personnel. Tank then cleaned, crushed and sent to B.F.I.

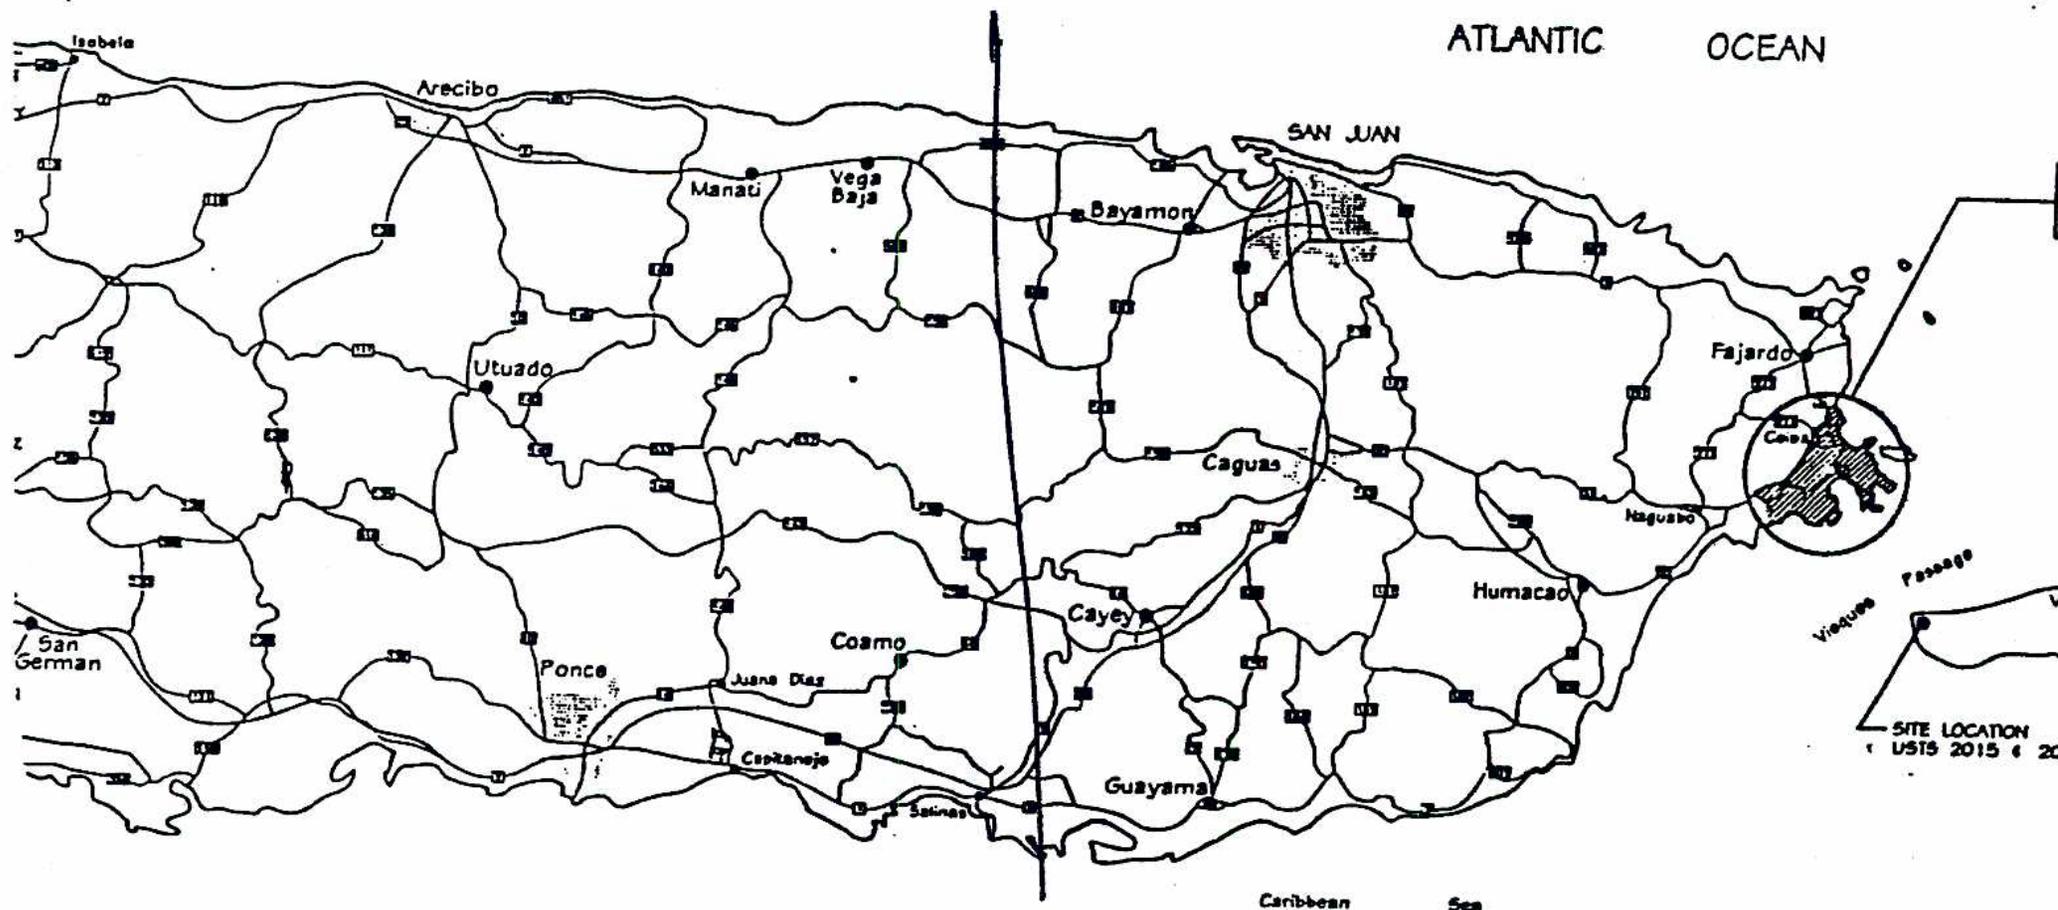

Piping - Flushed, cleaned, cut up and sold for scrap to Export.

C. Contaminated soil removed during tank excavation, placed on diked plastic and then transported to B.F.I. Landfill at Ponce, P.R.

Favor de llenar a maquinilla o en letra de molde (en tinta) todos los incisos, excepto "firma" en la sección V. Este formulario deberá ser cumplimentado para cada facilidad que posea tanques de almacenamiento soterrados. Si posee más de cinco (5) tanques en esta facilidad, favor de fotocopiar las siguientes hojas de continuación y grápelos con el formulario.

## INFORMACION GENERAL

Esta notificación es requerida por la Ley Federal para todos los tanques de almacenamiento soterrados (TAS) que hayan sido utilizados para almacenar sustancias reguladas desde el 1ro. de enero de 1984, o que estén soterrados desde el 8 de mayo de 1986. La información solicitada es requerida por la Sección 3002 de la Ley de Conservación y Recuperación de Recursos (RCRA), por sus reglas en inglés, según enmendada.

El propósito principal de este programa de notificación es el de localizar y evaluar aquellos tanques soterrados que almacenan o han almacenado productos de petróleo o sustancias peligrosas. Se espera que la información que usted provea este basada en documentación razonablemente exacta, o en el supuesto de caso, en su mejor conocimiento e recuerdo.

¿Quién deberá notificar? La Sección 3002 de RCRA, según enmendada, requiere que a no ser que sean exentos, los dueños de tanques soterrados que almacenan sustancias reguladas deberán notificar a la Junta de Calidad Ambiental (JCA) la existencia de sus tanques. Esto significa:

a) en el caso de un tanque de almacenamiento soterrado puesto en servicio el 8 de noviembre de 1984, o después de esta fecha, cualquier persona que posea un TAS utilizado para el almacenamiento, uso o disposición de sustancias reguladas;

b) en el caso de un TAS en uso antes del 8 de noviembre de 1984, pero que no exista en los datos del dueño, cualquier persona que posea tal tanque inmediatamente antes de transferir el mismo a otro dueño;

c) si la Junta de Calidad Ambiental así lo requiere, cualquier facilidad que haya tenido cualquier cambio en su información o en el estado del TAS.

¿Cuáles tanques están incluidos? Un TAS se define como cualquier tanque o combinación de tanques que (1) se utiliza para almacenar una acumulación de "sustancias reguladas" y (2) cuyo volumen (incluyendo la cabeza soterrada conectada a este) sea mayor que 10% o más por debajo de la superficie del terreno. Algunas categorías de tanques soterrados son los que almacenan: 1. gasolina, aceite usado, o diesel y 2. solventes industriales, alquilados, herbicidas, o sustancias para limpiar.

¿Cuáles tanques están excluidos? Los tanques removidos del terreno no están sujetos a notificación. Otros tanques excluidos del requisito de notificación son:

1. tanques para uso agrícola y residencial con capacidad de 1,100 galones o menos que sean utilizados para el almacenamiento de combustible de motor con propósito no comercial;

2. tanques seccionales;

3. facilidades con alcantarillas (incluyendo las líneas de recolección) requeridas bajo la Ley de Seguridad en los Oleoductos de Gas Natural de 1968 e la Ley de Seguridad en los Oleoductos de Líquidos Peligrosos de 1979;

4. embalses, mareas, estanques o lagunas;

5. sistemas para recolección de aguas de escorrentía o aguas usadas;

6. tanques de flujo continuo para procesos;

7. trampas de grasa o sus derivados de líneas de recolección de aguas residuales con la producción y recolección de petróleo o gas; y

8. tanques de almacenamiento utilizados en áreas bajo el nivel del terreno, tales como sótanos, bodegas, líneas e inlets, si los mismos se encuentran situados en o sobre el pie de las montañas.

¿Cuáles sustancias están reguladas? Los requisitos de notificación aplican a tanques soterrados que almacenan sustancias reguladas. Esto incluye cualquier sustancia definida como peligrosa por la Sección 101(14) de la Ley Federal Abarcadora de Emergencias Ambientales, Compensación y Responsabilidades de 1980 (CERCLA), por sus reglas en inglés o cualquier de aquellas sustancias reguladas catalogadas como peligrosas por la Sección C de RCRA. Además, se incluye petróleo, o diesel, aceite crudo o cualquier fracción de este que sea líquida a temperatura y presión ambiente (80 grados Fahrenheit y 14.7 lbs. por pulgada cuadrada absoluta).

¿A dónde notificar? Envíe las notificaciones debidamente cumplimentadas a:

Junta de Calidad Ambiental  
 Programa Control Tanques de Almacenamiento Soterrados  
 Apartado Postal 11488  
 Santurce, Puerto Rico 00910

¿Cuándo notificar?

1. Los dueños cuyos TAS estén en servicio o hayan sido puestos fuera de operación después del 1ro de enero de 1984, pero que sus permisos operativos, deberán notificar estos tanques en o antes del 8 de mayo de 1986.

2. Los dueños de TAS puestas en servicio después del 8 de mayo de 1986, deberán notificar dentro de un máximo de treinta (30) días antes de poner en servicio los tanques.

3. Los dueños de TAS que realicen cualquier enmienda o cambio en la facilidad, deberán notificar a la JCA a la mayor brevedad posible.

## SANCIONES

Cualquier dueño de tanque que con conocimiento no cumple con el proceso de notificación o omite información sobre estos sujetos a una penalidad civil máxima de DIEZ MIL DOLARES (\$10,000) por cada tanque que no haya notificado o para el cual no haya obtenido información falsa.

III. TYPE OF OWNER

IV. INDIAN LANDS

- Federal Government
- State Government
- Local Government
- Commercial
- Private

Tanks are located on land within an Indian Reservation or on other trust lands.

Tribe or Nation: \_\_\_\_\_

Tanks are owned by native American nation, tribe, or individual.

V. TYPE OF FACILITY

Select the Appropriate Facility Description

- \_\_\_ Gas Station
- \_\_\_ Railroad
- \_\_\_ Trucking/Transport
- \_\_\_ Petroleum Distributor
- \_\_\_ Federal - Non-Military
- \_\_\_ Utilities
- \_\_\_ Air Taxi (Airline)
- Federal - Military
- \_\_\_ Residential
- \_\_\_ Aircraft Owner
- \_\_\_ Industrial
- \_\_\_ Farm
- \_\_\_ Auto Dealership
- \_\_\_ Contractor
- \_\_\_ Other (Explain) \_\_\_\_\_

VI. CONTACT PERSON IN CHARGE OF TANKS

Name	Job Title	Address	Phone Number (Include Area Code)
PEDRO RUIZ	BASE ENVIRONMENTALIST	U.S. NAVAL STATION ROD STEVENS ROAD	(809) 865-4488

VII. FINANCIAL RESPONSIBILITY

I have met the financial responsibility requirements in accordance with 40 CFR Subpart H

**SUBJECT: DATA REPORT - VIEQUES SITE #2016**

Dear Mr. Thickstun:

Please find enclosed the data report for samples collected by TEG staff from the above referenced project site and delivered to TEG's laboratory under the proper chain-of-custody protocol. All samples were analyzed by TEG's California Department of Health Services (DOHS) certified mobile laboratory. TEG's Puerto Rico-certified chemist conducted the following analyses:

- 7 soil samples analyzed for TRPH by EPA test method 418.1.
- 7 soil samples analyzed for BTEX by modified EPA test method 8020.
- 1 trip, 1 field and 1 equipment blank water sample analyzed for TRPH and BTEX.
- Laboratory QA/QC analyses for TRPH and BTEX.

The results of the analyses are summarized in the attached table. Based on the analytical results, the excavation and stockpile samples **[REDACTED]** to the specification requirements. Applicable detection limits, QA/QC data, chromatograms, chain-of-custody and an invoice are also included as attachments.

TEG appreciates the opportunity to provide analytical services for this project. If you have any questions relating to the data or report, please do not hesitate to contact us.

Sincerely,  
TEG

Kevin Shelburne  
Principal

o-XYLENES	PID #2	0.100 - 10.000	2.57	4.5%	40.09	2.67	4.0%	39.33	2.62	2.0%

CALIB RANGE - RANGE OF CALIBRATION CURVE IN ppm  
 INITIAL RF - AVERAGE RESPONSE FACTOR FROM MULTIPOINT CALIBRATION CURVE  
 % RSD - LINEARITY OF MULTIPOINT CALIBRATION CURVE (+/- 20% ACCEPTABLE LIMITS)  
 AREA - AREA COUNTS FROM DAILY CALIBRATION STANDARD  
 RF - DETECTOR RESPONSE FACTOR FROM MID-POINT CALIBRATION STANDARD  
 % DIFF - DIFFERENCE, IN PERCENT, BETWEEN THE AVERAGE RF AND THE OPENING OR CLOSING RF (+/- 15% ACCEPTABLE LIMITS)  
 OPENING - MID-POINT CALIBRATION STANDARD ANALYZED BEFORE SAMPLE ANALYSES BEGIN  
 CLOSING - MID-POINT CALIBRATION STANDARD ANALYZED AFTER SAMPLES ANALYSES ARE COMPLETE

ANALYSES PERFORMED BY: MARCO A. PEDRAZA  
 DATA REVIEWED BY: KEVIN SHELburnE

## QA/QC REPORT - MS/MSD DATA

### MATRIX SPIKE (MS)/MATRIX SPIKE DUPLICATE (MSD) FOR SOILS

TEG Project #96I0321TB-8

PROJECT NAME: VIEQUES  
RELIABLE MECHANICAL 2016

DAILY CALIBRATION DATE : 11/18/96

COMPOUND	SPK CONC (mg/kg)	MS CONC (mg/kg)	%REC MS	MSD CONC (mg/kg)	%REC MSD	RPD	ACCEPTABLE RPD	ACCEPTABLE RECOVERY
TRPH	500	435	87%	441	88%	1%	15%	80% - 125%
BENZENE	5.000	4.15	83%	4.03	81%	3%	15%	77% - 109%
TOLUENE	5.000	5.41	108%	5.29	106%	2%	15%	75% - 112%
ETHYLBENZENE	5.000	4.86	97%	4.84	97%	0%	15%	65% - 115%
TOTAL XYLENES	15.000	15.63	104%	15.21	101%	3%	15%	70% - 115%

mg/kg = MILLIGRAMS PER KILOGRAM

SPK CONC - CONCENTRATION SPIKED INTO MATRIX

MS CONC - ANALYZED CONCENTRATION OF SPIKED SAMPLE

% REC - PERCENT RECOVERY OF SPIKE FROM MATRIX

RPD - RELATIVE PERCENT DIFFERENCE BETWEEN MATRIX SPIKE AND MATRIX SPIKE DUPLICATE RECOVERIES

ANALYSES PERFORMED BY: MARCO A. PEDRAZA

DATA REVIEWED BY: KEVIN SHELBURNE

BOX 66 PLAYA STATION - AVE. HOSTOS 112, PLAYA DE PONCE  
PONCE, P. R. 00734

December 23th, 1996

To whom it may concern:

We removed a 500 gallons fiber glass tank at Building 2016, at U.S. Naval Base, Roosevelt Roads, Ceiba, Puerto Rico.

This tank was cleaned, crushed and delivered to B.F.I facilities in Ponce, for disposal.

# NON-HAZARDOUS SPECIAL WASTE MANIFEST

## GENERATOR

Generator Name US Navy Generating Location (Name) US Navy  
 Address Roosevelt Road Address Roosevelt Road  
Guayama P.R. Guayama P.R.  
 Phone No. 787 8654488 Phone No. 787 8654488

WASTE DESCRIPTION	B. F. I. CODE	QUANTITY	UNIT	FOR B.F.I. USE ONLY
Waste Oil & Diesel Fuel Oil Containers used.	PR/233 19802181251486	30	gals.	3
	PR/233			

GENERATOR'S CERTIFICATION: I hereby certify that the above named material is not a hazardous waste as defined by 40 CFR Part 261, or any applicable state law, has been properly described, classified and packaged, and is in proper condition for transportation according to applicable regulations; AND, if the waste is a treatment residue of a previously restricted hazardous waste subject to the Land Disposal Restrictions, I certify and warrant that the waste has been treated in accordance with the requirements of 40 CFR Part 268 and is no longer a hazardous waste as defined by 40 CFR Part 261.

Generator Authorized Agent Name - Print Peter J. Ruiz Signature [Signature] Shipment Date 022097

## TRANSPORTER

Transporter Name Blue Puma Transporte Phone No. 787 - 9442205  
 Address Cabo Roa P.R. Driver Name (Print) QUIS VARGAS  
 Vehicle License No. /State: RP1064  
 Container id: \_\_\_\_\_

I hereby certify that the above named material was picked up at the generator site listed above. I hereby certify that above named material was delivered without incident to the destination listed below.

Driver Signature [Signature] Shipment Date 022097 Driver Signature [Signature] Delivery Date 022097

## DESTINATION

Site Name Ponce Sanitary Landfill Phone No. 787 - 8417775  
 Address Bo. La Cotorra Ponce, P.R. 00731

I hereby certify that the above named material has been accepted and to the best of my knowledge the foregoing is true and accurate.

Name of Authorized Agent [Signature] Signature [Signature] Receipt Date 022097

**Flow Velocity Calculations**

---

## AOC E Groundwater Flow Velocity Calculations

Groundwater Gradient (i):  $\frac{\Delta h}{\Delta L}$       Groundwater Flow Velocity (V):  $\frac{K i}{n}$

parameters:       $\Delta h$ = change in water level between points (feet)  
 $\Delta L$ = distance between points (feet)  
 K= hydraulic conductivity (Range: MW4=0.23 feet/day, MW7=0.055 feet/day)  
 n= porosity of the medium (percent)

Table of measured gradients, as measured between MW3 and MW2	
Date	Gradient (ft/ft)
September 1998	0.038
May 2000	0.014
May 2002	0.009
August 2003	0.002
August 2004	0.009
November 2005	0.023
March 2006	0.021

Table of measured hydraulic conductivities	
Test	K (ft/day)
MW4 test 1	0.17
MW4 test 2	0.23
MW7 test 1	0.055
MW7 test 2	0.057
Geometric mean	0.105

Geometric mean      0.012

The geometric mean of a data set ( $a_1, a_2, \dots, a_n$ ) is calculated as:

The  $n^{\text{th}}$  root of ( $a_1 \times a_2 \times \dots \times a_n$ )

**September 11, 1998**

Gradient (i):  $\frac{\Delta h}{\Delta L} = \frac{2.53 \text{ feet}}{67 \text{ feet}} = 0.038$       in north-northwestern direction

Velocity (V):  $\frac{K i}{n} = \frac{(0.23 \text{ ft/d})(0.014)}{0.45} = 0.007 \text{ feet/day}$       using MW4 permeability test results (K)

Calculated Velocities

Highest gradient, highest K value  
 $i=0.037$  September 11, 1998  
 $K=0.23$  (MW4 test 2)

Velocity (V):  $\frac{K i}{n} = \frac{(0.23 \text{ ft/d})(0.038)}{0.45} = 0.02 \text{ feet/day} = 7.1 \text{ ft/year}$

Lowest gradient, lowest K value  
 $i=0.002$  August 18, 2003  
 $K=0.055$  (MW7 test 1)

Velocity (V):  $\frac{K i}{n} = \frac{(0.055 \text{ ft/d})(0.002)}{0.45} = 0.0002 \text{ feet/day} = 0.07 \text{ ft/year}$

Velocity calculated from geometric mean of gradient and hydraulic conductivity

$i=0.012$   
 $K=0.105$

Velocity (V):  $\frac{K i}{n} = \frac{(0.105 \text{ ft/d})(0.012)}{0.45} = 0.0028 \text{ feet/day} = 1.0 \text{ ft/year}$

Multi-Phase Extraction Pilot Test

---

# 1 Multi-Phase Vacuum Extraction Pilot Study

---

This section presents the results of the MPE pilot study at AOC E after implementation of the RI field investigations in 2002. The pilot-scale testing at AOC E, proposed during development of the RI work plans, was intended to provide quantitative performance, cost, and design information to evaluate the effectiveness of this technology in mitigating the free phase hydrocarbon product accumulation that has persisted over time in two site monitoring wells. The MPE pilot study was started in early June 2002 and completed in mid-August 2002 over a period of approximately 10 weeks of system operation.

