MAGUIRE GROUP INC. FIELD REPORT

TRIP REPORT

REPORT TO: Bob Wardwell
REPORT BY: Thomas Klin
DATE: January 7, 1992
SUBJECT: Thames River Dredging Sediment Sampling
MGI JOB #: 13066
COPIES TO: CLW, SLL, file

Sediment sampling of the proposed dredging area on the Thames River was conducted from Thursday, December 19, 1991 to Saturday, December 21, 1991 aboard the 60 foot barge, "BRUTUS". This vessel, under private ownership by the Connecticut River Dock and Dredge Company, was rigged with navigational and sampling equipment by OSI on Wednesday the 18th. The sediment sampling participants were:

Edwin Libby	Captain
Daniel Rutan	First Mate
George Reynolds	OSI - Technical Supervisor
David Kowaleski	OSI - Field Technician
George Scherber	OSI - Field Technician
Roy Okurowski	OSI - Surveyor (landside)
Jeffrey Gardner	OSI - Marine Geologist
Clint Webb	MGI - Field Manager
Thomas Klin	MGI - Assistant Field Manager

The equipment used for navigation was a Hydro I - laser based electronic positioning system, an OSI Maretrack trackline control system and necessary support equipment. Sediment sampling equipment was an OSI Model 1500 pneumatic vibratory corer equipped with both 15 and 20 foot barrels, a rate of penetration meter and a standard 2 cubic yard clamshell bucket. "BRUTUS" was equipped with a 25 ton crane (used to maneuver the vibracore) and a large compressor (used to operate the pneumatic vibrator).

A reference core and 15 gallons of bioassay material were obtained at sites P-1, P-2, M-1, M-2, EB-1 and EB-2. A reference core and thirty gallons of sediment were obtained at site B-1. Water temperature (C), salinity (0/00), and specific conductivity (UMHOS) were also obtained and documented for each of the sampling locations (except location P-1).

Equipment malfunction due to extreme temperatures resulted in a late start on Thursday, December 19. Clint and George Reynolds obtained all of the water and sediment samples required for the elutriate analysis by Laboratory Resources. In addition, four 10 foot cores were obtained and transferred to three 5 gallon buckets to be used for the chemical, bulk sediment and the bioassay analysis of P-1.

On Friday (12-20-91) cores were taken at locations P-2, M-1 and M-2. Positioning was begun for sampling at location B-1, but a delay due to survey location complications resulted in the sample not being taken until the following day.

On Saturday (12-21-91) samples were obtained at locations B-1, EB-1 and EB-2. B-1 and EB-2 were areas of shallow sampling, therefore after reference cores were taken with the vibracore, the clamshell bucket was used to provide material for the bioassay containers. The clamshell bucket was brought on deck and the sediment material was sub-sampled into the sample buckets under Clint's supervision.

Sample times, water temperature, salinity and conductivity of the sample locations are noted on the attached field sheets.

When field work was completed on Saturday (1500), the material was trucked to OSI's facility in Old Saybrook by OSI. The reference cores were then cut in half lengthwise and OSI's marine geologist Jeff Gardner prepared descriptions of each core. The material in all of the cores is fairly uniform to approximately -5 feet. The major differences occurred between black, grey and brown mud, with varying percentages of silt and clay. Grey clay with strong cohesion was encountered between -4 and -6 feet in most cores. The only difference occurred at location EB-2, where grey clay was encountered at less than -1 foot.

The sediment from reference cores P-1, P-2, M-1 and M-2 was then stratified at three feet. This section was mixed in a sampling tub and packed in sample jars labeled with an "A". The remainder of the core (lower portion) was then homogenized in clean sampling tubs and representative samples were packed in sample jars labeled "B". Whole cores from stations B-1, EB-1, and EB-2 were composited in sampling tubs and representative samples were packed into jars for chemical and sediment analysis. These samples were packaged in ice chests for delivery to Laboratory Resources on Monday morning by MGI. Foul weather delayed several attempts by OSI personnel from obtaining sediment material at the reference site (the dumping grounds) on Friday and Saturday. Finally, 30 gallons of sample material was obtained and packed in buckets on Sunday morning (12-22-91). The thirty 5-gallon buckets of bioassay material were stored in a refrigerated truck which OSI delivered to ASI's lab in Flemmington, New Jersey on Monday morning. Copies of Chain of Custody sheets for the bioassay, sediment and water samples are attached.

Important aspects of the sampling architecture are documented photographically on prints, slides and video tape.

PROJECT: THAMES SEDS SAMPLE STATION: P1

DATE: 12-19-91 TIME: 1200 WEATHER: CLEAR + VERY COLD (20°F)

SAMPLERS: OSI + MGI

SAMPLING METHOD/EQUIPMENT Vibro-corer for sediment cores, Chon shell for grab sediments and electric pickup for water sample for elutriate testing

MATERIAL DESCRIPTION:

- Late start due to equipment malfunction because of low temp (15°F @ 7am plus 25 mph winds from the northwest - wind chill to -10°F)
- Core samples taken at 1410 pm. 4 ten foot cores were used to fill buckets for Elutriate samples (actual 7' to 8') 1 fifteen foot core (actual 10' of sediment) collected for reference to be sub-sampled later by OSI + MGI.
- Elutriate water samples taken between 1455 pm and 1515 pm by GGR/CLW. Filled 15 500ml bottles and one set of assort. size bottles for reference ^{test}
- Elutriate sediment samples at three stations by Chon shell bucket (penetrated to 3'+). Each bucket was sub-sampled to obtain representative sample. GGR/CLW collected these samples between 1530 - 1600 pm.
- No water Temp., Arsenic, or spec Con readings were taken.

PROJECT: Thames River SDEIS SAMPLE STATION: P-2 (Pier 32)

FINAL REPORT
SEDIMENT SAMPLING
THAMES RIVER
NEW LONDON, CONNECTICUT

1.0 INTRODUCTION

During the period December 18-22, 1991 OSI conducted a sediment and water sampling project on the Thames River in the vicinity of New London, Connecticut. The sampling program was performed for the Maguire Group Inc. in support of their Supplemental DEIS for dredging of the Thames River from the Naval Submarine Base south to the mouth of the river, a proposed US Navy project.

Three 500 ml sediment grab samples were acquired north of US Navy Pier 33 (see Figure 1) and twenty water samples were taken at sample station P1 for elutriate analysis. A 30 gallon grab sample was collected at the New London Dredge Disposal Reference Site for use in the bioassay analysis (See Figure #3). The elutriate samples were collected on December 19, 1991, and the reference site sample was acquired on December 22, 1991.

Vibratory core samples of the proposed dredge material were acquired between December 19 - 21, 1991 at seven (7) locations in the Thames River (See Figures #1 & #2). A total of 15 gallons of cored sediment were acquired at 6 of the 7 locations and 30 gallons of sediment was collected at sample station B1 immediately north of the Goldstar bridge. One core was acquired at each of the 7 river locations for geologic description of the proposed dredge sediments and subsequent subsampling of this material for chemical analysis. The remaining cores at each station were composited on board the coring vessel and stored in 5 gallon plastic containers.

2.0 EQUIPMENT AND PROCEDURES

2.1 Horizontal Control

Horizontal control for this project was accomplished by utilizing a combination of points previously established by the U.S. Coast and Geodetic Survey and OSI. These control points are located on both the east and west shores of the Thames River and north shore of Long Island Sound. Table 1 documents the points used for each sample location and the corresponding Connecticut State Plane Coordinates.

TABLE I
HORIZONTAL CONTROL POINTS

SEA SIDE OFFSET	179109.58	769109.58	DISPOSAL SITE
WESTERN	173438.18	802860.28	DISPOSAL SITE

2.2 Vertical Control

Water depths at each of the seven Thames River Core locations were determined from soundings plotted on the hydrographic survey sheets prepared by Gahagan and Bryant Associates, Inc and provided to OSI by Maguire Group Inc. As none of the samples were acquired directly over a published sounding point water depths were interpolated from the sounding sheets at the as sampled locations. These depths are referenced to Mean Low Water

2.3 Navigation

Positioning of the sampling vessel within the Thames River was accomplished utilizing a "Hydro I" Range-Azimuth navigation system. Vessel navigation for the New London Disposal Site was carried out by employing a Racal "Micro-Fix" Microwave Positioning system. Both positioning systems were interfaced to OSI's "Maretrack II" Navigation and Data Logging System.

2.3.1 Hydro I

The "Hydro I" navigation system consists of a manned shore station and onboard instrumentation. (Specification sheets for the HYDRO I and all other equipment used on this project are included in Appendix B.) The shore station includes a theodolite, a laser distance measuring instrument, and a computerized data transmitter/receiver radio link. The shipboard equipment includes a multiprism optical reflector and a computerized data transmitter/receiver radio link.

Operationally, the shore based instrumentation is positioned over a known geodetic point and a reference angle is set for a backsight to a second coordinated point. The coordinates of the occupied station and the reference azimuth are entered in the "HYDRO I" shore based unit. The "HYDRO I" operator then sights the shipboard prism and continuously tracks the vessel as it maneuvers onto location. The ship's position is computed by the shorebased equipment and transmitted to the shipboard receiver once every 0.7 seconds via the digital radio link. These data are then output to the OSI Maretrack II system via the Hydro I RS232 interface.

2.3.2 Micro-Fix

Vessel control for the New London Disposal Site was accomplished by employing a Racal "Micro-Fix" microwave

navigation system. "Micro-fix" is a high resolution, line-of-sight, dynamic positioning system which combines established microwave ranging techniques with advanced microprocessor technology. The combination of these technologies enables the system to provide ranging information at a once per second update rate.

The system consists of two or more shorebased remote stations and a master station installed aboard the coring vessel. A remote station is comprised of a Transponder unit (T/R) established over a known horizontal control point on shore and a Master station includes a Control Measurement Unit (CMU) interfaced to a T/R.

T/R units incorporate a fully automatic calibration capability to compensate for errors resulting from "turn-around delays" associated with microwave ranging systems. This feature eliminates the need for predeployment calibration and insures that the transponders can be interchanged as required, while maintaining a range accuracy of ± 1 meter under a wide range of environmental conditions.

CMU units are micro-processor based devices capable of measuring the range from the vessel to as many as 8 remote stations at a once per second update rate. The CMU corrects the "Raw" range measurements for any slant range component and deskews the range data to adjust for timing errors. Final range measurements are then output to the OSI Maretrack II System via the CMU's RS232 interface.

2.3.3 MARETRACK II Trackline Control and Data Logging System

The OSI MARETRACK II system is based on a ruggedized AT-level IBM-PC computer and OSI developed software that allows instantaneous flexibility to delineate and run any desired trackline spacing and line orientation and simultaneously log

vessel position and one or more other measured parameters. Data logging parameters are also equally flexible and data logging rates of up to 10 measurements/second can be efficiently employed. The MARETRACK II system has the additional capability to display pre-plot survey tracklines, target locations, survey area boundaries, and significant navigation features as well as provide real-time on-board plotting. Vessel guidance information in the form of "left/right cross track error" and "distance to go" is continuously displayed to the helmsman on the ship board computer screen.

In support of this project along with proposed sample locations, Navigation Chart information were entered in the MARETRACK II computer. Navigation Chart data included prominent shore line features, limits of the federal channel, channel buoys, and the locations of the horizontal control stations utilized during the course of this investigation. The as sampled coordinates of all grab samples and vibratory cores, along with the date and time each sample was acquired as well as the navigators comments were logged by the Maretrack II System.

2.4 Sediment Sampling Operations

2.4.1 Grab Samples

A total of 5 sites (P1 Grab A, B, and C/B1/EB2) were sampled utilizing the coring vessel's clam shell bucket. At all locations the clam shell bucket was capable of penetrating and acquiring a sample of the upper four feet of the river bed. Operationally, prior to deployment the bucket was rinsed thoroughly with site water. A sediment sample was then acquired and the bucket recovered and placed on deck. The field team subsampled the entire strata of material within the 4 foot long, 3 foot wide, clam shell bucket to insure that all samples

were representative of the dredge material. Subsequently, the sample material from Stations B1 and EB2 was stored in 5 gallon plastic containers. Sample material from the P1 grab samples were stored in two 500 ml glass jars for each station. The grab sample at the reference site was obtained using a Hydro Products Shipek Model 860 sediment sampler. The Model 860 is a surface sediment sampler designed to penetrate 4" into unconsolidated material and acquire a .2 cu ft sample. Multiple rabs were taken at the reference site to collect the required 30 gallons of sediment. Reference site material was stored in 5 gallon plastic containers. Coordinates of all grab sample locations are included in Table II .

The Model 1500 was configured to acquire 3½" diameter cores in incremental lengths to a maximum length of 20 feet. This configuration allowed the penetration depth of the corer to be appropriately adjusted at each station.

Operationally, the required penetration depth at each site was calculated from water depth values interpolated from the Gahagen and Bryant hydrographic survey charts and the proposed dredge depth plus the allowable two foot overdredge limit. Prior to deploying the vibratory core the operator adjusted the mechanical penetration stop to the appropriate sampling depth. To obtain the required sample volume multiple cores were taken at each station. Cores from each station were composited onboard the coring vessel and stored in 5 gallon plastic buckets. The 5 gallon containers were sealed, labeled, and placed in the onboard sample storage area. Additionally, one core was taken at each station and set aside to be described geologically and subsampled for chemical analysis. The air temperature throughout the survey period was cool enough to maintain the cores aboard the vessel at approximately the 4°C required. At the end of each day all

samples were transferred to and stored in a refrigerator truck. The temperature of the refrigerator truck was maintained at 4°C.

2.4.3 Water Samples

Multiple water samples with a total volume of 18,040 Milliliters were collected by Maguire Group personnel at sample station P1 for use in the elutriate tests.

