Hello All,

I am working at home today and just completed my review. I concur with the plan with the following comment.

I suggest we take a complete round of gw samples, (organics), before system startup. This will give us a real time base line. From this point we will know if we only have the vc to be concern with. If other contaminants are detected above standards, then I would suggest, at the first round of sampling, after start up, those contaminants be analyzed for until they fall below standards. Since this is only an interim action, we can determine at what point to begin collecting the required number of non detec. samples.

Also, I have emailed Ted Simon to verify that the November 1995 Risk guidance is the current document and if there are any changes to the equations. This will not delay the start of the field effort.

See you on Tuesday.