## 1.1 Pilot Study Description

Due to the existing site conditions at AOC E (the presence of free product, the depth to water greater than 40 ft bls, the tight clayey formation at the site, and the low water yield), several presumptive remedial technologies and/or alternatives were unlikely to pass the screening process in the FS for technical and implementation reasons. Therefore, innovative technologies, including MPE, were evaluated as options for the pilot test since these type of technologies proved successful in remedial efforts at other sites with similar contaminants and site characteristics. The MPE system was eventually selected for the pilot test because the technology effectively mitigated free product at depth at other sites and recovered petroleum-contaminated groundwater and soil vapors at rates that exceeded the capability of other available technologies. In addition (and unlike conventional pump and treat technologies), MPE was expected to provide beneficial removal of contaminants present in the smear zone resulting from water table fluctuations expected during the test.

### 1.1.1 Product Volume and Mass Determinations

Free phase petroleum hydrocarbon in the subsurface is typically delineated and measured with the use of groundwater monitoring wells. The thickness of free phase hydrocarbon product in a monitoring well is determined by using an oil-water interface probe with accuracy to 0.01 ft. Product thickness gauging can be difficult when the product is highly emulsified or very viscous, often resulting in misleading readings within individual monitoring points.

While monitoring wells do provide valuable data as to the general extent and geometry of the free phase hydrocarbon pool, difficulties persist in determining the true thickness, and therefore the volume and ultimately the duration of free phase recovery and remediation. One difficult aspect of determining product volumes using monitoring wells is that accumulation in monitoring wells does not correspond directly to the actual or true thickness in the surrounding formation (Blake and Fryberger, 1983). The thickness of free petroleum hydrocarbons, as measured in a monitoring well, is an apparent thickness rather than a true formation thickness (Blake and Fryberger, 1983).

The measured or apparent free phase hydrocarbon thickness is not only dependent on the capillary fringe but also on the actual hydrocarbon thickness in the formation. Thus, the measured or apparent hydrocarbon thickness is greater for fine-grained formations and less for coarser-grained formations in which the measured thickness may be more representative

of the true thickness. In areas of relatively thin layers of free phase hydrocarbon accumulations such as AOC E, the error between the apparent well thickness and the actual formation can be more pronounced than at sites with thicker accumulations (Farmer, 1983). Free phase hydrocarbon thickness was documented on a number of occasions prior to and after the pilot study at the site and during the latter part of August 2003, as presented in *Table 1*.

Based on the above discussions on product thickness determinations, the true free phase hydrocarbon thickness at MW-01 and MW-05 would be expected to be less than the values presented in *Table 1*, in the range of up to a 70 percent reduction between the apparent and actual product thickness (Gruszczenski, 1987).

From these data, calculations were made to estimate the non-aqueous phase liquid (NAPL) mass at the site. *Table 2* provides an estimate of the NAPL mass at the site, as based on the following assumptions:

- Geometrical shape of outermost NAPL plume: Elliptical
- Geometrical shape of inner NSPL plume: Elliptical
- Effective porosity in capillary zone: 0.45
- Product density of diesel fuel: 7.17 lbs/gal
- Correction factor for clayey sands: 5

It is important to note that in addition to the uncertainty associated with the product thickness measurements, uncertainty also exists in assumed simplistic mass estimation. The free product present could be higher or lower than the estimated values presented in *Table 2* if some of the product remains in the saturated soil zone above the water table during water level fluctuations. The water table fluctuations range up to 3 ft between the two water level measurements conducted, indicating that free product “smearing” could be occurring. However, it is difficult to estimate the amount of product retained in the soils above the water table in this smear-zone. Based on the soil sampling conducted at SB-09, the deepest sample at 42-44 ft bls had 2.3 mg/kg of the O&G range TPHs; this is the lowest observed concentrations at this soil boring location, where shallower depths above had higher TPH levels in this range (see Table 4-1 in the Draft AOC E RI report (CH2M HILL, 2004). Thus, some of the measured TPHs in soils at this boring location could be from the groundwater smear-zone effect; however, these soil TPH levels do not indicate soil saturation levels. Theoretically, it is possible that higher levels of free product may be trapped in soil pore spaces above the water table, although it is not apparent in the soil area at MW-05. Thus, there is some uncertainty in the estimated mass.

The calculations in *Table 2* helped define the approximate areal distribution of the free phase hydrocarbon pool at AOC E, as shown in *Figure 1*. This figure illustrates the path northward that the free phase hydrocarbon pool has taken over time as demonstrated by the free phase product recorded at MW-05, located approximately 10 to 12 ft north of the source area. *Figure 1* also shows that lateral migration of the free phase product is not occurring to any notable extent. This is confirmed by field observations and analytical soil data collected from RI soil borings advanced on all four sides of the source area, as presented in *Section 4*.

*Figure 2* presents the approximate extent of the free phase hydrocarbon pool at AOC E remaining after implementation of the MPE pilot study. This figure was generated from a groundwater/product gauging event completed in August 2003 and shows that free phase

product is no longer present in MW-05, illustrating the long-term effectiveness of the MPE system in mitigating a portion of the free phase hydrocarbon pool at AOC E. Free phase product was not noted in any other site well gauged as part of the August 2003 event, further confirming the localized area onsite at which free phase product accumulation has persisted over the last 2 years.

### 1.1.2 MPE System Design

The MPE system was designed to perform groundwater and soil vapor extraction, and conduct off-gas treatment and groundwater treatment using a low-profile air stripper (LPAS). A simplified schematic of the MPE concept is shown in *Figure 3* and a detailed design drawing of the system used at AOC E is shown in *Figure 4*. The trailer-mounted MPE system was originally equipped with the following components:

- 15 horsepower (hp) liquid ring vacuum pump capable of 160 cubic feet per minute (cfm) at 25 inches of mercury (Hg)
- 150-gallon liquid/ gas separator knockout tank
- 50-gallon product recovery tank
- Two 30-gallon per minute (gpm) transfer pumps
- 1-inch totalizing flow meter
- 300-gallon groundwater holding tank
- 150-gallon seal water tank
- 50-gpm shallow tray air stripping unit equipped with a 1,500-cfm blower
- Thermal catalytic oxidizer

After the equipment arrived onsite at AOC E, the following modifications to the original design were implemented:

- A higher power pump was used than originally planned to pull from two wells. A 20-hp liquid ring vacuum pump capable of 260 actual cubic feet per minute (acfm) at 24 inches of Hg was used to provide additional capacity to pull from two recovery wells instead of one well.
- A 50-gallon product recovery tank was added to the system to store free product.
- Two 1-inch totalizing flow meters were used – one to track the transferred water from the knockout tank to the air stripper unit and the other to document the volume of treated effluent water held in the aboveground storage tanks.
- The 300-gallon groundwater holding tank did not need to be included in the onsite system.
- Two 600-gallon holding tanks stored treated groundwater that was used to cool the liquid ring pump during operation. An onboard transfer pump moved the treated water between the two 600-gallon holding tanks and the liquid ring pump.

- An electric catalytic oxidizer was used on this pilot system. The electric oxidizer was chosen after determining that inconsistencies with receiving fuel deliveries would not be the preferred option since the unit was needed to be semi-automatic during the proposed 60-day pilot study period. With electrical service available to the trailer, the choice was made to proceed with the dependable choice of an electric catalytic oxidizer.

The MPE system was equipped with a vacuum pump that aggressively drew the contaminated groundwater and free product to the recovery wells by creating a low pressure point. The resultant rate of free product and dissolved contamination recovery was increased substantially above the rates possible using a gravity feed submersible or pneumatic pump system. In addition, the MPE system was configured to create a groundwater mound at the extraction point or to create a controlled cone of depression by using a drop tube placed within the recovery well.

### 1.1.3 Design Considerations

A number of considerations were made when designing the pilot study for AOC E. The depth to the free phase/water interface, the unknown dimensions of the free phase hydrocarbon pool, and the clayey geologic profile all made the test objective challenging.

To account for these challenges, the pilot test was designed to perform at incremental extraction wellhead vacuum settings (minimum of three) to determine the optimum extraction vacuum required to cost effectively design the full-scale system. Each vacuum setting was to be run until the induced vacuum and groundwater levels stabilized. Once stabilization was reached, the vacuum was increased to the next vacuum setting. Liquid levels and free product thickness were recorded at all monitoring wells prior to startup to develop baseline numbers.

To evaluate groundwater quality from MW-01 and MW-05 during the pilot test, influent and effluent samples were collected and submitted for laboratory analysis for BTEX, TPH-DRO, TPH-GRO, and TPH-O&G. An influent sample was also collected prior to the air stripper during the second and last pilot test vacuum setting (total of two influent samples). An effluent sample was collected after the air stripper during the second and last pilot test vacuum setting (total of two effluent samples).

### 1.1.4 MPE Operation

#### 1.1.4.1 Groundwater Recovery and Treatment

Free product recovery was accomplished primarily by direct extraction and volatilization. The rate of liquid phase free product recovery was highest during the initial weeks of operation when free product or NAPL were physically extracted from the vicinity of the two recovery wells. Subsequently, the rate of liquid phase free product recovery dropped off once a steady-state condition was reached. The residual NAPL recovery after steady-state condition was accomplished primarily by volatilization.

Total fluid recovery was composed of free product, groundwater, and vapor. As a result, free product and groundwater were emulsified with entrained air. The knockout tank acted as a modified oil/water separator, allowing a small portion of the available free product to separate prior to groundwater treatment. The groundwater was treated using a LPAS, as

described in subsequent sections, and transferred to a series of treated groundwater storage tanks for storage prior to testing and proper disposal. Disposal of the treated groundwater is discussed in later sections.

#### 1.1.4.2 Low Profile Air Stripper Operation

The contaminated groundwater, after separation from the free product within the knockout tank, was transferred to an LPAS for treatment. The LPAS operated by forcing air through perforated baffled trays filled with recovered groundwater cascading downward in a counter-current manner. The residence time of the contaminated groundwater in each tray provided extensive air-to-water contact, driving the dissolved volatile and semi-volatile contaminants from the water and into the air stream. The LPAS consisted of the following features:

- An air stripping unit with a sump and perforated baffled aeration trays providing an enhanced area of mass transfer between liquid and gas phase streams
- A blower, attached at the base of the tray aeration unit, to provide a counter-current air stream with the liquid phase influent

An automatic shutoff air flow switch fitted into the air stripper disabled the MPE recovery system in the event of blower failure or reduced air flow to the tray aerator. A centrifugal pump connected to the LPAS sump discharged the groundwater from the LPAS to the storage tanks. The LPAS sump was equipped with high and low water level sensors to control the discharge pump. A high water level sensor was installed in the air stripper sump to deactivate the recovery system should a high-level alarm condition be reached. An air pressure gauge was also installed to monitor for fouling effects and to enable air flow rate observations.

#### 1.1.4.3 Vadose Zone Vapor Recovery

The soil matrix contaminant partitioning typically consists of immiscible contaminant liquids partitioned to the aqueous and vapor phases, aqueous to the vapor phase, and sorption to the soils. Airflow through the soil matrix induces volatilization of volatile or semi-volatile contaminants. By inducing a vacuum in the gaseous phase, an imbalance develops between the gas and liquid phases, disrupting the equilibrium forces and causing the contaminant in the liquid phase to partition to the gas phase. Subsequent removal of the contaminant from the soil gaseous phase occurs through the exiting air flow stream. In addition, the sorption phase contaminants partitioned to the soil particles are subsequently removed by the induced airflow, thus removing contaminant mass from the vadose zone or smear zone and reducing the residual NAPL. Therefore, vadose zone vapor recovery was expected to occur during the MPE operation.

The vapor flow rate estimates and radius of influence were determined on the basis of the results of the pilot study. The vacuum blower size can be modified during the design of a full-scale system, if warranted, to allow several recovery wells to be placed online to achieve the required radius of influence of soil vapor extraction (SVE).

#### 1.1.4.4 Air Emission

Air emissions from the MPE system were treated with an electric catalytic oxidizer. The catalytic oxidizer burns VOCs to form carbon dioxide and water vapor. Air samples were collected from the MPE system at sampling ports prior to and after oxidation. *Table 5* presents laboratory results from this effort.

#### 1.1.5 MPE System Controls

The MPE system was equipped with an air/liquid separator, liquid ring vacuum pump, LPAS, product recovery tank, water seal tank, and a product-holding tank. A vacuum relief valve to protect the pump was installed on the inlet to the blower per manufacturer recommendations.

The system control panel provides interlocking controls for the liquid ring vacuum pump, air stripper sump high water level alarm sensor, air stripper low pressure blower switch, air/liquid separator high level alarm, liquid ring water seal tank low level, product recovery tank high level alarm, and product tank high level alarm. If any of the high-level alarm sensors are activated, operation of the liquid ring vacuum pump will be shut down. The system can only be started manually after the problem has been identified and corrected. Pump system sensors and controls are summarized below.

The vapor flow rate, free product recovery rate and groundwater flow rate from each MPE recovery well was controlled by a gate valve position at each MPE recovery well. Air entrainment from the MPE recovery wells was monitored by a clear PVC sight tube.

The recovered product included free product, groundwater, and soil vapors. Conventional flow meters are unable to measure two-phase flows for individual recovery wells so total system groundwater flow was measured with a flow meter on the LPAS discharge line.

The air/liquid separator tank was equipped with various sensors. The air/liquid separator tank transfer pump is controlled by a float-type high-pump on and low-pump off sensor. In addition, the air/liquid separator tank was equipped with a float sensor capable of detecting the presence of free product and activating a solenoid valve to remove any accumulated free product.

The product recovery tank was equipped with a high level alarm (system shut down), and a high level pump-on and low level pump-off switch. The high level pump activates the product transfer pump to transfer free product from the product recovery tank to the product holding tank. The product holding tank was equipped with a high level full indication and a high-level alarm switch.

A pair of 600-gallon water seal tanks were plumbed directly to the liquid ring pump and continuously fed treated groundwater to the pump for cooling purposes. Periodically, water was transferred manually from the other treated groundwater storage tanks to replenish the water supply since potable water was not available onsite.

Vacuum and temperature gauges were installed at the inlet of the air/water separator tank and liquid ring vacuum pump. Pressure and temperature gauges were installed at the liquid ring vacuum pump outlet and were used to monitor the liquid ring pump performance.

Vacuum gauges were temporarily installed upstream of the air/water flow valves to monitor the vacuum induced at each of the MPE recovery wells and at the other monitoring wells onsite to determine the radius of influence of the recovery wells. These data are presented in *Table 3*.

Results presented in *Table 3* confirm that a vacuum was induced approximately 60 and 70 feet from the MPE system at monitoring wells MW-02 and MW-07, respectively, which are well beyond the extent of the free product pool. These readings indicate that the MPE system induced a radius of influence out at least to MW-02 and MW-07, which are the two furthest monitoring points from the extraction system and MW-01.

## 1.2 Pilot Study Results

### 1.2.1 Start-up Procedures and Tests

Setup procedures included equipment and personnel mobilization to the site, installation and setup of the mobile treatment system, and installation of vacuum monitoring points. Groundwater levels and the depth of free product were recorded at all monitoring wells prior to startup. Upon completion of the system setup, a trial run was performed to verify the effluent water quality. This was performed prior to full-scale pilot operation because free product was detected and so treated groundwater effluent quality could be verified prior to the disposal of the treated groundwater. The samples were analyzed for BTEX, TPH-DRO, TPH-GRO, and O&G after startup, at the middle of the test, and prior to system shutdown.

A drop tube was inserted into the two source area monitoring wells (MW-01 and MW-05) used as the MPE system extraction points. Existing monitoring wells MW-02, MW-03, MW-04, MW-06, MW-07, and MW-08 were used as vacuum monitoring points later in the pilot test. The existing monitoring wells used as vacuum monitoring points are located at intervals of approximately 10, 15, 20, 40, and 60 ft from the extraction wells. The multi-phase mobile system was activated and, after treatment, the effluent was discharged into the groundwater holding tanks. The monitoring points were connected to water-filled magnehelic gauges to monitor the induced vacuum. The trial was run until the groundwater holding tanks reached their maximum capacity.

### 1.2.2 System Performance

When CH2M HILL's subcontractor, TSG Water Services, mobilized to the site on June 6, 2002, to perform the MPE system electrical connections, the service from the MOV was disconnected. After minor corrections to some electrical connections, the system came online and was fully functional by mid-day on June 13, 2002.

Water from Camp Garcia was delivered to the site on an as-needed basis throughout implementation of the MPE pilot study.

Once the MPE system was fully operational and a full vacuum was induced, the knockout tank began to fill with a mixture of emulsified free product and groundwater. The material had the appearance, texture, and odor of a diesel fuel/waste motor oil mixture. Effluent samples removed from the holding tank under the LPAS found relatively clear water with no apparent diesel odor, but the sample contained a light oil sheen on the surface after

sitting for a few minutes. Therefore, a 100-micron coalescing bag filter system was installed to remove the oil particles from the treated effluent.

The MPE unit went online on June 25, 2002, and groundwater accumulated in the knockout tank at a rate of approximately 0.25 to 0.5 gpm from the combined vacuum hoses connected to monitoring wells MW-01 and MW-05. The initial samples collected indicated that all constituents of concern, BTEX, DRO, and GRO were non-detect. The only analyte detected was O&G, which had values of 12.0 mg/L. Though O&G was not a COC with this site, the PREQB and the U.S. Navy opted to be conservative and not discharge groundwater effluent that contained O&G values of more than 10.0 mg/L. Field measurement estimates recorded during operations indicate that the MPE system recovered groundwater at an average rate of approximately 0.216 gpm over the study period. Following evaporation losses, approximately 11,000 gallons were left for disposal following treatment in the LPAS.

The treated water was discharged from the temporary holding tanks after a series of consistent laboratory results indicated that the stored water was sufficiently treated prior to discharge onsite. Treated water was discharged at the surface in a grassy area adjacent to the site over a period of 3 days under the supervision of field staff. No petroleum sheen or odor was noted during the discharge.

### 1.2.3 Pilot Study Analytical Data Summary

Analytical data were collected from three locations during execution of the MPE pilot study: oxidizer stack (before and after oxidizer), water tank (post treatment), and effluent water (for disposal purposes). Essential to the requirements for this study, sample data were examined from the water tank and are presented in *Table 4*.

According to the data collected, the MPE system successfully functioned according to the operating criteria set forth by PREQB. A summary of the results is as follows:

- DRO and GRO both were removed during the study period. A slight peak occurred with DRO in the midterm sample, but later was non-detect.
- BTEX compounds were essentially non-detect throughout the study period. These compounds were stripped and oxidized by the MPE unit.
- O&G was an unforeseen constituent, as mentioned in previous sections. Sample data were inconsistent although a coalescing bag filter was used to remove the O&G. Other sample results taken from tanks prior to discharge found actual O&G concentrations varying between 9 and 11 mg/L.

Air samples were collected to document the amount of free product stripped and consumed as it passed through the catalytic oxidizer. As *Table 5* illustrates, the LPAS unit on the MPE system was very effective in driving the dissolved volatile and semi-volatile contaminants from the water and into the air stream and in removing the BTEX compounds from the air stream prior to it passing through the final polishing in the catalytic oxidizer. A TPH C6-C10 (GRO) value of 15.9 mg/m<sup>3</sup> was noted in the air sample collected from the sampling port following oxidation and prior to discharge to the atmosphere. The TPH C6-C10 concentrations prior to oxidation was 38.8, indicating an approximate 59-percent concentration reduction for this analyte. All other sampled analytes were recorded as non-detect at the laboratory instrument method detection limit.

TABLE 1  
Summary of Product Gauging Events at AOC E  
Former NASD, Vieques, Puerto Rico

Location	Gauging Instrument	Product Thickness -May 2002 (pre Pilot Test)	Product Thickness - August 2002 post Pilot Test)	Product Thickness – August 2003
MW-01	Oil-water interface probe	0.48 ft	ND	Between 0.25 and 0.5 ft
MW-05	Oil-water interface probe	0.24 ft	ND	ND
ND	Free phase hydrocarbon accumulation not detected			

TABLE 2  
Estimation of NAPL Mass at AOC E  
Former NASD, Vieques, Puerto Rico

Plume Type	Length (ft)	Width (ft)	Geometric Shape	Estimated Area (ft <sup>2</sup> )	NAPL Thickness <sup>a</sup> (ft)	Estimated Volume (gal)	Estimated Mass (lbs)
NAPL	20	15	Elliptical	236	0.36	57.0	409.0
Estimated Maximum Recoverable NAPL Mass (lbs) b							205.0

Volume = (Area)(Average NAPL Thickness)(porosity)(7.48 gal/ft<sup>3</sup>)/Correction factor based on soil type

Mass = [Volume (gal)] [Density (lb/gal)]

a Based on the observed average NAPL thickness in monitor wells MW-01 and MW-05

b Mass of recoverable NAPL is assumed to represent approximately 50 percent of total estimated NAPL mass; however, this could be higher or lower.

Notes:

MW-01 thru MW-06 were surveyed by a license Surveyor in 2000.

<sup>1</sup> Horizontal coordinates were obtained by CH2M HILL in 2007 using a hand held GPS for MW-07 and MW-08.

\* Elevation was surveyed by a CH2M HILL Licensed Surveyor in 2002.

Soil boring location horizontal coordinates obtained from an aerial using ArcGIS.

BOX 66 PLAYA STATION - AVE. HOSTOS 112, PLAYA DE PONCE  
PONCE, P. R. 00734

December 23th, 1996

To whom it may concern:

We removed a 500 gallons fiber glass tank at Building 2016, at U.S. Naval Base, Roosevelt Roads, Ceiba, Puerto Rico.

This tank was cleaned, crushed and delivered to B.F.I facilities in Ponce, for disposal.

