## 1.0 INTRODUCTION

This Interim Data Summary Report was prepared by Tetra Tech NUS Inc. (Tetra Tech) for the Naval Facilities Engineering Command (NAVFAC) - Mid-Atlantic under the U.S. Navy's Comprehensive Long-Term Environmental Action Navy (CLEAN) Contract number N62470-08-D-1001, Contract Task Order (CTO) WE44. The Interim Data Summary Report presents the field activities at Site 1 – Former Drum Marshalling Area conducted from July 2010 through March 2011 at the Naval Weapons Industrial Reserve Plant (NWIRP) located in Bethpage, New York (Figures 1-1 and 1-2). The field activities consisted of the following: soil borings, soil sampling, groundwater grab sampling, and monitoring well installation, development, and groundwater sampling, as presented in the Sampling and Analysis Plan (SAP) (Tetra Tech, 2010a). Groundwater investigation activities were conducted in accordance with the Navy Environmental Restoration (ER) Program and New York State Department of Environmental Conservation (NYSDEC) Resource Conservation and Recovery Act (RCRA) permit number NYD003995198.

### 1.1 SCOPE AND OBJECTIVES

This document summarizes soil and groundwater investigation activities conducted at the NWIRP Bethpage Site 1 – Former Drum Marshalling Area between July 2010 and March 2011. The primary objectives of the investigation were to delineate the vertical extent (greater than 25 feet below ground surface [bgs]) of polychlorinated biphenyls (PCB) contamination in soil, determine whether PCB contaminated groundwater has migrated beyond the Site boundary, and whether organics (fuel-related or chlorinated solvents) are present at sufficient concentrations to act as a carrier fluid that could promote PCB migration.

Soil data collected during historical investigations delineated the horizontal and vertical extent of PCB-contaminated soils fairly well from the ground surface to 25 feet bgs. Based on the historical data, the known vertical extent of PCB-contaminated soil is to depths of approximately 65 feet bgs. However, the vertical extent was not clearly defined. Soil borings were advanced in known deep areas of contamination during this investigation to determine and/or confirm the depth of PCB-contaminated soils.

The existing groundwater monitoring well network at Site 1 was limited to four monitoring wells along the southern boundary of Site 1. Sampling of these monitoring wells indicated concentrations of PCBs near or above maximum contaminant levels (MCLs). Shallow, intermediate, and deeper monitoring wells were installed upgradient and downgradient of Site 1 to better characterize groundwater and determine if PCBs have mobilized and actually impacted groundwater, and if so, to delineate the extent of contamination.

A description of field activities is presented in Section 3.0 of this report. Field work conducted in 2010 and 2011 is summarized as follows.

- Advanced nine soil borings in known source areas
- Collected soil samples for field and laboratory analysis of PCBs
- Groundwater grab sampling at three downgradient soil boring locations
- Installation and development of fifteen monitoring wells
- Two rounds of monitoring well sampling

## **1.2 REPORT ORGANIZATION**

This Interim Data Summary Report provides general implementation information and the approach used in conducting the soil and groundwater investigation activities in 2010 and early 2011. The report consists of five sections. Section 1.0 provides an introduction. Section 2.0 provides the facility background and environmental setting. Section 3.0 provides a summary of the field activities. Section 4.0 presents the analytical results, and Section 5.0 presents the conclusion and recommendations.

## 2.0 BACKGROUND

### 2.1 SITE DESCRIPTION

The Navy's Bethpage facility is located in east-central Nassau County, Long Island, New York, approximately 30 miles east of New York City (Figure 1-1). Established in 1941, the property known as NWIRP Bethpage was originally situated on 109 acres entirely within the Northrop Grumman Aerospace complex. NWIRP Bethpage was a Government-Owned Contractor Operated (GOCO) facility that was operated by the Northrop Grumman Corporation (NGC) until September 1998. As a result of Northrop Grumman's decision to terminate operations at NWIRP Bethpage, the Navy transferred 96 acres of the 105-acre main parcel to Nassau County. The remaining 9-acre parcel is being retained by the Navy for environmental investigations and remediation. Other than environmental investigation and cleanup work, there are no operations conducted on the Navy's 9 acres that generate hazardous waste.

Site 1 - Former Drum Marshalling Area is located in the eastern portion of the Navy's 9-acre parcel. Site 1 is mostly an open area, which in the past included above ground storage tanks (ASTs) (Areas of Concern [AOC] 23), a sanitary settling tank, and sludge drying beds (AOC 35). All these structures were located in the northern portion of the Site, as well as a few scattered metal storage buildings. In general this area is relatively flat except for a 4-foot vegetated windrow located along the eastern end of the Site, and a mounded area which partially buries the abandoned sanitary settling tank. The Site is enclosed by a site perimeter fence along the north, west and south, with an eastern facility perimeter fence bounding the Site from a residential neighborhood. Figure 2-1 provides a site layout and aerial view of Site 1.

Site 1 originally consisted of two former drum marshalling pads located in the center of the site that were used to store drums containing waste materials from operations at Plant No. 3 and potentially other wastes from operations at the facility. Transformers and PCB-filled autoclaves were also stored at the Site.

In addition, underlying most of Site 1 is approximately 120 abandoned cesspools that were designed to discharge sanitary waste waters from Plant No. 3. These cesspools were approximately 10 feet in diameter and 16 feet deep. Based on field observations, the cesspools are currently filled with soil. It is possible that non-sanitary wastes may have been discharged into this system. The drum marshalling areas and extent of the leach field were the original extent of Site 1.

## **2.2 ENVIRONMENTAL SETTING**

### **2.2.1 Topography and Drainage**

NWIRP Bethpage is located in an area underlain by permeable glacial material and characterized by limited surface water drainage features. Normal precipitation at the facility is expected to infiltrate rapidly into the soil. Recharge basins which receive storm water runoff are located in the northeastern portion of the facility at Site 2. NWIRP Bethpage occupies a relatively flat, intermorainal area, and has very little topographic relief.

### **2.2.2 Geology and Soils**

NWIRP Bethpage is underlain by approximately 1,100 feet of unconsolidated sediments that overlie crystalline bedrock (Isbister, 1966). The unconsolidated sediments consist of four distinct geologic units: (in descending order) Upper Glacial Formation, Magothy Formation, Raritan Clay, and Lloyd Sand Formation. The 30- to 45-foot-thick Upper Glacial Formation consists chiefly of coarse sands and gravels. The Upper Magothy Formation consists primarily of coarse sands to a depth of approximately 100 feet, below which finer sands, silts, and clay predominate. The clay is common but laterally discontinuous; no individual clay horizon of regional extent underlies the facility. The 100- to 150-foot-thick Raritan Clay underlies the Magothy Formation at a depth of approximately 700 to 800 feet bgs. The underlying Lloyd Sand Formation is approximately 300 feet thick.

### **2.2.3 Hydrogeology**

Most of Long Island is bisected by an east-west-trending regional groundwater divide. NWIRP Bethpage occupies an area of recharge, lying to the south of the divide. Groundwater is in contact with the Upper Glacial and Upper Magothy Formations beneath the facility, and may be considered a common unconfined aquifer. The glacial deposits are characterized by a high primary porosity (exceeding 30 percent) and high permeability. The high permeability of the glacial deposits allows for the rapid recharge of precipitation to the underlying Magothy (Isbister, 1966; McClymonds and Franke, 1972). The number and thickness of clay lenses increase with depth in the Magothy Formation; however, the horizontally discontinuous nature of these units prevents any one of them from functioning as an aquitard or semi-confining unit.

Groundwater beneath the site flows in a general southerly direction toward the Atlantic Ocean. Across the facility, the horizontal hydraulic gradient and groundwater velocity in the unconfined common aquifer averages 5.3 feet per mile and 0.3 foot per day (ft/day), respectively [Halliburton NUS (HNUS), 1993].

Subtle vertical hydraulic gradients occur in a downward direction. Groundwater in the deeper portion of the Magothy is the primary source of potable water in Nassau County. Groundwater is encountered at a depth of approximately 50 feet bgs at the facility. Historically, because of pumping and recharge at the facility, groundwater depths have been measured ranging from 40 to 60 feet bgs.

Prior to 1998, the groundwater flow dynamics beneath the NWIRP and Grumman were complex. A total of 16 deep production wells (7 on the NWIRP and 9 on Grumman property) existed which were set in the Magothy and each yielded approximately 1,200 gallons per minute (gpm). All of the production wells on the Navy's property have been abandoned. The extracted water was mostly used for non-contact single pass cooling and then discharged into recharge basins located on Navy and Northrop Grumman property. Based on extraction and recharge rates and locations, groundwater on the Navy property flowed predominately west and southwest. In addition, the production wells extracted groundwater from depths of approximately 500 feet bgs and the water was recharged in the basins near grade. The extraction from the production wells and near surface recharge resulted in vertical gradients at the Site. Grumman continues to operate production wells (as well as a groundwater containment system) south of NWIRP Bethpage. The production wells and groundwater containment system operates with a combined flow rate of approximately 3,800 gpm.

The Magothy aquifer is highly conductive. For example, in the 1995 FS investigation's pumping test no. 2, the pumping of production well PW-11 located on the Navy's property at nearly 1,000 gpm for 72 hours produced little or no measurable drawdown in the nearby observation wells or other production wells.

## 3.0 FIELD INVESTIGATION

### 3.1 FIELD AND SAMPLING ACTIVITIES

The PCB field investigation was conducted to determine the following (as presented in the [Uniform Federal Policy] UFP SAP, Tetra Tech, 2010):

- The vertical extent (greater than 25 feet bgs) of PCB contamination in soil
- Whether PCB-contaminated groundwater has migrated beyond the Site boundary
- Whether organics (fuel-related or chlorinated solvents) are present at sufficient concentrations to act as a carrier fluid that could promote PCB migration

The field and sampling activities included the advancement of soil borings to collect soil and groundwater samples, permanent monitoring well installation, monitoring well development, sampling of new and existing monitoring wells, and surveying. These activities were conducted to meet the project objectives presented above, further evaluate the impact of PCB-contamination at the Site, and determine a path forward for further investigation and potential remediation.

The following subsections summarize the field investigation activities and identify the sampling locations and type of samples that were collected during the investigation.

#### 3.1.1 Soil Borings and Soil Sampling

In July and August 2010, nine soil borings were advanced using roto sonic drilling methods. The soil boring locations are presented on Figure 3-1 and the boring logs are presented in Appendix A. Continuous soil cores were obtained to an approximate depth of 250 feet bgs at each boring location. A 4-inch core barrel was advanced into undisturbed soil, thus filling the core barrel with a representative soil sample. From the ground surface to approximately 60 feet bgs, 4-inch cores were collected in 10 foot intervals, and below 60 feet bgs, cores were collected in 20 foot intervals. After each 4-inch core barrel was advanced, a 6-inch casing was driven over the 4-inch core to depth to maintain the open borehole while retrieving the 4-inch soil cores. An 8-inch override casing was advanced over both the 4- and 6-inch casings for the first 70 feet bgs at boring locations advanced in known source areas to minimize dragging of shallow soil contamination downwards and eliminate cross contaminating deeper soil samples. To recover the soil cores, the 4-inch core barrel was withdrawn and vibrated to release the soil cores into 10 or 20 foot plastic sample bags. Each sample bag was placed on a plastic liner, screened with a photoionization detector (PID), logged (lithology, visual staining, or odors), and soil samples were collected for field test kit and fixed based laboratory analysis.

Subsurface soil samples were analyzed on-site for total chloride (converted to Arochlor-1248 equivalents) with the Dexsil L2000DX Analyzer. This method assumes that all chloride present is associated with PCBs. Discrete soil samples were collected every 5 feet starting at 25 feet bgs in the source area soil borings for field test kit analysis, particularly at zones with elevated PID readings, above confining layers, or in visually stained layers. Below 120 feet, field test kit composite samples were collected every 10 feet. Each composite sample was homogenized in a disposable aluminum pan with a disposable plastic trowel. Composite samples were also collected at soil borings advanced outside of the known source areas. From the ground surface down to 120 feet bgs, 10-foot composite samples collected for test kit analysis. Below 120 feet composite samples were taken in 10- to 30-foot intervals depending on the shallower test kit results from that location. Table 3-1 presents a summary of the field test kit samples collected and the soil sample log sheets are presented in Appendix A.

