SECTION 1.0

Introduction

1.0 Introduction

In 1993, Naval Base (NAVBASE) Charleston was added to the list of bases scheduled for closure as part of the Defense Base Realignment and Closure Act (BRAC), which regulates closure and transition of property to the community. The Charleston Naval Complex (CNC) was formed as a result of the dis-establishment of the Charleston Naval Shipyard and NAVBASE on April 1, 1996.

CNC Corrective Action (CA) activities are being conducted under the Resource Conservation and Recovery Act (RCRA); the South Carolina Department of Health and Environmental Control (SCDHEC) is the lead agency for CA activities at the site. All RCRA CA activities are performed in accordance with the Final Permit (Permit No. SC0 170 022 560).

In April 2000, CH2M-Jones was awarded a contract to provide environmental investigation and remediation services at CNC. This submittal has been prepared by CH2M-Jones to document the basis for no further action (NFA) at Solid Waste Management Unit (SWMU) 2, which includes SWMU 1, in Zone A of the CNC.

1.1 Background and Summary for Interim Measure Work Plan

As part of RCRA CA activities, a RCRA Facility Investigation (RFI) report was finalized for Zone A (EnSafe Inc. [EnSafe], 1998). Zone A is located in the northern-most portion of CNC on the west side of the Cooper River. It is bounded by the base boundary to the north and west, the Cooper River to the east, and Noisette Creek to the south.

Figure 1-1 shows the location of SWMUs 1 and 2 within Zone A and illustrates the location of Zone A with respect to the CNC. Figure 1-2 is an aerial photograph of SWMUs 1 and 2. Detailed figures depicting SWMU 2 are presented in Section 2.0 of this Corrective Measures Study Work Plan (CMS WP).

The data and conclusions from the RFI Report pertaining to SWMUs 1 and 2 are discussed in Section 2.0.

1 Several constituents for surface soil at SWMU 2 were identified as chemicals of concern
2 (COCs) in the RFI report. The primary COC was lead. An interim measure (IM) was
3 conducted at SWMU 2 to remove lead-contaminated surface soil above 400 milligrams per
4 kilogram (mg/kg). The excavation included several locations where arsenic and antimony
5 were detected above their respective risk-based concentrations (RBCs) in surface soil.
6 Evaluation of current site data, including data collected during the IM, indicates that surface
7 soil COCs have been adequately remediated at SWMU 2.

8 The Zone A RFI Report did not identify COCs in subsurface soil at SWMUs 1 and 2.

9 Several groundwater COCs were identified by EnSafe in SWMU 2 groundwater in the Zone
10 A RFI Report. Evaluation of the groundwater data collected in and around SWMU 2
11 indicates that COCs identified in the RFI Report are currently present in groundwater at
12 concentrations below their respective maximum contaminant levels (MCLs), or at levels
13 considered to be consistent with background concentrations.

14 After reviewing the data collected during the RFI and subsequent IM, CH2M-Jones has
15 concluded that surface soil has been remediated to a level suitable for unrestricted land use.
16 Because no subsurface soil COCs were identified during the RFI, and because groundwater
17 COCs were either not detected above applicable comparative criteria (MCLs or tap water
18 RBCs) or were consistent with background reference concentrations (BRCs), CH2M-Jones
19 recommends SWMUs 1 and 2 for NFA.

20 Prior to changing the status of any site to NFA in the CNC RCRA CA permit, the BRAC
21 Clean-Up Team (BCT) agrees that the following issues should be considered:

- 22 • Status of the RFI
- 23 • Presence of metals (inorganics) in groundwater
- 24 • Potential linkage of SWMU/ AOC to SWMU 37 (investigated sanitary sewers)
- 25 • Potential linkage of SWMU/ AOC to AOC 699 (investigated stormwater sewers)
- 26 • Potential linkage of SWMU/ AOC to AOC 504 (investigated railroad lines)
- 27 • Potential linkage to surface water bodies (Zone J)
- 28 • Potential contamination associated with oil-water separators (OWSs)
- 29 • Relevance or need for land-use controls at the site

1 Information regarding these issues is also provided in this CMS WP to expedite the
2 evaluation of site closure.

3 Once the above issues have been adequately addressed, and the BCT concurs that NFA is
4 appropriate for the site, a Statement of Basis will be prepared. In accordance with SCDHEC
5 policy, the Statement of Basis will be made available for public comment, allowing the
6 public to participate in the final remedy selection. In addition, the BCT will inform the
7 Restoration Advisory Board (RAB) of its intent to change the status of SWMUs 1 and 2 to
8 NFA. The RAB may also then provide comments to the BCT on behalf of the public
9 concerning the proposed change of status.

10 **1.3 Document Organization**

11 This CMS WP consists of the following five sections, including this introductory section:

12 **1.0 Introduction** – Presents the purpose of the CMS WP and background information
13 pertaining to the site.

14 **2.0 Brief Overview of Site and Previous Investigations** – Provides a brief overview of the
15 site and previous investigations.