To: Kevin Sanders  
CH2M Hill  
3011 S.W. Williston Road  
Gainesville, FL 326147009

W 352-335-5877

**PROJECT ID:** VIEQUES - IDW / 180357.FI.22  
**WORK ORDER:** 2409211  
**DATE RECEIVED:** Friday, October 22, 2004

Project Notes: For 8260 TCLP analysis, sample -01 required an additional 1:10 dilution due to excessive foaming upon the purge step. Heavy emulsions were encountered during the extraction of the 8270 samples. These emulsions may have contributed to the low surrogate recoveries in the samples. For the 8081 analysis, sample -01 had surrogate recoveries below criteria. The most probable cause for the variances is matrix effect. For the 8151 analysis, the surrogate was below criteria for the samples and QC. The samples and QC was re-extracted and re-analyzed out of hold. With acceptable criteria. Both sets of data is reported.

(†): Short Hold Time Analysis Date

Samples reported on dry weight basis

## DATA QUALIFIER CODES

State of Florida, Department of Environmental Protection &  
Department of Health & Rehabilitative Services / NELAC

---

**J** Estimated value; value not accurate. This code shall be used in the following instances:

1. Surrogate recovery limits have been exceeded.
2. No known quality control criteria exists for the component
3. The reported value failed to meet the established quality control criteria for either precision or accuracy
4. The sample matrix interfered with the ability to make an accurate determination
5. If the data is questionable because of improper laboratory or field protocols (e.g. composite sample was collected instead of a grab sample)

Note: a “J” value shall be accompanied by justification for it’s use, and shall not be used if another code applies (e.g. L, V, Y, Q).

**L** Off-scale high. Actual value is known to be greater than the value given. To be used when the concentration of the analyte is above the acceptable limit for quantitation (exceeds the linear range of the highest calibration standard) and the calibration curve is known to exhibit a negative deflection.

**Q** Sample held beyond acceptable holding time. This code shall be used if the value is derived from a sample that was prepared or analyzed after the approved holding time restrictions for the sample preparation or analysis.

**U** Indicates that the compound was analyzed for but not detected. This shall be used to indicate that the specified component was not detected. The value associated with the qualifier shall be the laboratory reporting limit. Unless requested by the client, values less than the reporting limit shall not be reported.

**V** Indicates that the analyte was detected in both the sample and the associated method blank.  
Note: The value in the blank shall not be subtracted from associated samples.

**Y** The laboratory analysis was from an unpreserved or improperly preserved sample. The data may not be accurate.

*DATA VALIDATION REPORT*

**To:** Mr. Brian C. Spann  
Laboratory Manager  
PEL Laboratories, Inc.  
Tampa, FL

**From:** Rafael Infante, A&V Environmental Support

**Date:** November 5, 2004

**Re:** Data set from CH2M-Hill- Vieques IDW PR License  
Chemist Certification of Samples Analyzed for RCRA  
Characteristics for Disposal

The enclosed analysis report is based on data generated by PEL Laboratories, Inc. of Tampa, Florida for soil and aqueous samples collected on October 21, 2004. The analytical data was obtained directly from PEL and reviewed in accordance with the quality control requirements of the methods performed. The analyses were performed in accordance with the EPA SW-846 Methods.

This report applies to the following samples:

SAMPLE ID
WEST-IDW I & EW (ground water)
WEST-IDW I & ES (SOIL)

**Mr. Brian C. Spann**  
**Data Validation Report**  
**Page -2-**

TCLP Volatiles Data.

There were one (1) liquid sample and one (1) soil sample. No trip blanks or duplicates were taken. Samples were analyzed for TCLP volatiles following method SW-846 8260B (purge-and-trap gas chromatography with Mass Spectrometry detection). This report is based on a review of holding times, initial and continuing calibration data, blank analysis results, surrogate and matrix spike recoveries, quantitation of positive results, and sample result verification.

The data package obtained for TCLP volatiles is complete.

**Holding times.** All samples were analyzed within the required holding time of fourteen (14) days for TCLP extraction and fourteen days for analysis- 28 days total.

**BFB tuning** There is no indication that the frequency and abundance of BFB tune was outside the QC acceptance criteria.

**Calibration.** Internal standard calibration was employed; calibration extended the concentration range found in the samples. There are no indications that initial and continuing calibration were not in compliance with the method. Surrogate recoveries were within established limits.

**Blanks.** No contamination was found in the method blank. Field, trip and equipment blanks were not submitted for analysis.

**Matrix spikes (MS)/Matrix spike duplicate (MSD).** Laboratory control samples were within acceptance limit for the samples analyzed .

**Laboratory duplicates.** No information on laboratory duplicates was provided with the data package.

**Surrogate recovery.** Recoveries of surrogate standards were within control limits.

**Sample result calculation.** Calculation was based on the area for characteristics peaks for analyte and internal standard, sample volume, dilution factor, and calibration factor. Sample PEL-240921101 required a 10 dilution due to excessive foaming on the purge step.

**Mr. Brian C. Spann**  
**Data Validation Report**  
**Page -3-**

Detection limits are set to meet EPA's CLP OLMO1.0 standards.

**Overall assessment.** Sample data meet the necessary quality control requirements for the method.

TCLP Metals by ICAP (SW-846 6010) Data.  
**Trace metals (As, Ba, Cd, Cr, Pb, Se, and Ag)**

The following samples were analyzed for trace metals following SW-846 6010-induced coupled Argon plasma:

One (3) liquid sample and one (1) soil sample were analyzed.

The data package obtained for the trace metals is complete.

**Holding times.** Analytes analyzed within method holding times (180 days).

**Calibration.** Initial demonstration of instrument calibration- there are no indication that the calibration did not meet minimum performance criteria specific for the method. Quantification was performed by comparing emission intensity of standards with that of the sample for the wavelength characteristic for each element. Interelement correction factors were employed.

**Blanks.** No target analytes were detected in the initial and continuing calibration blanks except for the following:  
Sample: 240921101

Analyte	Concentration, ug/L
Lead	0.0326
Selenium	0.0639
Silver	0.00924

**Laboratory duplicates.** Duplicates (laboratory and field) data was not provided. There are no indication on the report that duplicates were outside the established limits.

**Laboratory control standards.** Within the laboratory control limit.

**Sample result calculation.** Calculation was based on emission of the corresponding element line, sample volume, and dilution factor.

Detection limit are set to meet EPA's CLP OLMO1.0

**Overall assessment.** Sample data meets the necessary quality control requirements for the method.

TCLP Metals by Flameless Atomic Absorption (SW-846 7470) Data.

**Mercury (Hg) by atomic absorption.**

The following samples were analyzed for TCLP Hg by atomic absorption following SW-846 7470:

One (1) liquid sample and one (1) soil sample.

The data package obtained for mercury metals is complete.

**Holding times.** Analytes analyzed within method holding times (28 days for Hg).

**Calibration.** Initial demonstration of instrument calibration- there are no indication that the calibration did not meet minimum performance criteria specific for the method. Quantification was performed by using a Beer law plot (absorbance vs. concentration) for each element.

**Blanks.** Preparation blank contained less than the minimum detectable quantity for mercury.

**Laboratory control standards.** Within the laboratory control limit.

**Sample result calculation.** Calculation was based on absorbance measurement and the Beer's law plot for the corresponding element, sample volume, and dilution factor.

Detection limit are set to meet EPA's CLP OLMO1.0.

**Overall assessment.** Sample data meets the necessary quality control requirements for the method.

TCLP Pesticides/Herbicides by (SW-846 8081A/8150) Data.

The following samples were analyzed for TCLP pesticides/herbicides by gas chromatography with electron capture detection following SW-846 8081A/81500:

One (1) liquid sample and one (1) soil sample.

The data package obtained for pesticides and herbicides is complete.

**Holding times.** Analytes analyzed within method holding times. Samples 240921101 and 240921102 has surrogate recoveries below the laboratory criteria for method 8150, the sample was re-extracted and re-analyzed out of holding time. Both data are reported.

**Calibration.** Initial demonstration of instrument calibration- there are no indication that the calibration did not meet minimum performance criteria specific for the method. In all cases, quantification was performed using a five points calibration.

**Blanks.** Method blank contained less than the minimum detectable quantity of the target analytes.

**Surrogate recoveries.** Were within established limits except for samples 240921101 and 240921102 for method 8051 and sample 240921101 for method 8081A.

**Laboratory control standards.** Within the laboratory control limits.

**Sample result calculation.** Calculation for TCLP pesticides and herbicides was based on the peak area, response factor, sample volume, dilution factor, and calibration curve response.

Detection limit are set to meet EPA's CLP OLMO1.0

**Overall assessment.** Sample data meets the necessary quality control requirements for the method.

TCLP Semivolatiles by (SW-846 8270C) Data.

One (1) liquid sample and one (1) soil sample were analyzed for TCLP semivolatile organics (acids/base neutrals).

The data package obtained is complete.

**Holding times.** Analytes analyzed within method holding times.

**Calibration.** Initial demonstration of instrument calibration- there are no indication that the initial and continuing calibration did not meet minimum performance criteria specific for the method.

**Blanks.** Method blank contained less than the minimum detectable quantity of the target analytes.

**Mr. Brian C. Spann**  
**Data Validation Report**  
**Page -7-**

**Surrogate recoveries.** Were within established limits except for the following:  
Sample 240921101- 2,4,6-Tribromophenol; 2-Fluorophenol

**Laboratory control standards.** Within the laboratory control limits.

**Sample result calculation.** Calculation for TCLP semivolatile organic analytes was based on the peak area, response factor, sample volume, dilution factor, and calibration curve response.

Detection limit are set to meet EPA's CLP OLMO1.0

**Overall assessment.** Sample data meets the necessary quality control requirements for the method.

**Hazardous Characteristics Data:**

Reactive cyanide by (SW-846 9012)

Reactive sulfide by (SW-846 9030-solid samples/376.1-liquid sample)

Corrosivity by (SW-846 9045-solid samples/150.1-liquid samples), and

Ignitability by (SW-846 1010)

One (1) liquid sample and one (1) liquid sample were analyzed by the methods described above.

The data package obtained for the hazardous characteristics is complete.

**Holding times.** Samples analyzed within method holding times.

**Calibration.** Initial demonstration of instrument calibration- there are no indications that calibration did not meet minimum performance criteria specific for the method. Continuing calibration were perform as per the method described frequency.

**Blanks.** Blanks did not have any positive results for target analytes.

**Sample result calculation.** Calculations were based on analyte response, sample volume, and dilution factor.

Detection limit are set to meet EPA's CLP OLMO1.0

**Overall assessment.** Sample data meets the necessary quality control requirements for the method.

The samples did neither exceeded the toxicity characteristic leaching procedure criteria for target analytes, nor the hazardous characteristics. Waste samples can be classified as non-hazardous.

**Certification**

The following samples 240921101 and 240921102 were analyzed following standard procedures accepted by regulatory agencies. The quality control requirements met the methods criteria except in the occasions described in this document. The results are valid.

## SDG NARRATIVE SDG # 8926 PROTOCOL: SW-846

### SAMPLE IDENTIFICATIONS: WAR-IDW-3

The one water sample listed above was scheduled for the requested analysis of the Herbicide fraction. The requested SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction (Method 3550B), and Method 8151A were used to prepare and analyze the samples, with the exceptions and/or additions requested by the client. All pertinent Quality Assurance notices are included in the narrative section and all pertinent Laboratory notices for SDG #8926 are included in the sample data sections.

### Herbicides

Extraction and analysis holding time requirements were met for the samples.

No target analytes confirmed above the reporting limits in the sample.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

All surrogate recoveries were with the method specified limits.

The method blank associated with the samples met all quality control criteria.

The Laboratory Control Sample (LCS) prepared and analyzed with the samples met all recovery and precision criteria for all spike analytes.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on CD has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

**Katrina L. Travis**

## SDG NARRATIVE SDG #8926 PROTOCOL: SW-846 8270C

### SAMPLE IDENTIFICATIONS: WAR-IDW-3

The one liquid sample listed above was scheduled for the requested analyses of the GC/MS Semivolatiles fraction. SW-846, 3rd Edition, Update 3, Method 1311, Separatory funnel extraction (Method 3510C) and Method 8270C were used to prepare and analyze this sample, with the exceptions and/or additions requested by the client. All pertinent Quality Assurance notices are included in the narrative section and all pertinent Laboratory notices for SDG #8926 are included in the sample data section.

### TCLP GC/MS Semivolatiles

Analysis holding time requirements were met for the sample.

There were no target analytes identified above the Quantitation Limit (QL) in the sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All decafluorotriphenylphosphine (DFTPP) abundance criteria were met for tunes associated to this SDG. Overall QC criteria were met for all initial and continuing calibration verification standards (CCVs) associated to this SDG. There is no Form VII in the deliverables package for the batch analyzed on instrument 5972hp64 on 01/26/06, associated with the DFTPP tune analyzed at 1441. This batch included an initial calibration and the relevant relative response factors are all displayed on the appropriate Form VIs. The initial calibration met all acceptance criteria and therefore samples could be analyzed without having to inject a continuing calibration verification standard.

All of the surrogates met recovery criteria in the analyses of the sample. All of the internal standards met response and retention time criteria in the analyses of the sample.

The associated method blank met all quality control criteria.

There were no duplicate matrix spikes (MS/MSD) associated with this SDG.

The associated Laboratory Control Sample (LCS) met all recovery criteria.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

## SDG NARRATIVE SDG # 8925 PROTOCOL: SW-846

### SAMPLE IDENTIFICATIONS:

#### WAR-IDW-4

The one water sample listed above was received intact, properly refrigerated with proper documentation, in sealed shipping containers, on January 19, 2006. The sample was scheduled for the requested analyses of the pesticide-TCLP fraction. SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction (Method 3550B), and Method 8081A were used to prepare and analyze this sample, with the exceptions and/or additions requested by the client. This portion of the SDG narrative deals with the pesticide-TCLP fraction only.

### Pesticides TCLP

Extraction and analysis holding time requirements were met for this sample.

There were no pesticide-TCLP analytes confirmed by dual column analysis above the Quantitation Limit (QL) in this sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

All of the surrogates met recovery and retention time criteria in the analyses of this sample.

The associated method blank met all quality control criteria.

There is no associated duplicate matrix spikes for this SDG.

The associated Laboratory Control Sample prepared and analyzed along with this sample (LCS) met all accuracy criteria.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. **SDG NARRATIVE**

**SDG # 8926**

The indicated Sample Delivery Group (SDG) consisting of one (1) liquid sample was received into the laboratory information management system (LIMS) on January 19, 2006 intact and in good condition with Chain of Custody (COC) Records in order, unless otherwise noted in any attachments or Quality Assurance Notices. The temperature of the sample was 4.6°C. Sample ID's reported in this data package are noted by the receiving department on the COC if they differ from those listed by the samplers on the COC.

The sample was prepared following the TCLP leaching procedure and analyzed in accordance with SW846 methodology for TCLP metals.

**INSTRUMENTAL QUALITY CONTROL:**

All calibration verification solutions (ICV & CCV), blanks (ICB, & CCB), and interference check samples (ICSA & ICSAB) associated with this data were confirmed to be within allowable limits.

**SAMPLE PREPARATION QUALITY CONTROL:**

The sample preparation procedure verifications (LCSW, & PBW) were found to be within acceptable ranges and the sample was prepared and analyzed within the specified holding times.

**MATRIX RELATED QUALITY CONTROL:**

No matrix spikes or duplicates were requested with this case.

The laboratory manager or his designee, as verified by the following signature has authorized release of the data contained in this hard copy data package. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

## SDG NARRATIVE

SDG # 8925

PROTOCOL: SW-846

### SAMPLE IDENTIFICATIONS:

WAR-IDW-4

The one water sample listed above was received intact, properly refrigerated, with proper documentation, in sealed shipping containers, on January 19, 2006. The sample was scheduled for the requested analyses of the herbicide fraction. SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction and Method 8151A were used to prepare and analyze these samples, with the exceptions and/or additions requested by the client. This portion of the SDG narrative deals with the herbicide fraction only.

### Herbicide-TCLP

Extraction and analysis holding time requirements were met for this sample.

There were no herbicide project analytes confirmed by dual column analysis above the Quantitation Limit (QL) in this sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

The surrogate met recovery and retention time criteria in the analyses of this sample.

The associated method blank met all quality control criteria.

There is no associated duplicate matrix spikes for this SDG.

The associated Laboratory Control Sample (LCS) prepared and analyzed along with this sample met all accuracy criteria.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

## SDG NARRATIVE SDG # 8926 PROTOCOL: SW-846

### SAMPLE IDENTIFICATIONS: WAR-IDW-3

The one water sample listed above was scheduled for the requested analysis of the Herbicide fraction. The requested SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction (Method 3550B), and Method 8151A were used to prepare and analyze the samples, with the exceptions and/or additions requested by the client. All pertinent Quality Assurance notices are included in the narrative section and all pertinent Laboratory notices for SDG #8926 are included in the sample data sections.

### Herbicides

Extraction and analysis holding time requirements were met for the samples.

No target analytes confirmed above the reporting limits in the sample.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

All surrogate recoveries were with the method specified limits.

The method blank associated with the samples met all quality control criteria.

The Laboratory Control Sample (LCS) prepared and analyzed with the samples met all recovery and precision criteria for all spike analytes.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on CD has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

## SDG NARRATIVE

SDG # 8926

CONTRACT # SW-846 8260B

### SAMPLE IDENTIFICATIONS:WAR-IDW-3

The one (1) water sample listed above was received intact, properly refrigerated at 4.6°C, with proper documentation, on January 19, 2006. The sample was scheduled for the requested ZHE extraction procedure followed by an 8260B volatile analysis for the ZHE compound list.

Analysis holding time requirements were met for the sample.

The sample contained no compounds above the Contract Required Quantitation Limit (CRQL).

All bromofluorobenzene (BFB) abundance criteria were met for tunes associated to this SDG. Overall QC criteria were met for the initial calibration and continuing calibration standard associated to this SDG.

All of the system monitoring compounds met recovery criteria in the analysis of this sample. All of the internal standards met response and retention time criteria in the analysis of this sample. The associated method blank met all quality control criteria.

A laboratory control sample was analyzed with this SDG and passed all QC criteria.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

**SDG NARRATIVE**

**SDG # 8925**

The indicated Sample Delivery Group (SDG) consisting of one (1) solid sample was received into the laboratory information management system (LIMS) on January 19, 2006 intact and in good condition with Chain of Custody (COC) Records in order, unless otherwise noted in any attachments or Quality Assurance Notices. The temperature of the sample was 4.6°C. Sample ID's reported in this data package are noted by the receiving department on the COC if they differ from those listed by the samplers on the COC.

The sample was prepared following the TCLP leaching procedure and analyzed in accordance with SW846 methodology for TCLP metals.

**INSTRUMENTAL QUALITY CONTROL:**

All calibration verification solutions (ICV & CCV), blanks (ICB, & CCB), and interference check samples (ICSA & ICSAB) associated with this data were confirmed to be within allowable limits.

**SAMPLE PREPARATION QUALITY CONTROL:**

The sample preparation procedure verifications (LCSW, & PBW) were found to be within acceptable ranges and the sample was prepared and analyzed within the specified holding times.

**MATRIX RELATED QUALITY CONTROL:**

No matrix spikes or duplicates were requested with this case.

The laboratory manager or his designee, as verified by the following signature has authorized release of the data contained in this hard copy data package. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

**SDG NARRATIVE**  
**SDG #8925**  
**PROTOCOL: SW-846 8270C**

**SAMPLE IDENTIFICATIONS: WAR-IDW-4**

The one soil sample listed above was scheduled for the requested analyses of the GC/MS Semivolatiles fraction. SW-846, 3rd Edition, Update 3, Method 1311, Separatory funnel extraction (Method 3510C) and Method 8270C were used to prepare and analyze this sample, with the exceptions and/or additions requested by the client. All pertinent Quality Assurance notices are included in the narrative section and all pertinent Laboratory notices for SDG #8925 are included in the sample data section.

**TCLP GC/MS Semivolatiles**

Analysis holding time requirements were met for the sample.

There were no target analytes identified above the Quantitation Limit (QL) in the sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All decafluorotriphenylphosphine (DFTPP) abundance criteria were met for tunes associated to this SDG. Overall QC criteria were met for all initial and continuing calibration verification standards (CCVs) associated to this SDG. There is no Form VII in the deliverables package for the batch analyzed on instrument 5972hp64 on 01/26/06, associated with the DFTPP tune analyzed at 1441. This batch included an initial calibration and the relevant relative response factors are all displayed on the appropriate Form VIs. The initial calibration met all acceptance criteria and therefore samples could be analyzed without having to inject a continuing calibration verification standard.

All of the surrogates met recovery criteria in the analyses of the sample. All of the internal standards met response and retention time criteria in the analyses of the sample.

The associated method blank met all quality control criteria.

There were no duplicate matrix spikes (MS/MSD) associated with this SDG.

The associated Laboratory Control Sample (LCS) met all recovery criteria.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

## I. SAMPLE DATA SUMMARY PACKAGE

GC by SW-846

The sample data summary package shall contain data for all samples in one Sample Delivery Group (SDG) of the Case, as follows:

- A. SDG Narrative
- B. Tabulated target compound results (Form I)
- C. Surrogate spike analysis results (Form II)  
By matrix (Water or Soil), and  
by concentration (Low, or Medium)
- D. Spike results MS / MSD / LCS (Form III)
- E. Blank data (Form IV)  
Tabulated blank results (Form I)

LAB CODE : COMPU

METHOD: 8081A TCLP

SDG # : 8425

# A. SDG Narrative

# CompuChem

a division of Liberty Analytical Corporation

501 Madison Avenue

Cary, N.C. 27513

Tel: 919/379-4100 Fax: 919/379-4050

## SDG NARRATIVE SDG # 8925 PROTOCOL: SW-846

### SAMPLE IDENTIFICATIONS:

#### WAR-IDW-4

The one water sample listed above was received intact, properly refrigerated with proper documentation, in sealed shipping containers, on January 19, 2006. The sample was scheduled for the requested analyses of the pesticide-TCLP fraction. SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction (Method 3550B), and Method 8081A were used to prepare and analyze this sample, with the exceptions and/or additions requested by the client. This portion of the SDG narrative deals with the pesticide-TCLP fraction only.