Lab confirmation samples for PCB analyses were selected based upon the field test kits results and elevated PID readings. Lab confirmation samples were co-located with the field test kit samples and placed on ice for preservation. For the source area soil borings, six laboratory confirmation samples were collected from each boring. Two of the six confirmation samples were collected from sample intervals with the highest test kit results. Two additional confirmation samples were taken from intervals just above clay units or within stained layers, and the remaining two samples were taken from suspected clean intervals. Four soil samples were also collected from each source area boring and analyzed for volatile organic compounds (VOCs), total organic carbon (TOC), total petroleum hydrocarbon (TPH)-diesel range organics (DRO) and TPH- gasoline range organics (GRO). These samples were co-located with the PCB samples. One sample was taken directly above the water table, while the remaining three were taken where elevated PID readings were observed or just above clay layers. The downgradient soil borings, followed the same sample procedures except only three VOC, TOC, TPH-DRO, and TPH-GRO samples were collected from these borings. Table 3-2 provides a summary of the laboratory confirmation samples.

Soil cuttings generated during the investigation were collected and placed in 10 to 20 cubic yard roll-off containers. If PCB field test kits indicated potentially elevated PCBs, those associated soils were placed in 55-gallon drums for further waste characterization sampling. After waste characterization, the soils were transported and disposed off-site at an approved disposal facility by the Investigation Derived Waste (IDW) subcontractor.

### **3.1.2 Groundwater Grab Sampling**

Groundwater grab samples were collected from downgradient boring locations BPS1-SB3010 and SB3012. Four groundwater grab samples were collected from each boring location at varying depths as determined or projected from analytical and lithological data collected from the source area borings Table

3-3 presents a summary of groundwater grab samples collected. Groundwater grab samples were collected utilizing a stainless steel screen sampler (Power Probe) and submersible pump (Grundfos RediFlo). The Power Probe attached to the 4-inch core barrel and was self contained and sealed. During advancement, the probe was pushed at least 5 feet below the 6-inch casing into the interval where groundwater was to be sampled. An ecologically safe biodegradable dye (Rhodamine WT) was added to the drilling water in order to visually determine if drilling fluid was encountered during purging and sampling. Before exposing the screen, a water level meter was used to determine if water existed inside the 4-inch core barrel. The 6-inch casing was withdrawn approximately 5 feet to expose the Power Probe screen and the Grundfos pump was then placed just above the 4 foot probe screen for purging groundwater.

Purging varied at each location and was dependent on the amount of drilling fluid observed in the purge water and turbidity readings. Groundwater grab samples were sent to a fixed based lab and analyzed for PCBs and VOCs. Field forms associated with the groundwater grab samples can be found in Appendix A.

### **3.1.3 Monitoring Well Installation**

Four monitoring well clusters were installed via rotosonic drilling methods in October and November 2010. One monitoring well cluster (BPS1-TT-MW301S, I, D) was installed in the hydraulically upgradient (north) portion of the study area and three monitoring well clusters (BPS1-TT-MW302, -MW303, and -MW304) were installed hydraulically downgradient (south) of Site 1. Each downgradient well cluster consisted of four monitoring wells at shallow, intermediate (2), and deeper zones (S, I1, I2, and D) as determined by the lithology observed in the source area and the downgradient soil borings. The monitoring well locations are presented on Figure 3-1 and the construction details are provided in Table 3-4.

The monitoring wells were installed by advancing the 6-inch rotosonic casing to the target depths and constructed with 2-inch schedule 40 polyvinyl chloride (PVC) screen (0.010 inch slot) and riser pipe. The sand pack consisted of #1 Silica sand and was placed from 1 foot below to 3 feet above the screened interval. A 5-foot bentonite seal consisting of 3/8 inch bentonite chips was placed above the sand pack and allowed to hydrate prior to grouting. Bentonite/cement grout slurry was then placed via tremie pipe to the ground surface. Steel protective stick up casings were installed at the BPS1-TT-MW301 and BPS1-TT-MW304 well clusters and flush mount well covers were installed at BPS1-TT-MW302 and BPS1-TT-MW303.

Well development was conducted using two different methods. Airlifting and a submersible pump (Grundfos) were used at the intermediate depths and deep monitoring wells, and surging/purging with a

submersible pump (Grundfos) was used at the shallow well locations. Well development began after the grout had cured at each monitoring well. During well development, groundwater parameters were measured every 15 minutes and included: pH, specific conductivity, temperature, turbidity, and oxygen reduction potential (ORP). Parameter stabilization was achieved and approximately 400 gallons of water was purged from each shallow monitoring well and about 1,000 gallons was purged at each intermediate/deep monitoring well. Monitoring well construction and development records are presented in Appendix A.

#### **3.1.4 Groundwater Flow and Sampling**

For both groundwater sampling events a round of synoptic groundwater elevations was taken from each monitoring well. These measurements were used to generate groundwater elevation contour maps and provide information on groundwater flow patterns and gradients (see Appendix A for Groundwater Level Measurement Sheets). The first round of water levels was taken on November 29, 2010 and the second occurred on March 3, 2011. Figure 3-2 presents the potentiometric surface for shallow monitoring wells and Figure 3-3 presents the potentiometric surface for deep monitoring wells as recorded in March 2011. The potentiometric surface for the intermediate well locations indicated a similar groundwater flow pattern as shown in the shallow and deep wells. Based on the groundwater levels, a slight downward vertical gradient is observed between shallow and deep monitoring wells and a south to southeast groundwater flow is apparent at the Site. Water level measurements were recorded to the nearest 0.01 foot and referenced to the top of casing of each monitoring well. Table 3-5 provides a summary of the groundwater elevations at the Site.

Groundwater sampling was conducted from November 29 through December 1, 2010 and March 1 through March 3, 2011. A Grundfos Rediflo pump was used for groundwater purging and sample collection activities. Water quality parameters and turbidity measurements were collected at each monitoring well during purging and sampling. All groundwater samples were collected using low flow sampling techniques and the samples were sent to a fixed based lab for VOC and PCB analysis. Groundwater sample log sheets and low flow purge data sheets are presented in Appendix A.

Quality Assurance (QA) samples were taken during groundwater sampling and included rinsate blanks, source water blanks, field duplicates, matrix spike matrix duplicated (MSMSD), and trip blanks. QA sample log sheets are presented in Appendix A.

Water generated during the groundwater grab sampling, well development, monitoring well sampling and during decontamination procedures were containerized and stored for waste characterization sampling.

### **3.1.5 Surveying**

The monitoring well and soil boring locations were surveyed by BANC3, a New York State licensed surveyor, on March 29, 2011. Each location was surveyed for horizontal position and vertical components including both ground surface and top of casing elevations for each monitoring well location. Horizontal measurements were accurate to 0.1 foot while vertical elevation measurements were accurate to 0.01 foot at each location. A summary of the survey results can be found in Appendix B.

## **4.0 GEOLOGY, ANALYTICAL RESULTS, AND FINDINGS**

### **4.1 INTRODUCTION**

Analytical results for this PCB field investigation consist of onsite field test kit for soils and fixed-based laboratory results for soil and groundwater. Results from the field test kits were used as screening level data to determine where fixed-based laboratory samples would be collected. The following subsections describe the analytical results and findings from this PCB investigation.

### **4.2 GEOLOGY**

The geology encountered at the site was variable both horizontally and vertically. Medium to course sand and gravel was consistently observed in the upper 30 feet of each source area boring. Below this unit a few clay and potential lignite layers were observed from a few inches up to approximately 10 feet thick. Finely laminated silt and clay layers and mottled sand layers were encountered, but these layers were not consistent and could not be traced from boring to boring. The few notable clay units were observed during drilling at BPS1-SB3007 and BPS1-SB3012 around 150 feet bgs and another clay unit that was observed at BPS1-SB3010 and BPS1-SB3012 around 225 feet bgs. The thickness of the deeper clay unit was not fully defined since soil borings were not advanced deeper. This deeper clay unit was fairly consistent across the study area and thought to confine the potential PCB-contaminated groundwater.

A cross section location map (Figure 4-1) presents the cross sections generated for the investigation. Figure 4-2 presents Cross Section A to A' which runs north and south through the study area, while Figure 4-3 present Cross Section B to B' which runs east-west through the three downgradient soil borings and monitoring well locations.

Based on the lithology encountered in these soil borings and the borings advanced in 2009, monitoring wells were installed at depths just above potential semi-confining units observed during drilling. Table 3-4 presents the construction details for each on the monitoring wells installed during this investigation.

### **4.3 SOIL SAMPLING RESULTS**

#### **4.3.1 Field Test Kit Results**

Field test kit samples were used to screen sample intervals for PCBs (measured as total chloride) to determine which samples to send for fixed-based laboratory analysis. Table 4-1 presents a summary of detections from the field test kits and the associated fixed-based laboratory results for comparison. The test kit results showed relatively good correlation with the laboratory data. Some false positives and

negatives were observed in the data comparison. The test kit results typically overestimated the PCB concentrations. The analytical results from this investigation will be used in conjunction with historical analytical results to determine where further PCB delineation is needed in the source areas. Further evaluation of the new and historical soil data will be presented under a separate cover and used to plan additional soil investigative activities at the site.

Appendix C provides the results from the field test kits.

#### **4.3.2 Laboratory Results**

PCBs were detected in 6 of the 9 soil borings with BPS1-SB3005, BPS1-SB3006, and BPS1-SB3009 showing the highest PCB concentrations (See Table 4-2). BPS1-SB3005 had detections of Aroclor-1242 (maximum of 160 milligram per kilogram [mg/kg]), Arcoclor-1248 (max. of 0.016 mg/kg), and Aroclor-1260 (max 0.8 mg/kg). The highest detection of Aroclor-1242 was found from 54.5 to 55.0 and 57.5 to 58.0 feet bgs (160 and 110 mg/kg respectively). BPS1-SB3006 had two detections of Aroclor-1248 at 32.5 (15 mg/kg) and 53.5 feet bgs (0.022 mg/kg). BPS1-SB3009, associated with Dry well 34-07 and had a maximum concentration of 10 mg/kg Aroclor-1248 at 36.0-36.5 feet bgs and was also detected as deep as 51.5 feet bgs at 0.27 mg/kg. PCB detections were also observed in BPS1-SB3008 (Aroclor-1248, 0.23 mg/kg at 52.5 feet bgs), BPS1-SB3010 (from 0 to 8 feet bgs, Aroclor-1242 at 0.023 mg/kg and Aroclor-1260 at 0.01 mg/kg), and a deep detection in BPS1-SB3012 of Aroclor-1242, 0.019 mg/kg at 203.5 feet bgs. Figure 4-4 presents a summary of the PCB detections observed in site soils during the investigation.

Detections of DROs were observed in some of the soil samples collected for laboratory analysis (see Table 4-2). BPS1-SB3008 had detections of DRO at 4 of the sample depths ranging from 4.6 to 13 mg/kg from 25 to 235 feet bgs. BPS1-SB3009 had detections of DRO at 4 of the sample depths ranging from 2.9 to 11 mg/kg from 25 to 209.5 feet bgs. BPS1-SB3011 had a DRO detection of 6.8 mg/kg at 49 feet bgs.

Appendix D and E provide the chain of custody forms, analytical results, and validation summaries of the soil samples sent for fixed based lab analysis.

### **4.4 GROUNDWATER SAMPLING RESULTS**

#### **4.4.1 Groundwater Grab Sampling Results**

Groundwater grab samples were collected at two of the downgradient soil boring locations and analyzed for VOCs and PCBs. Table 4-3 provides a summary of the groundwater grab detections at BPS1-

SB3010 and BPS1-SB3012 along with the results from the associated monitoring wells installed at these locations. Aroclor-1242 was detected in all four groundwater grab sample intervals at BPS1-SB3010, with a maximum concentration of 0.42 µg/L at 114 to 118 feet bgs. Aroclor-1242 was only detected in one of the four groundwater grab samples in BPS1-SB3012 at 0.24 µg/L from 144 to 148 feet bgs. One groundwater grab sample (BPS1-GW3012, from 144 to 148 feet bgs) indicated VOC concentrations of benzene (0.19 µg/L), cis-1,2-dichloroethene (0.61 µg/L), tetrachloroethene (PCE) (0.91 µg/L), toluene (0.25 µg/L), and trichloroethene (TCE) (1.4 µg/L).

Based on the low concentrations of PCBs observed in these groundwater grab samples, monitoring wells were installed at these downgradient locations to assess the potential PCB migration from the source areas. However, based on a comparison of the groundwater grab and subsequent monitoring well results, the groundwater grab samples under-estimated the PCBs in groundwater (Table 4-3).