16 **3.0 Interim Measure for Remediation of Lead-Contaminated Soil** – Provides a brief
17 overview of the Environmental Detachment Charleston (DET)'s delineation sampling and
18 subsequent IM.

19 **4.0 Review and Refinement of COCs** – Provides a review of COCs identified in the RFI
20 Report and re-evaluation of RFI data and evaluation data collected after the RFI to refine the
21 COC list.

22 **5.0 Summary of Information Related to Site Closeout Issues** – Summarizes the site
23 closeout issues.

24 **6.0 References** – Lists the references used in this document.

25 **Appendix A** contains excerpts from Section 10.2 (SWMU 2) of the Zone A RFI Report.

26 **Appendix B** contains Section 10.1 (SWMU 1) of the Zone A RFI Report.

- 1 **Appendix C** contains the DET's IM Completion Report.
- 2 **Appendix D** contains the data from the DET's delineation sampling and the IM
- 3 confirmatory sampling.
- 4 **Appendix E** contains boring logs for select monitor wells and Figures 3.1A and 3.1B from
- 5 EnSafe's CMS Technical Memorandum illustrating local aquifer physical characteristics.
- 6 **Appendix F** contains a list of known OWSs.
- 7 Tables and figures appear at the end of their respective sections.

SECTION 2.0

**Brief Overview of Site
and Previous Investigations**

2.0 Brief Overview of Site and Previous Investigations

Located within SWMU 2, in the northeast corner of Zone A, SWMU 1 was used by the Defense Reutilization Marketing Office (DRMO) to store excess military property. The stored property included products that could not be re-utilized by other commands and were consequently classified as waste. Those wastes that were considered hazardous were stored in Building 1617. Building 1617, which no longer exists, was a covered storage shed and was used until the early 1990s.

Materials of concern at SWMU 1, identified in the *Final Zones A and B RFI Work Plan*, were VOCs, hydrazine, metals, and characteristic wastes. SWMU 1 was identified as an area with potential contamination in the RCRA Facility Assessment (RFA) completed by EBASCO.

SWMU 2, Lead Contamination Area, is located in the same area as SWMU 1. It consists of salvage bin No. 3 and the adjacent paved ground surface at the DRMO facility. The area was formerly used to store recovered lead from lead-acid submarine batteries from the mid-1960s until 1984. Electrodes and associated internal metallic components were removed from the battery jars in the battery electrode treatment area, SWMU 5 in Zone E. Recovered materials were then placed on a railcar and transferred to the DRMO area for storage and eventual sale to a salvage contractor. Extensive sampling has been conducted at SWMU 2 from 1986 to present. Due to potential contaminant migration via surface water runoff, the investigation area for SWMU 2 was expanded to cover a larger area, as shown in Figure 1-2. Figure 1-2 also illustrates SWMU 1.

To the southwest of SWMU 2, there is a small area where, prior to 1998, an intermittent wetland area was located. The approximate area of the intermittent wetland is illustrated in Figure 2-1. This area is not believed to be a natural wetland. The area was reportedly flooded during EnSafe's initial site visit in 1995, but was only intermittently wet during subsequent visits. Apparently, the water source for this area was a leaking underground water line. Since the line was repaired in 1998, the area has become dry.

1 The intermittent wetland was evaluated in the ecological risk assessment (ERA), Section 8 of
2 the RFI Work Plan. The ERA results that relate to SWMU 2 are presented in Section 4.1 of
3 this CMS WP.

4 Materials of concern at SWMU 2, identified in the *Final Zones A and B RFI Work Plan*, were
5 lead-acid batteries. SWMU 2 was identified as an area with potential contamination in the
6 RFA completed by EBASCO.

7 SWMUs 1 and 2 are evaluated jointly in this CMS WP, and are generally referred to as
8 SWMU 2.

9 Based on the investigations completed at SWMU 2, lead was identified as being present in
10 site soil at concentrations above the generally accepted level for unrestricted land use. Other
11 constituents were reported in soil at concentrations that exceeded their BRCs, but no
12 significant source areas of these constituents were identified at SWMU 2.

13 An IM was conducted at SWMU 2 to remove lead-impacted soil above the typical
14 residential cleanup level of 400 mg/kg. As a result of this removal, COCs identified in the
15 RFI Work Plan are considered to have been adequately remediated.

16 **2.1 RFI Status and Conclusions**

17 The status of the *Zone A RCRA Facility Investigation Report* is final (EnSafe, 1998). Results of
18 the RFI for SWMUs 1 and 2 were presented in Sections 10.1 and 10.2, respectively, of the
19 *Zone A Final RFI Report*. The RFI Report included the data collected prior to and as part of
20 the RFI.

21 **2.1.1 Brief Summary of Soil Samples from the Zone A RFI**

22 Extensive soil sampling has been conducted to delineate the extent of contamination at
23 SWMU 2. A brief summary of the sampling activities is provided below.