### Pesticides TCLP

Extraction and analysis holding time requirements were met for this sample.

There were no pesticide-TCLP analytes confirmed by dual column analysis above the Quantitation Limit (QL) in this sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

All of the surrogates met recovery and retention time criteria in the analyses of this sample.

The associated method blank met all quality control criteria.

There is no associated duplicate matrix spikes for this SDG.

The associated Laboratory Control Sample prepared and analyzed along with this sample (LCS) met all accuracy criteria.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

## **CompuChem's Pagination Convention**

As required by the EPA CLP Statement of Work (SOW) documents, data to be delivered must be paginated (by machine or hand). In the event that the initial numbering is incorrect (a page numbered twice or a page skipped, for example), it is CompuChem's policy to add an alphabetic suffix to a page number when necessary (e.g., 100A, 100B, etc.).

## Notification Regarding Manual Editing/Integration Flags

In some instances, manual adjustments to the software output are necessary to provide accurate data. These manual integrations are performed by the data reviewers, GC/MS operators, or GC chemists. An Extracted Ion Current Profile (EICP) or a GC chromatographic peak has been provided for the manual integration performed on each compound to demonstrate the accuracy of that process. The manual integrations are flagged on the quantitation report in the far right column beyond the FINAL concentration for GC/MS analysis, and in the "Flags" column for GC analysis. The manual editing/integration flags are:

- M** - Denotes that a manual integration has been performed for this compound. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- H** - Denotes that the data reviewer, GC/MS operator, or GC Chemist has chosen an alternate peak within the retention time window from that chosen by the software for that compound. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- MH** - Denotes that an alternate peak has been chosen within the retention time window from that chosen by the software for that compound and also a manual integration of the chosen peak has been performed. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- L** - Denotes that a data reviewer or GC/MS operator has selected an alternate library search. This is typically done when an additional tentatively identified compound (TIC) has been added to the number of peaks searched. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- ML** - Denotes that an alternate library search has been selected and a manual integration has also been performed. This is typically done when an additional TIC has been added and the TIC peak also required a manual integration.

The EPA CLP SOW documents require additional explanations for manual editing/integration. In the accompanying raw data packages, additional codes have been applied to the "M" flag and carry the following meanings;

- M1** - The compound was not found by the automatic integration routine.
- M2** - The compound was incorrectly integrated by the automatic integration routine.
- M3** - The co-eluting compounds were incorrectly integrated by the automatic integration routine.

These codes will appear in the GC/MS and GC raw data.

## DATA REPORTING QUALIFIERS

On the Form I, under the column labeled "Q" for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. Up to five qualifiers may be reported on Form I for each compound. The qualifiers used are:

U : This flag indicates the compound was analyzed for but not detected. The Contract Required Quantitation Limit (CRQL), or reporting limit, will be adjusted to reflect any dilution and, for soils, the percent moisture.

J : This flag indicates an estimated value. The flag is used as detailed below:

1. When estimating a concentration for tentatively identified compounds (TICs) where a response factor of 1.0 is assumed for the TIC analyte,

2. When the mass spectral and retention time data indicate the presence of a compound that meets the volatile and semivolatile GC/MS identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero, and

3. When the retention time data indicate the presence of a compound that meets the pesticide/Aroclor or other GC or HPLC identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero. For example, if the CRQL (or Reporting Limit) is 10 µg/L, but a concentration of 3 µg/L is calculated, it is reported as 3J.

N : This flag indicates presumptive evidence of a compound. This flag is only used for TICs, where the identification is based on a mass spectral library search. For generic characterization of a TIC such as 'chlorinated hydrocarbon', the N flag is not used.

P : In the EPA's Contract Laboratory Program (CLP), this flag is used for a pesticide/Aroclor target analyte, when there is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form I and flagged with a P. For SW-846 GC and HPLC analyses, when the Relative Percent Difference (RPD) is greater than 40% and there is no evidence of chromatographic anomalies or interferences, then the higher of the two values is reported and flagged with a P. When the RPD is equal to or less than 40%, our policy is to also report the higher of the two values, although the choice could be a project specific issue. For certain HPLC analyses, if one of the HPLC columns displays co-elution of target analytes, all results are reported from a primary column displaying no co-elution. Results are still flagged with a P if the RPD between columns is greater than 40%.

## DATA REPORTING QUALIFIERS (continued)

- C : This flag applies to GC or HPLC results where the identification has been confirmed by GC/MS. If GC/MS confirmation was attempted but was unsuccessful, this flag is not applied; a laboratory-defined flag is used instead (see the X/Y/Z qualifier.)
- B : This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates probable blank contamination and warns the data user to take appropriate action. This flag is used for a TIC as well as for a positively identified target compound. The combination of flags BU or UB is not an allowable policy. Blank contaminants are flagged B only when they are detected in the sample.
- E : This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis. If one or more compounds have a response greater than the upper level of the calibration range, the sample or extract will be diluted and reanalyzed. All such compounds with a response greater than the upper level of the calibration range will have the concentration flagged with an E on Form I for the original analysis.
- D : If a sample or extract is reanalyzed at a higher dilution factor, for example when the concentration of an analyte exceeds the upper calibration range, the DL suffix is appended to the sample number on Form I for the more diluted sample, and **all** reported concentrations on that Form I are flagged with the D flag. This flag alerts data users that any discrepancies between the reported concentrations may be due to dilution of the sample or extract.
- NOTE 1: The D flag is not applied to compounds which are not detected in the sample analysis i.e. compounds reported with the CRQL (or Reporting Limit) and the U flag.
- NOTE 2: Separate Form Is are used for reporting the original analysis (Client Sample No. XXXXX) and the more diluted sample analysis (Client Sample No. XXXXXDL) i.e. the results from both analyses are not combined on a single Form I.
- A: This flag indicates that a TIC is a suspected aldol-condensation product.
- S: In the SOM01.1 SOW, this flag is used to indicate an estimated value for Aroclor target compounds where a valid 5-point initial calibration was not performed prior to the analytes detection in a sample. If an "S" flag is used for a specific Aroclor, then a reanalysis of the sample is required after a valid 5-point calibration is performed for the detected Aroclor.
- X/Y/Z : Other specific flags may be required to properly define the results. If used, the flags will be fully described in the SDG Narrative. The laboratory-defined flags are limited to X, Y and Z.

## I. SAMPLE DATA PACKAGE

GC by SW-846

The sample data package shall include data for all analyses of all samples in one Sample Delivery Group (SDG), including field samples, dilutions, reanalyses, blanks, matrix spikes, matrix spike duplicates, and laboratory control samples. The sample data package consists of the following:

- A. SDG Narrative
- B. Chain-of-Custody Documentation
- C. SDG Data

LAB CODE : COMPU

METHOD: 8081A TCLP

CASE # : \_\_\_\_\_

SDG # : 8925

# A. SDG Narrative

# CompuChem

a division of Liberty Analytical Corporation

501 Madison Avenue

Cary, N.C. 27513

Tel: 919/379-4100 Fax: 919/379-4050

## SDG NARRATIVE SDG # 8925 PROTOCOL: SW-846

### SAMPLE IDENTIFICATIONS: WAR-IDW-4

The one water sample listed above was received intact, properly refrigerated with proper documentation, in sealed shipping containers, on January 19, 2006. The sample was scheduled for the requested analyses of the pesticide-TCLP fraction. SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction (Method 3550B), and Method 8081A were used to prepare and analyze this sample, with the exceptions and/or additions requested by the client. This portion of the SDG narrative deals with the pesticide-TCLP fraction only.

### Pesticides TCLP

Extraction and analysis holding time requirements were met for this sample.

There were no pesticide-TCLP analytes confirmed by dual column analysis above the Quantitation Limit (QL) in this sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

All of the surrogates met recovery and retention time criteria in the analyses of this sample.

The associated method blank met all quality control criteria.

There is no associated duplicate matrix spikes for this SDG.

The associated Laboratory Control Sample prepared and analyzed along with this sample (LCS) met all accuracy criteria.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

## Notification Regarding Manual Editing/Integration Flags

In some instances, manual adjustments to the software output are necessary to provide accurate data. These manual integrations are performed by the data reviewers, GC/MS operators, or GC chemists. An Extracted Ion Current Profile (EICP) or a GC chromatographic peak has been provided for the manual integration performed on each compound to demonstrate the accuracy of that process. The manual integrations are flagged on the quantitation report in the far right column beyond the FINAL concentration for GC/MS analysis, and in the "Flags" column for GC analysis. The manual editing/integration flags are:

- M** - Denotes that a manual integration has been performed for this compound. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- H** - Denotes that the data reviewer, GC/MS operator, or GC Chemist has chosen an alternate peak within the retention time window from that chosen by the software for that compound. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- MH** - Denotes that an alternate peak has been chosen within the retention time window from that chosen by the software for that compound and also a manual integration of the chosen peak has been performed. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- L** - Denotes that a data reviewer or GC/MS operator has selected an alternate library search. This is typically done when an additional tentatively identified compound (TIC) has been added to the number of peaks searched. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- ML** - Denotes that an alternate library search has been selected and a manual integration has also been performed. This is typically done when an additional TIC has been added and the TIC peak also required a manual integration.

The EPA CLP SOW documents require additional explanations for manual editing/integration. In the accompanying raw data packages, additional codes have been applied to the "M" flag and carry the following meanings;

- M1** - The compound was not found by the automatic integration routine.
- M2** - The compound was incorrectly integrated by the automatic integration routine.
- M3** - The co-eluting compounds were incorrectly integrated by the automatic integration routine.

These codes will appear in the GC/MS and GC raw data.

## DATA REPORTING QUALIFIERS

On the Form I, under the column labeled “Q” for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. Up to five qualifiers may be reported on Form I for each compound. The qualifiers used are:

- U : This flag indicates the compound was analyzed for but not detected. The Contract Required Quantitation Limit (CRQL), or reporting limit, will be adjusted to reflect any dilution and, for soils, the percent moisture.
- J : This flag indicates an estimated value. The flag is used as detailed below:
1. When estimating a concentration for tentatively identified compounds (TICs) where a response factor of 1.0 is assumed for the TIC analyte,
  2. When the mass spectral and retention time data indicate the presence of a compound that meets the volatile and semivolatile GC/MS identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero, and
  3. When the retention time data indicate the presence of a compound that meets the pesticide/Aroclor or other GC or HPLC identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero. For example, if the CRQL (or Reporting Limit) is 10 µg/L, but a concentration of 3 µg/L is calculated, it is reported as 3J.
- N : This flag indicates presumptive evidence of a compound. This flag is only used for TICs, where the identification is based on a mass spectral library search. For generic characterization of a TIC such as ‘chlorinated hydrocarbon’, the N flag is not used.
- P : In the EPA’s Contract Laboratory Program (CLP), this flag is used for a pesticide/Aroclor target analyte, when there is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form I and flagged with a P. For SW-846 GC and HPLC analyses, when the Relative Percent Difference (RPD) is greater than 40% and there is no evidence of chromatographic anomalies or interferences, then the higher of the two values is reported and flagged with a P. When the RPD is equal to or less than 40%, our policy is to also report the higher of the two values, although the choice could be a project specific issue. For certain HPLC analyses, if one of the HPLC columns displays co-elution of target analytes, all results are reported from a primary column displaying no co-elution. Results are still flagged with a P if the RPD between columns is greater than 40%.

## DATA REPORTING QUALIFIERS (continued)

- C : This flag applies to GC or HPLC results where the identification has been confirmed by GC/MS. If GC/MS confirmation was attempted but was unsuccessful, this flag is not applied; a laboratory-defined flag is used instead (see the X/Y/Z qualifier.)
- B : This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates probable blank contamination and warns the data user to take appropriate action. This flag is used for a TIC as well as for a positively identified target compound. The combination of flags BU or UB is not an allowable policy. Blank contaminants are flagged B only when they are detected in the sample.
- E : This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis. If one or more compounds have a response greater than the upper level of the calibration range, the sample or extract will be diluted and reanalyzed. All such compounds with a response greater than the upper level of the calibration range will have the concentration flagged with an E on Form I for the original analysis.
- D : If a sample or extract is reanalyzed at a higher dilution factor, for example when the concentration of an analyte exceeds the upper calibration range, the DL suffix is appended to the sample number on Form I for the more diluted sample, and **all** reported concentrations on that Form I are flagged with the D flag. This flag alerts data users that any discrepancies between the reported concentrations may be due to dilution of the sample or extract.
- NOTE 1: The D flag is not applied to compounds which are not detected in the sample analysis i.e. compounds reported with the CRQL (or Reporting Limit) and the U flag.
- NOTE 2: Separate Form Is are used for reporting the original analysis (Client Sample No. XXXXX) and the more diluted sample analysis (Client Sample No. XXXXXDL) i.e. the results from both analyses are not combined on a single Form I.
- A: This flag indicates that a TIC is a suspected aldol-condensation product.
- S: In the SOM01.1 SOW, this flag is used to indicate an estimated value for Aroclor target compounds where a valid 5-point initial calibration was not performed prior to the analytes detection in a sample. If an "S" flag is used for a specific Aroclor, then a reanalysis of the sample is required after a valid 5-point calibration is performed for the detected Aroclor.
- X/Y/Z : Other specific flags may be required to properly define the results. If used, the flags will be fully described in the SDG Narrative. The laboratory-defined flags are limited to X, Y and Z.

Revision 9 (12-6-2005)

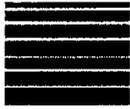

## B. Chains-of-Custody

The laboratory shall include a copy of the Chain-of-Custody (CoC) documentation for all of the samples in the SDG. The CoC documents shall be arranged in increasing Client Sample ID number order, considering both letters and numbers.

## 2. Sample Data

Sample data shall be arranged in packets with the Organic Analysis Data Sheet (Form I), followed by the raw data for samples. These sample packets shall be placed in increasing Client Sample ID number order, considering both letters and numbers.

a. Target Analyte Results (Form I)

Tabulated results (identification and quantitation) shall be included.

b. Copies of Chromatograms

Positively identified compounds shall be labeled with the names of compounds, either directly out from the peak on the chromatogram, or on a printout of retention times on the data system printout if retention times are printed over the peak on the chromatogram. Include for each sample or sample extract, including dilutions and reanalyses. The chromatogram shall contain the following header information: Client Sample ID number, volume injected ( $\mu\text{L}$ ), date and time of injection, GC column ID, and GC instrument ID.

c. Copies of Chromatograms from the Second Column  
(if necessary)

d. Data System Printout

A printout of retention time and corresponding peak height or peak area shall accompany each chromatogram. Where edits have been made, initialing, dating and integration time range are required.

At least 3 peaks are required for identification of multicomponent analytes.

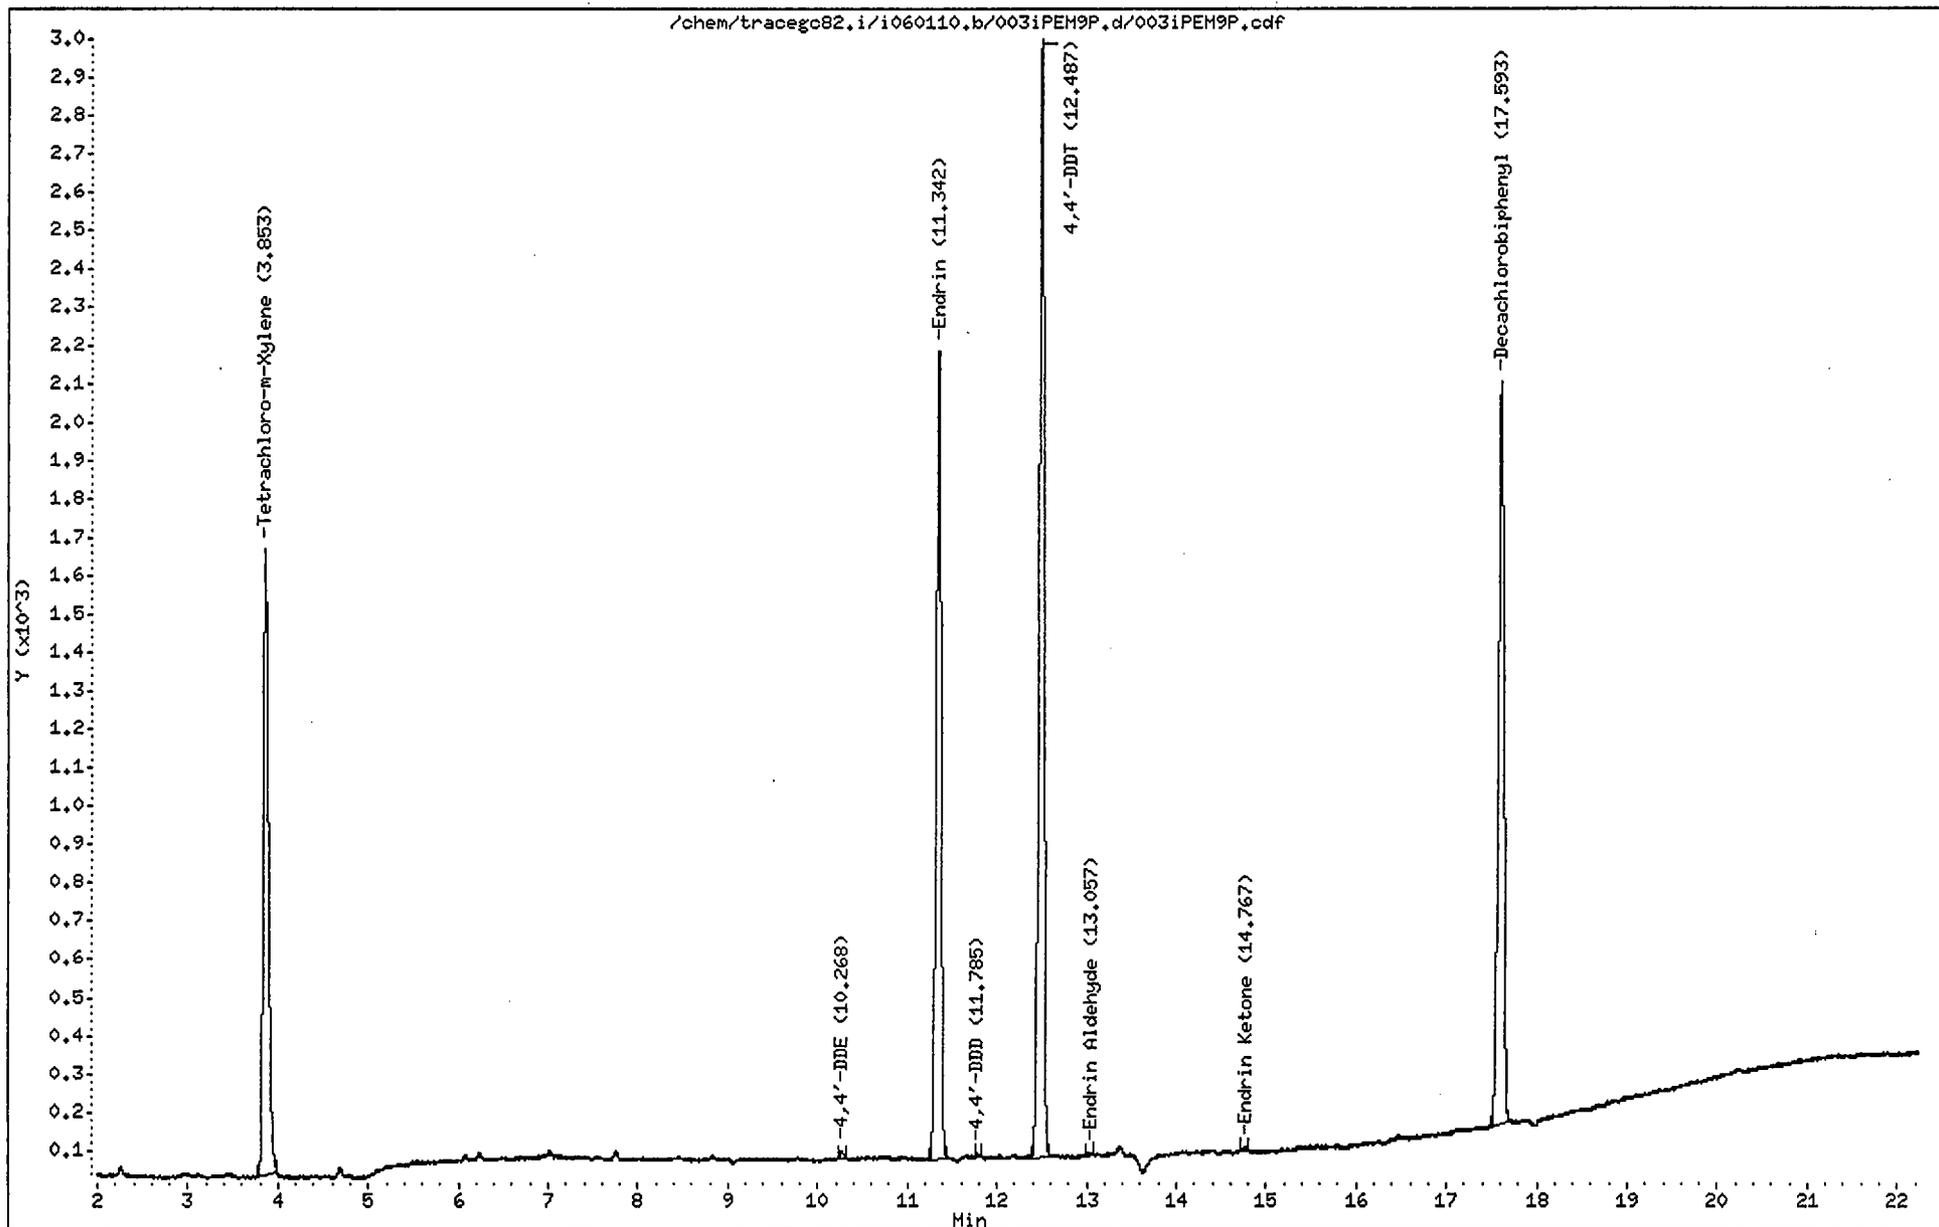

## f. Chromatograms and Data System Printouts

For all methods, standards packages shall include the following:

- Performance evaluation mixtures (8081 only)
- Initial Calibration Standards
- Second Source Initial Calibration Verifications  
(if required by client)
- Continuing Calibration Verification Standards
- The quantitation report must include the Client Sample ID number.
- The chromatograms shall include the following:  
Client Sample ID number for the standard, labeled standard peaks, volume injected, for each standard, date and time of injection GC column identifier, and GC instrument identifier.