#### **4.4.2 Monitoring Well Sampling Results**

Nineteen monitoring wells were sampled for VOCs and PCBs during the two sampling events conducted in 2010 and March 2011. Based on detections of chromium and hexavalent chromium observed in IDW samples collected after the sampling event in 2010, select monitoring wells were also sampled for total metals and hexavalent chromium during the March 2011 event.

Aroclor-1242 was detected by the laboratory in all of the groundwater samples except for BPS1-MW304S and the field quality control blanks. The laboratory indicated that a conclusive PCB Aroclor identification was not possible due to the interference and/or weathering of the samples. Validation of the laboratory results indicated that both Aroclor-1242 and Aroclor-1248 have several common peaks and similar patterns in their standard chromatograms. Because of these similarities, it was too difficult to determine the predominant Aroclor or how to precisely quantify each Aroclor separately. Therefore the laboratory reported a single Aroclor mixture, Aroclor-1242. A “weathering effect” or degradation of compounds within the specific mixtures is also a likely factor in precisely identifying the Aroclor mixture present. Despite these complexities, validation concluded that an Aroclor mixture is present in the affected samples and due to the similarities between Aroclor-1242 and Aroclor-1248, the detected results (as Aroclor-1242) were qualified as estimated.

Of the 38 groundwater samples collected during both rounds of sampling, 32 samples indicated concentrations of Aroclor-1242 that exceeded the Federal and New York State Department of Health (NYSDOH) MCL of 0.5 micrograms per liter (µg/L). Aroclor-1242 was detected at concentrations ranging from 0.052 to 14 µg/L. See Table 4-4 and Figures 4-5, 4-6, and 4-7 for further details regarding the detections and distribution of Aroclor-1242.

A total of twelve VOCs were detected in groundwater during the two sampling events, with five of those VOCs (1,1,1-trichloroethane, 1,1-dichloroethane, cis-1,2-dichloroethene, PCE, and TCE) exceeding the NYSDOH MCL of 5 µg/L. 1,1,1-trichloroethane was detected in two of the monitoring wells at concentrations ranging from 6.1 to 23 µg/L during both sampling events. 1,1-dichloroethane was detected at BPS1-TT-MW304I1 (6.9 µg/L) during the 2010 sample event. Cis-1,2-dichloroethene was detected at concentrations ranging from 8.8 µg/L to 110 µg/L. Concentrations of PCE ranged from 17 to 550 µg/L with the highest detection found in BPS1-FW-MW01 during the March 2011 sampling event. PCE was also detected above MCLs in BPS1-FW-MW02, BPS1-FW-MW03, BPS1-TT-MW303I1, BPS1-TT-MW304I1, and at BPS1-TT-MW304I2. TCE was also exceeded the MCL at BPS1-FW-MW01 (41 µg/L) and concentrations ranging from 5.4 to 27 µg/L in BPS1-TT-MW303I1 and BPS1-TT304I2.

Total metals and hexavalent chromium samples were collected from eight of the monitoring well locations during the March 2011 sampling event. Hexavalent chromium and total chromium were observed at elevated concentrations. Hexavalent chromium was detected at BPS1-HN-MW29I (1.1 µg/L), BPS1-TT-MW-301I (4.5 µg/L), BPS1-TT-MW304I1 (58 µg/L), and BPS1-TT-MW304I2 (166 µg/L). Total chromium exceeded the MCL of 100 µg/L at BPS1-TT-MW304I2 (180 µg/L) and was detected all 8 groundwater samples. Total cadmium was detected in 5 of the groundwater samples below the MCL with a maximum concentration of 2.7 µg/L at BPS1-TT-MW301I1.

Table 4-4 provides an analytical summary of detected compounds observed in the groundwater samples collected at Site 1. Figures 4-5, 4-6, and 4-7 present the analytical detections for the shallow, intermediate, and deep monitoring wells respectively.

Appendix D and E provide the chain of custody forms, analytical results, and validation summaries of the groundwater samples sent for fixed based lab analysis.

## 5.0 CONCLUSIONS AND RECOMMENDATIONS

Conclusions based on the PCB investigation activities are as follows:

1. Based on the analytical results for soil, the vertical extent of PCB-contaminated soil (concentrations > 10 mg/kg) in the source area is approximately 65 feet bgs.
2. The low concentrations of VOCs, TPH-DRO, and TPH-GRO detected in site soils and groundwater during this investigation are not sufficient to confirm whether fuel or solvents have acted as a carrier fluid that could promote PCB migration.
3. Potentiometric surface mapping of groundwater in the study area indicated groundwater flow is south to southeast.
4. Detections of PCBs in the groundwater samples collected in BPS1-MW301s, MW301I, and MW301D indicate a potential source of PCB-contaminated groundwater north of Site 1.
5. Detections of PCBs in all of the downgradient monitoring wells, except BPS1-MW304S, indicate that PCBs have migrated past the Site 1 boundary.
6. The vertical and horizontal extent of PCB-contaminated groundwater has not been defined.
7. Total chromium and hexavalent chromium were detected at elevated concentrations in groundwater.
8. A good correlation was observed between the PCB test kit results and the laboratory confirmation samples for soil.
9. A poor correlation was observed between groundwater grab results and the associated monitoring well samples.

Recommendations are as follows:

1. Further evaluate current and historical analytical data for soil to determine where additional PCB delineation is needed in the source areas.
2. Investigate potential upgradient sources of PCB groundwater contamination.
3. Determine the extent of PCB-contaminated groundwater downgradient of Site 1.
4. Further investigate the occurrence of chromium and hexavalent chromium in groundwater.

BPS1-SB3012	48 - 58	<b>12</b>	ND
BPS1-SB3012	58 - 68	<b>16.8</b>	ND

**Notes:**

bgs : below ground surface

PCB : Polychlorinated Biphenyls

mg/kg : milligram per kilogram

**Bolded** values are greater than 10 ppm (subsurface soil screening level)

ND : Not detected

NA : Not analyzed (between 0-25 feet bgs)

\* : Field test kit readings of 0 to 3 mg/kg may be a result of the analytical method and potential chloride interferences and do not necessarily indicate the presence of PCBs.

BANC3 Project # 2000215-04

Dear Mr. Sok,

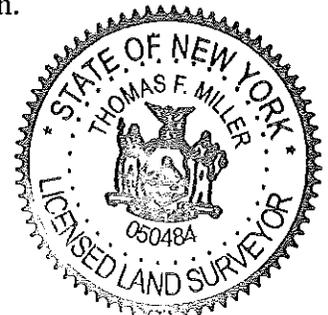

BANC3 Inc. is pleased to provide you with our completed Survey Report for the above referenced project.

BANC3 performed field surveys relative to the subject project to include Global Positioning Systems (GPS), conventional Total Station Surveys and differential leveling surveys. From the data, a table of Monitoring Well and Soil Boring Locations was prepared and included herein. The table includes control points utilized, locations and elevations of Monitoring Well cover, inner casing and adjacent ground where appropriate and Soil Boring locations and elevations. BANC3 performed field reconnaissance and locations of survey control markers tied National Geodetic Survey (NGS) monument designated as "15E 14N" (PID # KU5039) included herein. BANC3 verified the positioning and accuracy of the Monitoring Wells and Soil Borings through our ground field locations and redundant measurements of survey control points. All locations are referenced to New York State Plane Coordinates (Long Island Zone), North American Datum of 1983 and elevations referenced to North American Vertical Datum of 1988. (NAD83, NAVD 88).

We appreciate the opportunity to work with your organization and the US Navy. Please contact me if you have any questions and/or require additional information.

Respectfully submitted,

Thomas F. Miller, PLS, PP  
State of New York Professional Land Surveyor #050484

DERIVATION OF ORTHOMETRIC HEIGHT OF NATIONAL GEODETIC SURVEY  
MONUMENT 15E 14N (PID # KU5039)

“It is a straightforward procedure to algebraically subtract an interpolated geoid height, N, from a GPS ellipsoidal height, h, to obtain an orthometric height, H:

$$H = h - N^{1}$$

For NGS Monument 15E 14N:

H = Orthometric Height (to be determined)

h = Ellipsoidal Height ( 6.331 meters) Adjusted 02/10/07

N = Geoid Height ( -31.11 meters)

or

H = 6.331m – (-31.11m)

H = 37.441m (or 122.84 feet)

---

<sup>1</sup> Converting GPS Height into NAVD88 Elevation with the GEOID96 Geoid Height Model, Dennis G. Milbert, Ph.D. and Dru A. Smith, Ph.D., National Geodetic Survey, NOAA

**Overview**

The sample set for NWIRP Bethpage, CTO WE44, SDG 50063-1 consisted of twenty-four (24) soil environmental samples, three (3) aqueous trip blanks, one (1) aqueous rinse blank, and one (1) aqueous source water blank. The samples were analyzed for an abbreviated list of volatile organic compounds (VOC), polychlorinated biphenyls (PCB), Petroleum Extractible (PET) Gasoline Range Organics (GRO), & Diesel Range Organics (DRO) as listed above. One field duplicate pair was associated with this sample delivery group (SDG); BPS1-Dup01-20100717 / BPS1-SB3005-145.0145.5.

The samples were collected by Tetra Tech on July 13, 14, 15, 16, 17 and 19, 2010 and analyzed by TriMatrix Laboratories. All analyses were conducted in accordance with EPA Method SW-846 8260B, 8015C, and 8082 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters:

- Data Completeness
- Holding Times
- \* • GC/MS Tuning
- \* • Initial and Continuing Calibration
- Laboratory Blank Analyses
- System Monitoring Compound/Surrogate Recovery
- \* • Blank Spike Results
- \* • Internal Standard Recoveries
- \* • Matrix Spike/Matrix Spike Duplicate Recoveries
- \* • Compound Quantitation
- \* • Compound Identification
- \* • Detection Limits

The symbol (\*) indicates that all quality control criteria were met for this parameter. Qualified analytical results are presented in Appendix A, results as reported by the laboratory are presented in Appendix B, Region II data validation forms are presented in Appendix C, and documentation supporting these findings is presented in Appendix D.

### **Volatile (VOC)**

All trip blanks for this SDG were analyzed by the mid-level 5035 Soil Purge & Trap method and were reported in units of mg/kg even though they were aqueous samples. The rinse blank and sample blank were analyzed using a low level 5030B Aqueous Purge & Trap method and the results were reported in units of µg/L.

The following compound was detected in the method blank BLK0721A affecting all SDG samples.

<u>Compound</u>	<u>Maximum Conc. mg/kg</u>	<u>Action Level mg/kg</u>
Acetone	0.14	1.40
2-Butanone	0.088	0.880

An action level of 10X the maximum concentration for the common laboratory contaminant acetone and 2-butanone was established to evaluate laboratory contamination. Dilution factors, sample aliquots and percent solids for soils, if applicable, were taken into consideration during the application of all action levels. The positive results for acetone below the blank action level were qualified as non-detected, (U). The trip blanks, rinse blank, and source water blank were not qualified due to method blank contamination.

### **PCBs**

Some samples were analyzed both undiluted and diluted due to Aroclors which exceeded the highest calibration standard. The non-detect Aroclor results were reported from the undiluted analyses. The samples and the dilutions are listed below.

<u>Samples</u>	<u>Dilution</u>
BPS1-SB3005-54.555.0	1X, 5X, 500X
BPS1-SB3005-57.558.0	1X, 10X, 400X

The sample BPS1-SB3005-94.595.0 Aroclor-1248 positive result was qualified estimated, (J), as the relative percent difference (RPD) between the analytical columns DB-35 and DB-XLB for the result was greater than the 25% quality control limit.

The percent recovery (%R) was less than the quality control limit for the surrogate decachlorobiphenyl for sample BPS1-SB3005-57.558.0 re-analysis for column DB-35. The %R was within the quality control limits for column DB-XLB. The non-detected results were not reported from this sample dilution re-analysis and the positive result for Aroclor-1260 reported from the DB-35 column was qualified estimated, (J).

The %R was less than the quality control limit for the surrogate decachlorobiphenyl (DCB) for sample BPS1-SB3005-57.558.0 for both the chromatography columns DB-35 and DB-XLB. The non-detected Aroclor results were qualified estimated, (UJ). The positive Aroclor results were not qualified as the results were not reported from this analysis as they were greater than the highest standard on the calibration curve.

The continuing calibration verification (CCV) percent differences (%D) were not calculated by the laboratory for a number of the CCVs. The calculations were performed manually to verify the %Ds were within the quality control limits.

Multiple CCV percent recoveries (%R) for the surrogate decachlorobiphenyl (DCB) were either less than the quality control limit or greater than the quality control limit on either or both of the chromatography columns DB-35 and DB-XLB for a number of calibration check CCVs. No action was required for these issues.