Operationally, all water samples were pumped from 3 feet below the river surface utilizing a stainless steel, submersible sampling pump. To insure that the sampling pump was rinsed thoroughly, the unit was deployed at sample station P1, energize and allowed to pump site water for approximately 10 minutes prior to obtaining the required samples. Samples taken include a 3,040 milliliter water sample to be analyzed to establish an elutriate background reference. This sample was stored in the following glass containers 2 each 1000 milliliter, 2 each 500 milliliter, and 1 each 40 milliliter. Additionally, a 15,000 milliliter elutriate bulk water sample was acquired at P1. This sample was stored in 15 each 1000 milliliter glass containers. These samples were delivered by Maguire Group to Lab Resources on December 20, 1991.

3.0 DATA PRESENTATION AND SAMPLE DISPENSATION

After the completion of field work, 150 gallons of reference material and composited core samples (thirty 5 gallon buckets) were delivered to Aqua Survey Inc. in New Jersey for analysis on December 23, 1991. The 7 cores set aside for chemical analysis were split at OSI offices in Old Saybrook and described geologically. The core descriptions are documented on the Vibratory Core Log Sheets included in Appendix A.

After the cores were described, Maguire personnel took custody of and subsampled the individual cores for the required chemical/bulk sediment analysis samples. These samples were delivered by Maguire Group to Lab Resources on December 23, 1991.

Sample Recovery: 100%

Core Length: 11.6 ft

Core Description:

0 - 4.7 ft Black anoxic mud typical of all cores,
Material is composed of approximately 80%
clay, 15% silt, 4% sand and 1% other.

Sharp contact between units.

4.7 - 11.6 ft Gray mud also similar to other cores
however, much higher shell content both
whole and fragments.

Includes clam, mussel, gastropod shells.

Dominantly clay and very cohesive.

Comments: A 3,040 Milliliter water sample was acquired at this
station and will be analyzed to establish an elutriate
background reference. The sample is stored in the
following glass containers.

2 each 1000 Ml
2 each 500 Ml
1 each 40 Ml

A 15,000 milliliter elutriate bulk water sample was also acquired at P1. The sample was stored in 15 each 1000 Milliliter glass containers.

In the vicinity of P1 sediment grab samples for elutriate testing were acquired at stations A, B and C. These samples are stored in 6 each (2 per station) 500 Ml glass containers. Station coordinates are as follows:

Station	Easting	Northing
P1 Grab A	779,821	208,483
P1 Grab B	779,834	208,480

Core Length: 15.1 ft

Core Description:

4 distinct units evident in core: black mud, gray mud, brown-gray mud, and brown mud.

1. Black mud - Anoxic clay with very little silt and sand, some shell fragments, similar to other cores.
2. Gray mud - Dominantly clay with no sand, very cohesive, abundant shell fragments, similar to all other cores.
3. Brown-Gray mud - Unit is composed of approximately 85% clay and approximately 15 % silt, very few shell fragments, some evidence of peat development.
4. Brown mud - Clay with some silt and sand, definite peat layer in early stage of development, organics and debris common, no shells.

0 - 1.3 ft - Black mud
1.3 - 1.4 ft - Coarse sand layer, possibly result of storm event
1.4 - 8.1 ft - Black mud
8.1 - 8.4 ft - Gray mud
8.4 - 8.6 ft - Black mud
8.6 - 8.9 ft - Gray mud
8.9 - 9.2 ft - Black mud

9.2 - 9.8 ft - Gray mud
9.8 - 10.8 ft - Brown - gray mud
10.8 - 12.0 ft - Gray mud
12.0 - 12.5 ft - Brown - gray mud
12.5 - 14.0 ft - Gray mud
14.0 - 14.2 ft - Brown mud
14.2 - 15.1 ft - Gray mud

Relatively sharp contacts at all unit boundaries, except around brown - gray mud which shows a gradual transition into gray mud on either side.

Easting: 792,068
Northing: 159,878

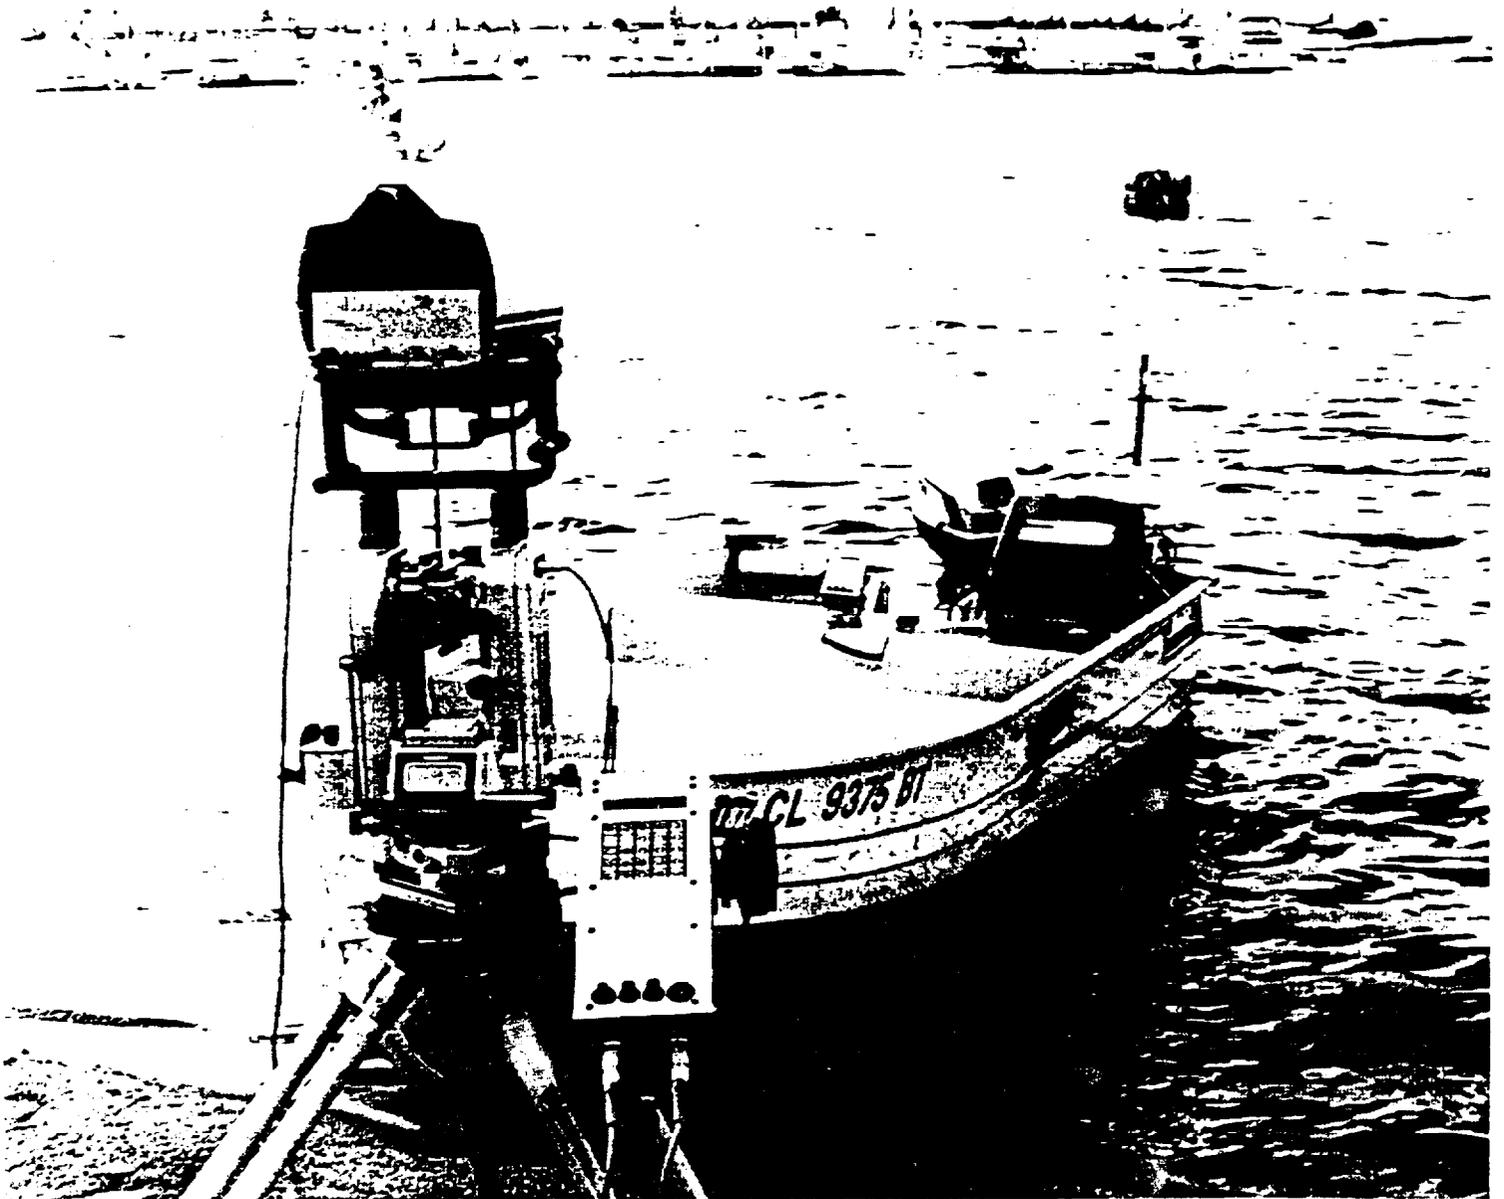

A total of 30 gallons of sediment was acquired at this location and stored in 6 each 5 gallon plastic pails.

Material is a mixed silt and fine sands, medium brown in color, with no obvious odor and some cohesiveness.

APPENDIX B
EQUIPMENT SPECIFICATIONS

Hydro I

FULLY AUTOMATED RANGE AZIMUTH SURVEYING SYSTEM

THE HYDRO I IS A HIGHLY RELIABLE AND FULLY AUTOMATED HYDROGRAPHIC POSITIONING SYSTEM THAT CAN BE INTERFACED WITH YOUR EXISTING SOUNDING EQUIPMENT AND COMPUTER, TO PROVIDE YOU WITH A COMPLETE HYDROGRAPHIC SURVEYING PACKAGE INCLUDING COMPUTERIZED MAPPING.

International Measurement
and Control Company
300 E. Mineral Suite #5
Littleton, Colorado 80122
(303) 797-7722

SYSTEM OVERVIEW

The Hydro I is a very compact range azimuth surveying system which makes it ideal for small boat situations. The system will automatically collect an (x,y) coordinate and a depth reading at a pre-set distance interval. The diagram below shows an example of the system programmed on a parallel line grid with a 50 ft. offset between lines. It has also been programmed to store an (x,y) coordinate and a depth reading at 10 ft. intervals. After entering the Start and End Points of the first grid line the system will automatically enter new line coordinates when surveying a parallel line grid. When surveying non-parallel lines, line coordinates can be stored and recalled as needed.

NAVIGATE AND SOUND DISPLAY EXAMPLES

The system provides navigation information both for navigating to the Start Point of a grid in the "Navigate Mode" and for keeping on line as soundings are being stored in the "Sound Mode".

NAVIGATE MODE (Navigating to a New Line)

180°	45°	75'
------	-----	-----

Azimuth to Start Point	Azimuth of Desired Line	Distance to Start Point
------------------------	-------------------------	-------------------------

In the Navigate Example in the diagram below, the boat operator would be provided with the information in the display above. From where the boat is located it needs to proceed 75 ft. straight south at a heading of 180° to arrive at the start of the next line which runs at a heading of 45°.

SOUND MODE

(Collecting depths & positions at preset increments)

D	■■■■>	D
---	-------	---

This display would be provided in the Sound Mode Example below. Each block has been assigned a value of 5 ft., therefore the display is indicating the boat is off course to the left 15 ft. The arrow indicates the direction to return to course. The D indicates the data collector is on.

In both navigate and sound mode three additional displays are accessible.

X	±	999999.99 F
---	---	-------------

x coordinate of boat position

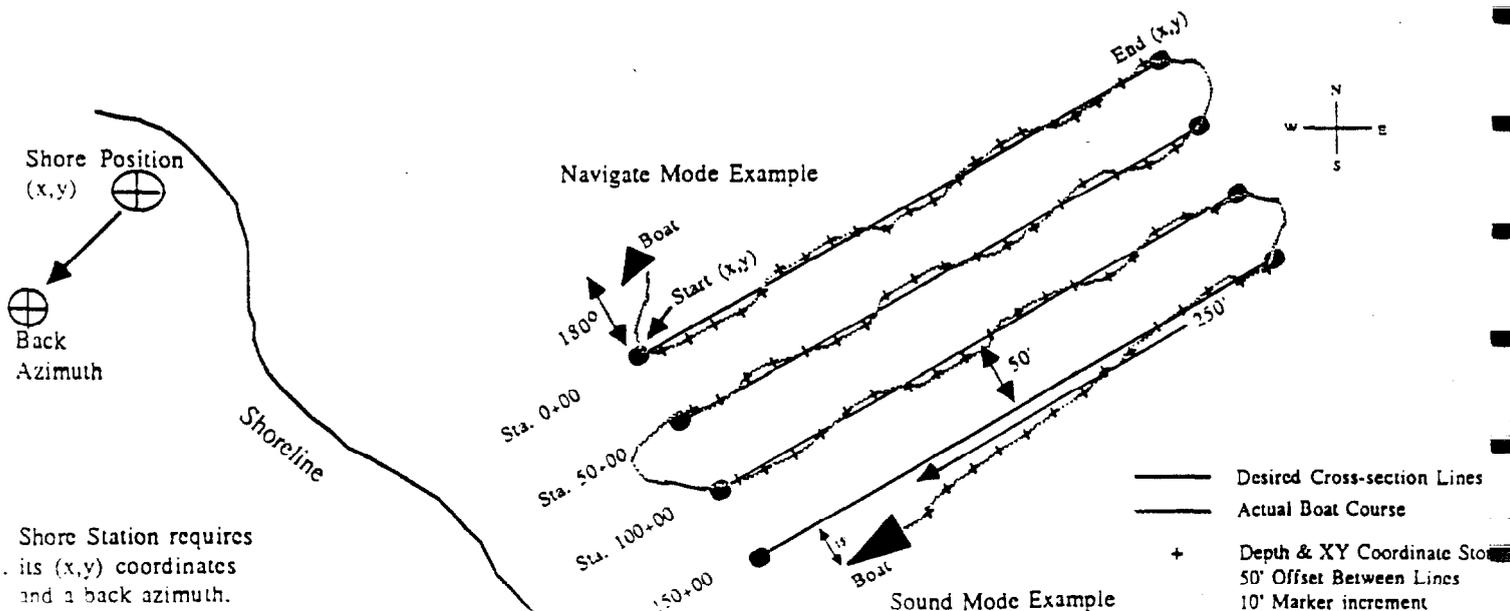

- 15 F	-250 N
--------	--------

Distance off line Distance on line

Y	±	999999.99 F
---	---	-------------

y coordinate of boat position

Refer to Sound Mode Example.
In this situation the boat is off line to the left 15 ft. and 250 ft. along the line from the start point.