## I. SAMPLE DATA SUMMARY PACKAGE

GC by SW-846

The sample data summary package shall contain data for all samples in one Sample Delivery Group (SDG) of the Case, as follows:

- A. SDG Narrative
- B. Tabulated target compound results (Form I)
- C. Surrogate spike analysis results (Form II)  
By matrix (Water or Soil), and  
by concentration (Low, or Medium)
- D. Spike results MS / MSD / LCS (Form III)
- E. Blank data (Form IV)  
Tabulated blank results (Form I)

LAB CODE : COMPU

METHOD: 8151A

SDG # : 8925

# A. SDG Narrative

# CompuChem

a division of Liberty Analytical Corporation

501 Madison Avenue

Cary, N.C. 27513

Tel: 919/379-4100 Fax: 919/379-4050

## SDG NARRATIVE

SDG # 8925

PROTOCOL: SW-846

### SAMPLE IDENTIFICATIONS:

WAR-IDW-4

The one water sample listed above was received intact, properly refrigerated, with proper documentation, in sealed shipping containers, on January 19, 2006. The sample was scheduled for the requested analyses of the herbicide fraction. SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction and Method 8151A were used to prepare and analyze these samples, with the exceptions and/or additions requested by the client. This portion of the SDG narrative deals with the herbicide fraction only.

### Herbicide-TCLP

Extraction and analysis holding time requirements were met for this sample.

There were no herbicide project analytes confirmed by dual column analysis above the Quantitation Limit (QL) in this sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

The surrogate met recovery and retention time criteria in the analyses of this sample.

The associated method blank met all quality control criteria.

There is no associated duplicate matrix spikes for this SDG.

The associated Laboratory Control Sample (LCS) prepared and analyzed along with this sample met all accuracy criteria.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

**Elsie S. Byrd**  
Senior Scientist I  
January 27, 2006

## **CompuChem's Pagination Convention**

As required by the EPA CLP Statement of Work (SOW) documents, data to be delivered must be paginated (by machine or hand). In the event that the initial numbering is incorrect (a page numbered twice or a page skipped, for example), it is CompuChem's policy to add an alphabetic suffix to a page number when necessary (e.g., 100A, 100B, etc.).

# CompuChem

a division of Liberty Analytical Corporation

## Notification Regarding Manual Editing/Integration Flags

In some instances, manual adjustments to the software output are necessary to provide accurate data. These manual integrations are performed by the data reviewers, GC/MS operators, or GC chemists. An Extracted Ion Current Profile (EICP) or a GC chromatographic peak has been provided for the manual integration performed on each compound to demonstrate the accuracy of that process. The manual integrations are flagged on the quantitation report in the far right column beyond the FINAL concentration for GC/MS analysis, and in the "Flags" column for GC analysis. The manual editing/integration flags are:

- M** - Denotes that a manual integration has been performed for this compound. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- H** - Denotes that the data reviewer, GC/MS operator, or GC Chemist has chosen an alternate peak within the retention time window from that chosen by the software for that compound. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- MH** - Denotes that an alternate peak has been chosen within the retention time window from that chosen by the software for that compound and also a manual integration of the chosen peak has been performed. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- L** - Denotes that a data reviewer or GC/MS operator has selected an alternate library search. This is typically done when an additional tentatively identified compound (TIC) has been added to the number of peaks searched. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- ML** - Denotes that an alternate library search has been selected and a manual integration has also been performed. This is typically done when an additional TIC has been added and the TIC peak also required a manual integration.

The EPA CLP SOW documents require additional explanations for manual editing/integration. In the accompanying raw data packages, additional codes have been applied to the "M" flag and carry the following meanings;

- M1** - The compound was not found by the automatic integration routine.
- M2** - The compound was incorrectly integrated by the automatic integration routine.
- M3** - The co-eluting compounds were incorrectly integrated by the automatic integration routine.

These codes will appear in the GC/MS and GC raw data.

## DATA REPORTING QUALIFIERS

On the Form I, under the column labeled “Q” for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. Up to five qualifiers may be reported on Form I for each compound. The qualifiers used are:

U : This flag indicates the compound was analyzed for but not detected. The Contract Required Quantitation Limit (CRQL), or reporting limit, will be adjusted to reflect any dilution and, for soils, the percent moisture.

J : This flag indicates an estimated value. The flag is used as detailed below:

1. When estimating a concentration for tentatively identified compounds (TICs) where a response factor of 1.0 is assumed for the TIC analyte,
2. When the mass spectral and retention time data indicate the presence of a compound that meets the volatile and semivolatile GC/MS identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero, and
3. When the retention time data indicate the presence of a compound that meets the pesticide/Aroclor or other GC or HPLC identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero. For example, if the CRQL (or Reporting Limit) is 10 µg/L, but a concentration of 3 µg/L is calculated, it is reported as 3J.

N : This flag indicates presumptive evidence of a compound. This flag is only used for TICs, where the identification is based on a mass spectral library search. For generic characterization of a TIC such as ‘chlorinated hydrocarbon’, the N flag is not used.

P : In the EPA’s Contract Laboratory Program (CLP), this flag is used for a pesticide/Aroclor target analyte, when there is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form I and flagged with a P. For SW-846 GC and HPLC analyses, when the Relative Percent Difference (RPD) is greater than 40% and there is no evidence of chromatographic anomalies or interferences, then the higher of the two values is reported and flagged with a P. When the RPD is equal to or less than 40%, our policy is to also report the higher of the two values, although the choice could be a project specific issue. For certain HPLC analyses, if one of the HPLC columns displays co-elution of target analytes, all results are reported from a primary column displaying no co-elution. Results are still flagged with a P if the RPD between columns is greater than 40%.

## DATA REPORTING QUALIFIERS (continued)

- C : This flag applies to GC or HPLC results where the identification has been confirmed by GC/MS. If GC/MS confirmation was attempted but was unsuccessful, this flag is not applied; a laboratory-defined flag is used instead (see the X/Y/Z qualifier.)
- B : This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates probable blank contamination and warns the data user to take appropriate action. This flag is used for a TIC as well as for a positively identified target compound. The combination of flags BU or UB is not an allowable policy. Blank contaminants are flagged B only when they are detected in the sample.
- E : This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis. If one or more compounds have a response greater than the upper level of the calibration range, the sample or extract will be diluted and reanalyzed. All such compounds with a response greater than the upper level of the calibration range will have the concentration flagged with an E on Form I for the original analysis.
- D : If a sample or extract is reanalyzed at a higher dilution factor, for example when the concentration of an analyte exceeds the upper calibration range, the DL suffix is appended to the sample number on Form I for the more diluted sample, and **all** reported concentrations on that Form I are flagged with the D flag. This flag alerts data users that any discrepancies between the reported concentrations may be due to dilution of the sample or extract.
- NOTE 1: The D flag is not applied to compounds which are not detected in the sample analysis i.e. compounds reported with the CRQL (or Reporting Limit) and the U flag.
- NOTE 2: Separate Form Is are used for reporting the original analysis (Client Sample No. XXXXX) and the more diluted sample analysis (Client Sample No. XXXXXDL) i.e. the results from both analyses are not combined on a single Form I.
- A: This flag indicates that a TIC is a suspected aldol-condensation product.
- S: In the SOM01.1 SOW, this flag is used to indicate an estimated value for Aroclor target compounds where a valid 5-point initial calibration was not performed prior to the analytes detection in a sample. If an "S" flag is used for a specific Aroclor, then a reanalysis of the sample is required after a valid 5-point calibration is performed for the detected Aroclor.
- X/Y/Z : Other specific flags may be required to properly define the results. If used, the flags will be fully described in the SDG Narrative. The laboratory-defined flags are limited to X, Y and Z.

## I. SAMPLE DATA PACKAGE

GC by SW-846

The sample data package shall include data for all analyses of all samples in one Sample Delivery Group (SDG), including field samples, dilutions, reanalyses, blanks, matrix spikes, matrix spike duplicates, and laboratory control samples. The sample data package consists of the following:

- A. SDG Narrative
- B. Chain-of-Custody Documentation
- C. SDG Data

LAB CODE : COMPU

METHOD: 8151A

CASE # : \_\_\_\_\_

SDG # : 8925

# A. SDG Narrative

# CompuChem

a division of Liberty Analytical Corporation

501 Madison Avenue

Cary, N.C. 27513

Tel: 919/379-4100 Fax: 919/379-4050

## SDG NARRATIVE

SDG # 8925

PROTOCOL: SW-846

### SAMPLE IDENTIFICATIONS:

WAR-IDW-4

The one water sample listed above was received intact, properly refrigerated, with proper documentation, in sealed shipping containers, on January 19, 2006. The sample was scheduled for the requested analyses of the herbicide fraction. SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction and Method 8151A were used to prepare and analyze these samples, with the exceptions and/or additions requested by the client. This portion of the SDG narrative deals with the herbicide fraction only.

### Herbicide-TCLP

Extraction and analysis holding time requirements were met for this sample.

There were no herbicide project analytes confirmed by dual column analysis above the Quantitation Limit (QL) in this sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

The surrogate met recovery and retention time criteria in the analyses of this sample.

The associated method blank met all quality control criteria.

There is no associated duplicate matrix spikes for this SDG.

The associated Laboratory Control Sample (LCS) prepared and analyzed along with this sample met all accuracy criteria.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

## **CompuChem's Pagination Convention**

As required by the EPA CLP Statement of Work (SOW) documents, data to be delivered must be paginated (by machine or hand). In the event that the initial numbering is incorrect (a page numbered twice or a page skipped, for example), it is CompuChem's policy to add an alphabetic suffix to a page number when necessary (e.g., 100A, 100B, etc.).

# CompuChem

a division of Liberty Analytical Corporation

## Notification Regarding Manual Editing/Integration Flags

In some instances, manual adjustments to the software output are necessary to provide accurate data. These manual integrations are performed by the data reviewers, GC/MS operators, or GC chemists. An Extracted Ion Current Profile (EICP) or a GC chromatographic peak has been provided for the manual integration performed on each compound to demonstrate the accuracy of that process. The manual integrations are flagged on the quantitation report in the far right column beyond the FINAL concentration for GC/MS analysis, and in the "Flags" column for GC analysis. The manual editing/integration flags are:

- M** - Denotes that a manual integration has been performed for this compound. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- H** - Denotes that the data reviewer, GC/MS operator, or GC Chemist has chosen an alternate peak within the retention time window from that chosen by the software for that compound. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- MH** - Denotes that an alternate peak has been chosen within the retention time window from that chosen by the software for that compound and also a manual integration of the chosen peak has been performed. The manual integration was performed in order to provide the most accurate area count possible for the peak.
- L** - Denotes that a data reviewer or GC/MS operator has selected an alternate library search. This is typically done when an additional tentatively identified compound (TIC) has been added to the number of peaks searched. No manual integration is performed in choosing an alternate peak. The software still performs the integration.
- ML** - Denotes that an alternate library search has been selected and a manual integration has also been performed. This is typically done when an additional TIC has been added and the TIC peak also required a manual integration.

The EPA CLP SOW documents require additional explanations for manual editing/integration. In the accompanying raw data packages, additional codes have been applied to the "M" flag and carry the following meanings;

- M1** - The compound was not found by the automatic integration routine.
- M2** - The compound was incorrectly integrated by the automatic integration routine.
- M3** - The co-eluting compounds were incorrectly integrated by the automatic integration routine.

These codes will appear in the GC/MS and GC raw data.

## DATA REPORTING QUALIFIERS

On the Form I, under the column labeled “Q” for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. Up to five qualifiers may be reported on Form I for each compound. The qualifiers used are:

- U : This flag indicates the compound was analyzed for but not detected. The Contract Required Quantitation Limit (CRQL), or reporting limit, will be adjusted to reflect any dilution and, for soils, the percent moisture.
- J : This flag indicates an estimated value. The flag is used as detailed below:
1. When estimating a concentration for tentatively identified compounds (TICs) where a response factor of 1.0 is assumed for the TIC analyte,
  2. When the mass spectral and retention time data indicate the presence of a compound that meets the volatile and semivolatile GC/MS identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero, and
  3. When the retention time data indicate the presence of a compound that meets the pesticide/Aroclor or other GC or HPLC identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero. For example, if the CRQL (or Reporting Limit) is 10 µg/L, but a concentration of 3 µg/L is calculated, it is reported as 3J.
- N : This flag indicates presumptive evidence of a compound. This flag is only used for TICs, where the identification is based on a mass spectral library search. For generic characterization of a TIC such as ‘chlorinated hydrocarbon’, the N flag is not used.
- P : In the EPA’s Contract Laboratory Program (CLP), this flag is used for a pesticide/Aroclor target analyte, when there is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form I and flagged with a P. For SW-846 GC and HPLC analyses, when the Relative Percent Difference (RPD) is greater than 40% and there is no evidence of chromatographic anomalies or interferences, then the higher of the two values is reported and flagged with a P. When the RPD is equal to or less than 40%, our policy is to also report the higher of the two values, although the choice could be a project specific issue. For certain HPLC analyses, if one of the HPLC columns displays co-elution of target analytes, all results are reported from a primary column displaying no co-elution. Results are still flagged with a P if the RPD between columns is greater than 40%.

## DATA REPORTING QUALIFIERS (continued)

- C : This flag applies to GC or HPLC results where the identification has been confirmed by GC/MS. If GC/MS confirmation was attempted but was unsuccessful, this flag is not applied; a laboratory-defined flag is used instead (see the X/Y/Z qualifier.)
- B : This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates probable blank contamination and warns the data user to take appropriate action. This flag is used for a TIC as well as for a positively identified target compound. The combination of flags BU or UB is not an allowable policy. Blank contaminants are flagged B only when they are detected in the sample.
- E : This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis. If one or more compounds have a response greater than the upper level of the calibration range, the sample or extract will be diluted and reanalyzed. All such compounds with a response greater than the upper level of the calibration range will have the concentration flagged with an E on Form I for the original analysis.
- D : If a sample or extract is reanalyzed at a higher dilution factor, for example when the concentration of an analyte exceeds the upper calibration range, the DL suffix is appended to the sample number on Form I for the more diluted sample, and **all** reported concentrations on that Form I are flagged with the D flag. This flag alerts data users that any discrepancies between the reported concentrations may be due to dilution of the sample or extract.
- NOTE 1: The D flag is not applied to compounds which are not detected in the sample analysis i.e. compounds reported with the CRQL (or Reporting Limit) and the U flag.
- NOTE 2: Separate Form Is are used for reporting the original analysis (Client Sample No. XXXXX) and the more diluted sample analysis (Client Sample No. XXXXXDL) i.e. the results from both analyses are not combined on a single Form I.
- A: This flag indicates that a TIC is a suspected aldol-condensation product.
- S: In the SOM01.1 SOW, this flag is used to indicate an estimated value for Aroclor target compounds where a valid 5-point initial calibration was not performed prior to the analytes detection in a sample. If an "S" flag is used for a specific Aroclor, then a reanalysis of the sample is required after a valid 5-point calibration is performed for the detected Aroclor.
- X/Y/Z : Other specific flags may be required to properly define the results. If used, the flags will be fully described in the SDG Narrative. The laboratory-defined flags are limited to X, Y and Z.

Revision 9 (12-6-2005)

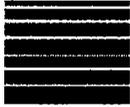

## B. Chains-of-Custody

The laboratory shall include a copy of the Chain-of-Custody (CoC) documentation for all of the samples in the SDG. The CoC documents shall be arranged in increasing Client Sample ID number order, considering both letters and numbers.

## 2. Sample Data

Sample data shall be arranged in packets with the Organic Analysis Data Sheet (Form I), followed by the raw data for samples. These sample packets shall be placed in increasing Client Sample ID number order, considering both letters and numbers.

a. Target Analyte Results (Form I)

Tabulated results (identification and quantitation) shall be included.

b. Copies of Chromatograms

Positively identified compounds shall be labeled with the names of compounds, either directly out from the peak on the chromatogram, or on a printout of retention times on the data system printout if retention times are printed over the peak on the chromatogram. Include for each sample or sample extract, including dilutions and reanalyses. The chromatogram shall contain the following header information: Client Sample ID number, volume injected ( $\mu\text{L}$ ), date and time of injection, GC column ID, and GC instrument ID.

c. Copies of Chromatograms from the Second Column  
(if necessary)

d. Data System Printout

A printout of retention time and corresponding peak height or peak area shall accompany each chromatogram. Where edits have been made, initialing, dating and integration time range are required.

e. Identification Summary for  
Multicomponent Analytes  
(Form X) - if applicable

For all samples with positively identified multicomponent analytes, in order by increasing Client Sample ID number.

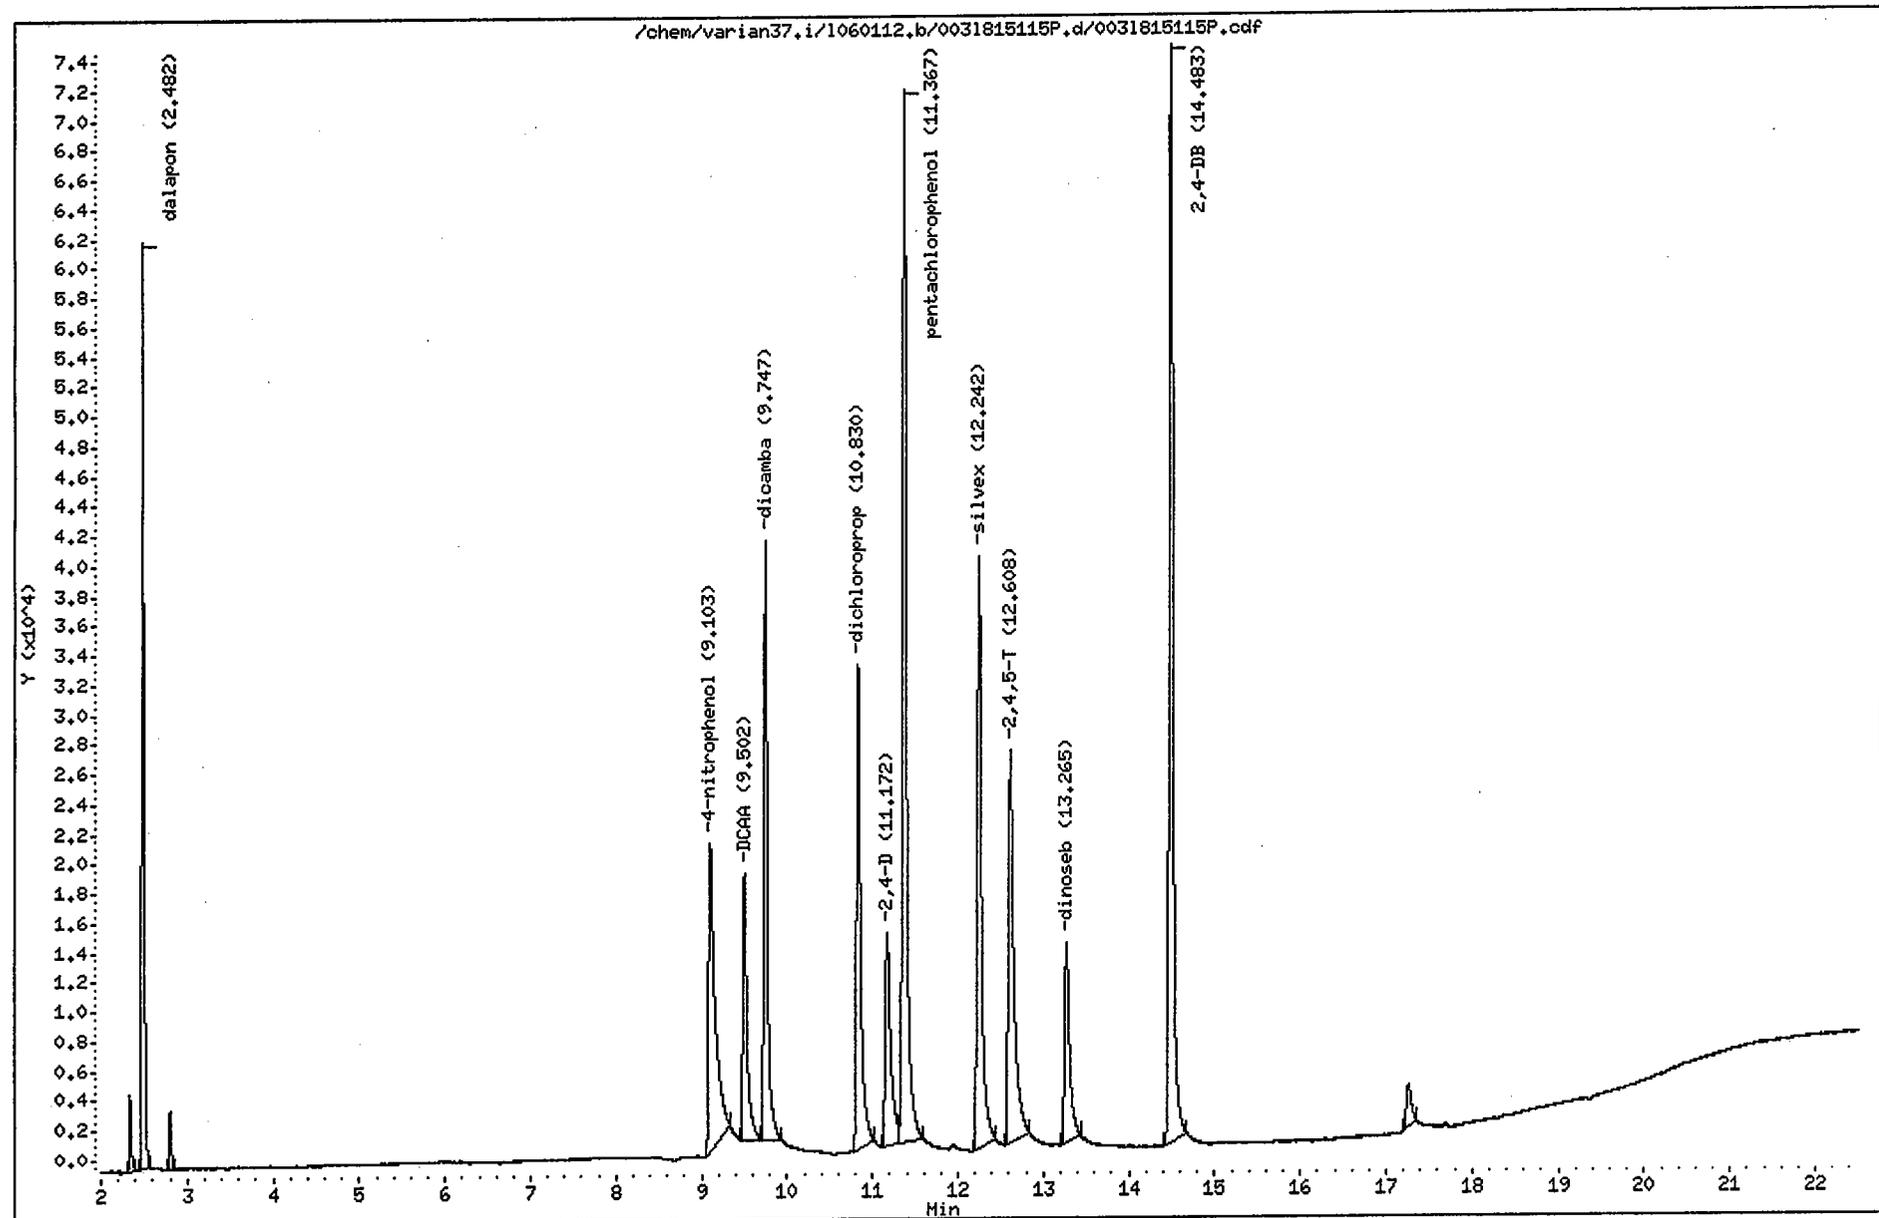

## f. Chromatograms and Data System Printouts

For all methods, standards packages shall include the following:

- Performance evaluation mixtures (8081 only)
- Initial Calibration Standards
- Second Source Initial Calibration Verifications  
(if required by client)
- Continuing Calibration Verification Standards
- The quantitation report must include the Client Sample ID number.
- The chromatograms shall include the following:  
Client Sample ID number for the standard, labeled standard peaks, volume injected, for each standard, date and time of injection GC column identifier, and GC instrument identifier.