The %R was less than the quality control limit for the surrogate decachlorobiphenyl for sample BPS1-SB3005-54.555.0 for column DB-35. The %R was within the quality control limits for column DB-XLB. Therefore, the non-detected Aroclor results for the sample were not qualified. The positive Aroclor results were not qualified as the positive Aroclor results were not reported from this analysis as they were greater than the highest standard on the calibration curve.

### **DRO**

The blank had DRO result detected in the method blank associated with batch 1007021 affecting all SDG soil samples.

<u>Compound</u>	<u>Maximum Conc. mg/kg</u>	<u>Action Level mg/kg</u>
Diesel Range Organics	2.5	12.5

An action level of 5X the maximum concentration for the laboratory contaminant was established to evaluate laboratory contamination. Dilution factors and sample aliquots and percent solids for soils, if applicable, were taken into consideration during the application of all action levels. The positive results for DRO below the blank action level were qualified as non-detected, (U). All samples had positive DRO detections which were qualified due to method blank contamination.

### **GRO**

The sample to analysis hold time of 14 days was exceeded by <2X for samples BPS1-TB01, TB-20100715, and TB-20100717. The samples had non-detected GRO results which were qualified estimated, (UJ).

The surrogate %R was greater than the quality control limit for sample TB-20100715. No action was taken as the GRO result for the sample was non-detected.

### **Additional Comments**

Positive results below the Reporting Limit (RL) and above the detection limit were qualified as estimated, (J), due to uncertainty near the detection limit.

**EXECUTIVE SUMMARY**

**Laboratory Performance Issues:** VOC method blank contamination resulted in qualification of sample acetone results. An Aroclor-1248 positive result for sample BPS1-SB3005-94.595.0 was qualified due to a column RPD quality control limit exceedance. An Aroclor-1260 positive result was qualified due to a %R surrogate quality control limit exceedance. A low surrogate % recovery for DCB resulted in the qualification of non-detected PCB results for sample BPS1-SB3005-57.558.0. DRO method blank contamination resulted in qualification of sample DRO results. Sample GRO non-detected results were qualified due exceeding the sample to analysis hold time.

**Other Factors Affecting Data Quality:** Positive results below the Reporting Limit (RL) and above the detection limit were qualified as estimated, (J), due to uncertainty near the detection limit.

The data for these analyses were reviewed with reference to the Organic Data Validation (10/99), USEPA Region II Standard Operating Procedures for Validating Volatile Organic Compounds by SW-846 Method 8260B (October 2006), validating PCB compounds by SW-846 Method 8082A (Oct. 2006), and the Department of Defense (DoD) document entitled "Quality Systems Manual (QSM) for Environmental Laboratories" (January 2006).

**Appendix A**

Qualified Analytical Results

### **Value Qualifier Key (Val Qual)**

J – The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ – The result is an estimated non-detected quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

U - Value is a non-detect as reported by the laboratory.

UR – Non-detected result is considered rejected, (UR), as a result of technical non-compliances.

### **DATA QUALIFICATION CODE (QUAL CODE)**

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
- C01 = GC/MS Tuning Noncompliance
- D = MS/MSD Recovery Noncompliance
- E = LCS/LCSD Recovery Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's  $r < 0.995$  / ICP PDS Recovery Noncompliance
- K = ICP Interference - includes ICS % R Noncompliance
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation Noncompliance
- N = Internal Standard Noncompliance
- N01 = Internal Standard Recovery Noncompliance Dioxins
- N02 = Recovery Standard Noncompliance Dioxins
- N03 = Clean-up Standard Noncompliance Dioxins
- O = Poor Instrument Performance (e.g. base-line drifting)
- P = Uncertainty near detection limit ( $< 2 \times$  IDL for inorganics and  $<$ CRQL for organics)
- Q = Other problems (can encompass a number of issues; e.g. chromatography, interferences, etc.)
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin
- U = % Difference between columns/detectors  $> 25\%$  for positive results determined via GC/HPLC
- V = Non-linear calibrations; correlation coefficient  $r < 0.995$
- W = EMPC result
- X = Signal to noise response drop
- Y = Percent solids  $< 30\%$
- Z = Uncertainty at 2 sigma deviation is greater than sample activity

#### Overview

The sample set for NWIRP Bethpage, SDG 022HG, consists of twenty-four (24) soil environmental samples, one (1) rinse blank and one (1) source blank. One field duplicate pair (BPS1-Dup01-20100717/BPS1-SB3005-145.0145.5) was included within this SDG.

All soil samples were analyzed for total solids, nine soil samples were analyzed for total organic carbon, and the aqueous samples were analyzed for total organic carbon. The samples were collected by Tetra Tech NUS on July 13,14,15,16,17, and 19, 2010 and analyzed by Trimatrix Laboratories. Analyses were conducted using SW-846 Method 9060 and 3550B.

These data were evaluated based on the following parameters:

- \* • Data Completeness
- \* • Holding Times
- \* • Initial and Continuing Calibrations
- \* • Laboratory Method Blank Analyses
- \* • Laboratory Control Sample Results
- \* • Field Duplicate Results
- \* • Detection Limits
- \* • Analyte Quantitation

\* - All quality control criteria were met for this parameter.

Problems affecting data quality are discussed below; documentation supporting these findings is

**TO: R. SOK – PAGE 2**  
**DATE: OCTOBER 11, 2010**

presented in Appendix C. Qualified Analytical results are presented in Appendix A. Results as reported by the laboratory are presented in Appendix B.

TOC

Positive results greater than the detection limit (DL), but less than the limit of quantitation (LOQ) were qualified as estimated "J".

Notes

Executive Summary

**Laboratory Performance:** None to report.

**Other Factors Affecting Data Quality:** Positive results greater than the DL, but less than the LOQ were qualified.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", October 2004 and the DOD document entitled "Quality System Manual (QSM) for Environmental Laboratories" (January 2006).

The text of this report has been formulated to address only those problem areas affecting data quality.

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

**APPENDIX A**  
**QUALIFIED ANALYTICAL RESULTS**

**Data Validation Qualifier Codes:**

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
- C01 = GC/MS Tuning Noncompliance
- D = MS/MSD Recovery Noncompliance
- E = LCS/LCSD Recovery Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS-GFAA MSA's  $r < 0.995$  / ICP PDS Recovery Noncompliance
- K = ICP Interference - includes ICS % R Noncompliance
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation Noncompliance
- N = Internal Standard Noncompliance
- N01 = Internal Standard Recovery Noncompliance Dioxins
- N02 = Recovery Standard Noncompliance Dioxins
- N03 = Clean-up Standard Noncompliance Dioxins
- O - Poor Instrument Performance (e.g. base-line drifting)
- P = Uncertainty near detection limit ( $< 2 \times$  IDL for inorganics and  $<$ CRQL for organics)
- Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DOT and Endrin
- U = % Difference between columns/detectors  $>25\%$  for positive results determined via GC/HPLC
- V = Non-linear calibrations; correlation coefficient  $r < 0.995$
- W = EMPC result
- X = Signal to noise response drop
- Y = Percent solids  $<30\%$
- Z = Uncertainty at 2 sigma deviation is greater than sample activity

### Overview

The sample set for NWIRP Bethpage, CTO WE44, SDG 50063-2 consisted of twenty-seven (27) soil environmental samples, four (4) aqueous trip blanks, and one (1) aqueous rinse blank. The samples were analyzed for an abbreviated list of volatile organic compounds (VOC), polychlorinated biphenyls (PCB), Gasoline Range Organics (GRO), Diesel Range Organics (DRO), and total organic carbon (TOC) as listed above. Three field duplicate pairs were associated with this sample delivery group (SDG); BPS1-Dup02-20100728 / BPS1-SB3006-181.0181.5, BPS1-Dup03-20100727 / BPS1-SB3006-32.032.5, and BPS1-Dup04-20100731 / BPS1-SB3009-51.051.5.

The samples were collected by Tetra Tech on July 27, 28, 29, 30, 31 and August 1, 2, and 3, 2010 and analyzed by TriMatrix Laboratories. All analyses were conducted in accordance with EPA Method SW-846 8260B, 8015C, 9060, and 8082 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters:

- Data Completeness
- \* • Holding Times
- \* • GC/MS Tuning
- Initial and Continuing Calibration
- Laboratory Blank Analyses
- \* • System Monitoring Compound/Surrogate Recovery
- \* • Blank Spike Results
- \* • Internal Standard Recoveries
- \* • Matrix Spike/Matrix Spike Duplicate Recoveries
- \* • Field Duplicate Results
- \* • Compound Quantitation
- \* • Compound Identification
- \* • Detection Limits

The symbol (\*) indicates that all quality control criteria were met for this parameter. Qualified analytical results are presented in Appendix A, results as reported by the laboratory are presented in Appendix B, Region II data validation forms are presented in Appendix C, and documentation supporting these findings is presented in Appendix D.

### VOC

All trip blanks for this SDG were analyzed by the mid-level 5035 Soil Purge & Trap method and were reported in units of mg/kg even though they were aqueous samples. The rinse blank was analyzed using a low level 5030B Aqueous Purge & Trap method and the results were reported in units of µg/L. Only the trip blank results were used to qualify soil samples for blank contamination.

The following compound was detected in the trip blank BPS1-TB-20100727 affecting all SDG soil samples.

<u>Compound</u>	<u>Maximum Concentration</u>	<u>Action Level</u>
2-Butanone	0.056 mg/kg	0.560 mk/kg

An action level of 10X the maximum concentration for the common laboratory contaminant 2-butanone was established to evaluate laboratory contamination. Dilution factors, sample aliquots, and percent solids for soils, if applicable, were taken into consideration during the application of all action levels. The positive results for 2-butanone below the blank action

level were qualified as non-detected (U). The quality control sample trip and rinse blanks were not qualified for method blank contamination.

The initial calibration linear calibration r value was less than the 0.995 quality for methylene chloride for instrument 224 on 08/03/10 for the mid-level 5035 Soil Purge & Trap method calibration 0H05022 used for the methanol preserved soil VOC analyses affecting all soil sample analyses. The non-detected methylene chloride results for all the soil samples were qualified estimated, (UJ),

### **PCB**

The continuing calibration verification (CCV) percent differences (%D) were not calculated by the laboratory for a number of the CCVs. The calculations were performed manually to verify the %Ds were within the quality control limits.

Some sample Form 1s did not have the Aroclor-1248 reported on the Form 1 for the initial column analysis even though Aroclor -1248 was detected. This was due to the fact that the initial analysis was performed on an instrument that had only a 1 point calibration level for Aroclor -1248. All samples with initial analysis positive Aroclor -1248 detections were re-analyzed on an instrument that was calibrated at multiply levels for Aroclor -1248 and the result from this analysis was reported in the EDD.

The Aroclor -1248 opening and closing continuing calibration verification data was not initially submitted by the laboratory for 08/12/10 @ 22:26 and 08/13/10 @ 02:28. The laboratory was contacted and they submitted the missing data.

The higher of the two column positive results was reported in the EDD by the laboratory.

Three samples were analyzed both undiluted and diluted due to a Aroclor -1248 result which exceeded the highest calibration level in the undiluted sample analysis. The non-detected Aroclor results were reported from the undiluted analyses and the Aroclor -1248 results were reported from the dilution analyses. The samples requiring dilution and the dilutions are listed below.

<u>Samples</u>	<u>Dilution</u>
BPS1-Dup03-20100727	1X, 50X
BPS1-SB3006-32.032.5	1X, 50X
BPS1-SB3009-36.036.5	1X, 50X

### **DRO**

No issues were identified.

### **GRO**

The continuing calibration verification %D for the GRO analysis was greater than the quality control limit of 15% for instrument 140 for 08/12/10 @ 05:07 affecting sample BPS1-SB3008-234.5235.0. The sample non-detected GRO result was qualified estimated, (UJ).

### **Additional Comments**

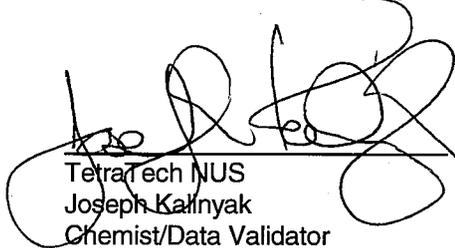

Positive results below the Reporting Limit (RL) and above the detection limit were qualified as estimated, (J), due to uncertainty near the detection limit.