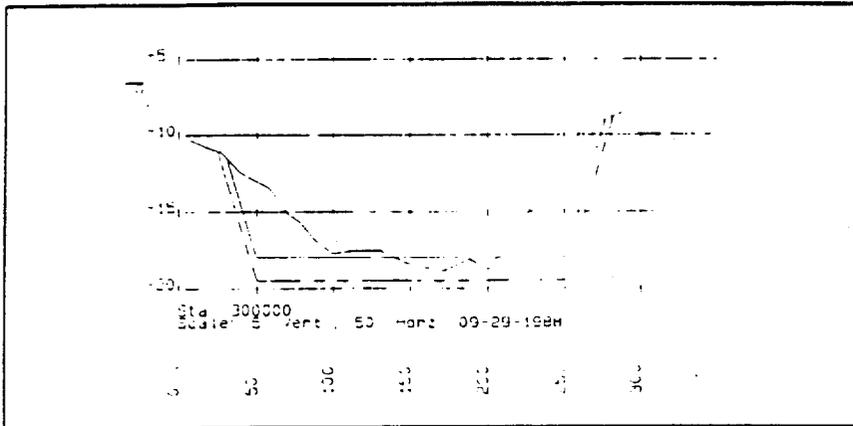

Shore Station requires its (x,y) coordinates and a back azimuth.

FIELD TO FINISH SOFTWARE

The IMC Post Processing software package is IBM compatible, very easy to use, and enables operator to:

- A. Download data from Data Collector
- B. Edit Data (on screen graphics)
- C. Enter Tide Corrections
- D. Plot Plan View (color select for depth highlighting)
- E. Plot Cross Section View
- F. Draw in Desired Dredge Template and Over-Dredge Template
- G. Compute Dredge Volumes and Over-Dredge Volumes (fill also)
- H. Print out of x, y coord., Dist. on line, Dist. off-line, Depths.

CROSS-SECTION VIEW WITH DREDGE TEMPLATE

DREDGE VOLUME PRINT-OUT

STANDARD SYSTEM EQUIPMENT:

1. Hydro I Laser
2. Lietz DT5 Theodolite
3. Quick Track Endless Tangent
4. Shore/Ship Voice and Data Links
5. Navigator Box
6. 12,000 Point Data Collector (x,y,z=1 Point)
7. Rechargeable Batteries w/chargers
8. RS232 Computer Interface

OPTIONAL EQUIPMENT:

1. IMC Post Processing Software Package
2. Fathometer
3. Fathometer Digitizer
4. Computer
5. Plotter
6. Prisms with omni Directional Cylinder
7. Tri-Pod
8. External Gei Cell Batteries
9. Internal Time Clock
10. High Gain Antennas
11. 30 A.H. Gel Cells

STANDARD SYSTEM FEATURES:

1. Navigation Directional Indicators which include:
 - A. Navigation to Start Point of Line
 - B. Course Navigation - Left/Right Steering Indicator
2. Interface to Sounder
3. Distance Measurement 5 times per second
4. Vertical & Horizontal angle measurement 2 times per second
5. Conversion to x,y, or station range positioning
6. Position update time .7 seconds
7. Depths recorded at distance intervals
8. Automatic computation of next line coordinates
9. Parallel and non-parallel line modes
10. Real time data output

SYSTEM SPECIFICATIONS

1. HYDRO I LASER: CLASS I EYE SAFE (CFR 21)
 - A. Range: 5000m (to a triple prism)
 - B. Update Rate: 5 times/sec.
 - C. Accuracy: ± 2 ft.
 - D. Beam Width: 7 milliradians Hor. x 2 milliradians Ver.
 - E. Power Source: 12 V DC
2. LIETZ DT5: ELECTRONIC THEODOLITE
 - A. Accuracy: ± 5 Arc Sec.
 - B. Resolution: 10 Arc Sec.
 - C. Power Source: Rechargeable 6 Volt Ni Cad
3. HYDROLINKS (Data Transmitters)
 - A. Radio: 4 Watt Half-Duplex Voice/Data Communications
 - B. Radio Range: 3 miles
 - C. Power Source: 12 VDC
4. DATA COLLECTOR
 - A. 12,000 Point Storage (1 Point = x,y, depth)
 - B. Real Time Serial Output

Data transferred is standard ACSII format via RS232 Serial Link.

International Measurement & Control Company is continuously upgrading and improving it's products. Specifications may change without notice.

MICRO-FIX

General Description

- Low power solid state transmitter allows immediate ranging
- Continuous automatic self-adjustment eliminates pre-deployment calibration and maintains accuracy over the operating temperature range.
- Master and Remote T/R units interchangeable.
- Circular polarisation ensures virtually null-free operation and rejection of reflections using a single antenna.
- Data transfer in both directions allows automatic monitoring of deployed remote stations and transfer of other information.
- Standard facilities include full spheroid conversion, track guidance, and real-time clock.
- Automatic self-test and monitoring during system operation.
- All operating parameters stored during power-off for immediate recall when system is powered up.
- Software options for plotter drive, serial range/guidance data and helmsmans track guidance output.

Micro-Fix is a short range position fixing system combining the proven microwave interrogation technique with state-of-the-art technology to achieve a repeatable accuracy of, typically, ± 1 metre. The system utilises a low power solid state transmitter operating in the 5 GHz band providing a working range of 80 km with line of sight.

A basic Micro-Fix system consists of two principal units; a Microwave Transponder (T/R) and a Control Measurement Unit (CMU). Details of these units are given in TIL 11-3 and 11-5 respectively.

T/R units are sited at known shore locations around the survey area and are referred to as Remote stations. Remote T/R units are usually mounted on a surveyor's tripod and powered by a +24V d.c. supply.

A Master station is located on the user's vehicle within the survey area and consists of a CMU connected to a T/R. The Master station interrogates all Remote stations in turn and, by measuring the time interval between the transmitted interrogating pulse and received reply, the range of each Remote can be determined.

The Master station can interrogate up to 8 Remote stations from a possible total of 31 with each Remote T/R unit preset to recognise its own unique station code. By the inclusion of a chain code, up to 4 separate chains can be deployed in the same survey area without inter-station interference. Multi-user capability allows a maximum of 16 users for each deployed chain depending on number of Remotes and interrogation demands. The Master station can be powered by the normal range of A.C. supplies (110V/230V, 50-400 Hz) or from a +24V D.C. source. Both units are designed for minimum power consumption.

Operator communication is via the keyboard and display of the CMU for all data presentation and control purposes. All operating parameters are stored during power-off thus obviating the need to re-enter on power-up.

The CMU design reflects the use of microprocessors to increase the facilities available as standard for the user. These include full self-test, track guidance, plotter drive, X-Y conversion (full spheroid and multi-range solution) and

slant range correction. The CMU has the ability to provide serial and/or parallel data outputs for use by peripheral equipments.

The operator can monitor the CMU and Master T/R voltage rails for fault diagnosis. The Remote T/Rs are continuously monitored via a data link thus allowing their voltages to be remotely checked and to initiate an alarm on the CMU if any out of limit voltages are detected.

The T/R unit incorporates automatic adjustment to compensate for errors due to the turn around delays associated with microwave ranging systems. This eliminates the need for pre-deployment calibration and, since it is a continuous self-adjustment, the accuracy is maintained over the whole operating temperature range. T/R units operate on the same single frequency of 5.48 GHz (other frequencies are available to special order) and can be inter-changed. This 'common unit' concept presents logistical advantages to the user.

T/R units can be fitted with either an omni-directional or sector antenna. Normally a Master designated T/R is fitted with an omni antenna and Remote T/Rs with a sector. Both types of antenna are available in different beamwidths and clip onto the T/R without use of waveguide retaining rings or screws. Circular polarisation is employed to reduce the null effect phenomenon and to ensure the rejection of any reflections. Interference suppression is inherent in the operation of the T/R unit.

Units are constructed to meet the expected environmental operating conditions. The T/R unit is fully waterproof and capable of withstanding high impact forces and vibration. The CMU is housed in a strong weatherproof case which may be free-standing or mounted in a 19 inch racking system.

A Remote Front Panel Unit is available when installations require the CMU display to be duplicated at another location. Alternatively, this information can be presented on a monitor by fitting the CMU with a video board. Track guidance data can also be remotely presented using a L/R display.

STATION EQUIPMENT SCHEDULE

Remote Station

1 T/R unit mounted on surveyor's tripod; for permanent installation use Ship Mounting Bracket 90105 fixed to suitable building.

1 Sector Antenna

1 Cable d.c. Power (Length 5m or 10m)

Power requirements: +16V to +30V d.c. (typically +24V battery)

Power Consumption 12 watts operating
3 watts stand-by

Master Station

1 T/R unit masthead mounted using Ship Mounting Bracket 90105.

1 Omni-directional Antenna.

1 CMU fitted with either A.C. power supply 90515/1/3/6 or D.C. power supply 90515/1/3/5 as required.

1 Cable Power/Signal (Length to be specified)

Power requirements: 110V/230V, 50-400Hz or +16V to 36V d.c.

Power Consumption 40 watts @ +24V.

MARETRACK-MAREPLOT II

The OSI Maretrack/Mareplot system is the result of more than a decade of integrated software/hardware evolution and development. Initially starting as a programmable calculator-based system, capability has been progressively increased with greatly expanded task abilities, processing speed, expanded display of real-time data, simultaneous multi-terminal output, redundant real-time data logging and most recently a full stand-alone remote site data processing ability.

The present version of the OSI Maretrack/Mareplot II survey vessel navigation, trackline control, data logging and post-processing system operates on high speed AT and 80386-based portable micro-computers. The OSI Maretrack® system accepts position data input from an extensive range of instrumentation including:

Racal "Micro-Fix" Falcon
Motorola "IV"
Del Norte "540"
Cubic "Autotape"
Navitrack "Rho-Thata"

Krup Atlas "Polarfix"
IMC "Hydro I"
Northstar 800 Loran-C
Trimble 4000 GPS
Magnavox 1101& 4200 GPS

and offers the following real-time outputs:

Numerical Outputs

Line number and azimuth/heading
Distance to go start/end of line
Depth, Fix No., Vessel Speed, Time
Range data (R1, R2, R3, R4,...R8)
Vessel position (x,y)
Data Acquisition Status (on/off)

Graphical Outputs

- Labelled tracklines with fixes and vessel location
- Vessel icon shown on
- selectable scale left/right "off-line" bar display
- Grid North Arrow

Post processing capability include full data analysis and editing through generation of both profile and "boat" or "smooth" sheet presentations at any desired scale, complete drawing labelling including graphic scales and title blocks, project location and survey site inset and generation of ASCII or DFX format (AutoCad) 5¼" or 3½" IBM diskettes.

HYDROGRAPHIC DATA COLLECTION/PROCESSING SYSTEM

HARDWARE

- 80286 Portable Computer Featuring:
 - 30 Mb Shock mounted hard disk
 - 1.2 Mb Floppy disk
 - 720Kb 3.5" Fixed disk
 - 10MHz Turbo Mode
 - RGB graphics monitor with external option
 - Special 4 Port Serial I/O card for system peripherals
 - Operates with MS-DOS 3.2 (IBM Compatible!)