SUPERVISOR APPROVAL [Signature]

DATE: 1/12/06

The presence of the Chemist's/Analyst's employee ID number, or signature, on this run log attests that strict compliance with the method's SOP has occurred. Any SOP deviations require documentation by the responsible chemist/analyst together with the chemist's/analyst's initials and the initials of the lab supervisor and a QA department representative, signifying approval of the deviation.

## 4. Raw QC Data

a. Blank Data

b. Laboratory Control Sample Data

c. Matrix Spike Data

d. Matrix Spike Duplicate Data

a. Blank Data

Arranged by type of blank (method, then instrument), and shall be in chronological order, by instrument.

- Tabulated Results (Form I)

- Chromatograms and data system printout(s)  
by instrument used for analysis.

## DATA REPORTING QUALIFIERS

On the Form I, under the column labeled "Q" for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. Up to five qualifiers may be reported on Form I for each compound. The qualifiers used are:

- U: This flag indicates the compound was analyzed for but not detected. The Contract Required Quantitation Limit (CRQL), or reporting limit, will be adjusted to reflect any dilution and, for soils, the percent moisture.
- J: This flag indicates an estimated value. The flag is used as detailed below:
1. When estimating a concentration for tentatively identified compounds (TICs) where a response factor of 1.0 is assumed for the TIC analyte,
  2. When the mass spectral and retention time data indicate the presence of a compound that meets the volatile and semivolatile GC/MS identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero, and
  3. When the retention time data indicate the presence of a compound that meets the pesticide/Aroclor or other GC or HPLC identification criteria, and the result is less than the CRQL (or Reporting Limit) but greater than zero. For example, if the CRQL (or Reporting Limit) is 10 µg/L, but a concentration of 3 µg/L is calculated, it is reported as 3J.
- N: This flag indicates presumptive evidence of a compound. This flag is only used for TICs, where the identification is based on a mass spectral library search. For generic characterization of a TIC such as 'chlorinated hydrocarbon', the N flag is not used.
- P: In the EPA's Contract Laboratory Program (CLP), this flag is used for a pesticide/Aroclor target analyte, when there is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form I and flagged with a P. For SW-846 GC and HPLC analyses, when the Relative Percent Difference (RPD) is greater than 40% and there is no evidence of chromatographic anomalies or interferences, then the higher of the two values is reported and flagged with a P. When the RPD is equal to or less than 40%, our policy is to also report the higher of the two values, although the choice could be a project specific issue. For certain HPLC analyses, if one of the HPLC columns displays co-elution of target analytes, all results are reported from a primary column displaying no co-elution. Results are still flagged with a P if the RPD between columns is greater than 40%.

## AMENDED SDG NARRATIVE

SDG # 8925

PROTOCOL: SW-846

### SAMPLE IDENTIFICATIONS:

WAR-IDW-4

The one soil sample listed above was received intact, properly refrigerated, with proper documentation, in sealed shipping containers, on January 19, 2006. The sample was scheduled for the requested analyses of the herbicide fraction. SW-846, 3rd Edition, Update 3, the Toxicity Characteristic Leaching Procedure (TCLP) (Method 1311), Separatory Funnel extraction and Method 8151A were used to prepare and analyze these samples, with the exceptions and/or additions requested by the client. This portion of the SDG narrative deals with the herbicide fraction only.

### Herbicide-TCLP

Extraction and analysis holding time requirements were met for this sample.

There were no herbicide project analytes confirmed by dual column analysis above the Quantitation Limit (QL) in this sample.

Manual quantitations were performed on one or more of the process files associated with this SDG. The reasons have been coded with explanations provided in the notice included in the narrative section of the SDG.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

The surrogate met recovery and retention time criteria in the analyses of this sample.

The associated method blank met all quality control criteria.

There is no associated duplicate matrix spikes for this SDG.

The associated Laboratory Control Sample (LCS) prepared and analyzed along with this sample met all accuracy criteria.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on diskette has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

## **INTRODUCTION**

As part of a Resource Conservation and Recovery Act (RCRA) facility investigation at Vieques, ecological risk assessments were conducted at 10 solid waste management unit (SWMU) sites. A habitat characterization was conducted at each SWMU in order to determine the presence of plant and animal species and to determine whether preferred habitat was present for any federally endangered or threatened plant and animal species.

## **SITE LOCATION**

The Naval Ammunition Support Department (NASD) Vieques (approximately 8,265 acres) is operated by the Weapons Department of Naval Station Roosevelt Roads and is located on the western end of Vieques (Figure 1). This report covers 10 SWMU sites located at NASD Vieques (Figure 2). Four of the sites were separated geographically and were located in different plant communities. These sites, SWMU 4, SWMU 5, SWMU 6, and SWMU 7, are presented individually in this report. SWMU 4, an inactive Waste Explosive Open Burn/Detonation Range, is approximately 3 acres in size and is located on the western side of NASD. SWMU 5, IRFNA/MAF-4 Disposal Site, is located adjacent to magazine Building 422 and consists of a small ditch and ravine. SWMU 6, Mangrove Disposal Site, is located north of Laguna Kiani. SWMU 7, Quebrada Disposal Site, is approximately 5.0 acres in size and is located within a quebrada (drainage channel or ravine) located about 0.5 miles west of the NASD Public Works area.

Six of the SWMU sites (SWMU 10, SWMU 14, SWMU 15, AOC C, AOC E-UST, and AOC F-UIC) were located near each other and were potentially contaminated with similar debris; therefore, they were analyzed as one unit and are presented in the same section of this report. These six sites were all located in the NASD Public Works area.

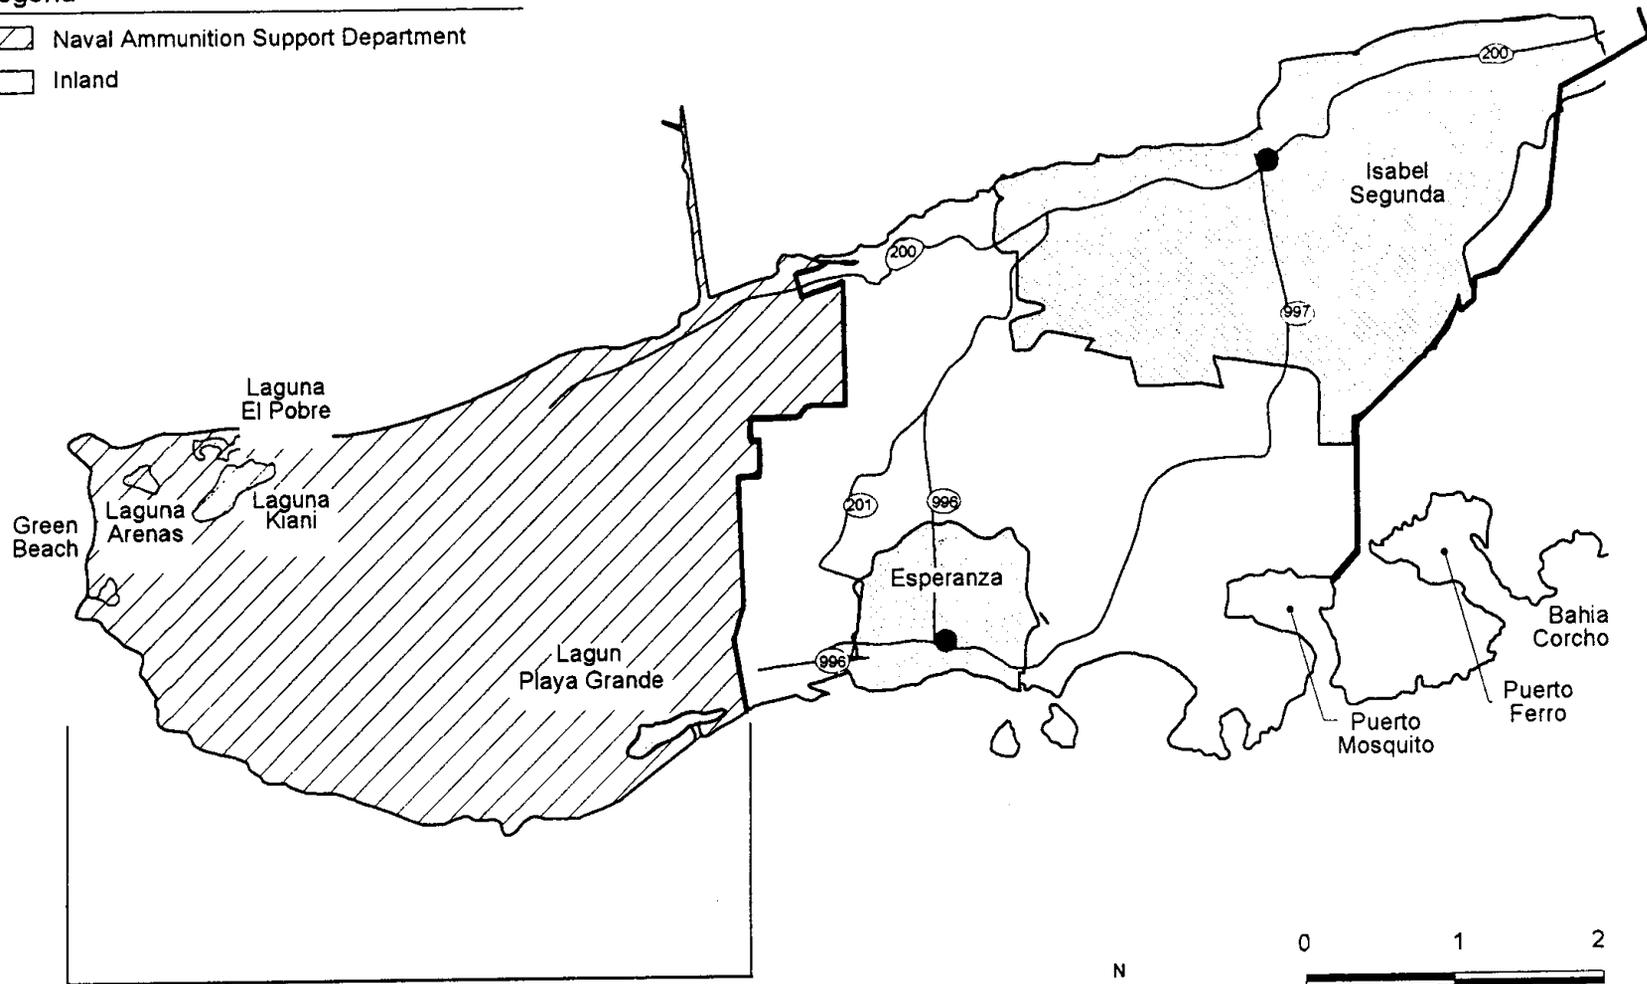

## **METHODS**

Vegetation communities were initially characterized into broad community types based on color signatures from true-color aerial photographs (November 4, 1999: scale, RF=1:6000). Different vegetation communities were delineated based on species composition and structure by viewing magnified stereo pairs of aerial photography. The community types were marked on overlying acetate for use in the field (May 15-19, 2000). Personnel walked transects through each of these SWMU to:

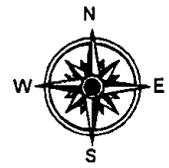

1. verify that the community types were identified and delineated correctly from the true color aerial photography;
2. identify the species composition of the dominant vegetation;
3. identify the wildlife species present in the SWMU sites;

4. identify habitat that may potentially support federally designated threatened and endangered species within and contiguous to each SWMU; and
5. identify any obvious impacts potentially related to previous waste management activities.

The vegetation communities were verified by walking surveys through each community type previously identified with aerial photography. Most species were identified in the field; however, some specimens were collected for identification using reference books (Liogier 1985, 1988, 1994, 1995, 1997; Little and Wadsworth 1964; Little et al. 1964; and Acevedo-Rodriguez 1996) and herbarium specimens. Relative dominance and species structure were characterized from the visual observations within each community type and SWMU.

Wildlife species residing within or utilizing each SWMU habitat, and wildlife habitat were identified during the vegetation field surveys. A wildlife biologist characterized the habitats and determined the types of wildlife that could potentially inhabit the plant communities or SWMU sites. Any wildlife species that were observed were identified in the field with the use of 8 x 40 binoculars and reference guides (Raffaele 1989 and Raffaele et al 1998).

Fourteen federally listed species are known to occur or have the potential to occur on NASD Vieques (Table 1). Prior to conducting the fieldwork, a literature search was conducted for each federally protected species. During the May 15-19 surveys, biologists walked transects through each site and identified any federally protected species seen and noted the presence or absence of preferred habitat for the species.

**Table 1**

<b>Federally Listed Species Occurring or Potentially Occurring at NASD Vieques</b>	
<b>Scientific Name (Common Name)</b>	<b>Federal Status</b>
<b>Plants</b>	
<i>Chaemacrista glandulosa</i> var. <i>mirabilis</i> (Herb)	Endangered
<i>Stahliia monosperma</i> (Cobana negra)	Threatened
<i>Calyptanthus thomasiana</i> (Tree)	Endangered
<i>Eugenia woodburyana</i> (Evergreen tree)	Endangered
<b>Reptiles and Amphibians</b>	
<i>Chelonia mydas</i> (Green sea turtle)	Threatened
<i>Dermochelys coriacea</i> (Leatherback sea turtle)	Endangered
<i>Eretmochelys imbricata</i> (Hawksbill sea turtle)	Endangered
<b>Birds</b>	
<i>Falco peregrinus tundrius</i> (Arctic peregrine)	Threatened
<i>Pelecanus occidentalis occidentalis</i> (Brown pelican)	Endangered
<i>Sterna dougalli dougalli</i> (Roseate tern)	Endangered
<b>Mammals</b>	
<i>Physeter macrocephalus</i> (Sperm whale)	Endangered
<i>Balaenoptera physalus</i> (Fin whale)	Endangered
<i>Megaptera novaeangliae</i> (Humpback whale)	Endangered
<i>Trichechus manatus</i> (West Indian manatee)	Endangered

Source: NASD 1996

Past management activities at the SWMU sites may have potentially impacted the current vegetation communities. During the field surveys the biologists made visual observations to characterize the health of the plants in the SWMU sites. Indications of altered plant communities include: chlorotic leaves, epinasty (deformities of leaves and stems), patches of altered plant growth, absence of plants (bare ground), and changes in species composition. To determine if the SWMU sites contained altered plant communities, a nearby representative site was selected as a control. When altered plant communities were identified, the biologists made an effort to determine and record the probable cause (i.e., chemical, soil compaction, natural causes, etc.).

In addition to identification of wildlife in the field, existing literature sources were used to identify any additional species that may have occurred on the SWMU sites but were not observed. Most of the wildlife occurring in the area is bird species and these are presented in Appendix A. Species information and field data was used to generate a simplified food web for the sites. A food web is an interlocking pattern of several to many food chains that is helpful in determining ecosystem processes including those that may occur when a contaminant is introduced to a system.

## RESULTS AND DISCUSSION

### SWMU 4

#### *Vegetation Community Description*

SWMU 4, an inactive Waste Explosive Open Burn/Detonation Range, is approximately 3 acres in size and is located on the western side of NASD. The area is located on a hill that is completely surrounded by dirt roads (Figure 3). A high density of thorny shrubs dominates species composition on the site. Many areas of the site had both a shrub and a herbaceous stratum. With the two strata combined, the canopy cover was approximately 75-95 percent. Dominant shrubs identified on the site included *Acacia farnenciana*, *Prosopis glandulosa*, *Pithecellobium dulce*, and *Zanthoxylum brevipes*. Another shrub that was present throughout the site and was dominant in some areas was *Leucaena leucocephala*. In certain areas there was an herbaceous stratum that was dominated by *Bothriochloa ischaemum*, *Commelina erecta*, *C. diffusa*, and *Lasiacis divaricata*. Vegetation photos are presented in Figures 4 and 5. The vegetation observed at SWMU 4 is presented in Table 2.

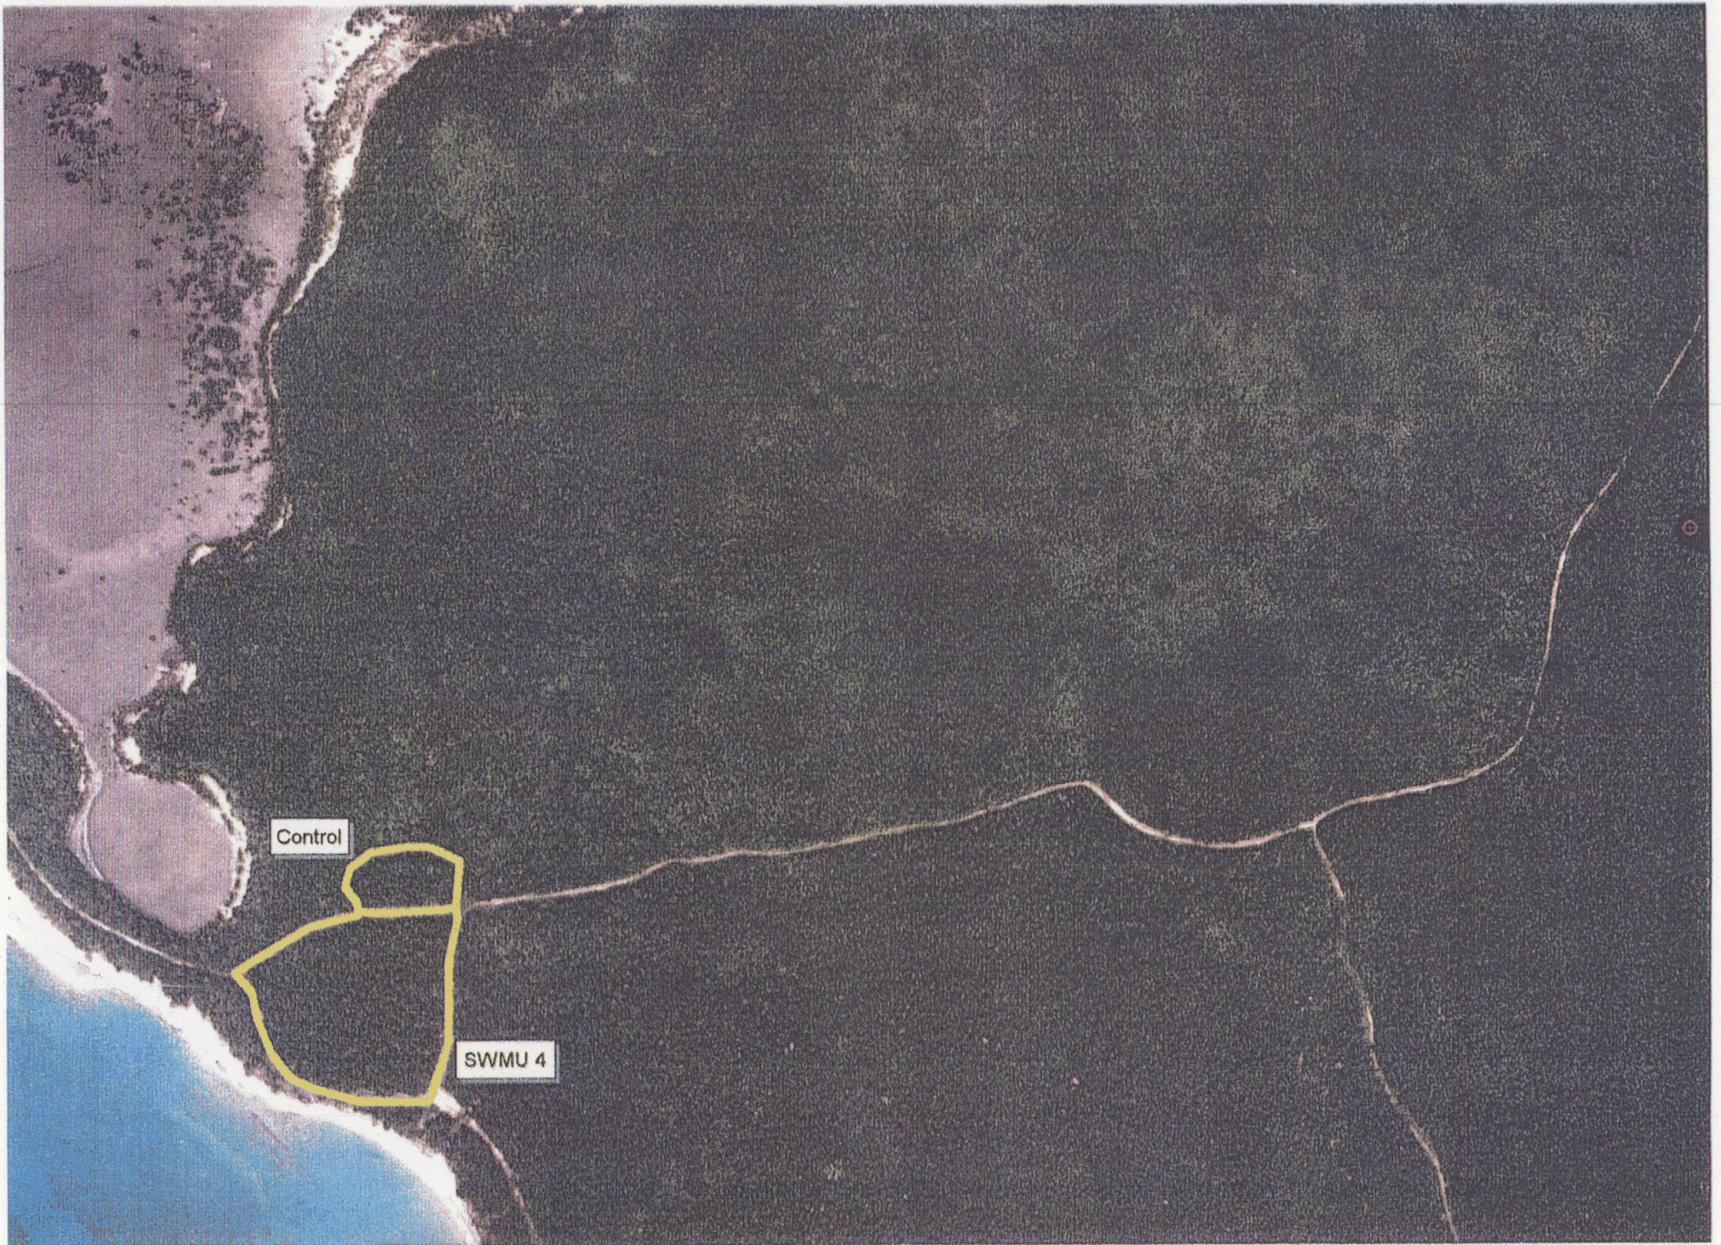

Figure 3. Location of SWMU 4 and control site at NASD Vieques Island, Puerto Rico.