**EXECUTIVE SUMMARY**

**Laboratory Performance Issues:** VOC method blank contamination resulted in qualification of sample 2-butanone results. All methylene chloride results were qualified due to the r value for the initial linear calibration was less than the quality control limit. Sample BPS1-SB3008-234.5235.0 GRO non-detected result was qualified due to a CCV exceeding the quality control limit.

**Other Factors Affecting Data Quality:** Positive results below the Reporting Limit (RL) and above the detection limit were qualified as estimated, (J), due to uncertainty near the detection limit.

The data for these analyses were reviewed with reference to the Organic Data Validation (10/99), USEPA Region II Standard Operating Procedures for Validating Volatile Organic Compounds by SW-846 Method 8260B (October 2006), validating PCB compounds by SW-846 Method 8082A (Oct. 2006), the National Functional Guidelines for Inorganic Review (October 2004), and the Department of Defense (DoD) document entitled "Quality Systems Manual (QSM) for Environmental Laboratories" (January 2006).

**Attachments:**

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as Reported by the Laboratory
3. Appendix C - Region II Data Validation Forms
4. Appendix D - Support Documentation

**Appendix A**

Qualified Analytical Results

### **Value Qualifier Key (Val Qual)**

J – The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ – The result is an estimated non-detected quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

U - Value is a non-detect as reported by the laboratory.

UR – Non-detected result is considered rejected, (UR), as a result of technical non-compliances.

### **DATA QUALIFICATION CODE (QUAL CODE)**

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
- C01 = GC/MS Tuning Noncompliance
- D = MS/MSD Recovery Noncompliance
- E = LCS/LCSD Recovery Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's  $r < 0.995$  / ICP PDS Recovery Noncompliance
- K = ICP Interference - includes ICS % R Noncompliance
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation Noncompliance
- N = Internal Standard Noncompliance
- N01 = Internal Standard Recovery Noncompliance Dioxins
- N02 = Recovery Standard Noncompliance Dioxins
- N03 = Clean-up Standard Noncompliance Dioxins
- O = Poor Instrument Performance (e.g. base-line drifting)
- P = Uncertainty near detection limit ( $< 2 \times$  IDL for inorganics and  $<$ CRQL for organics)
- Q = Other problems (can encompass a number of issues; e.g. chromatography, interferences, etc.)
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin
- U = % Difference between columns/detectors  $>25\%$  for positive results determined via GC/HPLC
- V = Non-linear calibrations; correlation coefficient  $r < 0.995$
- W = EMPC result
- X = Signal to noise response drop
- Y = Percent solids  $<30\%$
- Z = Uncertainty at 2 sigma deviation is greater than sample activity

PAGE: 2

The samples were collected by Tetra Tech on August 9, 10, 11, 12, 13, 14, 15 and 16, 2010 and analyzed by Trimatrix Laboratories. VOC and PCB analyses were conducted in accordance with EPA Method SW-846 8260B and 8082, respectively. GRO and DRO analyses were conducted using SW-846 method 8015B. TOC analyses followed MSA 29-3.5.2. The data contained in this SDG were validated with regard to the following parameters:

- \*     •     Data completeness
- \*     •     Holding times
- \*     •     GC/MS Tuning
- \*     •     Initial/continuing calibrations
- \*     •     Laboratory Method Blank Results
- \*     •     Surrogate Recoveries
- \*     •     Matrix Spike / Matrix Spike Duplicate Recoveries
- \*     •     Laboratory Control Sample Recoveries
- \*     •     Internal Standard Recoveries
- \*     •     Compound Quantitation
- \*     •     Compound Identification
- \*     •     Field Duplicate Precision
- \*     •     Detection Limits

The symbol (\*) indicates that all quality control criteria were met for this parameter. Qualified analytical results are presented in Appendix A, results as reported by the laboratory are presented in Appendix B, Region II data validation forms are presented in Appendix C, and documentation supporting these findings is presented in Appendix D.

Volatile- None.

#### PCB

The percent difference (%D) between columns was greater than the 25% quality control limit but less than 100% for PCB-1242 in sample BPS1-GW3010-5761. The positive PCB-1242 result in sample BPS1-GW3010-5761 was qualified as estimated (J).

GRO- None.

DRO- None.

TOC- None.

#### Additional Comments

Rinse blank BPS1-RB03-20100815 contained contaminants 2-butanone and acetone in the VOC fraction. There were no positive detections of 2-butanone or acetone in any of the samples analyzed for VOCs. No action was warranted.

The percent recovery (%R) of surrogate aaa-trifluorotoluene in sample BPS1-TB07-20100809 was greater than the upper quality control limit in the GRO fraction. No action was taken on the nondetected GRO result in sample BPS1-TB07-20100809.

TO: R. Sok  
FROM: A. Cognetti  
SDG: 50063-3  
DATE: October 11, 2010  
PAGE: 3

Positive results below the Reporting Limit (RL) and above the detection limit were qualified as estimated, (J), due to uncertainty near the detection limit.

Trip blanks BPS1-TB07-20100809 and BPS1-TB08-20100814 were reported by the laboratory in soil units (mg/kg). The chain of custody indicated the trip blanks contained methanol.

#### EXECUTIVE SUMMARY

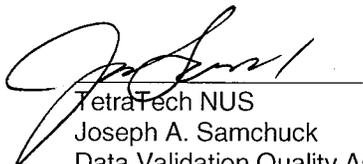

**Laboratory Performance Issues:** The %D between columns was greater than the quality control limit for PCB-1242 in sample BPS1-GW3010-5761.

**Other Factors Affecting Data Quality:** None.

The data for these analyses were reviewed with reference to SOP # HW-24 Revision #2, October 2006, USEPA Region II Hazardous Waste Support Branch Validating Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry SW-846/8260B, SOP # HW-45 Revision #1, October 2006, USEPA Region II Hazardous Waste Support Branch Validating PCB Compounds by Gas Chromatography SW-846 Method 8082A and the Department of Defense (DoD) document entitled "Quality Systems Manual (QSM) for Environmental Laboratories", January 2006.

The text of this report has been formulated to address only those problem areas affecting data quality.

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as Reported by the Laboratory
3. Appendix C - Region II Data Validation Forms
4. Appendix D - Support Documentation

**Appendix A**

Qualified Analytical Results

**Data Validation Qualifier Codes:**

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
- C01 = GC/MS Tuning Noncompliance
- D = MS/MSD Recovery Noncompliance
- E = LCS/LCSD Recovery Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's  $r < 0.995$
- K = ICP Interference - includes ICS % R Noncompliance
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation Noncompliance
- N = Internal Standard Noncompliance
- N01 = Internal Standard Recovery Noncompliance Dioxins
- N02 = Recovery Standard Noncompliance Dioxins
- N03 = Clean-up Standard Noncompliance Dioxins
- O = Poor Instrument Performance (e.g. base-line drifting)
- P = Uncertainty near detection limit ( $< 2 \times$  IDL for inorganics and  $<$ CRQL for organics)
- Q = Other problems (can be any number of issues; e.g. poor chromatography,interferences, etc.)
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin
- U = % Difference between columns/detectors  $>25\%$  for positive results determined via GC/HPLC
- V = Non-linear calibrations; correlation coefficient  $r < 0.995$
- W = EMPC result
- X = Signal to noise response drop
- Y = Percent solids  $<30\%$
- Z = Uncertainty at 2 sigma deviation is greater than sample activity

The samples were collected by Tetra Tech on July 15, 16, 17, 18, and 26, 2010 and analyzed by TriMatrix Laboratories. All analyses were conducted in accordance with EPA Method SW-846 8260B, 8270C, 8015C, and 8082 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters:

- \*     •     Data Completeness
- \*     •     Holding Times
- \*     •     GC/MS Tuning
- Initial and Continuing Calibration
- Laboratory Blank Analyses
- System Monitoring Compound/Surrogate Recovery
- \*     •     Blank Spike Results
- \*     •     Internal Standard Recoveries
- \*     •     Field Duplicate Precision
- Compound Quantitation
- \*     •     Compound Identification
- \*     •     Detection Limits

The symbol (\*) indicates that all quality control criteria were met for this parameter. Qualified analytical results are presented in Appendix A, results as reported by the laboratory are presented in Appendix B, Region II data validation forms are presented in Appendix C, and documentation supporting these findings is presented in Appendix D.

### **Volatile (VOC)**

Trip blanks for this SDG were analyzed by both the mid-level 5035 Soil Purge & Trap method reported in units of mg/kg and using the low level 5030B Aqueous Purge & Trap reported in units of µg/L. The rinse blank and field sample blank were analyzed using a low level 5030B Aqueous Purge & Trap method and the results were reported in units of µg/L. Trip blank sample BPS1-TB09-20100817 was a methanol trip blank and was analyzed using the mid-level Soil Purge & Trap method.

The following compound was detected in the method blank for batch 1008984 affecting SDG samples BPS1-TB-20100826 and BPS1-TW3011-20100826.

<u>Compound</u>	<u>Maximum Concentration</u>	<u>Action Level</u>
Acetone	3.6 µg/L	36.0 µg/L

An action level of 10X the maximum concentration for the common laboratory contaminant acetone was established to evaluate laboratory contamination. Dilution factors and sample aliquots, if applicable, were taken into consideration during the application of all action levels. The positive result for acetone below the blank action level for sample BPS1-TW3011-20100826 was qualified as non-detected, (U). The trip blank was not qualified due to method blank contamination.

The trip blank BPS1-TB-20100826 had detections for the common laboratory contaminant VOCs acetone, 2-butanone, and methylene chloride. These compounds were not present in the associated samples and qualification of the data was not necessary.

**TCLPV (TCLP VOC)**

No issues were identified.

**TCLPS (TCLP SVOC)**

The initial calibration response factors (RF) for chlordane and toxaphene were less than the 0.05 quality control limit affecting the sample BPS1-DrumIDW-01-20100818 non-detected chlordane and toxaphene results. The non-detected chlordane and toxaphene results were qualified estimated, (UJ), for the sample.

**PCBs**

Sample BPS1-DrumIDW-01-20100818 was analyzed both undiluted and diluted 100X for Aroclor-1248 due to the Aroclor-1248 analysis result which exceeded the highest calibration standard in the undiluted sample analysis. The non-detect PCB results were reported from the undiluted analyses and the Aroclor-1248 result was reported from the 100X dilution re-analysis.

The sample BPS1-DrumIDW-01-20100818 Aroclor-1248 positive result was qualified estimated, (J), as the relative percent difference (RPD) between the analytical columns DB-35 and DB-XLB for the result was greater than the 25% quality control limit.

The percent recovery (%R) was greater than the quality control limit for the surrogate tetrachloro-m-xylene (TCX) for sample BPS1-GW3010-144148 for the analytical column DB-XLB. The non-detected Aroclor results were not qualified as the alternated column had a %R for the surrogate within the quality control limits, and the positive Aroclor-1242 result was not qualified as it was reported from the alternate column.

Three continuing calibration verifications (CCV) had surrogate %Rs greater than the quality control limit for decachlorobiphenyl (DCB). No action was taken as this did not affect the sample analyses.

No LCS was performed for the Aroclor-1242 and the Aroclor-1248 analyses.

Per the laboratory narrative for Aroclor-1242 positive results, "A conclusive PCB Aroclor identification is not possible due to matrix interference and/or weathering of the sample. The identity of the reported Aroclor is tentative." The positive Aroclor-1242 sample results for samples BPS1-GW3010-144148, BPS1-GW3010-196200, BPS1-GWDup01-20100817, and BPS1-SB3010-0008 were qualified estimated, (J), due to this issue.

**DRO (C10-C28)**

DRO was detected in the DRO aqueous method blank associated with batch 1007869 at 97 µg/L affecting aqueous rinse blank sample BPS1-RB04-20100818. Additionally, the rinse blank sample BPS1-RB04-20100818 had DRO detected at 180 µg/L. No action was taken for this method blank contamination as QC rinse blank samples are not qualified for method blank contamination.

The continuing calibration verification percent difference (%D) for the DRO analysis was greater than the 15% quality control limit for instrument 157 for 09/04/10 @ 13:23 and @ 15:50 affecting sample BPS1-RB04-20100818. The sample BPS1-RB04-20100818 positive DRO result was qualified estimated, (J).

**GRO (C06-C10)**

The continuing calibration verification %D for the GRO analysis was greater than the quality control limit of 15% for instrument 140 for 08/20/10 @ 22:29 affecting samples BPS1-SB3010-188.0188.5, BPS1-SB3011-48.549.0, and BPS1-TB09-20100817. The samples non-detected GRO results were qualified estimated, (UJ).