HY87 — HYDROGRAPHIC DATA COLLECTION

- Range/Range or Range/Azimuth
- Supports up to 16 ranges
- Interfaces to support:
 - Digital Echosounders
 - Plotters
 - Event Markers
 - Remote left/right indicators
 - Printer
 - Remote Graphics Display
- Supports the following grids:
 - Transverse Mercator
 - Universal Transverse Mercator
 - Lambert Conformal Conic
 - Engineering
- On-Line Screen Graphics displaying:
 - Boat Track
 - Survey Lines
 - Digitized Shoreline Data
 - Adjustable Left/Right indicator
 - Positioning Information
- On-Line Plotting of Boat Track and/or Corrected Soundings
- Keyboard interrupts to change program parameters while on-line
- Keyboard entry mode for processing manually collected data
- System Configuration selected from software
- Records data on hard disk and 3.5" fixed disk

TIDE — PREDICTED HARMONIC TIDE

- Calculates and stores predicted tide corrections
- Accessed by HY87 for on-line depth reduction
- Provides a printed summary of corrections
- Screen graphics provide a tide graph

DEPDIG — DEPTH DIGITIZATION

- Provides for digitization of echograms and tide charts
- DEPDIG data is merged with positions from HY87 for processing

SHORE — SHORELINE FEATURE DIGITIZATION

- For digitizing shoreline and hydrographic features
- Information is displayed on graphics screen of HY87
- Information can be plotted on boat and smooth sheets
- Separate symbols for:

Shorelines and buildings	Wrecks
Geodetic Marks	Tanks
Exposed Rocks	Spires
Tide Gauges	Bouys
Grid and Magnetic North	Antennae
Text	Boats

DCORR — DEPTH AND POSITION CORRECTION

- Provides graphic displays of depth and positions for on-screen editing
- Provides for entry of final tide, draft, and zero corrections
- Builds final data file for input into HY PLOT

HY PLOT — HYDROGRAPHIC PLOTTING

- Plots and labels grids
- Plots boat's track from either HY87 or DCORR files
- Plots soundings in the following styles:
 - Decimal point on the mark (Corps of Engineers format)
 - Centered sounding with small lowered fraction (IHB format)
- Soundings can be oriented either:
 - Perpendicular to track
 - At a fixed angle to sheet
- Additional plot features:
 - Range/Range nets
 - Range/Azimuth nets
 - Plots Shoreline and Hydrographic Features
 - Plots Lines and Points
- Standard Title Blocks Include:
 - Plotting Record
 - Work Record
 - Smooth Sheet Record
 - Tidal Information Block

GEOD — Geodetic Support

- GP to UTM Conversions
- UTM to GP Conversions
- Forward GP
- Grid Traverse

SHIPEK SEDIMENT SAMPLER MODEL 860

FEATURES

- UNDISTURBED SAMPLES
- UNLIMITED DEPTHS
- AUTOMATIC ACTUATION
- FOOLPROOF OPERATION

DESIGN

The advanced concept in bottom samplers is based upon the patented design of the late Carl J. Shipek, noted oceanographer. Specially designed for sampling unconsolidated sediment, from soft ooze to hard-packed coarse sand, the device is capable of obtaining virtually undisturbed, unwashed samples to the surface from any depth.

The Shipek sampler is designed to take a sample 1/25 square meter in surface area and approximately 4 inches deep at the bottom. It is therefore particularly well adapted for pickup of benthic organisms living at or immediately below the water bottom interface.

PERFORMANCE

Basically the unit is composed of 2 concentric half cylinders. The inner semi-cylinder, or sample bucket, is rotated at high torque by 2 helically wound external springs. Upon contact with the bottom it is automatically triggered by the inertia of a self-contained weight upon a sear mechanism. At the end of its 180° travel the sample bucket is stopped and held at the closed position by residual spring torque.

After closure the sample is given optimum protection from washout during the return trip by the cylindrical configuration of the unit. Unlike many types of samplers, closure of the unit is made at the side, rather than at the bottom. Therefore, if complete closure is prevented by a rock or some other consolidated substance, it is improbable that the entire sample will be lost.

Based on in situ experience, special attention has been given to ease of removal of the sample from the unit. Once on deck, the sample bucket may be disengaged from the rest of the device by releasing two retaining latches at each end of the upper semi-cylinder. The sample is then readily accessible for immediate study or transport to off-site laboratory facilities. Any number of interchangeable sample buckets may be purchased for use with a single actuating mechanism. The Shipek Sediment Sampler is covered by U.S. Patent No. 3,165,935, dated January 19, 1965.

OCEAN SURVEYS, INC.

OLD SAYBROOK, CONNECTICUT

June 1973

SPECIFICATIONS

SIZE: 18.6 in. x 17.4 in. x 25.1 in. (47.2 x 44.2 x 65.8 cm)

WEIGHT: 134 lbs. (60.8 kg) net; 200 lbs. (90.8 kg) shipping weight

MATERIALS: Sampler: Cast Iron
Springs: Tempered stainless steel

FINISH: International Orange epoxy paint applied over inert primer coat

SAMPLE SIZE: Surface area: 8 in. x 8 in. (1/25 square meter)
Depth: 4 in. (10.2 cm) at center

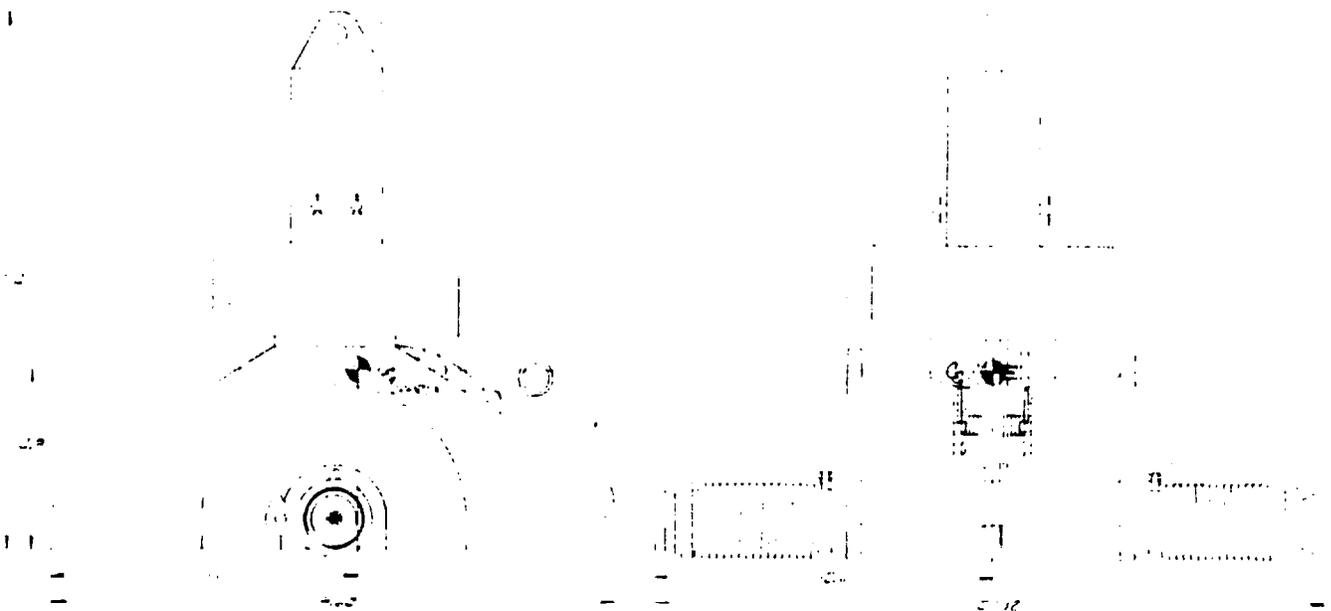

ORDERING INFORMATION

The Model 860 Shipek Sediment Sampler is shipped from the factory in a re-usable packing crate, complete with one sample bucket and one hand cocking wrench. Complete operating instructions and handling recommendations are also provided. For ease in carrying, handles are affixed to the unit.

The complete crate measures 21.5 in. x 21 in. x 29.75 in. (54.6 x 43.3 x 75.6 cm), and will hold the sampler cocking wrench and extra sample buckets. Net weight of the Model 860 is 134 lbs., with a shipping weight of 200 lbs.

GUARANTEE

The Shipek Sediment Sampler is unconditionally guaranteed against all defects in material, workmanship, or operation for a period of one year from the date of sale. This guarantee is voided only if the sampler is obviously misused or modified by the customer.

PNEUMATIC VIBRATORY CORER

MODEL 1500

In addition to offering a full range of gravity coring services, Ocean Surveys, Inc. provides sampling of fine to coarse granular sediments in water depths to 300 feet employing the OSI Model 1500 pneumatic vibracorer.

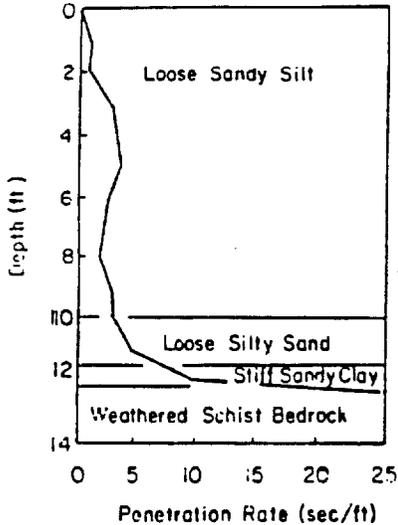

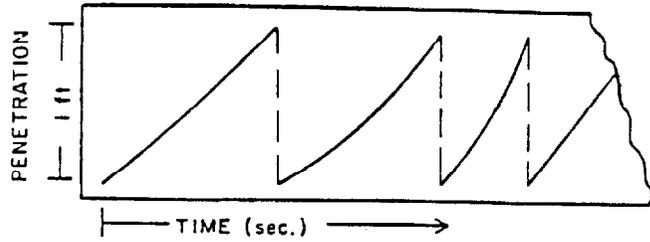

In operation, the OSI corer employs an oscillating air-driven mass which generate axial forces causing the core head to oscillate vertically. These forces, together with the longitudinal impact created by the core head striking an anvil at the bottom of each stroke, are transmitted to the core barrel. As both the frequency and intensity of the core head forces are controllable, sampling operations may be "tuned" to achieve maximum subbottom core penetration, minimum sediment disturbance, and efficient sampling of sediments exhibiting a wide range of geotechnical properties.

In sheltered water and for sampling low strength sediments, maximum efficiency can be achieved employing the Model 1500 as a free-standing corer. Offshore or in compact sediments, use of a bottom-standing frame is recommended. Core barrels are available in

up to 40 foot lengths with removable plastic core liners up to 3-5/8" ID which facilitate core handling, shipping and storage. The additional capability of jetting to predetermined depths before coring commences permits recovery of sequential core sections from subbottom depths in excess of those attainable by conventional vibratory coring approaches.

The coring rig can be handled with a crane or an A-frame and a winch mounted on a ship or barge. Twenty to 40 foot cores are generally taken in 15 to 45 minutes, which includes the time to lower the unit to the bottom, penetrate the sediment and return it to the vessel. The corer at left is returning from the sea floor with a 20 foot core.

Penetration of the core barrel into sediment as a function of time is recorded as shown above on a strip chart recorder on the support vessel.

Penetration rate is used to evaluate soil consistency in a similar fashion to a "blow count" obtained from conventional split spoon sampling and a penetration profile may be prepared (left).

OSI MODEL 1500 VIBRACORER SPECIFICATIONS

SPECIFICATIONS

Power System: Engine: 4-cycl., air-cooled, diesel air compressor
 Flow Capacity: 150 cfm @ 120 psi
 Connecting Lines: Supply (Low Pressure): 1 in.
 Return (Low Pressure): 1 inc.

Core Barrel: Lengths Available: 20 ft. std. (40 ft. available)
 Outside Diameters: 3 to 4 in.
 Inside Diameters: 2-3/4 in. to 3-5/8 in.
 Liner: Plastic, removable in 20 ft. lengths

PROJECT SUMMARY

PROJECT SUMMARY

The samples of Thames River Dredge sediment were shipped to Aqua Survey, Inc. (ASI) on December 23, 1991. Split samples of the sediment were shipped to NYTEST for chemical analysis and physical characterization. The samples of sediment were tested for toxicity to the estuarine amphipod, *Ampelisca abdita* under flow-through conditions. The sample were tested for bioaccumulation of select chemicals in the clam, *Macoma nasuta*, and the sandworm, *Nereis virens*, in a 28-day flow-through exposure.

Fourteen percent mortality was observed in the control sediment for *A. abdita*. No significant mortality of *A. abdita* was observed in the test sediments Mamacoke (32%), Electric Boat (18%), Gold Star (14%) and Piers 32 and 33 (24%) as compared to the reference sediment.

Twenty percent mortality was observed in the *N. virens* control sediment. No significant mortality was observed in the Mamacoke (9%), Electric Boat (5%), Gold Star (6%) or Piers 32 and 33 (2%) test sediments as compared to the reference.

Thirteen point three (13.3) percent mortality was observed in the *M. nasuta* control sediment. No significant mortality was observed for Gold Star, Mamacoke or Electric Boat. The Piers 32 and 33 sample may or may not be significantly toxic. In the Gold Star sample, replicate two showed only 9 percent survival. It is possible that this is an outlier and does not reflect a toxic response. If this data point is removed, problems with normality and homoscedasticity of the data set disappear, and parametric analysis of variance can be conducted. In this case, the response of the clams in the Piers 32 and 33 sample becomes statistically significant. No other changes occur. Both results should be reported to the regulatory agency for a decision regarding the outlier.

No significant bioaccumulation of metals or PAH's was detected in any of the samples for either Nereis or Macoma in the Gold Star, Electric Boat, or Pier 32 and 33 samples. Significant accumulation of lead was detected in Macoma exposed to Mamacoke sediment.

PERCENT MORTALITY OBSERVED

		<u>10-Day Solid Phase</u>	<u>28-Day Solid Phase</u>	
		<i>A. abdita</i>	<i>N. virens</i>	<i>M. nasuta*</i>
Control		14.0	20.0	13.3
Reference		12.0	4.0	10.4
Test	Electric Boat	18.0	5.0	9.6
	Gold Star	14.0	6.0	32.8
	Mamacoke	32.0	9.0	16.8
	Piers 32 and 33	24.0	2.0	28.8

* See test for discussion and interpretation of results.

The following report is divided into four volumes, one for each sample site. Each section is a full report containing text, statistics, and raw data for that site.

ELECTRIC BOAT

SECTION 1 - AMPHIPOD REPORT

I. OBJECTIVE

The objective of this test was to determine the toxic effects of test sediment from Electric Boat when in the environment of a benthic invertebrate. The measure of potency is significant reduction in survival of exposed organisms as compared to a reference after ten days exposure.

II. TEST MATERIAL

Source: Electric Boat

Date
Received: December 23, 1991

III. MATERIALS AND METHODS

A. Method

The method employed was a modification of the method outlined by the American Society of Testing Materials, Standard Guide for Conducting 10-Day Sediment Toxicity Tests with Marine and Estuarine Amphipods, E1367-90, and the Evaluation of Dredged Material Proposed for Ocean Disposal, USEPA, USACOE, EPA-503/8-91/001, February 1991.