V = vine

### Plant Community Health

Although some debris was found at SWMU 4, there was little evidence of past military activities. There were some indications from openings in the plant communities and from worn trails that horses (*Equus caballus*) occasionally graze throughout the site. No other plant stresses were observed in SWMU 4. The control site for SWMU 4 was located adjacent to the northern boundary of the SWMU 4 site. Canopy openings and trails made by horses were also observed in the control.

### Wildlife Description

During the short duration of wildlife surveys conducted on this site, numerous wildlife species were observed utilizing the habitat of this site. Although no individual horses were observed within the site, there was sufficient evidence to indicate that horses use this habitat. The bird species observed at this habitat type consisted of coastal forest and shore species due to the close proximity to ocean. Numerous lizards (*Anolis* species) were also identified. There was no evidence that the SWMU site had an impact on the wildlife diversity or its habitat. Wildlife that was observed at SWMU 4 is presented in Table 3.

**Table 3**  
**Wildlife Observed at SWMU 4**

English Name	Scientific Name	Local Name
<b>Mammals</b>		
Horse	<i>Equus caballus</i>	Horse, caballo
Mongoose	<i>Herpestes auropunctatus</i>	Not known
<b>Reptiles and Amphibians</b>

Yellow Warbler	<i>Dendroica petechia</i>	Canario de Mangle
Pearly-eyed Thrasher	<i>Margarops fuscatus</i>	Zorzal Pardo
Greater Antillean Grackle	<i>Quiscalus niger</i>	Mozambique (Chango)
Puerto Rican Lizard Cuckoo	<i>Saurothera vieilloti</i>	Pájaro Bobo Mayor
Loggerhead Kingbird	<i>Tyrannus caudifasciatus</i>	Clérigo
Gray Kingbird	<i>Tyrannus dominicensis</i>	Pitirre

### Protected Species

*Stahlia monosperma* (Cobana negra), a federally threatened tree, has been found between the boundary of black mangrove (*Avicennia germinans*) communities, salt flats and the upland communities at NASD Vieques. This species is also known to occur in coastal forests of southeastern Puerto Rico (Little and Wadsworth 1964). The preferred habitat for *Stahlia monosperma* was not present at this site.

Federally threatened and endangered sea turtles such as the Green (*Chelonia mydas*), Hawksbill (*Eretmochelys imbricata*), and Leatherback sea turtles (*Dermochelys coriacea*), and endangered marine mammals such as the West Indian manatee (*Trichechus manatus*), Sperm whale (*Physeter macrocephalus*), Fin whale (*Balaenoptera physalus*), and Humpback whale (*Megaptera novaeangliae*) would not occur at this site because they require marine habitats.

The Artic peregrine falcon (*Falco peregrinus tundrius*) has been observed nearby at NAVSTA Roosevelt Roads (U.S. Navy 1998b). This species utilizes open grassland areas for potential feeding areas. This type of habitat was not present at or near this site.

Federally endangered marine birds such as the Brown pelican (*Pelecanus occidentalis occidentalis*) and the Roseate tern (*Sterna dougalli dougalli*) would most likely not occur at this terrestrial site. During these surveys, Brown pelicans were observed flying over the adjacent marine habitat, but not at SWMU 4.

#### *Food Web*

The information in a food web is very important when considering the potential for contaminants existing in the ecosystem. Many contaminants are passed from one trophic level to the next. A contaminant at the soil surface goes through a different process than a contaminant that has leached into the soil. The surface contaminant may be ingested by a decomposer such as a hermit crab and then passed on to the secondary consumer (i.e., a carnivorous bird). Leached contaminants are picked up by the primary producers and are then passed upwards in the food chain.

Figure 6 presents a generalized food web for the forested and herbaceous community types found at all SWMU sites except SWMU 6. The abundance within each of the food groups is represented by the size of their polygon in the figure. Dominant species are listed in each of the food groups except for plants, which were provided previously in this section.

### **SWMU 5**

#### *Vegetation Community Description*

SWMU 5, IRFNA/MAF-4 Disposal Site, is located adjacent to magazine Building 422 and consists of a small ditch and ravine (Figure 7). There were two plant communities present at this site – the maintained grasslands of the small ditch and the non-maintained large ravine (quebrada). This ravine occurs as a long depression that was created during the construction of a road that leads to additional magazine buildings (243-249). The elevated road was blocking the natural water flow and was creating a hydrophytic plant community.

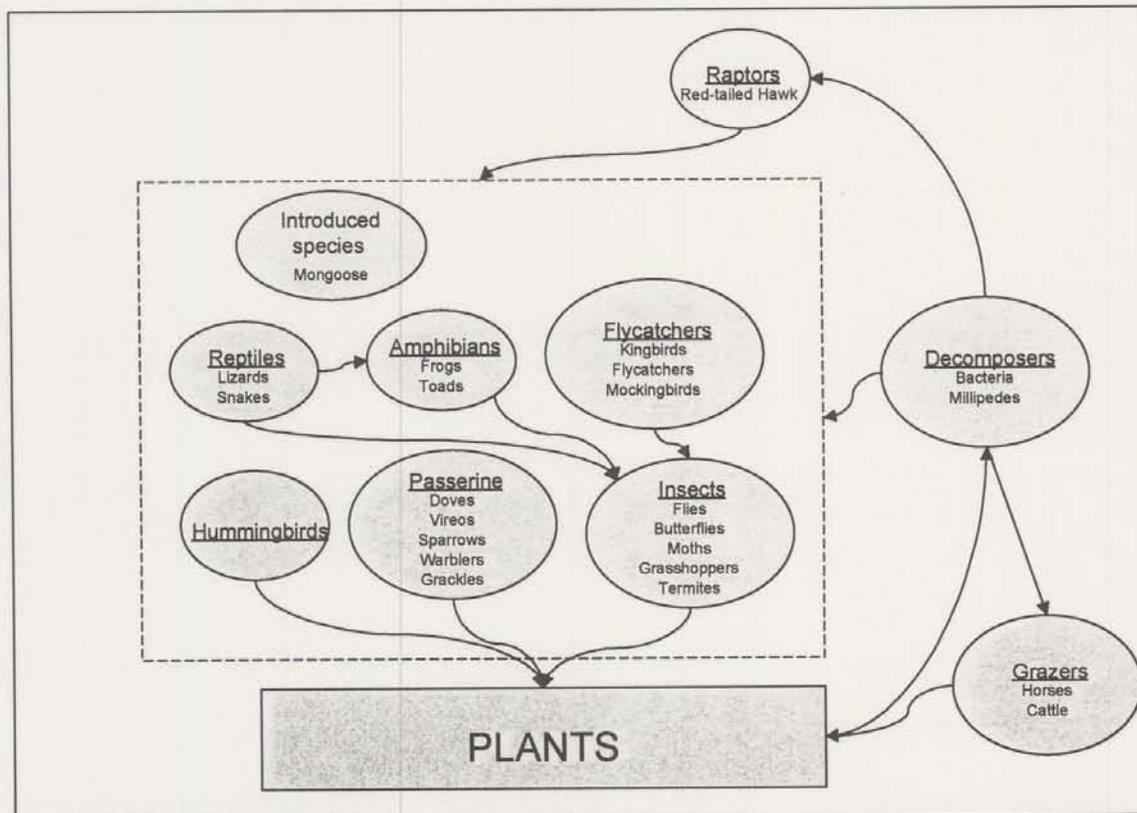

Figure 6. Generalized food web for the forested and herbaceous community types at NASD Vieques.

The non-maintained area consisting of a patchy canopy of various trees, shrubs, and herbaceous ground cover had 100 percent cover. *Eriochloa polystachya*, *Leonotis nepetifolia*, *Panicum maximum*, and *Commelina erecta* dominated the herbaceous canopy. Shrubs were mostly found along the hillside edges; these included *Randia aculeata*, *Erythroxylum brevipes*, *Acacia farnenciana*, and *Leucaena leucocephala*. There were a few trees (*Bursera simaruba* and *Tamarindus indica*) found throughout the site.

The small drainage ditch is located within the area where regular grounds maintenance occurs around Magazine Building 422. A regular disturbance by mowing has created a low-growing herbaceous community. Grasses dominated this drainage ditch and included *Bothriochloa ischaemum*, *Sporobolus indicus*, *Cynodon dactylon*, and *Scleria* sp. Vegetation photos are presented in Figures 8 and 9. The vegetation observed at SWMU 5 is presented in Table 4

Figure 7. Location of SWMU 5 and control site at NASD Vieques Island, Puerto Rico.

Figure 8. SWMU 5, maintained area.

V = vine

#### *Plant Community Health*

It was difficult to select a control for this community due to the effects of anthropomorphic disturbances (previous road construction) on the existing topography. The selected control was split into two areas so that an adequate comparison of the site could be accomplished. The non-maintained control area was adjacent to the southern border of the SWMU 5 site. The maintained control area was adjacent to the northern border of the maintained portion of SWMU 5. There were no differences identified in the vegetation communities with the exception of the drainage ditch that had some soil disturbance from recent soil removal during which some of the vegetation was trampled or cut.

Two dead animals were found near the site. One of the remains was the skeleton of a bovine species that died some time ago. The other animal was a horse that looked to have died more recently (less than five

days old). The cause of mortality of these animals is unknown, but they probably died due to natural causes and their presence was most likely coincidental.

#### *Wildlife Description*

During the short duration of wildlife surveys conducted on this site, numerous wildlife species were observed utilizing the habitat of this site. Although no horses were observed within the site, there was sufficient evidence to indicate that they frequent this habitat. The bird species observed at this habitat type consisted of coastal forest species (Table 5). Numerous lizards were also identified at this site. There was no evidence that the SWMU site had an impact on the wildlife or its habitat.

**Table 5

Gray Kingbird	<i>Tyrannus dominicensis</i>	Pitirre
Zenaida Dove	<i>Zenaida aurita</i>	Tórtola Cardosanterá

#### *Protected Species*

There were no federally protected species or preferred habitat observed at this site. Terrestrial forested plant community dominated the sites and is not preferred habitat for any of the species.

#### *Food Web*

Figure 6 presents a generalized food web for the forested community type found at this SWMU site.

### **SWMU 6**

#### *Vegetation Community Description*

SWMU 6, Mangrove Disposal Site, consists of black and red mangrove (*Rhizophora mangle*) communities located between Laguna Kiani and the Caribbean Sea (Figure 10). These communities were separated by position within the landscape. The red mangroves were located near open water where there is saturation/inundation of seawater while the black mangroves were located on higher land.

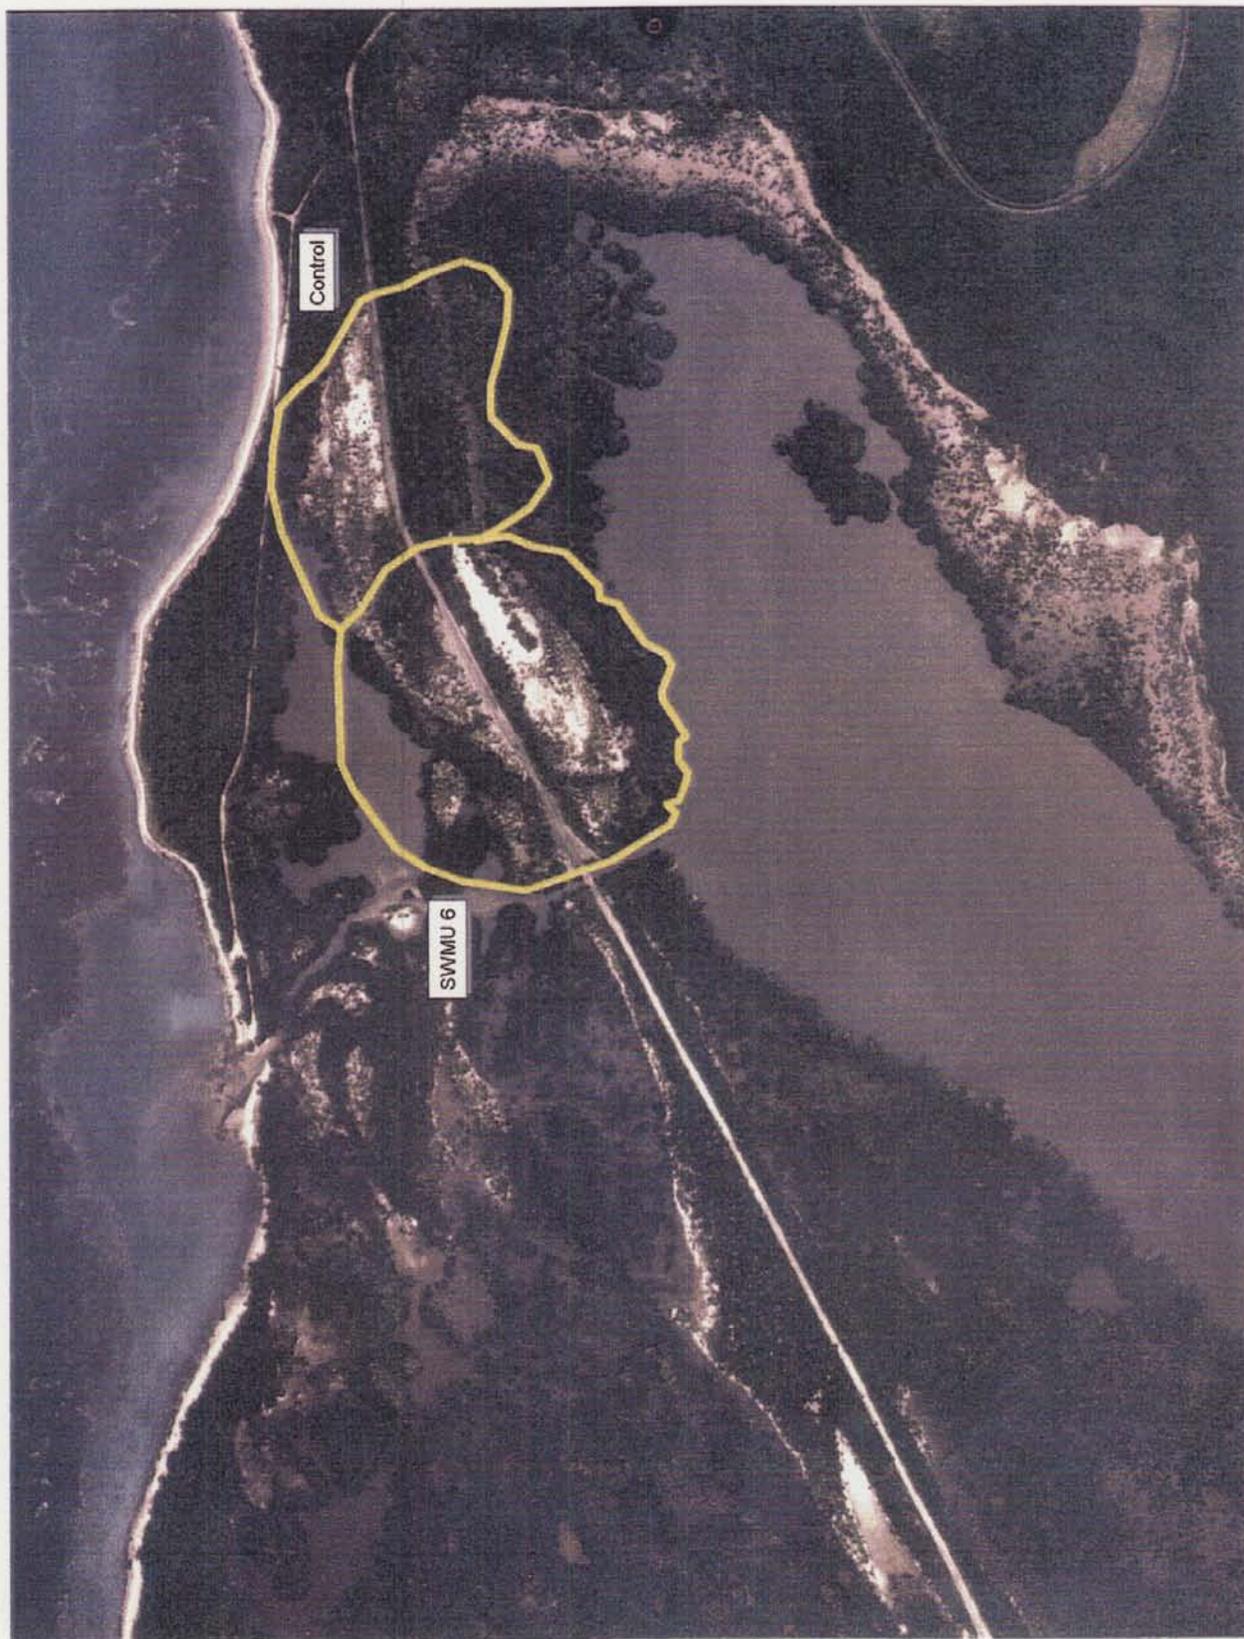

Figure 10. Location of SWMU 6 and control site at NASD Vieques Island, Puerto Rico.

The red mangrove community was sparsely vegetated (approximately 25 percent cover) with large pools of open water. Nearly all vegetation included short shrubs of red mangrove; no other vegetation was observed in this community. Numerous red mangrove seedlings were also observed in this site.

The black mangrove community also had sparse vegetation cover; there was approximately 25 percent cover. Plants were predominately short shrubs (8-15 feet); however, there were some patches of herbaceous vegetation located on higher topography. Black mangrove dominated the shrub vegetation, with *Laguncularia racemosa*, *Prosopis glandulosa*, and *Acacia farnesiana* also present. The herbaceous vegetation was dominated by *Sporobolus virginicus*. *Heliotropium curassavicum*, *Sesuvium portulacastrum*, and *Blutaparon vermiculare* were also identified. Vegetation photos are presented in Figures 11 and 12. The vegetation observed at SWMU 6 is presented in Table 6.

#### *Plant Community Health*

A control site was selected along the eastern boundary of the SWMU 6 site for plant community comparisons. These sites (control vs. SWMU 6) were essentially the same. The only difference was that the open areas of the black mangrove community in SWMU 6 were covered in debris. There were no observed stresses in the plant communities.

#### *Wildlife Description*

During the short duration of wildlife surveys conducted on this site, numerous wildlife species such as birds and lizards were observed utilizing the habitat of this site (Table 7). The mangrove communities had significant crab activity. The red mangrove community, with more water present, had more crab holes than the black mangrove. There was no evidence that the SWMU site had an impact on the wildlife or habitat.

Figure 11. SWMU 6, typical vegetation, mangroves

*Protected Species*

There were no federally protected species or preferred habitat observed at this site which was dominated by black and red mangrove communities.