**Additional Comments**

Positive results below the Reporting Limit (RL) and above the detection limit were qualified as estimated, (J), due to uncertainty near the detection limit.

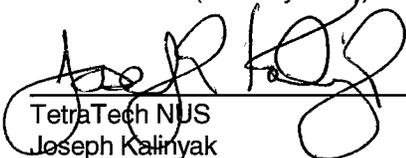

Aroclor results were reported from the DB-35 column by the laboratory regardless of whether the results were the highest or the lowest of the two analytical columns.

**EXECUTIVE SUMMARY**

**Laboratory Performance Issues:** VOC method blank contamination resulted in qualification of sample acetone results. Initial calibration response factors <0.05 for chlordane and toxaphene resulted in the qualification of the non-detected TCLP sample BPS1-DrumIDW-01-20100818 chlordane and toxaphene results. Aroclor-1242 positive results were qualified due to laboratory identified "weathering" of the sample Aroclor results. Continuing calibration verification %D quality control limit non-compliances resulted in the data qualification for a positive DRO result and non-detected GRO results.

**Other Factors Affecting Data Quality:** Positive results below the Reporting Limit (RL) and above the detection limit were qualified as estimated, (J), due to uncertainty near the detection limit.

The data for these analyses were reviewed with reference to the Organic Data Validation (10/99), USEPA Region II Standard Operating Procedures for Validating Volatile Organic Compounds by SW-846 Method 8260B (October 2006), validating PCB compounds by SW-846 Method 8082A (Oct. 2006), and the Department of Defense (DoD) document entitled "Quality Systems Manual (QSM) for Environmental Laboratories" (January 2006).

3. Appendix C - Region II Data Validation Forms
4. Appendix D - Support Documentation

**Appendix A**

Qualified Analytical Results

### **Value Qualifier Key (Val Qual)**

J – The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ – The result is an estimated non-detected quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

U - Value is a non-detect as reported by the laboratory.

UR – Non-detected result is considered rejected, (UR), as a result of technical non-compliances.

### **DATA QUALIFICATION CODE (QUAL CODE)**

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, HRFs, etc.)
- C01 = GC/MS Tuning Noncompliance
- D = MS/MSD Recovery Noncompliance
- E = LCS/LCSD Recovery Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's  $r < 0.995$  / ICP PDS Recovery Noncompliance
- K = ICP Interference - includes ICS % R Noncompliance
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation Noncompliance
- N = Internal Standard Noncompliance
- N01 = Internal Standard Recovery Noncompliance Dioxins
- N02 = Recovery Standard Noncompliance Dioxins
- N03 = Clean-up Standard Noncompliance Dioxins
- O = Poor Instrument Performance (e.g. base-line drifting)
- P = Uncertainty near detection limit ( $< 2 \times$  IDL for inorganics and  $< CRQL$  for organics)
- Q = Other problems (can encompass a number of issues; e.g. chromatography, interferences, etc.)
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin
- U = % Difference between columns/detectors  $> 25\%$  for positive results determined via GC/HPLC
- V = Non-linear calibrations; correlation coefficient  $r < 0.995$
- W = EMPC result
- X = Signal to noise response drop
- Y = Percent solids  $< 30\%$
- Z = Uncertainty at 2 sigma deviation is greater than sample activity

- \* • Detection Limits
- \* • Analyte Quantitation

Metals:

The following contaminants were detected in preparation blanks at the following maximum concentrations:

<u>Analyte</u>	<u>Maximum Concentration</u>	<u>Action Level</u>
Barium	35 ug/L	175 ug/L
Mercury	0.092 ug/L	0.46 ug/L

An action level of 5X the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. The positive barium result was less than the blank action level reported and was qualified nondetected (U) for laboratory blank contamination.

Positive results greater than the detection limit (DL) but less than the limit of quantitation (LOQ) were qualified as estimated (J).

Notes

Executive Summary

**Laboratory Performance:** Preparation blank contamination resulted in the qualification of barium results.

**Other Factors Affecting Data Quality:** None.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Data Validation" as amended for Region II and the Department of Defense (DoD) document entitled "Quality Systems Manual (QSM) for Environmental Laboratories", January 2006.

The text of this report has been formulated to address only those problem areas affecting data quality.

**APPENDIX A**

**QUALIFIED ANALYTICAL RESULTS**

### Data Validation Qualifier Codes:

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
- C01 = GC/MS Tuning Noncompliance
- D = MS/MSD Recovery Noncompliance
- E = LCS/LCSD Recovery Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's  $r < 0.995$
- K = ICP Interference - includes ICS % R Noncompliance
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation Noncompliance
- N = Internal Standard Noncompliance
- N01 = Internal Standard Recovery Noncompliance Dioxins
- N02 = Recovery Standard Noncompliance Dioxins
- N03 = Clean-up Standard Noncompliance Dioxins
- O = Poor Instrument Performance (e.g. base-line drifting)
- P = Uncertainty near detection limit ( $< 2 \times$  IDL for inorganics and  $<$ CRQL for organics)  
Other problems (can be any number of issues; e.g. poor chromatography,interferences,  
etc.)
- Q =
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin  
% Difference between columns/detectors  $>25\%$  for positive results determined via
- U = GC/HPLC
- V = Non-linear calibrations; correlation coefficient  $r < 0.995$
- W = EMPC result
- X = Signal to noise response drop
- Y = Percent solids  $<30\%$
- Z = Uncertainty at 2 sigma deviation is greater than sample activity

The data contained in this SDG were validated with regard to the following parameters:

- Data Completeness
- \* • Holding Times
- \* • GC/MS Tuning
- \* • Initial and Continuing Calibration
- Blank Analyses
- \* • System Monitoring Compound/Surrogate Recovery
- \* • Laboratory Blank Spike Results
- \* • Internal Standard Recoveries
- \* • Field Duplicate Precision
- Compound Quantitation
- Compound Identification
- \* • Detection Limits

The symbol (\*) indicates that all quality control criteria were met for this parameter. Qualified analytical results are presented in Appendix A, results as reported by the laboratory are presented in Appendix B, Region II data validation forms are presented in Appendix C, and documentation supporting these findings is presented in Appendix D.

#### **Volatile (VOC)**

The following common laboratory contaminants were detected in the rinse blank for BPS1-RB01-20101201 affecting all SDG samples.

<u>Compound</u>	<u>Maximum Conc. µg/L</u>	<u>Action Level µg/L</u>
2-Butanone	5	50
Acetone	38	380
Methylene chloride	1	10

An action level of 10X the maximum concentration for the common laboratory contaminant acetone was established to evaluate laboratory contamination. Dilution factors and sample aliquots, if applicable, were taken into consideration during the application of all action levels. The positive results for acetone below the blank action level for acetone were qualified as non-detected, (U). The trip and sample blanks were not qualified due to method blank contamination.

#### **PCB**

Regarding positive Aroclor-1242 detections, the laboratory stated the following in their case narrative: "A conclusive PCB Aroclor identification is not possible due to matrix interference and/or weathering of the sample. The identity of the reported Aroclor is tentative." The laboratory was contacted for a closer examination of the raw data to ensure that other Aroclor results were not omitted, particularly Aroclor-1248. The laboratory provided raw data and Aroclor-1242 and Aroclor-1248 standard chromatograms for visual comparison. These chromatograms are included in the Appendix C of this report.

Aroclor-1242 was reported by the laboratory in all environmental samples except for sample BPS1-TT-MW304S-20101201 and the field quality control blanks. Because the presence of Aroclors are unusual in water samples, the data reviewer has examined the chromatograms of the method and field quality control blanks, the samples with detections, and compared them to the patterns of Aroclor standards 1242 and 1248. No detections of Aroclors were reported in the method and field quality control blanks. The chromatograms of the method and field quality control blanks do not contain a discernable pattern

representative of Aroclors 1242 and 1248. This is an indication that the appearance of Aroclors in the samples is not a result of laboratory or field personnel contamination of the samples.

The chromatograms for Aroclors 1242 and 1248 share several common peaks within their characteristic patterns. The peaks common to both Aroclor mixtures are contained in each of the environmental samples that exhibit detections. Because of shared compounds and similarities in portions of the chromatographic patterns for the mixtures of Aroclors 1242 and 1248, it is difficult to determine which Aroclor is predominant or how to precisely quantify each Aroclor separately. The laboratory has therefore reported a single Aroclor mixture, Aroclor-1242, in each sample with a detection. A "weathering effect" or degradation of compounds within the specific mixtures is also a likely factor in precisely identifying the Aroclor mixture present. Despite the aforementioned complexities associated with exact identification and quantification, the reviewer has concluded that an Aroclor mixture is present in the affected samples. Therefore, because the exact identification of the Aroclor mixture is complicated by the similarities between Aroclors 1242 and 1248 and from natural "weathering" of the mixture, detected results reported in samples have been qualified as estimated, (J).

The relative percent difference (RPD) between analytical columns was greater than the 25% quality control limit for the positive Aroclor-1242 result for samples BPS1-DUP01-20101130 and BPS1-TT-MW303S-20101130. The positive Aroclor-1242 result for the samples were qualified estimated, (J).

#### **Additional Comments**

Positive results below the Limit of Quantitation (LOQ) and above the detection limit were qualified as estimated, (J), due to uncertainty near the detection limit.

Two Aroclor analysis continuing calibration verifications (CCV) had surrogate %Rs greater than the quality control limit for decachlorobiphenyl (DCB) and one CCV had a surrogate %R greater than the quality control limit for tetrachloro-m-xylene (TCMX). No action was taken as this did not affect the sample analyses.

All reported Aroclor results were reported from the lower of the two column Aroclor results.

Some of the Aroclor %D results for the CCVs were not calculated by the laboratory. The data validation chemist manually calculated the CCVs where necessary.

The PCB laboratory control sample (LCS) and the LCS duplicate (LCSD) analyses as well as the matrix spike (MS) and MS duplicate (MSD) analyses were spiked and analyzed only for the analytes Aroclor-1016 and Aroclor-1260.

Samples were diluted for the Aroclor-1242 analysis as listed below.

<u>Sample</u>	<u>Dilution</u>
BPS1-FW-MW03-20101130	2X
BPS1-TT-MW302I2-20101129	2X
BPS1-TT-MW303I1-20101130	4X
BPS1-TT-MW303I2-20101129	2X
BPS1-TT-MW304D-20101130	4X

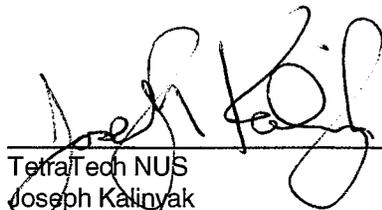

The original Form I for sample BPS1-HN-29I-20101201 incorrectly displayed a non-detected result for Aroclor-1242. The Form I for the sample was corrected and revised by the laboratory.

**EXECUTIVE SUMMARY**

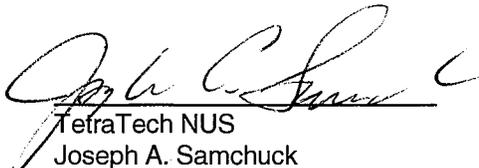

**Laboratory Performance Issues:** VOC method blank contamination resulted in qualification of sample acetone results. The positive Aroclor-1242 result for samples BPS1-DUP01-20101130 and BPS1-TT-MW303S-20101130 were qualified due to the RPD between analytical columns.

**Other Factors Affecting Data Quality:** Positive results below the Reporting Limit (RL) and above the detection limit were qualified as estimated, (J), due to uncertainty near the detection limit. Per the laboratory narrative for Aroclor-1242 positive results, "A conclusive PCB Aroclor identification is not possible due to matrix interference and/or weathering of the sample. The identity of the reported Aroclor is tentative." All positive Aroclor-1242 sample results were qualified estimated, (J), due to this issue.

The data for these analyses were reviewed with reference to the USEPA Region II Standard Operating Procedures for Validation - SOP HW-24 Revision #2 Volatile Organic Compounds by SW-846 Method 8260B (August 2008) and SOP HW-45 Data Validation SOP of Organic Analysis of PCBs by Gas Chromatography SW-846 Method 8082A (October 2006), and the Department of Defense (DoD) document entitled "Quality Systems Manual (QSM) for Environmental Laboratories" (January 2006).

**Appendix A**

Qualified Analytical Results

### **Value Qualifier Key (Val Qual)**

J – The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ – The result is an estimated non-detected quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

U - Value is a non-detect as reported by the laboratory.

UR – Non-detected result is considered rejected, (UR), as a result of technical non-compliances.