B. Test Organisms

Species

The test species used for this test was *Ampelisca abdita*, a representative benthic invertebrate.

Size/Age/Physical Condition

Animals used in this test were all mixed adults, field collected by an outside company specializing in animal husbandry. All animals appeared to be in good condition.

Source/Acclimation

A. abdita were obtained from Northwestern Aquatic Sciences. Animals were held at least one day prior to testing during which time they were acclimated to dilution water and test temperature.

C. Test System

Source of Dilution Water

Dilution water was obtained from Manasquan Inlet in Manasquan, New Jersey. The salinity was modified to meet organism requirements using deionized water. Water is periodically tested according to ACOE guidelines to ensure its purity.

Temperature

The test temperature was 20 +/- 2°C.

Test Vessels

The test vessels were 1-liter polyethylene beakers covered with a petri plate and gently aerated through glass-tipped aeration lines. Flow-through conditions were provided by means of a calibrated gravity feed system entering the test chamber through the petri plate to approximately two centimeters below the water surface. Daily checks of systems were made to ensure delivery at a minimum of six exchanges per day.

Photoperiod

The test was conducted in continuous light.

D. Test Design

Test Levels

Five replicates of undiluted test sediment and reference sediment were tested and compared to five replicates of control sediment.

Control

A control sediment was obtained from the collection site of the organisms. This sediment was sent to Aqua Survey, Inc. along with the organisms at the time of purchase from the organism supplier.

Reference

Reference sediment was dredged from New London Sound off the Connecticut coast and sent to ASI along with the test sediments.

Beginning the Test

The test was initiated by placing approximately 200 cm³ of test sediment into each of five replicate test vessels and filling the vessels with dilution water. The system was allowed to settle under gentle aeration overnight. After settling, 20 animals were chosen at random and gently added to each test vessel.

The test was of 10 days duration.

All test vessels were examined for survival at 10 days.

Water Quality Measurements

Dissolved oxygen, pH, temperature and salinity were determined at the start of the test and at each 24 hour interval thereafter in every test vessel.

Feeding

Animals were not fed during the test.

E. Reference Toxicant

A 48-hour standard reference toxicant test with sodium dodecyl sulfate was performed. The toxicant was dissolved in dilution water to create a stock solution, followed by mixing with dilution water to achieve the desired concentration. No substrate was provided.

F. Physical Testing

Grain size analyses were performed in accordance with:

Standard Method for Particle-Size Analysis of Soils
ASTM Designation: D422 - 63 (Reapproved 1972)
American National Standard A37 145-1972 Approved
March 2, 1972 by American National Standard Institute.

IV. RESULTS

A. Control survival was 86 percent. Reference survival was 88 percent. Survival in the test sediment was 82 percent. Survival in the test sediment was compared to that in the reference using both parametric and nonparametric ANOVA. No significant differences were detected by either method at $\alpha \leq 0.05$.

B. Water Quality

The test solution temperature was 20.0 - 21.0°C (See Table 1.2).

The pH ranged from 7.8 - 8.1 (See Table 1.2).

The salinity ranged from 30.0 - 32.0 ppt. Dissolved oxygen was kept at or above 3.5 mg/L in all test vessels (See Table 1.2).

C. Reference Toxicant

The 48-hour LC50 for *Ampelisca abdita* was determined to be 3.16 ppm sodium dodecyl sulfate. Three attempts were made to run a Standard Reference Toxicant using copper sulfate; unfortunately a good dose response was not obtained. Finally, a 48-hour sodium dodecyl sulfate bioassay was run with the remaining animals from the shipment. The lack of a sufficient data base limits interpretation of this value (See Table 1.3.)

Table 1.1

Results of the 10-day Solid Phase Bioassay. Testing was initiated with 20 *Ampelisca abdita* per replicate.

Solid Phase Chemical/Physical Data Ranges for the 10-Day <i>A. abdita</i> Bioassay.				
Concentration	pH	Salinity (ppt)	Temp. (C°)	Dissolved Oxygen (ppm)
Control 1-5	7.8-8.1	30.0-31.5	20.0-21.0	5.7-7.5
Reference 1-5	7.8-8.0	30.0-31.5	20.0-21.0	6.3-7.5
Test 1-5	7.8-8.1	30.0-32.0	20.0-21.5	3.5-7.2

Table 1.3

Results of 48-hour Standard Reference Toxicant Bioassays with sodium dodecyl sulfate. Bioassays were initiated with 5 *A. abdita* per replicate.

Concentration (ppm)	Replicate	Final Live Counts
		<i>A. abdita</i> 48 hour
control	A	5
0.1	A	5
1.0	A	5
10.0	A	0
100.0	A	0

D. Physical Testing

Grain size and moisture determinations were made for the control and reference sediment. Grain size distribution is defined by the following criteria:

Sand > or = to 0.0625 mm
Silt < 0.0625 but > 0.0039 mm
Clay < 0.0039 mm

See Table 2.1 for Grain Size and Percent Moisture results.

Table 2.1

Results of Grain Size and Moisture Content Analysis				
Sample	% Sand	% Silt	% Clay	% Moisture
Control	22.0	34.0	44.0	59.15
Reference New London	77.0	15.0	8.0	25.65

V. SOURCE OF DOCUMENTATION

All original data documentation is being maintained at:

Aqua Survey, Inc.

Flemington, NJ 08822

SECTION 2 - BIOACCUMULATION ASSAYS

I. OBJECTIVE

The objective of this test was to determine the bioaccumulation of select chemicals from test sediments from ELECTRIC BOAT when in the environment of benthic invertebrates.

II. TEST MATERIAL

Source: Electric Boat

Date
Received: December 23, 1991

III. MATERIALS AND METHODS

A. Method

The method employed was a modification of the methods outlined by the Testing Manual entitled Evaluation of Dredged Material Proposed for Ocean Disposal, USEPA, USACOE, EPA-503/8-91/001, February, 1991 and the EPA Guidance Manual: Bedded Sediment Bioaccumulation Tests, USEPA, EPA/600/x-89/302, and Guidance for Performing Tests on Dredged Material to be Disposed of in Open Waters, USEPA Region I, 1989.

B. Test Organisms

Species

The test species used for this test were the clam, *Macoma nasuta*, and the sandworm, *Nereis virens*.

Size/Age/Physical Condition

Animals used in this test were all mixed adults, field collected by an outside company specializing in animal husbandry. All animals appeared to be in good condition.

C. Source/Acclimation

M. nasuta were obtained from A.K. Siewers. *N. virens* were obtained from Aquatic Research Organisms. Both species were held at least 24 hours prior to testing during which time they were acclimated to dilution water and test temperature.

Test System

Source of Dilution Water

Dilution water was obtained from Manasquan Inlet in Manasquan, New Jersey. The salinity was modified to meet organism requirements using deionized water. Water was tested according to ACOE guidelines to ensure its purity.

Temperature

The test temperature was 15 +/- 2°C.

Test Vessels

The test vessels were 10-gallon glass aquaria. Aeration was provided through a forced air system ending in sand airstones. Eleven liters of control, reference, and test material were added to each chamber for *Macoma*, six liters for *Nereis*. Flow-through conditions were provided by means of a calibrated metering pump system entering the test chamber through the top to approximately two centimeters below the water surface. Daily checks of systems were made to ensure delivery at a minimum of six exchanges per day.

Photoperiod

The test was conducted under a photoperiod of 16 hour light / eight hours dark.

D. Test Design

Test Levels

Five replicates of undiluted test sediment and reference sediment were tested and compared to three replicates of control sediment. An extra chamber of reference and test material was set up to provide the extra tissue needed for quality assurance checks of chemistry on the fifth replicate. Although this tank was treated identically to the other tanks, results are not included in the chemistry or the mortality data. Observations are included in the raw data only.

Control

A control sediment for the *M. nasuta* bioassay was obtained from Brezina and Associates. This sediment was sent to Aqua Survey, Inc with the organisms at the time of purchase from the organism supplier. Control sediment for the *N. virens* bioassay was collected from the ACOE designated site in Milton Harbor, New York. Grain size determinations were run on both these sediments.

Reference

Reference sediment was dredged from New London Sound off the Connecticut coast and sent to ASI along with the test sediments. Bulk sediment analyses and grain size determinations were also run on this sediment following guidelines stated in Guidance for Performing Tests on Dredged Material to be Disposed of in Open Waters, USEPA Region 1, 1989.

E. Test Procedure

Beginning the Test

The test was initiated by placing the appropriate amount of test sediment into each of five replicate (plus the extra) test vessels. The flow-through delivery system was started prior to sediment addition, to fill the test chambers with water. Twenty *N. virens*, and 25 *M. nasuta* were randomly selected and gently added to each chamber.

The test was of 28 days duration.

All test vessels were examined for survival at 28 days. Surviving animals were rinsed in clean seawater and placed in a clean exposure chamber filled with dilution water for 24 hours to depurate. After depuration, the clams were shucked, and the sandworms rinsed in deionized water, and all the tissues placed in clean, labeled glass sample containers. The tissues were frozen prior to chemical analysis. The tissue from the sixth replicate was mixed with the tissue from the fifth replicate prior to freezing.

Water Quality Measurements

Dissolved oxygen, pH, temperature and salinity were determined daily in every test vessel.

Feeding

Animals were not fed during the test.

Tissue Analysis

Tissues were thawed, extracted and analyzed for the requisite chemicals following guidelines in Guidance for Performing Tests on Dredged Material to be Disposed of in Open Waters, USEPA Region I, 1989.

F. Reference Toxicant

A standard reference toxicant test with Copper Sulfate was performed. The toxicant was dissolved in dilution water to create a stock solution, followed by mixing with dilution water to achieve the desired concentration. No substrate was provided. A 96-hour exposure was used for both species.

G. Physical Testing

Grain size analyses were performed in accordance with:

Standard Method for Particle-Size Analysis of Soils
ASTM Designation: D422 - 63 (Reapproved 1972)
American National Standard A37 145-1972 Approved
March 2, 1972 by American National Standard Institute.

IV. RESULTS

A. Survival

Survival for *N. virens* was 80 percent in the control sediment, 96 percent in the reference sediment and 95 percent in the test sediment. Survival for *M. nasuta* was 86.7 percent in the control sediment, 89.6 percent in the reference sediment and 90.4 percent in the test sediment. (See Tables 3.1 and 3.2). There was no significant difference in the responses for either species between the reference and test substrate as determined by both parametric and nonparametric ANOVA.

B. Water Quality

Salinity ranged from 28.5 - 33.0 ppt. Dissolved oxygen was kept at or above 6.8 mg/L in the test vessels. The pH ranged from 7.7 - 8.2 for *N. virens*, and 7.6-8.1 for *M. nasuta*. Temperature was maintained between 10.5 and 15.0°C for the *M. nasuta* test, and between 12.0 and 16.0°C for the *N. virens* bioassay (See Tables 3.3 and 3.4.).

C. Reference Toxicant

A standard reference toxicant test was conducted on both species with Copper Sulfate. The 96 hour LC50 for *N. virens* was 1.43 ppm. The 96-hour LC50 for *M. nasuta* was 2.8 ppm. Due to the lack of a large enough database, we are unable to make conclusions regarding these data. Survival and water quality data are presented in Tables 3.5 through 3.8.

D. Physical Testing

Grain size analyses were conducted on the reference and each control sediment as required. The results are presented in Table 4.1.

E. Bulk Sediment

Bulk Sediment analyses were conducted as required on the New London Sound reference material. The results are presented in Table 5.1 - 5.2.

F. Bioaccumulation

Bioaccumulation potential was assessed by comparing the concentration of accumulated material in each test sediment to the reference using ANOVA. Missing data points were not used. Data below detection limits was assumed to be the detection limit value for sake of analysis. If all parameters were below detection limits or missing, no analysis was run. Triplicate analyses were averaged for statistics. No significant bioaccumulation was detected for either species. Data are presented in Tables 6.1 - 6.4.

G. Physical Testing

Grain size and moisture determinations were made for the control and reference sediment. Grain size distribution is defined by the following criteria:

Sand > or = to 0.0625 mm
Silt < 0.0625 but > 0.0039 mm
Clay < 0.0039 mm

See Table 4.1 for Grain Size and Percent Moisture results.

Table 4.1

Results of Grain Size and Moisture Content Analysis				
Sample	% Sand	% Silt	% Clay	% Moisture
Control <i>N. virens</i>	33.0	41.0	26.0	60.45
Control <i>M. nasuta</i>	76.0	12.0	12.0	28.14
Reference New London	77.0	15.0	8.0	25.65

H. Chemical Testing

Results of the Bulk Sediment analyses on the New London Reference sediment sample.

Table 5.1

Flemington, NJ 08822

GOLD STAR BRIDGE

SECTION 1 - AMPHIPOD REPORT

I. OBJECTIVE

The objective of this test was to determine the toxic effects of test sediment from Gold Star when in the environment of a benthic invertebrate. The measure of potency is significant reduction in survival of exposed organisms as compared to a reference after ten days exposure.

II. TEST MATERIAL

Source: Gold Star

Date
Received: December 23, 1991

III. MATERIALS AND METHODS

A. Method

The method employed was a modification of the method outlined by the American Society of Testing Materials, Standard Guide for Conducting 10-Day Sediment Toxicity Tests with Marine and Estuarine Amphipods, E1367-90, and the Evaluation of Dredged Material Proposed for Ocean Disposal, USEPA, USACOE, EPA-503/8-91/001, February 1991.

B. Test Organisms

Species

The test species used for this test was *Ampelisca abdita*, a representative benthic invertebrate.

Size/Age/Physical Condition

Animals used in this test were all mixed adults, field collected by an outside company specializing in animal husbandry. All animals appeared to be in good condition.

