Sounds good Kim - please revise the text.

Thanks!

Karen

Hi Karen,

In response to your comment, the abandonment of deep monitoring well SJS02-MW10D is recommended to remove it as a potential conduit for transmission of the CVOC plume (DNAPL) from the shallow aquifer into the deep aquifer. One round of sampling was conducted in November 2006, TCE was not detected and the breakdown products were detected at concentrations below the MCLs (data attached). Should results from the second round of sampling (planned for April 2006) reveal significant increases (i.e, above the MCLs) in CVOC concentrations in deep monitoring well SJS02-MW10D, then this recommendation will be reassessed. We can revise the text in the tech memo to reflect this if it is ok with you.

Thanks!

Kim

Team -

I have reviewed the referenced report and submit the following general comments:

\* The VDEQ concurs with the recommendation to collect two additional samples from the affected monitoring well.

\* The VDEQ suggests reassessment of the recommendation of closure of the monitoring well following the receipt of results from the two additional sampling events referenced above.

Thank you for the opportunity to comment.