### **DATA QUALIFICATION CODE (QUAL CODE)**

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
- C01 = GC/MS Tuning Noncompliance
- D = MS/MSD Recovery Noncompliance
- E = LCS/LCSD Recovery Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's  $r < 0.995$  / ICP PDS Recovery Noncompliance
- K = ICP Interference - includes ICS % R Noncompliance
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation Noncompliance
- N = Internal Standard Noncompliance
- N01 = Internal Standard Recovery Noncompliance Dioxins
- N02 = Recovery Standard Noncompliance Dioxins
- N03 = Clean-up Standard Noncompliance Dioxins
- O = Poor Instrument Performance (e.g. base-line drifting)
- P = Uncertainty near detection limit ( $< 2 \times$  IDL for inorganics and  $<$ CRQL for organics)
- Q = Other problems (can encompass a number of issues; e.g. chromatography, interferences, etc.)
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin
- U = % Difference between columns/detectors  $>25\%$  for positive results determined via GC/HPLC
- V = Non-linear calibrations, correlation coefficient  $r < 0.995$
- W = EMPC result
- X = Signal to noise response drop
- Y = Percent solids  $<30\%$
- Z = Uncertainty at 2 sigma deviation is greater than sample activity

### Overview

The sample set for NWIRP Bethpage, CTO WE44, SDG 50063-8 consisted of twenty-nine (29) aqueous samples and five (5) soil environmental samples including three (3) aqueous trip blank samples, one (1) aqueous rinse blank sample, and one (1) aqueous field blank sample. A sample set of twenty-six (26) aqueous samples including the trip and field blank samples were analyzed for a select list of volatile organic compounds (VOC). A different sample set of twenty-six (26) aqueous samples were analyzed for polychlorinated biphenyls (PCB) as listed above. The five (5) soil samples were analyzed for PCBs only. Two field duplicate sample pairs were associated with this sample delivery group (SDG); BPS1-DUP01-20110302 / BPS1-TT-MW301D-20110302 and BPS1-DUP02-20110302 / BPS1-TT-MW304D-20110302.

The samples were collected by Tetra Tech on February 28, and March 1, 2, and 3, 2011 and analyzed by TriMatrix Laboratories. All analyses were conducted in accordance with EPA Methods SW-846 8260B and 8082A analytical and reporting protocols.

The data contained in this SDG was validated with regard to the following parameters:

- Data Completeness
- \* • Holding Times
- \* • GC/MS Tuning
- Initial and Continuing Calibration
- Blank Analyses
- \* • System Monitoring Compound/Surrogate Recovery
- \* • Laboratory Blank Spike Results
- \* • Internal Standard Recoveries
- \* • Field Duplicate Precision
- Compound Quantitation
- Compound Identification
- \* • Detection Limits

The symbol (\*) indicates that all quality control criteria were met for this parameter. Qualified analytical results are presented in Appendix A, results as reported by the laboratory are presented in Appendix B, Region II data validation forms are presented in Appendix C, and documentation supporting these findings is presented in Appendix D.

#### **Volatile (VOC)**

The following common laboratory contaminants were detected in the rinse blank BPS1-RB01-20110302 affecting all SDG samples.

<u>Compound</u>	<u>Maximum Conc. µg/L</u>	<u>Action Level µg/L</u>
2-Butanone	2.2	22
Acetone	8.9	89.0
Methylene chloride	0.37	3.7
Toluene	0.2	1.0

An action level of 10X the maximum concentration for the common laboratory contaminants and 5X the maximum concentration for toluene was established to evaluate for laboratory contamination. Dilution factors and sample aliquots, if applicable, were taken into consideration during the application of all action levels. The positive results for acetone, 2-butanone, and toluene below the blank action level were qualified as non-detected, (U).

The initial calibration Relative Response Factor (RRF) was less than the 0.05 quality control limit for acetone for instrument 328 on 03/01/11 and the continuing calibration verification (CCV) RRFs for acetone were less than the quality control limit on 03/06/11 @ 11:23 and 03/06/11 @ 22:20 affecting samples BPS1-TB01-20110228, BPS1-TT-MW302D-20110301, BPS1-TT-MW303D-20110301, BPS1-TT-MW302I2-20110301, BPS1-TT-MW303I2-20110301, BPS1-TT-MW302I1-20110301, BPS1-TT-MW303I1-20110301, BPS1-TT-MW302S-20110301, BPS1-TT-MW303S-20110301, BPS1-TB02-20110301, BPS1-RB01-20110302, BPS1-FB01-20110303, BPS1-TB03-20110303, BPS1-TT-MW301S-20110302, BPS1-FW-MW02-20110302, BPS1-TT-MW301D-20110302, BPS1-FW-MW01-20110302, BPS1-TT-MW304D-20110302, BPS1-DUP02-20110302, BPS1-TT-MW304I1-20110302, BPS1-DUP01-20110302, BPS1-FW-MW03-20110303, BPS1-TT-MW304I2-20110303, and BPS1-TT-MW304S-20110303. The non-detected acetone results for the aforementioned samples were qualified rejected, (UR), except where qualified for blank contamination. The positive acetone result for sample BPS1-RB01-20110302 was qualified estimated, (J).

### **PCB**

The continuing calibration verification (CCV) Aroclor-1260 result was greater than the 15% quality control limit for the CLPEST column for instrument 158 on 03/09/11 @ 05:33. No action was taken as the CLPEST2 column Aroclor-1260 CCV was within the quality control limits and all samples had non-detected Aroclor results for all Aroclors except Aroclor-1242. All positive Aroclor-1242 sample results were reported from specific Aroclor-1242 calibrations and analyses and are not affected by this issue.

Aroclor-1242 was reported by the laboratory in all environmental samples except for sample BPS1-TT-MW304S-20110303, BPS1-SW01-20110228 and the field quality control blanks. Because the presence of Aroclors are unusual in water samples, the data reviewer has examined the chromatograms of the method and field quality control blanks, the samples with detections, and compared them to the patterns of Aroclor standards 1242 and 1248. No detections of Aroclors were reported in the method and field quality control blanks. The chromatograms of the method and field quality control blanks do not contain a discernable pattern representative of Aroclors 1242 and 1248. This is an indication that the appearance of Aroclors in the samples is not a result of laboratory or field personnel contamination of the samples.

The chromatograms for Aroclors 1242 and 1248 share several common peaks within their characteristic patterns. The peaks common to both Aroclor mixtures are contained in each of the environmental samples that exhibit detections. Because of shared compounds and similarities in portions of the chromatographic patterns for the mixtures of Aroclors 1242 and 1248, it is difficult to determine which Aroclor is predominant or how to precisely quantify each Aroclor separately. The laboratory has therefore reported a single Aroclor mixture, Aroclor-1242, in each sample with a detection. A "weathering effect" or degradation of compounds within the specific mixtures is also a likely factor in precisely identifying the Aroclor mixture present. Despite the aforementioned complexities associated with exact identification and quantification, the reviewer has concluded that an Aroclor mixture is present in the affected samples. Therefore, because the exact identification of the Aroclor mixture is complicated by the similarities between Aroclors 1242 and 1248 and from natural "weathering" of the mixture, detected results reported in samples have been qualified as estimated, (J).

The laboratory stated the following in their case narrative regarding a positive Aroclor-1242 detection for sample BPS1-TT-MW301S-20110302: "A conclusive Aroclor identification is not possible due to matrix interference and/or weathering of the sample. The result is qualitative and the identity of the reported Aroclor is tentative. The Aroclor may also be PCB-1248." The laboratory used a different set of peaks for the calibration and analysis for this particular sample. This sample was analyzed using peaks labeled as PCB9, PCB10, PCB11, PCB13, and PCB14 for the determination and quantitation of Aroclor-1242, while the other samples analyzed for Aroclor-1242 used peaks labeled as PCB7, PCB11, PCB12, PCB13, and PCB14 for the determination and quantitation of Aroclor-1242. The labeled peaks are not indicative of individual PCB congeners in this case and are used simply as reference peaks. The positive result is qualified as estimated, (J).

The relative percent difference (RPD) between analytical columns was greater than the 25% quality control limit for the positive Aroclor-1242 result for samples BPS1-DUP02-20110302, BPS1-TT-MW302S-20110301, BPS1-TT-MW303S-20110301, BPS1-TT-MW304I1-20110302, and BPS1-TT-MW304I2-20110303. Aroclor-1242 results in these samples were qualified estimated, (J).

### **Additional Comments**

Positive results below the Limit of Quantitation (LOQ) and above the detection limit were qualified as estimated, (J), due to uncertainty near the detection limit.

Sample BPS1-FW-MW01-20110302 was analyzed both undiluted and diluted 5X due to a greater than the calibration limit tetrachloroethene result in the undiluted VOC analysis. Only the tetrachloroethene result was reported from the dilution sample analysis.

The data reviewer questioned the laboratory regarding the reporting of nondetected results from the undiluted analyses of samples S1-SB3005-DR2 and S1-SB3005-DR3. The aforementioned samples contained Aroclor 1242 at concentrations of 25 and 580 mg/kg, respectively, which are several orders of magnitude greater than the Limit of Detection (LOD). Because of the relatively high concentrations of Aroclor 1242 in the samples, the chromatograms of the undiluted samples displayed peaks that are completely unresolved and the rendered the initial analyses essentially useless. The laboratory responded with an addendum to the Aroclor data validation package that included non-detected Aroclor results for the aforementioned samples at dilutions. All Aroclor results were reported from the dilution analyses of the aforementioned samples. The addendum pages are included in this report in Appendices B and D and the electronic data base (EDD) results were manually edited for the sample non-detected results which were reported from these dilutions.

Two Aroclor analysis CCVs had surrogate %Rs less than the quality control limit for decachlorobiphenyl (DCB) for both analytical columns. One CCV had surrogate %Rs greater than the quality control limit for DCB for both analytical columns. No action was taken as the CCV %R quality control limit non-compliances did not affect the sample analyses.

All reported Aroclor results for the samples were reported from the DB-35 column regardless if the result was the higher or lower of the two column Aroclor results, with the exception of sample BPS1-TT-MW304I-20110302.

Some of the Aroclor %D results for the CCVs were not calculated by the laboratory. The data validation chemist manually calculated the CCVs where necessary.

The Aroclor laboratory control sample (LCS) and the LCS duplicate (LCSD) analyses as well as the matrix spike (MS) and MS duplicate (MSD) analyses were spiked and analyzed only for the analytes Aroclor-1016 and Aroclor-1260.

Aroclor 1242 results were quantified and reported from dilution analyses in the following samples:

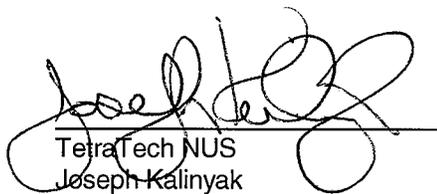

<u>Sample</u>	<u>Dilution</u>
BPS1-DUP02-20110302	3X
BPS1-FW-MW03-20110303	2X
BPS1-TT-MW301S-20110302	10X
BPS1-TT-MW302I1-20110301	2X
BPS1-TT-MW302I2-20110301	2X
BPS1-TT-MW303I1-20110301	3X
BPS1-TT-MW303I2-20110301	2X
BPS1-TT-MW304D-20110302	2X
BPS1-TT-MW304I2-20110303	2X
S1-SB3005-DR1	10X
S1-SB3005-DR2	100X
S1-SB3005-DR3	3000X
S1-SB3005-DR4	4X

### EXECUTIVE SUMMARY

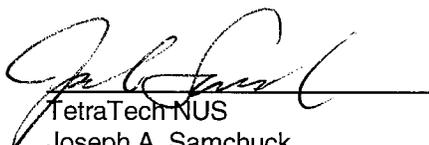

**Laboratory Performance Issues:** VOC method blank contamination resulted in qualification of sample acetone results. Non-detected acetone results were rejected due to RRF quality control limit non-compliances and a positive acetone result was qualified estimated for the same non-compliance. Positive Aroclor-1242 results for samples were qualified due to analytical column RPD quality control limit non-compliances.

**Other Factors Affecting Data Quality:** Positive results below the LOQ and above the detection limit were qualified as estimated, (J), due to uncertainty near the detection limit. Aroclor 1242 results were qualified as estimated in all water samples because exact identification is tentative due to similarities with Aroclor 1248 and from "weathering effects".