Source/Acclimation

A. abdita were obtained from Northwestern Aquatic Sciences. Animals were held at least one day prior to testing during which time they were acclimated to dilution water and test temperature.

C. Test System

Source of Dilution Water

Dilution water was obtained from Manasquan Inlet in Manasquan, New Jersey. The salinity was modified to meet organism requirements using deionized water. Water is periodically tested according to ACOE guidelines to ensure its purity.

Temperature

The test temperature was 20 +/- 2°C.

Test Vessels

The test vessels were 1-liter polyethylene beakers covered with a petri plate and gently aerated through glass-tipped aeration lines. Flow-through conditions were provided by means of a calibrated gravity feed system entering the test chamber through the petri plate to approximately two centimeters below the water surface. Daily checks of systems were made to ensure delivery at a minimum of six exchanges per day.

Photoperiod

The test was conducted in continuous light.

D. Test Design

Test Levels

Five replicates of undiluted test sediment and reference sediment were tested and compared to five replicates of control sediment.

Control

A control sediment was obtained from the collection site of the organisms. This sediment was sent to Aqua Survey, Inc. along with the organisms at the time of purchase from the organism supplier.

Reference

Reference sediment was dredged from New London Sound off the Connecticut coast and sent to ASI along with the test sediments.

Beginning the Test

The test was initiated by placing approximately 200 cm³ of test sediment into each of five replicate test vessels and filling the vessels with dilution water. The system was allowed to settle under gentle aeration overnight. After settling, 20 animals were chosen at random and gently added to each test vessel.

The test was of 10 days duration.

All test vessels were examined for survival at 10 days.

Water Quality Measurements

Dissolved oxygen, pH, temperature and salinity were determined at the start of the test and at each 24 hour interval thereafter in every test vessel.

Feeding

Animals were not fed during the test.

E. Reference Toxicant

A 48-hour standard reference toxicant test with sodium dodecyl sulfate was performed. The toxicant was dissolved in dilution water to create a stock solution, followed by mixing with dilution water to achieve the desired concentration. No substrate was provided.

F. Physical Testing

Grain size analyses were performed in accordance with:

Standard Method for Particle-Size Analysis of Soils
ASTM Designation: D422 - 63 (Reapproved 1972)
American National Standard A37 145-1972 Approved
March 2, 1972 by American National Standard Institute.

IV. RESULTS

A Control survival was 86 percent. Reference survival was 88 percent. Survival in the test sediment was 86 percent. Survival in the test sediment was compared to that in the reference using both parametric and nonparametric ANOVA. No significant differences were detected by either method at $\alpha \leq 0.05$.

B. Water Quality

The test solution temperature was 19.0 - 21.5°C (See Table 1.2).

The pH ranged from 7.8 - 8.1 (See Table 1.2).

The salinity ranged from 30.0 - 32.0 ppt. Dissolved oxygen was kept at or above 5.8 mg/L in all test vessel (See Table 1.2).

C. Reference Toxicant

The 48-hour LC50 for *Ampelisca abdita* was determined to be 3.16 ppm sodium dodecyl sulfate. Three attempts were made to run a Standard Reference Toxicant using copper sulfate; unfortunately a good dose response was not obtained. Finally, a 48-hour sodium dodecyl sulfate bioassay was run with the remaining animals from the shipment. The lack of a sufficient data base limits interpretation of this value (See Table 1.3.)

control	A	5
0.1	A	5
1.0	A	5
10.0	A	0
100.0	A	0

D. Physical Testing

Grain size and moisture determinations were made for the control and reference sediment. Grain size distribution is defined by the following criteria:

Sand > or = to 0.0625 mm
Silt < 0.0625 but > 0.0039 mm
Clay < 0.0039 mm

See Table 2.1 for Grain Size and Percent Moisture results.

Control	22.0	34.0	44.0	59.15
Reference New London	77.0	15.0	8.0	25.65

V. SOURCE OF DOCUMENTATION

All original data documentation is being maintained at:

Aqua Survey, Inc.
499 Point Breeze Road
Flemington, NJ 08822

SECTION 2 - BIOACCUMULATION ASSAYS

I. OBJECTIVE

The objective of this test was to determine the bioaccumulation of select chemicals from test sediment from GOLD STAR when in the environment of benthic invertebrates.

II. TEST MATERIAL

Source: Gold Star

Date
Received: December 23, 1991

III. MATERIALS AND METHODS

A. Method

The method employed was a modification of the methods outlined by the Testing Manual entitled Evaluation of Dredged Material Proposed for Ocean Disposal, USEPA, USACOE, EPA-503/8-91/001, February, 1991 and the EPA Guidance Manual: Bedded Sediment Bioaccumulation Tests, USEPA, EPA/600/x-89/302, and Guidance for Performing Tests on Dredged Material to be Disposed of in Open Waters, USEPA Region I, 1989.

B. Test Organisms

Species

The test species used for this test were the clam, *Macoma nasuta*, and the sandworm, *Nereis virens*.

Size/Age/Physical Condition

Animals used in this test were all mixed adults, field collected by an outside company specializing in animal husbandry. All animals appeared to be in good condition.

C. Source/Acclimation

M. nasuta were obtained from A.K. Siewers. *N. virens* were obtained from Aquatic Research Organisms. Both species were held at least 24 hours prior to testing during which time they were acclimated to dilution water and test temperature.

Test System

Source of Dilution Water

Dilution water was obtained from Manasquan Inlet in Manasquan, New Jersey. The salinity was modified to meet organism requirements using deionized water. Water was tested according to ACOE guidelines to ensure its purity.

Temperature

The test temperature was 15 +/- 2°C.

Test Vessels

The test vessels were 10-gallon glass aquaria. Aeration was provided through a forced air system ending in sand airstones. Eleven liters of control, reference, and test material were added to each chamber for *Macoma*, six liters for *Nereis*. Flow-through conditions were provided by means of a calibrated metering pump system entering the test chamber through the top to approximately two centimeters below the water surface. Daily checks of systems were made to ensure delivery at a minimum of six exchanges per day.

Photoperiod

The test was conducted under a photoperiod of 16 hour light / eight hours dark.

D. Test Design

Test Levels

Five replicates of undiluted test sediment and reference sediment were tested and compared to three replicates of control sediment. An extra chamber of reference and test material was set up to provide the extra tissue needed for quality assurance checks of chemistry on the fifth replicate. Although this tank was treated identically to the other tanks, results are not included in the chemistry or the mortality data. Observations are included in the raw data only.

Control

A control sediment for the *M. nasuta* bioassay was obtained from Brezina and Associates. This sediment was sent to Aqua Survey, Inc with the organisms at the time of purchase from the organism supplier. Control sediment for the *N. virens* bioassay was collected from the ACOE designated site in Milton Harbor, New York.

Reference

Reference sediment was dredged from New London Sound off the Connecticut coast and sent to ASI along with the test sediments following guidelines stated in Guidance for Performing Tests on Dredged Material to be Disposed of in Open Waters, USEPA Region I, 1989.

E. Test Procedure

Beginning the Test

The test was initiated by placing the appropriate amount of test sediment into each of five replicate (plus the extra) test vessels. The flow-through delivery system was started prior to sediment addition, to fill the test chambers with water. Twenty *N. virens*, and 25 *M. nasuta*, were randomly selected and gently added to each chamber.

The test was of 28 days duration.

All test vessels were examined for survival at 28 days. Surviving animals were rinsed in clean seawater and placed in a clean exposure chamber filled with dilution water for 24 hours to depurate. After depuration, the clams were shucked, and the sandworms rinsed in deionized water, and all the tissues placed in clean, labeled glass sample containers. The tissues were frozen prior to chemical analysis. The tissue from the sixth replicate was mixed with the tissue from the fifth replicate prior to freezing.

Water Quality Measurements

Dissolved oxygen, pH, temperature and salinity were determined daily in every test vessel.

Feeding

Animals were not fed during the test.

Tissue Analysis

Tissues were thawed, extracted and analyzed for the requisite chemicals following guidelines in Guidance for Performing Tests on Dredged Material to be Disposed of in Open Waters, USEPA Region I, 1989.

F. Reference Toxicant

A standard reference toxicant test with Copper Sulfate was performed. The toxicant was dissolved in dilution water to create a stock solution, followed by mixing with dilution water to achieve the desired concentration. No substrate was provided. A 96-hour exposure was used for both species.

G. Physical Testing

Grain size analyses were performed in accordance with:

Standard Method for Particle-Size Analysis of Soils
ASTM Designation: D422 - 63 (Reapproved 1972)
American National Standard A37 145-1972 Approved
March 2, 1972 by American National Standard Institute.

IV. RESULTS

A. Survival

Survival for *N. virens* was 80 percent in the control sediment, 96 percent in the reference sediment and 94 percent in the test sediment. Survival for *M. nasuta* was 86.7 percent in the control sediment, 89.6 percent in the reference sediment and 67.2 percent in the test sediment. (See Tables 3.1 and 3.2). There was no significant difference in the responses of either species between the reference and test substrate as determined by both parametric and nonparametric ANOVA.

B. Water Quality

Salinity ranged from 28.5 - 33.0 ppt. Dissolved oxygen was kept at or above 3.9 mg/L in all test vessels. The pH ranged from 7.7 - 8.2 for *N. virens*, and 7.6-8.1 for *M. nasuta*. Temperature was maintained between 10.5 and 15.5°C for the *M. nasuta* test, and between 12.0 and 16.0°C for the *N. virens* bioassay (See Tables 3.3 and 3.4.).

C. Reference Toxicant

A standard reference toxicant test was conducted on both species with Copper Sulfate. The 96 hour LC50 for *N. virens* was 1.43 ppm. The 96-hour LC50 for *M. nasuta* was 2.48 ppm. Due to the lack of a large enough database, we are unable to make conclusions regarding these data. Survival and water quality data are presented in Tables 3.5 through 3.8.

D. Physical Testing

Grain size analyses were conducted on the reference and each control sediment as required. The results are presented in Table 4.1.

E. Bulk Sediment

Bulk Sediment analyses were conducted as required on the New London Sound reference material. The results are presented in Table 5.1-5.2.

F. Bioaccumulation

Bioaccumulation potential was assessed by comparing the concentration of accumulated material in each test sediment to the reference using ANOVA. Missing data points were not used. Data below detection limits was assumed to be the detection limit value for the sake of analysis. If all parameters were below detection limits or missing, no analysis was run. Triplicate analyses were averaged for statistics. Data are presented in Tables 6.1 - 6.4.

Table 3.1

G. Physical Testing

Grain size and moisture determinations were made for the control and reference sediment. Grain size distribution is defined by the following criteria:

Sand > or = to 0.0625 mm
Silt < 0.0625 but > 0.0039 mm
Clay < 0.0039 mm

See Table 4.1 for Grain Size and Percent Moisture results.

Table 4.1

Results of Grain Size and Moisture Content Analysis				
Sample	% Sand	% Silt	% Clay	% Moisture
Control <i>N. virens</i>	33.0	41.0	26.0	60.45
Control <i>M. nasuta</i>	76.0	12.0	12.0	28.14
Reference New London	77.0	15.0	8.0	25.65

H. Chemical Testing

Results of the Bulk Sediment analyses on the New London Reference sediment sample.

MAMACOKE

SECTION 1 - AMPHIPOD REPORT

I. OBJECTIVE

The objective of this test was to determine the toxic effects of test sediment from Mamacoke when in the environment of a benthic invertebrate. The measure of potency is significant reduction in survival of exposed organisms as compared to a control after ten days exposure.

II. TEST MATERIAL

Source: Mamacoke

Date

Received: December 23, 1991

III. MATERIALS AND METHODS

A. Method

The method employed was a modification of the method outlined by the American Society of Testing Materials, Standard Guide for Conducting 10-Day Sediment Toxicity Tests with Marine and Estuarine Amphipods, E1367-90, and the Evaluation of Dredged Material Proposed for Ocean Disposal, USEPA, USACOE, EPA-503/8-91/001, February 1991.

B. Test Organisms

Species

The test species used for this test was *Ampelisca abdita*, a representative benthic invertebrate.

Size/Age/Physical Condition

Animals used in this test were all mixed adults, field collected by an outside company specializing in animal husbandry. All animals appeared to be in good condition.

Source/Acclimation

A. abdita were obtained from Northwestern Aquatic Sciences. Animals were held at least one day prior to testing during which time they were acclimated to dilution water and test temperature.

C. Test System

Source of Dilution Water

Dilution water was obtained from Manasquan Inlet in Manasquan, New Jersey. The salinity was modified to meet organism requirements using deionized water. Water is periodically tested according to ACOE guidelines to ensure its purity.

Temperature

The test temperature was 20 +/- 2°C.

Test Vessels

The test vessels were 1-liter polyethylene beakers covered with a petri plate and gently aerated through glass-tipped aeration lines. Flow-through conditions were provided by means of a calibrated gravity feed system entering the test chamber through the petri plate to approximately two centimeters below the water surface. Daily checks of systems were made to ensure delivery at a minimum of six exchanges per day.

Photoperiod

The test was conducted in continuous light.

D. Test Design

Test Levels

Five replicates of undiluted test sediment and reference sediment were tested and compared to five replicates of control sediment.

Control

A control sediment was obtained from the collection site of the organisms. This sediment was sent to Aqua Survey, Inc. along with the organisms at the time of purchase from the organism supplier.

Reference

Reference sediment was dredged from New London Sound off the Connecticut coast and sent to ASI along with the test sediments.

Beginning the Test

The test was initiated by placing approximately 200 cm³ of test sediment into each of five replicate test vessels and filling the vessels with dilution water. The system was allowed to settle under gentle aeration overnight. After settling, 20 animals were chosen at random and gently added to each test vessel.

The test was of 10 days duration.

All test vessels were examined for survival at 10 days.

Water Quality Measurements

Dissolved oxygen, pH, temperature and salinity were determined at the start of the test and at each 24-hour interval thereafter in every test vessel.