The federally endangered tree *Stahlia monosperma* is known to occur in coastal forests of southeastern Puerto Rico (Little and Wadsworth 1964). One of the two known *Stahlia monosperma* populations is

located on the eastern boundary of Laguna Kiani which is fairly close to SWMU 6. No individuals of *Stahlia monosperma* were found at SWMU 6. Although *Stahlia monosperma* has been found at NASD Vieques (in the boundary between black mangrove communities, salt flats and the upland communities), the habitat at SWMU is a mixed mangrove and therefore not preferred habitat.

Brown pelicans and roseate terns, both federally endangered marine birds, would most likely not occur at the site, but have been found adjacent to the site at Laguna Kiani. During the surveys, brown pelicans were observed flying over the adjacent marine habitat, but not at SWMU 7.

### Food Web

Figure 13 presents a generalized food web for the mangrove community type found at SWMU 6. The abundance within each of the food groups is represented by the size of their polygon in the figure. Dominant species are listed in each of the food groups except for plants, which were provided previously in this section.

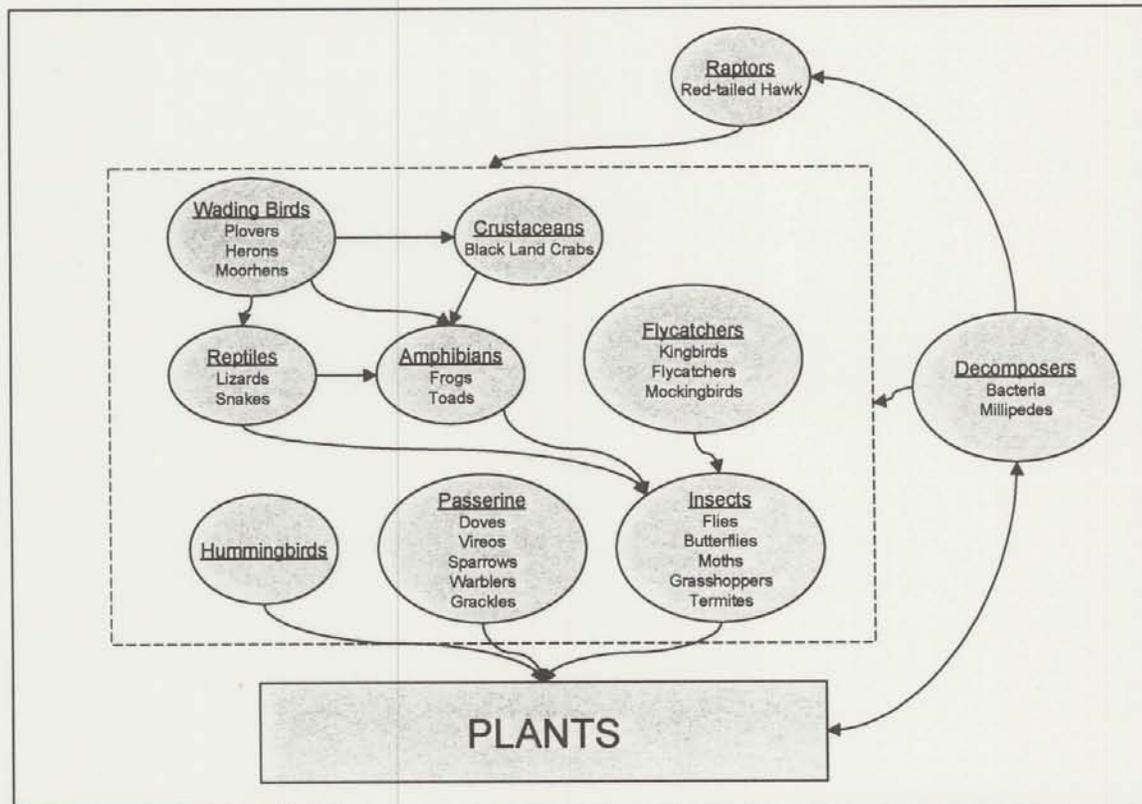

Figure 13. Generalized food web for the mangrove community types at NASD Vieques.

**SWMU 7**

*Vegetation Community Description*

SWMU 7, Quebrada Disposal Site, is located within a ravine approximately 0.5 miles west of the NASD Public Works area (Figure 14). This site had historically been used as a trash dump, but had been abandoned long enough for a shrub plant community to establish. This plant community had two canopy layers (shrub and tree), which provided nearly 100 percent canopy cover. The dense shrub and tree canopies provided little sunlight for an herbaceous canopy. *Lasiacis divaricata* was present in some areas. The dominant shrubs in this community consisted of *Leucaena leucocephala*, *Foresteria eggersiana*, and *Acacia retusa*. There was a lower density of trees than shrubs, but dominant tree species such as *Andira inermis* and *Cordia alliodora* provided a significant contribution to the plant community. Vegetation photos are presented in Figures 15 and 16. The vegetation observed at SWMU 7 is presented in Table 8.

Figure 14. Location of SWMU 7 and control site at NASD Vieques Island, Puerto Rico.

Figure 15. SWMU 7, typical vegetation

Figure 16. SWMU 7, vegetation located downstream

### *Plant Community Health*

Despite a large amount of debris at the site, the plant community was very similar to the control. The control was located downstream of the site along the same ravine. The species composition and structure was similar between the two sites (control and SWMU 7). Additionally, no vegetation stresses were observed in SWMU 7.

### *Wildlife Description*

During the short duration of wildlife surveys conducted on this site, numerous wildlife species were observed utilizing the habitat of this site. The bird species observed at this habitat type consisted of coastal forest and shore species due to the close proximity to Caribbean Sea (Table 9). Numerous lizards were also identified at this site. There was no evidence that the SWMU site had an impact on the wildlife or its habitat.

**Table 9**  
**Wildlife Observed at SWMU 7**

English Name	Scientific Name	Local Name
Reptiles and Amphibians		
Lizards	<i>Anolis</i> sp.	Not known
Birds		
Red-tailed Hawk	<i>Buteo jamaicensis</i>	Guaraguo de Cola Roja
Bananaquit	<i>Coereba flaveola</i>	Reinita Común
Adelaidae Warbler	<i>Dendroica adelaidae</i>	Reinita Mariposera
Green-throated Carib	<i>Eulampis holosericeus</i>	Zumbador de Pecho Azul
Pearly-eyed Thrasher	<i>Margarops fuscatus</i>	Zorzal Pardo
Northern Mockingbird	<i>Mimus polyglottos</i>	Ruiseñor
Puerto Rican Lizard Cuckoo	<i>Saurothera vieilloti</i>	Pájaro Bobo Mayor
Louisiana Waterthrush	<i>Seiurus motacilla</i>	Pizpita de Río
Loggerhead Kingbird	<i>Tyrannus caudifasciatus</i>	Clérigo
Gray Kingbird	<i>Tyrannus dominicensis</i>	Pitirre
White-winged Dove	<i>Zenaida asiatica</i>	Tórtola Aliblanca

### *Protected Species*

There were no federally protected species or preferred habitat observed at this site. Terrestrial forested plant community dominated the sites, which is not preferred habitat for any of the species.

The federally endangered Brown pelican would most likely not occur at this terrestrial site. During the surveys Brown pelicans were observed flying over the adjacent marine habitat, but not at SWMU 7.

### *Food Web*

Figure 6 presents a generalized food web for the forested community type found at this SWMU site.

## AOC Sites, SWMU 10, SWMU 14, and SWMU 15

### *Vegetation Community Description*

The SWMU 10, SWMU 14, SWMU 15, AOC C, AOC E-UST, and AOC F-UIC sites contained similar plant communities and were all located in the NASD Public Works area (Figure 17). The plant communities at these sites were dominated by herbaceous species due to grounds maintenance activities (mowing). A few shrubs with decumbent growth were present and there was approximately 70 to 85 percent ground cover at all the sites. The herbaceous plant community was dominated by several species, including: *Bothriochloa ischaemum*, *Digitaria ciliaris*, *Cynodon dactylon*, and *Commelina erecta*. Vegetation photos are presented in Figures 18 through 23. The vegetation observed at the NASP Public Works sites is presented in Table 10.

### *Plant Community Health*

These sites have experienced regular disturbance from mowing that has resulted in a grassland community. Grounds maintenance is the primary factor affecting the species composition and structure of the sites. A control plot was selected within the Public Works area, southeast of SWMU 14.

There was no significant difference between any of the sites and the control. SWMU 10 had a greater abundance of *Digitaria ciliaris* and *Commelina erecta* than the control; however, this was most likely due to the shading effect of the associated buildings (both species are shade tolerant). AOC-C had a higher abundance of hydrophytic vegetation than the other sites because of the drainage ditches on the site. There was some surface disturbance (bare ground) at both AOC-E UST and AOC-F UIC due to the installation/maintenance of monitoring wells.

SWMU 15 was the only site that had evidence of stressed vegetation. There was a greater abundance of *Cynodon dactylon* growing at this site than other sites. *Cynodon dactylon* is an exotic and invasive grass species that can tolerate variable growing conditions. The presence of this species on any of these sites is not significant, due to the grounds maintenance. The decumbent growth form of this species indicates that this area had been compacted from heavy vehicles driving or parking on the site. The soil compaction may also limit the species diversity of the site. It appears that the site may have been a parking lot or vehicle staging area because some small patches of oil stained soil were observed in the south central portion of the site.

### *Wildlife Description*

Wildlife observed at these sites is typical for developed areas on Vieques and is presented in Table 11. Two mammal species (horse and mongoose) were observed utilizing the sites. Numerous birds including

Zenaida Dove	<i>Zenaida aurita</i>	Tórtola Cardosantera

the Red-tailed hawk (*Buteo jamaicensis*) and Killdeer (*Charadrius vociferous*) were present during the surveys and utilize the habitat for feeding and/or breeding.

#### Protected Species

There were no federally protected species or preferred habitat observed at this site. The sites were dominated by maintained herbaceous grassland, which is not preferred habitat for any of the species except the Arctic peregrine falcon.

The Arctic peregrine falcon has been observed nearby at NAVSTA Roosevelt Roads (U.S. Navy 1998b), and potential feeding habitat for these birds is present on the site. Arctic peregrine falcons prefer edges and open areas to hunt prey. Foraging habitat within and/or near the site is present since the majority of the area is open grassland.

#### Food Web

Figure 6 presents a generalized food web for the herbaceous community type found at this SWMU site.

## CONCLUSION

The past activities at all to the SWMU sites presented in this report have some degree of impacts on their ecosystems. However, these impacts appear to be limited to changes in species composition based on physical disturbances. The construction of roads and grounds maintenance is the only disturbances that

have caused noticeable differences. Wildlife at these sites seems to be healthy and utilizing the habitats to their fullest extent. Through these surveys, no federally protected species were identified at these sites.

# APPENDIX A

## Birds Potentially Occurring at NASD Vieques

---

Pied-billed grebe (*Podilymbus podiceps*)  
Red-billed tropicbird (*Phaethon aethereus*)  
Brown pelican (*Pelecanus occidentalis*)  
Brown booby (*Sula leucogaster*)  
Magnificent frigatebird (*Fregata magnificens*)  
Great blue heron (*Ardea herodias*)  
Louisiana heron (*Hydranassa tricolor*)  
Snowy egret (*Egretta thula*)  
Great egret (*Egretta alba*)  
Striated heron (*Butorides striatus*)  
Little blue heron (*Florida caerulea*)  
Cattle egret (*Bubulcus ibis*)  
Least bittern (*Ixobrychus exilis*)  
Yellow-crowned night heron (*Nyctanassa violacea*)  
Black-crowned night heron (*Nycticorax nycticorax*)  
White-cheeked pintail (*Anas bahamensis*)  
Blue-winged teal (*Anas discors*)  
American widgeon (*Anas americana*)  
Red-tailed hawk (*Buteo jamaicensis*)  
Osprey (*Pandion haliaetus*)  
Merlin (*Falcon columbarius*)  
Clapper rail (*Rallus longirostris*)  
American coot (*Fulica americana*)  
Caribbean coot (*Fulica caribaea*)  
Common gallinule (*Gallinula chloropus*)  
Piping plover (*Charadrius melodus*)  
Semipalmated plover (*Charadrius semipalmatus*)  
Black-bellied plover (*Squatarola squatarola*)  
Wilson's plover (*Charadrius wilsonia*)  
Killdeer (*Charadrius vocifera*)  
Ruddy turnstone (*Arenaria interpres*)  
Black-necked stilt (*Himantopus himantopus*)  
Whimbrel (*Numenius phaeopus*)  
Spotted sandpiper (*Actitis macularia*)  
Semipalmated sandpiper (*Calidris pusilla*)  
Short-billed dowitcher (*Limnodromus griseus*)  
Greater yellowlegs (*Tringa melanoleuca*)  
Lesser yellowlegs (*Tringa flavipes*)  
Willet (*Catoptrophorus semipalmatus*)  
Stilt sandpiper (*Micropalama himantopus*)  
Pectoral sandpiper (*Calidris melanotos*)  
Laughing gull (*Larus atricilla*)  
Royal tern (*Thalasseus maximus*)  
Sandwich tern (*Thalasseus sandvicensis*)  
Bridled tern (*Sterna anaethetus*)  
Least tern (*Sterna albifrons*)  
Brown noddy (*Anous stolidus*)  
White-winged dove (*Zenaida asiatica*)  
Zenaida dove (*Zenaida aurita*)  
White-crowned pigeon (*Columba leucocephala*)  
Mourning dove (*Zenaida macroura*)  
Red-necked pigeon (*Columba squamosa*)  
Common ground dove (*Columba passerina*)  
Bridled quail dove (*Geotrygon mystacea*)

---

## Birds Potentially Occurring at NASD Vieques (Continued)

---

Ruddy quail dove (*Geotrygon montana*)  
Caribbean parakeet (*Aratinga pertinax*)  
Smooth-billed ani (*Crotophaga ani*)  
Yellow-billed cuckoo (*Coccyzus americanus*)  
Mangrove cuckoo (*Coccyzus minor*)  
Short-eared owl (*Asio flammeus*)  
Chuck-will's-widow (*Caprimulgus carolinensis*)  
Common nighthawk (*Chordeiles minor*)  
Antillean crested hummingbird (*Orthorhynchus cristatus*)  
Green-throated carib (*Sericotes holosericeus*)  
Antillean mango (*Anthracothonax dominicus*)  
Belted kingfisher (*Ceryle alcyon*)  
Gray kingbird (*Tyrannus dominicensis*)  
Loggerhead kingbird (*Tyrannus caudifasciatus*)  
Stolid flycatcher (*Myiarchus stolidus*)  
Caribbean elaenia (*Elaenia martinica*)  
Purple martin (*Progne subis*)  
Cave swallow (*Petrochelidon fulva*)  
Barn swallow (*Hirundo rustica*)  
Northern mockingbird (*Mimus polyglottos*)  
Pearly-eyed thrasher (*Maragarops fuscatus*)  
Red-legged thrush (*Mimocichla plumbea*)  
Black-whiskered vireo (*Vireo altiloquus*)  
American redstart (*Setaophaga ruticilla*)  
Parula warbler (*Parula americana*)  
Prairie warbler (*Dendroica discolor*)  
Yellow warbler (*Dendroica petechia*)  
Magnolia warbler (*Dendroica magnolia*)  
Cape May warbler (*Dendroica tigrina*)  
Black-throated blue warbler (*Dendroica caerulescens*)  
Adelaide's warbler (*Dendroica adelaidae*)  
Palm warbler (*Dendroica palmarum*)  
Black and white warbler (*Mniotilta varia*)  
Ovenbird (*Seiurus aurocapillus*)  
Northern water thrush (*Seiurus noveboracensis*)  
Bananaquit (*Coerba flaveola*)  
Striped-headed tanager (*Spindalis zena*)  
Shiny cowbird (*Molothrus bonariensis*)  
Black-cowled oriole (*Icterus dominicensis*)  
Greater Antillean grackle (*Quiscalis niger*)  
Yellow-shouldered blackbird (*Agelaius xanthomus*)  
Hooded mannikin (*Lonchura cucullata*)  
Yellow-faced grassquit (*Tiaris olivacea*)  
Black-faced grassquit (*Tiaris bicolor*)  
Least sandpiper (*Calidris minutilla*)  
Western sandpiper (*Calidris mauri*)  
Puerto Rican woodpecker (*Melanerpes portoricensis*)  
Rock dove (*Columba livia*)  
Puerto Rican emerald (*Chlorostilbon maugaeus*)  
Puerto Rican flycatcher (*Myiarchus antillarum*)  
Pin-tailed whydah (*Vidua macroura*)  
Spice finch (*Lonchura punctulata*)  
Ruddy duck (*Oxyura jamaicensis*)  
Peregrine falcon (*Falco peregrinus*)

Chemical Name								
<b>Semi-volatile Organic Compounds (UG/L)</b>								
1,1-Biphenyl	5.2 U	NA	NA	NA	NA	NA	NA	NA
1,2,4,5-Tetrachlorobenzene	5.2 U	NA	NA	NA	NA	NA	NA	NA
1,2,4-Trichlorobenzene	NA	NA						
2,2'-Oxybis(1-chloropropane)	5.2 U	NA	NA	NA	NA	NA	NA	NA
2,4,5-Trichlorophenol	20.6 U	NA	NA	NA	NA	NA	NA	NA
2,4,6-Trichlorophenol	5.2 U	NA	NA	NA	NA	NA	NA	NA
2,4-Dichlorophenol	5.2 U	NA	NA	NA	NA	NA	NA	NA
2,4-Dimethylphenol	5.2 U	NA	NA	NA	NA	NA	NA	NA
2,4-Dinitrophenol	20.6 UJ	NA	NA	NA	NA	NA	NA	NA
2,4-Dinitrotoluene	5.2 U	NA	NA	NA	NA	NA	NA	NA
2,6-Dinitrotoluene	5.2 U	NA	NA	NA	NA	NA	NA	NA
2-Chloronaphthalene	5.2 U	NA	NA	NA	NA	NA	NA	NA
2-Chlorophenol	5.2 U	NA	NA	NA	NA	NA	NA	NA
2-Methylnaphthalene	5.2 U	NA	NA	NA	NA	NA	NA	NA
2-Methylphenol	5.2 U	NA	NA	NA	NA	NA	NA	NA
2-Nitroaniline	20.6 U	NA	NA	NA	NA	NA	NA	NA
2-Nitrophenol	5.2 U	NA	NA	NA	NA	NA	NA	NA
3,3'-Dichlorobenzidine	5.2 U	NA	NA	NA	NA	NA	NA	NA
3- and 4-Methylphenol	NA	NA						
3-Nitroaniline	20.6 U	NA	NA	NA	NA	NA	NA	NA
4,6-Dinitro-2-methylphenol	20.6 U	NA	NA	NA	NA	NA	NA	NA
4-Bromophenyl-phenylether	5.2 U	NA	NA	NA	NA	NA	NA	NA
4-Chloro-3-methylphenol	5.2 U	NA	NA	NA	NA	NA	NA	NA
4-Chloroaniline	5.2 U	NA	NA	NA	NA	NA	NA	NA
4-Chlorophenyl-phenylether	5.2 U	NA	NA	NA	NA	NA	NA	NA
4-Methylphenol	6.3 U	NA	NA	NA	NA	NA	NA	NA
4-Nitroaniline	20.6 U	NA	NA	NA	NA	NA	NA	NA
4-Nitrophenol	20.6 UJ	NA	NA	NA	NA	NA	NA	NA
Acenaphthene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Acenaphthylene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Acetophenone	5.2 U	NA	NA	NA	NA	NA	NA	NA
Anthracene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Atrazine	5.2 U	NA	NA	NA	NA	NA	NA	NA
Benzaldehyde	5.2 U	NA	NA	NA	NA	NA	NA	NA
Benzo(a)anthracene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Benzo(a)pyrene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Benzo(b)fluoranthene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Benzo(b,k)fluoranthene	NA	NA						
Benzo(g,h,i)perylene	5.2 UJ	NA	NA	NA	NA	NA	NA	NA
Benzo(k)fluoranthene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Butylbenzylphthalate	5.2 U	NA	NA	NA	NA	NA	NA	NA
Caprolactam	5.2 U	NA	NA	NA	NA	NA	NA	NA
Carbazole	10.3 U	NA	NA	NA	NA	NA	NA	NA
Chrysene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Di-n-butylphthalate	5.2 U	NA	NA	NA	NA	NA	NA	NA
Di-n-octylphthalate	5.2 U	NA	NA	NA	NA	NA	NA	NA
Dibenz(a,h)anthracene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Dibenzofuran	5.2 U	NA	NA	NA	NA	NA	NA	NA
Diethylphthalate	5.2 U	NA	NA	NA	NA	NA	NA	NA
Dimethyl phthalate	5.2 U	NA	NA	NA	NA	NA	NA	NA
Fluoranthene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Fluorene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Hexachlorobenzene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Hexachlorobutadiene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Hexachlorocyclopentadiene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Hexachloroethane	5.2 U	NA	NA	NA	NA	NA	NA	NA
Indeno(1,2,3-cd)pyrene	5.2 UJ	NA	NA	NA	NA	NA	NA	NA
Isophorone	5.2 U	NA	NA	NA	NA	NA	NA	NA
Naphthalene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Nitrobenzene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Pentachlorophenol	20.6 U	NA	NA	NA	NA	NA	NA	NA
Phenanthrene	5.2 U	NA	NA	NA	NA	NA	NA	NA
Phenol	5.2 U	NA	NA	NA	NA	NA	NA	NA
Polynuclear aromatic hydrocarbons	NA	NA						
Pyrene	5.2 U	NA	NA	NA	NA	NA	NA	NA
bis(2-Chloroethoxy)methane	5.2 U	NA	NA	NA	NA	NA	NA	NA
bis(2-Chloroethyl)ether	5.2 U	NA	NA	NA	NA	NA	NA	NA
bis(2-Ethylhexyl)phthalate	10.3 U	NA	NA	NA	NA	NA	NA	NA
n-Nitroso-di-n-propylamine	5.2 U	NA	NA	NA	NA	NA	NA	NA
n-Nitrosodiphenylamine	5.2 U	NA	NA	NA	NA	NA	NA	NA

Notes:  
NA - Not analyzed  
U - Analyte not detected  
J - Result may be estimated  
R - Unreliable result