The data for these analyses were reviewed with reference to the USEPA Region II Standard Operating Procedures for Validation - SOP HW-24 Revision #2 Volatile Organic Compounds by SW-846 Method 8260B (August 2008) and SOP HW-45 Data Validation SOP of Organic Analysis of PCBs by Gas Chromatography SW-846 Method 8082A (October 2006), and the Department of Defense (DoD) document entitled "Quality Systems Manual (QSM) for Environmental Laboratories" (April 2009).

**Appendix A**

Qualified Analytical Results

### **Value Qualifier Key (Val Qual)**

J – The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

UJ – The result is an estimated non-detected quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

U - Value is a non-detect as reported by the laboratory.

UR – Non-detected result is considered rejected, (UR), as a result of technical non-compliances.

### **DATA QUALIFICATION CODE (QUAL CODE)**

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, HRFs, etc.)
- C01 = GC/MS Tuning Noncompliance
- D = MS/MSD Recovery Noncompliance
- E = LCS/LCSD Recovery Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's  $r < 0.995$  / ICP PDS Recovery Noncompliance
- K = ICP Interference - includes ICS % R Noncompliance
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation Noncompliance
- N = Internal Standard Noncompliance
- N01 = Internal Standard Recovery Noncompliance Dioxins
- N02 = Recovery Standard Noncompliance Dioxins
- N03 = Clean-up Standard Noncompliance Dioxins
- O = Poor Instrument Performance (e.g. base-line drifting)
- P = Uncertainty near detection limit ( $< 2 \times$  IDL for inorganics and  $<$ CRQL for organics)
- Q = Other problems (can encompass a number of issues; e.g. chromatography, interferences, etc.)
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin
- U = % Difference between columns/detectors  $>25\%$  for positive results determined via GC/HPLC
- V = Non-linear calibrations, correlation coefficient  $r < 0.995$
- W = EMPC result
- X = Signal to noise response drop
- Y = Percent solids  $<30\%$
- Z = Uncertainty at 2 sigma deviation is greater than sample activity

Page 2 of 2  
4/27/2011

Positive results greater than the detection limit (DL) but less than the limit of quantitation (LOQ) were qualified as estimated (J).

Notes

The following samples analyzed at dilutions:

<u>Sample IDs</u>	<u>Dilution factors</u>	<u>Anaytes</u>
BPS1-DUP02-20110302	5X	Aluminum
BPS1-TT-MW304D-20110302	10X	Aluminum
BPS1-TT-MW304I1-20110302	50X	Aluminum
BPS1-TT-MW304I1-20110302	5X	Hexavalent Chromium
BPS1-TT-MW304I2-20110303	2X	Chromium
BPS1-TT-MW304I2-20110303	5X	Vanadium
BPS1-TT-MW304I2-20110303	10X	Hexavalent Chromium

The hexavalent chromium result of 58 ug/L was greater than the total chromium result of 55 ug/L for sample BPS1-TT-MW304I1-20110302. No validation action was taken as the degree of error between instrumentation accounts for the difference in values.

Calcium, iron, magnesium, potassium, and sodium were analyzed by method 6010C. All other metals (except mercury) were analyzed by method 6020.

The CRDL standard analyzed for hexavalent chromium was analyzed on 3/4/11 had a percent recovery greater than the upper control limit. No action was taken on the affected samples because one result was greater than the 2X the reporting limit and the other sample result was non-detected.

Executive Summary

**Laboratory Performance:** Preparation blank contamination resulted in the qualification of barium results.

**Other Factors Affecting Data Quality:** Field duplicate non-compliance for aluminum resulted in the qualification of sample results.

The data for these analyses were reviewed with reference to the "Validation of metals for the Contract Laboratory Program based on SOW ILMO5.3 (SOP Revision 13)", September 2006 and the Department of Defense (DoD) document entitled "Quality Systems Manual (QSM) for Environmental Laboratories", April 2009.

The text of this report has been formulated to address only those problem areas affecting data quality.

**APPENDIX A**

**QUALIFIED ANALYTICAL RESULTS**

**Data Validation Qualifier Codes:**

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
- C01 = GC/MS Tuning Noncompliance
- D = MS/MSD Recovery Noncompliance
- E = LCS/LCSD Recovery Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's  $r < 0.995$
- K = ICP Interference - includes ICS % R Noncompliance
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation Noncompliance
- N = Internal Standard Noncompliance
- N01 = Internal Standard Recovery Noncompliance Dioxins
- N02 = Recovery Standard Noncompliance Dioxins
- N03 = Clean-up Standard Noncompliance Dioxins
- O = Poor Instrument Performance (e.g. base-line drifting)
- P = Uncertainty near detection limit ( $< 2 \times$  IDL for inorganics and  $< CRQL$  for organics)  
Other problems (can be any number of issues; e.g. poor chromatography, interferences, etc.)
- Q =
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin  
% Difference between columns/detectors  $> 25\%$  for positive results determined via
- U = GC/HPLC
- V = Non-linear calibrations; correlation coefficient  $r < 0.995$
- W = EMPC result
- X = Signal to noise response drop
- Y = Percent solids  $< 30\%$
- Z = Uncertainty at 2 sigma deviation is greater than sample activity

**APPENDIX F**  
**WORK PLAN (SAP) ADDENDUM**

**SAMPLING AND ANALYSIS PLAN ADDENDUM  
ADDITIONAL GROUNDWATER INVESTIGATION  
SITE 1 – FORMER DRUM MARSHALLING AREA  
NAVAL WEAPONS INDUSTRIAL RESERVE PLANT (NWIRP) BETHPAGE  
BETHPAGE, NEW YORK**

**INTRODUCTION**

This Work Plan Addendum has been prepared for the Mid-Atlantic Division of the Naval Facilities Engineering Command (NAVFAC) under Contract Task Order (CTO) WE44 issued by the Mid-Atlantic Division of NAVFAC under the Comprehensive Long-Term Environmental Action Navy (CLEAN) III contract number N62470-08-D-1001. This document is an addendum to the May 2010 Sampling and Analysis Plan (SAP) PCB Investigation at Site 1 – Former Drum Marshalling Area (herein referenced as the SAP). This SAP addendum addresses the installation of additional monitoring wells to further delineate the extent of PCB-contaminated groundwater at Site 1.

**SCOPE AND OBJECTIVE**

Fifteen monitoring wells will be installed during this additional investigation. Groundwater samples will be collected from the new and existing monitoring wells and analyzed for volatile organic compounds (VOCs), polychlorinated biphenyls (PCBs), total chromium, and hexavalent chromium. Soil borings will be advanced at each of the proposed monitoring well clusters and gamma logging will be used to interpret lithology and determine actual screen intervals at these locations. The objective is to further delineate the extent of PCB and hexavalent chromium contamination in groundwater and investigate potential upgradient source areas (sludge beds and recharge basins). Total chromium and hexavalent chromium have been added to the groundwater sampling to further investigate the detections observed during groundwater sampling in March 2011. Because a good correlation did not occur between groundwater grab sampling and permanent monitoring wells during the previous sampling, this activity will not be conducted. Groundwater investigative activities will be conducted in accordance with the procedures outlined in the Final SAP (May 2010). Results from these additional investigative activities will be evaluated and presented in a data summary report.

**SOIL BORINGS**

Five soil borings will be advanced via hollow stem auger (HSA) or mud rotary drilling methods at each of the monitoring well clusters. Each soil boring will be advanced to a depth of

approximately 250 to 300 feet bgs to define the deeper clay unit observed during previous drilling at Site 1. Lithology will be obtained at each soil boring via gamma logging. The gamma logs will be interpreted and used to determine actual screened intervals for the monitoring well installation. Split spoon samples will be collected as needed to confirm lithology encountered at these soil borings. The soil borings may be used for the deeper well installations at each of the monitoring well clusters.

## **MONITORING WELL INSTALLATION**

Fifteen monitoring wells will be installed via HSA or mud rotary drilling methods (Figure 1) during this additional groundwater investigation. Two monitoring well clusters will be installed upgradient of Site 1. One of these clusters will be installed north of the former sludge drying beds and one cluster will be installed south or downgradient of the former sludge drying beds. The well clusters will be used to determine whether the former sludge drying beds or recharge basin are the source of the PCB-contaminated groundwater detected in wells upgradient of Site 1. Three monitoring well clusters will be installed downgradient of the previously installed downgradient well clusters along the facility's southern fence line. Based on lithology, each monitoring well cluster will consist of three or four monitoring wells and will be installed based on the lithology interpreted from the gamma logging and the inferred geology observed in previous soil borings at Site 1. The deeper wells installed at each well cluster location will be screened below the observed deeper clay unit at an estimated depth of 270-280 feet bgs. Table 1 provides a summary of estimated screened intervals for the monitoring well installation. Each monitoring well will be developed prior to groundwater sampling.

Soil cuttings and/or fluids generated from the soil boring and monitoring well installations will be field screened for evidence of contamination (visual staining or elevated photoionization detector [PID] readings >10 parts per million [ppm]). If contamination is suspected, those soils will be segregated and characterized for disposal. All soil cuttings or drilling mud will be containerized in 55-gallon drums or roll off containers, sampled, and be managed as Investigation Derived Waste (IDW).

## **GROUNDWATER SAMPLING**

Groundwater samples will be collected from each new and existing monitoring well and sampled for VOCs, PCBs, total chromium, and hexavalent chromium as presented in Table 1. A submersible pump (e.g. Grundfos) will be utilized for groundwater sampling and low flow procedures will be followed as outlined in the Final SAP. Wellhead parameters including pH,

temperature, specific conductivity, oxygen reduction potential, turbidity, and dissolved oxygen will be collected during sampling and allowed to stabilize prior to sample collection.

All decon and purge water obtained during well installation, development, and sampling will be containerized in a poly tank or Frac tank, sampled, and be managed as Investigation Derived Waste (IDW).

### **SURFACE WATER SAMPLING**

Surface water samples will be collected from the outfall into the southwestern and northeastern recharge basins during a storm event and sampled for VOCs, PCBs, total chromium, and hexavalent chromium as presented in Table 1. These recharge basins accept storm water runoff from Plant 3 and other areas of the facility and could be a potential source of shallow groundwater contamination observed in the existing upgradient well at Site 1.

**TABLE 1  
SAP ADDENDUM MONITORING WELL INSTALATION AND SAMPLING  
SITE 1 - FORMER DRUM MARSHALLING AREA  
NWIRP BETHPAGE, NEW YORK**

Activity	Sample Point ID	Estimated Total Depth (feet bgs)	Sample Analysis	Activity Details
Surface Water Sampling	BPS1-SW3001	NA	TCL VOCs, PCBs, Total Chromium, Hexavalent Chromium	Samples to be collected from outfall into southwest and northeast recharge basins
	BPS1-SW3002	NA		
Monitoring Well Installation	BPS1-MW305	50 - 60	TCL VOCs, PCBs, Total Chromium, Hexavalent Chromium	Groundwater table well (Screened similar to BPS1-TT-MW302S)
		140 - 150		Screened above semi-confining unit (Screened similar to BPS1-TT-MW302I2)
		270 - 280		Screened below deeper clay unit
	BPS1-MW306	50 - 60	TCL VOCs, PCBs, Total Chromium, Hexavalent Chromium	Groundwater table well (Screened similar to BPS1-TT-MW303S)
		140 - 150		Screened above semi-confining unit (Screened similar to BPS1-TT-MW303I2)
		270 - 280		Screened below deeper clay unit
	BPS1-MW307	50 - 60	TCL VOCs, PCBs, Total Chromium, Hexavalent Chromium	Groundwater table well (Screened similar to BPS1-TT-MW304S)
		140 - 150		Screened above semi-confining unit (Screened similar to BPS1-TT-MW304I2)
		270 - 280		Screened below deeper clay unit
	BPS1-MW308	50 - 60	TCL VOCs, PCBs, Total Chromium, Hexavalent Chromium	Groundwater table well
		130 - 140		Screened interval based on gamma logging
		270 - 280		Screened interval based on gamma logging
	BPS1-MW309	50 - 60	TCL VOCs, PCBs, Total Chromium, Hexavalent Chromium	Groundwater table well
		130 - 140		Screened interval based on gamma logging
		270 - 280		Screened interval based on gamma logging

**Notes:**

SW - Surface Water  
 MW - Monitoring Well  
 NA - Not Applicable  
 TCL VOCs - Target Compound List Volatile Organic Compounds  
 PCBs - Polychlorinated Biphenyls  
 bgs - below ground surface

Quality Control/Quality Assurance samples will consist of the following:  
 - 10% Duplicate  
 - 5% MS/MSD  
 - Field Blank  
 - Trip Blank per cooler containing VOC samples  
 - Rinsate Blank