Feeding

Animals were not fed during the test.

E. Reference Toxicant

A 48-hour standard reference toxicant test with sodium dodecyl sulfate was performed. The toxicant was dissolved in dilution water to create a stock solution, followed by mixing with dilution water to achieve the desired concentration. No substrate was provided.

F. Physical Testing

Grain size analyses were performed in accordance with:
Standard Method for Particle-Size Analysis of Soils
ASTM Designation: D422 - 63 (Reapproved 1972)
American National Standard A37 145-1972 Approved
March 2, 1972 by American National Standard Institute.

IV. RESULTS

A. Control survival was 86 percent. Reference survival was 88 percent. Survival in the test sediment was 68 percent. Survival in the test sediment was compared to that in the reference using both parametric and nonparametric ANOVA. No significant differences were detected by either method at $\alpha \leq 0.05$.

B. Water Quality

The test solution temperature was 20.0 - 21.5°C (See Table 1.2).

The pH ranged from 7.8 - 8.1 (See Table 1.2).

The salinity ranged from 30.0 - 32.0 ppt. Dissolved oxygen was kept at or above 5.7 mg/L in all test vessel (See Table 1.2).

C. Reference Toxicant

The 48-hour LC50 for *Ampelisca abdita* was determined to be 3.16 ppm sodium dodecyl sulfate. Three attempts were made to run a Standard Reference Toxicant using copper sulfate; unfortunately a good dose response was not obtained. Finally, a 48-hour sodium dodecyl sulfate bioassay was run with the remaining animals from the shipment. The lack of a sufficient data base limits interpretation of this value (See Table 1.3.)

SECTION 2 - BIOACCUMULATION ASSAYS

I. OBJECTIVE

The objective of this test was to determine the bioaccumulation of select chemicals from test sediment from GOLD STAR when in the environment of benthic invertebrates.

II. TEST MATERIAL

Source: Mamacoke

Date Received: December 23, 1991

III. MATERIALS AND METHODS

A. Method

The method employed was a modification of the methods outlined by the Testing Manual entitled Evaluation of Dredged Material Proposed for Ocean Disposal, USEPA, USACOE, EPA-503/8-91/001, February, 1991 and the EPA Guidance Manual: Bedded Sediment Bioaccumulation Tests, USEPA, EPA/600/x-89/302 and Guidance for Performing Tests on Dredged Material to be Disposed of in Open Waters, USEPA Region I, 1989.

B. Test Organisms

Species

The test species used for this test were the clam, *Macoma nasuta*, and the sandworm, *Nereis virens*.

Size/Age/Physical Condition

Animals used in this test were all mixed adults, field collected by an outside company specializing in animal husbandry. All animals appeared to be in good condition.

C. Source/Acclimation

M. nasuta were obtained from A.K. Siewers. *N. virens* were obtained from Aquatic Research Organisms. Both species were held at least 24 hours prior to testing during which time they were acclimated to dilution water and test temperature.

Test System

Source of Dilution Water

Dilution water was obtained from Manasquan Inlet in Manasquan, New Jersey. The salinity was modified to meet organism requirements using deionized water. Water was tested according to ACOE guidelines to ensure its purity.

Temperature

The test temperature was 15 +/- 2°C.

Test Vessels

The test vessels were 10-gallon glass aquaria. Aeration was provided through a forced air system ending in sand airstones. Eleven liters of control, reference, and test material were added to each chamber for *Macoma*, six liters for *Nereis*. Flow-through conditions were provided by means of a calibrated metering pump system entering the test chamber through the top to approximately two centimeters below the water surface. Daily checks of systems were made to ensure delivery at a minimum of six exchanges per day.

Photoperiod

The test was conducted under a photoperiod of 16 hour light / eight hours dark.

D. Test Design

Test Levels

Five replicates of undiluted test sediment and reference sediment were tested and compared to three replicates of control sediment. An extra chamber of reference and test material was set up to provide the extra tissue needed for quality assurance checks of chemistry on the fifth replicate. Although this tank was treated identically to the other tanks, results are not included in the chemistry or the mortality data. Observations are included in the raw data only.

Control

A control sediment for the *M. nasuta* bioassay was obtained from Brezina and Associates. This sediment was sent to Aqua Survey, Inc with the organisms at the time of purchase from the organism supplier. Control sediment for the *N. virens* bioassay was collected from the ACOE designated site in Milton Harbor, New York.

Reference

Reference sediment was dredged from New London Sound off the Connecticut coast and sent to ASI along with the test sediments. Bulk sediment analyses and grain size determinations were also run on this sediment following guidelines stated in Guidance for Performing Tests on Dredged Material to be Disposed of in Open Water, USEPA Region I, 1989.

E. Test Procedure

Beginning the Test

The test was initiated by placing the appropriate amount of test sediment into each of five replicate (plus the extra) test vessels. The flow-through delivery system was started prior to sediment addition, to fill the test chambers with water. Twenty *N. virens*, and 25 *M. nasuta* were randomly selected and gently added to each chamber.

The test was of 28 days duration.

All test vessels were examined for survival at 28 days. Surviving animals were rinsed in clean seawater and placed in a clean exposure chamber filled with dilution water for 24 hours to depurate. After depuration, the clams were shucked, and the sandworms rinsed in deionized water, and all the tissues placed in clean, labeled glass sample containers. The tissues were frozen prior to chemical analysis. The tissue from the sixth replicate was mixed with the tissue from the fifth replicate prior to freezing.

Water Quality Measurements

Dissolved oxygen, pH, temperature and salinity were determined daily in every test vessel.

Feeding

Animals were not fed during the test.

Tissue Analysis

Tissues were thawed, extracted and analyzed for the requisite chemicals following guidelines in Guidance for Performing Tests on Dredged Material to be Disposed of in Open Waters, USEPA Region I, 1989.

F. Reference Toxicant

A standard reference toxicant test with Copper Sulfate was performed. The toxicant was dissolved in dilution water to create a stock solution, followed by mixing with dilution water to achieve the desired concentration. No substrate was provided. A 96-hour exposure was used for both species.

G. Physical Testing

Grain size analyses were performed in accordance with: Standard Method for Particle-Size Analysis of Soils ASTM Designation: D422 - 63 (Reapproved 1972) American National Standard A37 145-1972 Approved March 2, 1972 by American National Standard Institute.

IV. RESULTS

A. Survival

Survival for *N. virens* was 80 percent in the control sediment, 96 percent in the reference sediment and 91 percent in the test sediment. Survival for *M. nasuta* was 86.7 percent in the control sediment, 89.6 percent in the reference sediment and 83.2 percent in the test sediment. (See Tables 3.1 and 3.2). There was no significant difference in the response of either species between the reference and test substrate as determined by both parametric and nonparametric ANOVA.

B. Water Quality

Salinity ranged from 29.5 - 33.0 ppt. Dissolved oxygen was kept at or above 5.0 mg/L in all test vessels. The pH ranged from 7.6 - 8.2 for *N. virens*, and 7.5-8.1 for *M. nasuta*. Temperature was maintained between 10.5 and 15.5°C for the *M. nasuta* test, and between 11.5 and 16.0°C for the *N. virens* bioassay (See Tables 3.3 and 3.4).

C. Reference Toxicant

A standard reference toxicant test was conducted on both species with Copper Sulfate. The 96-hour LC50 for *N. virens* was 1.43 ppm. The 96-hour LC50 for *M. nasuta* was 2.48 ppm. Due to the lack of a large enough database, we are unable to make conclusions regarding these data. Survival and water quality data are presented in Tables 3.5 through 3.8.

D. Physical Testing

Grain size analyses were conducted on the reference and each control sediment as required. The results are presented in Table 4.1.

E. Bulk Sediment

Bulk Sediment analyses were conducted as required on the New London Sound reference material. The results are presented in Table 5.1 - 5.2.

F. Bioaccumulation

Bioaccumulation potential was assessed by comparing the concentration of accumulated material in each test sediment to the reference using ANOVA. Missing data points were not used. Data below detection limits was assumed to be the detection limit value for sake of analysis. If all parameters were below detection limits or missing, no analysis was run. Triplicate analyses were averaged for statistics. Data are presented in Tables 6.1 - 6.4. The only significant bioaccumulation detected was the accumulation of lead in clam tissue.

G. Physical Testing

Grain size and moisture determinations were made for the control and reference sediment. Grain size distribution is defined by the following criteria:

Sand > or = to 0.0625 mm
Silt < 0.0625 but > 0.0039 mm
Clay < 0.0039 mm

See Table 4.1 for Grain Size and Percent Moisture results.

Table 4.1

Results of Grain Size and Moisture Content Analysis				
Sample	% Sand	% Silt	% Clay	% Moisture
Control <i>N. virens</i>	33.0	41.0	26.0	60.45
Control <i>M. nasuta</i>	76.0	12.0	12.0	28.14

V. SOURCE OF DOCUMENTATION

All original data documentation is being maintained at:

Aqua Survey, Inc.
499 Point Breeze Road
Flemington, NJ 08822

PIERS 32 AND 33

SECTION 1 - AMPHIPOD REPORT

I. OBJECTIVE

The objective of this test was to determine the toxic effects of test sediment from Pier 32 and 33 when in the environment of a benthic invertebrate. The measure of potency is significant reduction in survival of exposed organisms as compared to a control after ten days exposure.

II. TEST MATERIAL

Source: Pier 32 and 33

Date Received: December 23, 1991

III. MATERIALS AND METHODS

A. Method

The method employed was a modification of the method outlined by the American Society of Testing Materials, Standard Guide for Conducting 10-Day Sediment Toxicity Tests with Marine and Estuarine Amphipods, E1367-90, and the Evaluation of Dredged Material Proposed for Ocean Disposal, USEPA, USCOE, EPA-503/8-91/001, February 1991.

B. Test Organisms

Species

The test species used for this test was *Ampelisca abdita*, a representative benthic invertebrate.

Size/Age/Physical Condition

Animals used in this test were all mixed adults, field collected by an outside company specializing in animal husbandry. All animals appeared to be in good condition.

Source/Acclimation

A. abdita were obtained from Northwestern Aquatic Sciences. Animals were held at least one day prior to testing during which time they were acclimated to dilution water and test temperature.

C. Test System

Source of Dilution Water

Dilution water was obtained from Manasquan Inlet in Manasquan, New Jersey. The salinity was modified to meet organism requirements using deionized water. Water is periodically tested according to ACOE guidelines to ensure its purity.

Temperature

The test temperature was 20 +/- 2°C.

Test Vessels

The test vessels were 1-liter polyethylene beakers covered with a petri plate and gently aerated through glass-tipped aeration lines. Flow-through conditions were provided by means of a calibrated gravity feed system entering the test chamber through the petri plate to approximately two centimeters below the water surface. Daily checks of systems were made to ensure delivery at a minimum of six exchanges per day.

Photoperiod

The test was conducted in continuous light.

D. Test Design

Test Levels

Five replicates of undiluted test sediment and reference sediment were tested and compared to five replicates of control sediment.

Control

A control sediment was obtained from the collection site of the organisms. This sediment was sent to Aqua Survey, Inc. along with the organisms at the time of purchase from the organism supplier.

Reference

Reference sediment was dredged from New London Sound off the Connecticut coast and sent to ASI along with the test sediments.

Beginning the Test

The test was initiated by placing approximately 200 cm³ of test sediment into each of five replicate test vessels and filling the vessels with dilution water. The system was allowed to settle under gentle aeration overnight. After settling, 20 animals were chosen at random and gently added to each test vessel.

The test was of 10 days duration.

All test vessels were examined for survival at 10 days.

Water Quality Measurements

Dissolved oxygen, pH, temperature and salinity were determined at the start and at each 24 hour interval thereafter in every test vessel.

Feeding

Animals were not fed during the test.

E. Reference Toxicant

A 48-hour standard reference toxicant test with sodium dodecyl sulfate was performed. The toxicant was dissolved in dilution water to create a stock solution, followed by mixing with dilution water to achieve the desired concentration. No substrate was provided.

F. Physical Testing

Grain size analyses were performed in accordance with:

Standard Method for Particle-Size Analysis of Soils
ASTM Designation: D422 - 63 (Reapproved 1972)
American National Standard A37 145-1972 Approved
March 2, 1972 by American National Standard Institute.

IV. RESULTS

A. Control survival was 86 percent. Reference survival was 88 percent. Survival in the test sediment was 76 percent. Survival in the test sediment was compared to that in the reference using both parametric and nonparametric ANOVA. No significant differences were detected by either method at $\alpha \leq 0.05$.

B. Water Quality

The test solution temperature was 20.0 - 21.0°C (See Table 1.2).

The pH ranged from 7.8 - 8.1 (See Table 1.2).

The salinity ranged from 30.0 - 32.0 ppt. Dissolved oxygen was kept at or above 4.9 mg/L in all test vessel (See Table 1.2).

C. Reference Toxicant

The 48-hour LC50 for *Ampelisca abdita* was determined to be 3.16 ppm sodium dodecyl sulfate. Three attempts were made to run a Standard Reference Toxicant using copper sulfate; unfortunately a good dose response was not obtained. Finally, a 48-hour sodium dodecyl sulfate bioassay was run with the remaining animals from the shipment. The lack of a sufficient data base limits interpretation of this value (See Table 1.3.)

Table 1.3

Results of 48-hour Standard Reference Toxicant Bioassays with sodium dodecyl sulfate Bioassays were initiated with 5 *A. abdita* per replicate.

Concentration (ppm)	Replicate	Final Live Counts
		<i>A. abdita</i> 48 hour
control	A	5
0.1	A	5
1.0	A	5
10.0	A	0
100.0	A	0

D. Physical Testing

Grain size and moisture determinations were made for the control and reference sediment. Grain size distribution is defined by the following criteria:

Sand > or = to 0.0625 mm
Silt < 0.0625 but > 0.0039 mm
Clay < 0.0039 mm

See Table 2.1 for Grain Size and Percent Moisture results.

Table 2.1

Results of Grain Size and Moisture Content Analysis				
Sample	% Sand	% Silt	% Clay	% Moisture
Control	22.0	34.0	44.0	59.15
Reference New London	77.0	15.0	8.0	25.65

Flemington, NJ 08822

SECTION 2 - BIOACCUMULATION ASSAYS

I. OBJECTIVE

The objective of this test was to determine the bioaccumulation of select chemicals from test sediment from PIER 32 and 33 when in the environment of benthic invertebrates.

II. TEST MATERIAL

Source: Pier 32 and 33

Date

Received: December 23, 1991

III. MATERIALS AND METHODS

A. Method

The method employed was a modification of the methods outlined by the Testing Manual entitled Evaluation of Dredged Material Proposed for Ocean Disposal, USEPA, USACOE, EPA-503/8-91/001, February, 1991 and the EPA Guidance Manual: Bedded Sediment Bioaccumulation Tests, USEPA, EPA/600/x-89/302, and Guidance for Performing Tests on Dredged Material to be Disposed of in Open Waters, USEPA Region I, 1989.

B. Test Organisms

Species

The test species used for this test were the clam, *Macoma nasuta*, and the sandworm, *Nereis virens*.

Size/Age/Physical Condition

Animals used in this test were all mixed adults, field collected by an outside company specializing in animal husbandry. All animals appeared to be in good condition.

C. Source/Acclimation

M. nasuta were obtained from A.K. Siewers. *N. virens* were obtained from Aquatic Research Organisms. Both species were held at least 24 hours prior to testing during which time they were acclimated to dilution water and test temperature.

Test System

Source of Dilution Water

Dilution water was obtained from Manasquan Inlet in Manasquan, New Jersey. The salinity was modified to meet organism requirements using deionized water. Water was tested according to ACOE guidelines to ensure its purity.

Temperature

The test temperature was 15 +/- 2°C.

Test Vessels

The test vessels were 10-gallon glass aquaria. Aeration was provided through a forced air system ending in sand airstones. Eleven liters of control, reference, and test material were added to each chamber for *Macoma*, six liters for *Nereis*. Flow-through conditions were provided by means of a calibrated metering pump system entering the test chamber through the top to approximately two centimeters below the water surface. Daily checks of systems were made to ensure delivery at a minimum of six exchanges per day.

Photoperiod

The test was conducted under a photoperiod of 16 hour light / eight hours dark.

D. Test Design

Test Levels

Five replicates of undiluted test sediment and reference sediment were tested and compared to three replicates of control sediment. An extra chamber of reference and test material was set up to provide the extra tissue needed for quality assurance checks of chemistry on the fifth replicate. Although this tank was treated identically to the other tanks, results are not included in the chemistry or the mortality data. Observations are included in the raw data only.

Control

A control sediment for the *M. nasuta* bioassay was obtained from Brezina and Associates. This sediment was sent to Aqua Survey, Inc with the organisms at the time of purchase from the organism supplier. Control sediment for the *N. virens* bioassay was collected from the ACOE designated site in Milton Harbor, New York.

Reference

Reference sediment was dredged from New London Sound off the Connecticut coast and sent to ASI along with the test sediments. Bulk sediment analyses and grain size determinations were also run on this sediment following guidelines stated in Guidance for Performing Tests to be Disposed of in Open Waters, USEPA Region I, 1989.

E. Test Procedure

Beginning the Test

The test was initiated by placing the appropriate amount of test sediment into each of five replicate (plus the extra) test vessels. The flow-through delivery system was started prior to sediment addition, to fill the test chambers with water. Twenty *N. virens*, and 25 *M. nasuta* were randomly selected and gently added to each chamber.

The test was of 28 days duration.

All test vessels were examined for survival at 28 days. Surviving animals were rinsed in clean seawater and placed in a clean exposure chamber filled with dilution water for 24 hours to depurate. After depuration, the clams were shucked, and the sandworms rinsed in deionized water, and all the tissues placed in clean, labeled glass sample containers. The tissues were frozen prior to chemical analysis. The tissue from the sixth replicate was mixed with the tissue from the fifth replicate prior to freezing.

Water Quality Measurements

Dissolved oxygen, pH, temperature and salinity were determined daily in every test vessel.

Feeding

Animals were not fed during the test.

Tissue Analysis

Tissues were thawed, extracted and analyzed for the requisite chemicals following guidelines in Guidance for Performing Tests on Dredged Material to be Disposed of in Open Waters, USEPA Region I, 1989.

F. Reference Toxicant

A standard reference toxicant test with Copper Sulfate was performed. The toxicant was dissolved in dilution water to create a stock solution, followed by mixing with dilution water to achieve the desired concentration. No substrate was provided. A 96-hour exposure was used for both species.

G. Physical Testing

Grain size analyses were performed in accordance with:

Standard Method for Particle-Size Analysis of Soils

ASTM Designation: D422 - 63 (Reapproved 1972)

American National Standard A37 145-1972 Approved

March 2, 1972 by American National Standard Institute.

IV. RESULTS

A. Survival

Survival for *N. virens* was 80 percent in the control sediment, 96 percent in the reference sediment and 98 percent in the test sediment. Survival for *M. nasuta* was 86.7 percent in the control sediment, 89.6 percent in the reference sediment and 71.2 percent in the test sediment. (See Tables 3.1 and 3.2). In the Gold Star sample replicate two showed only 9 percent survival. It is possible that this an outlier and does not reflect a toxic response. If this data point is removed, the problems with normality and homoscedasticity disappear, and parametric analysis of variance can be conducted. In this case, the response of the clams in PIER 32 and 33 sample becomes statistically significant. No other changes occur. Both results should be reported to the regulatory agency for a decision on the outlier.

B. Water Quality

Salinity ranged from 29.0 - 33.0 ppt. Dissolved oxygen was kept at or above 4.2 mg/L in all test vessels. The pH ranged from 7.7 - 8.2 for *N. virens*, and 7.6-8.1 for *M. nasuta*. Temperature was maintained between 10.5 and 15.5°C for the *M. nasuta* test, and between 12.0 and 16.0°C for the *N. virens* bioassay (See Tables 3.3 and 3.4.).

C. Reference Toxicant

A standard reference toxicant test was conducted on both species with Copper Sulfate. The 96 hour LC50 for *N. virens* was 1.48 ppm. The 96-hour LC50 for *M. nasuta* was 2.47 ppm. Due to the lack of a large enough database, we are unable to make conclusions regarding these data. Survival and water quality data are presented in Tables 3.5 through 3.8.

D. Physical Testing

Grain size analyses were conducted on the reference and each control sediment as required. The results are presented in Table 4.1.

E. Bulk Sediment

Bulk Sediment analyses were conducted as required on the New London Sound reference material. The results are presented in Table 5.1 - 5.2.

F. Bioaccumulation

Bioaccumulation potential was assessed by comparing the concentration of accumulated material in each test sediment to the reference using ANOVA. Missing data points were not used. Data below detection limits was assumed to be the detection limit value for sake of analysis. If all parameters were below detection limits or missing, no analysis was run. Triplicate analyses were averaged for statistics. Data are presented in Tables 6.1 - 6.4.

G. Physical Testing

Grain size and moisture determinations were made for the control and reference sediment. Grain size distribution is defined by the following criteria:

Sand > or = to 0.0625 mm
 Silt < 0.0625 but > 0.0039 mm
 Clay < 0.0039 mm

See Table 4.1 for Grain Size and Percent Moisture results.

Transform: ARC SINE(SQUARE ROOT(Y))

Shapiro Wilks test for normality

D = 0.727

W = 0.987

Critical W (P = 0.05) (n = 25) = 0.918
Critical W (P = 0.01) (n = 25) = 0.888

Data PASS normality test at P=0.01 level. Continue analysis.

91-368 A.abdita
File: 91-368.aas

Transform: ARC SINE(SQUARE ROOT(Y))

Bartlett's test for homogeneity of variance

Calculated B statistic = 3.78
Table Chi-square value = 13.28 (alpha = 0.01)
Table Chi-square value = 9.49 (alpha = 0.05)

Average df used in calculation ==> df (avg n - 1) = 4.00
Used for Chi-square table value ==> df (#groups-1) = 4

Data PASS homogeneity test at 0.01 level. Continue analysis.

NOTE: If groups have unequal replicate sizes the average replicate size is used to calculate the B statistic (see above).

File: 91-368.nvs Transform: ARC SINE(SQUARE ROOT(Y))

Bartlett's test for homogeneity of variance

Calculated B statistic = 4.41
Table Chi-square value = 13.28 (alpha = 0.01)
Table Chi-square value = 9.49 (alpha = 0.05)

Average df used in calculation ==> df (avg n - 1) = 4.00
Used for Chi-square table value ==> df (#groups-1) = 4

Data PASS homogeneity test at 0.01 level. Continue analysis.

NOTE: If groups have unequal replicate sizes the average replicate size is used to calculate the B statistic (see above).

Maguire New London, N. virens, Arsenic Bioaccumulation
File: mnlw.as Transform: NO TRANSFORMATION

Shapiro Wilks test for normality

D = 2.321

W = 0.825

Critical W (P = 0.05) (n = 23) = 0.914

Critical W (P = 0.01) (n = 23) = 0.881

Data FAIL normality test. Try another transformation.

Warning - The two homogeneity tests are sensitive to non-normal data and should not be performed.

Maguire New London, N. virens, Arsenic Bioaccumulation
File: mnlw.as Transform: NO TRANSFORMATION

Bartlett's test for homogeneity of variance

Calculated B statistic = 17.01

Table Chi-square value = 13.28 (alpha = 0.01)

Table Chi-square value = 9.49 (alpha = 0.05)

Average df used in calculation ==> df (avg n - 1) = 3.60

Used for Chi-square table value ==> df (#groups-1) = 4

Data FAIL homogeneity test at 0.01 level. Try another transformation.

NOTE: If groups have unequal replicate sizes the average replicate size is used to calculate the B statistic (see above).

Maguire New London, N. virens, Nickel Bioaccumulation
File: mnlw.ni Transform: NO TRANSFORMATION

Shapiro Wilks test for normality

D = 5.214

W = 0.804

Critical W (P = 0.05) (n = 24) = 0.916
Critical W (P = 0.01) (n = 24) = 0.884

Data FAIL normality test. Try another transformation.

Warning - The two homogeneity tests are sensitive to non-normal data and should not be performed.

Maguire New London, N. virens, Nickel Bioaccumulation
File: mnlw.ni Transform: NO TRANSFORMATION

Hartley test for homogeneity of variance
Bartlett's test for homogeneity of variance

These two tests can not be performed because at least one group has zero variance.

Data FAIL to meet homogeneity of variance assumption.
Additional transformations are useless.

Shapiro Wilks test for normality

D = 0.220

W = 0.903

Critical W (P = 0.05) (n = 8) = 0.818

Critical W (P = 0.01) (n = 8) = 0.749

Data PASS normality test at P=0.01 level. Continue analysis.

Maguire New London, M. nasuta, Lead Bioaccumulation
File: mnlc.as Transform: NO TRANSFORMATION

Bartlett's test for homogeneity of variance

Calculated B statistic = 0.12

Table Chi-square value = 9.21 (alpha = 0.01)

Table Chi-square value = 5.99 (alpha = 0.05)

Average df used in calculation ==> df (avg n - 1) = 1.67

Used for Chi-square table value ==> df (#groups-1) = 2

Data PASS homogeneity test at 0.01 level. Continue analysis.

NOTE: If groups have unequal replicate sizes the average replicate size is used to calculate the B statistic (see above).

KRUSKAL-WALLIS ANOVA BY RANKS - TABLE 1 OF 2 (p=0.05)

GROUP	IDENTIFICATION	TRANSFORMED MEAN	MEAN CALCULATED IN ORIGINAL UNITS	RANK SUM
1	reference	1.613	1.613	14.000
2	electric boat	1.785	1.785	9.000
3	mamacoke	1.795	1.795	13.000

Calculated H Value = 2.000 Critical H Value Table = 5.333
 Since Calc H < Crit H FAIL TO REJECT Ho: All groups are equal.

Maguire New London, M. nasuta, Nickel Bioaccumulation
 File: mnlc.ni Transform: NO TRANSFORMATION

DUNNS MULTIPLE COMPARISON - KRUSKAL-WALLIS - TABLE 2 OF 2 (p=0.05)

GROUP	IDENTIFICATION	TRANSFORMED MEAN	ORIGINAL MEAN	GROUP		
				0	0	0
1	reference	1.613	1.613	\		
2	electric boat	1.785	1.785	.	\	
3	mamacoke	1.795	1.795	.	.	\

* = significant difference (p=0.05)
 Table q value (0.05,3) = 2.394

. = no significant difference
 Unequal reps - several SE values us.

Maguire New London, M. nasuta, Lead Bioaccumulation
File: mnlc.as Transform: NO TRANSFORMATION

Shapiro Wilks test for normality

D = 0.220

W = 0.903

Critical W (P = 0.05) (n = 8) = 0.818

Critical W (P = 0.01) (n = 8) = 0.749

Data PASS normality test at P=0.01 level. Continue analysis.

Maguire New London, M. nasuta, Lead Bioaccumulation
File: mnlc.as Transform: NO TRANSFORMATION

Bartlett's test for homogeneity of variance

Calculated B statistic = 0.12

Table Chi-square value = 9.21 (alpha = 0.01)

Table Chi-square value = 5.99 (alpha = 0.05)

Average df used in calculation ==> df (avg n - 1) = 1.67

Used for Chi-square table value ==> df (#groups-1) = 2

Data PASS homogeneity test at 0.01 level. Continue analysis.

NOTE: If groups have unequal replicate sizes the average replicate size is used to calculate the B statistic (see above).