24 **1986 Sampling Event**

25 The Zone A RFI Report indicated that, in 1986, Environmental Science and Engineering
26 collected 71 samples from the DRMO site; 35 samples consisted of surficial soil (surface to 6
27 inches), and the remaining 36 samples were collected at various depth intervals from 10

1 separate soil borings (total depth of 7.5 feet to 10 feet below land surface [ft bgs])
2 (Environmental Science and Engineering, 1986). The RFI concluded that, because this
3 sampling was conducted outside of the RFI process, and lacked detailed quality
4 assurance/quality control (QA/QC) documentation, and because Hurricane Hugo may
5 have altered lead distribution of the site in 1993, the lead concentrations from these samples
6 could only be used as "screening" data. Therefore, EnSafe conducted several soil sampling
7 events to delineate the nature and extent of contamination.

8 **1993 Sampling Event**

9 In 1993, after Hurricane Hugo potentially impacted the lead distribution in soil in 1989 due
10 to the heavy rains it deposited at the CNC, samples were collected to further investigate soil
11 and groundwater near SWMU 2. Twenty-five soil borings and 6 shallow monitor wells
12 were installed. Twenty-four surface and 22 subsurface soil samples were submitted for
13 metals and cyanide analysis. Additionally, 11 sediment samples were collected from the
14 Cooper River and the storm sewer system in the vicinity.

15 **1995-1997 Sampling Event**

16 The *Final Zones A and B RFI Work Plan* proposed collecting 30 soil samples from the upper or
17 surface interval (0 to 1 foot) and 30 samples from the lower interval (3 to 5 feet) for the
18 SWMU 2 investigation area in 1995. Six of the proposed boring locations at SWMU 2 (near
19 the former storage bin) were postponed until 1997. The 1997 soil sampling event was
20 expanded to include 10 additional soil borings in areas that exhibited elevated lead
21 concentrations during the 1986 sampling event.

22 During the 1997 sampling of the intermittent wetland area, southwest of SWMU 2, three
23 sediment locations (A002M0003, A002M0004, and A002M0005) were sampled for metals
24 analysis. One of these samples, A002M000401, was analyzed for the Appendix IX list of
25 parameters at DQO Level IV to investigate other potential constituents that could have
26 migrated to the intermittent wetland area. Because this area is no longer a wetland, data
27 from these sediment samples have been incorporated as soil data.

28 Including these samples as surface soil samples, 44 samples were collected from the upper
29 interval (surface soil) in the 1995/97 sampling effort (68 total RFI surface soil samples).
30 Thirty-five lower-interval samples were collected during the 1995/97 sampling effort (57

1 total RFI subsurface soil samples). Six of the lower-interval samples were not collected due
2 to a water table less than 5 ft bls; saturated samples were not submitted for analysis. All 79
3 soil samples were submitted for metals analysis. Table 10.2.6 of the Zone A RFI Report
4 summarizes soil sample results for both the 1993 and 1995/97 investigations at SWMU 2
5 (see Appendix A-1).

6 A summary of soil sampling locations completed during the RFI is shown on Figure 2-1.

7 **2.1.2 Surface Soil**

8 Results of surface soil analyses were compared in the RFI to applicable screening criteria
9 (U.S. Environmental Protection Agency [EPA] Region III RBCs or Zone A BRCs).

10 Analytes that exceeded the screening criteria were considered to be chemicals of potential
11 concern (COPCs) and were further evaluated in the risk assessment to determine which of
12 these parameters were considered COCs (page 10.1.39 of the SWMU 1 investigation [see
13 Appendix B] and page 10.2.107 of the SWMU 2 investigation [see Appendix A-2] summarize
14 the findings of the human health risk assessment [HHRA]). This analysis resulted in the
15 identification of the following preliminary COCs for SWMU 2 for future residential land
16 use:

- 17 • Aluminum
- 18 • Antimony
- 19 • Aroclor 1260
- 20 • Arsenic
- 21 • Benzo(a)pyrene equivalents (BEQs)
- 22 • Beryllium
- 23 • Lead
- 24 • Thallium

25 Benzo(a)pyroene equivalents (BEQs) were identified as a COC for SWMUs 1 and 2. Data
26 from both sites are included in the evaluation of the combined site.

27 Table 2-1 presents a summary of the surface soil COC data identified in the Zone A RFI
28 Report for surface soil samples collected at SWMU 2; Figure 2-1 illustrates the sample

1 locations. Each of the analytes identified as COCs in the Zone A RFI Report is discussed in
2 Section 4.0.

3 Because SWMU 2 was a lead storage area, lead in surface soil was generally the focus of
4 investigations at SWMU 2. Figure 10.2.5 of the SWMU 2 investigation illustrates the
5 reported lead concentrations at the site and is included in Appendix A-3. Figure 2-2 re-
6 creates the information provided in the Zone A RFI Report, based on the data in the CNC
7 GIS system.

8 **2.1.3 Subsurface Soil**

9 Results of subsurface soil analyses in the RFI were compared to applicable screening criteria
10 (EPA soil screening levels [SSLs] or BRCs). Analytes detected in subsurface soils were either
11 not detected above their respective SSLs or not reliably identified in shallow groundwater
12 above their reference concentration or MCL, indicating that existing soil concentrations are
13 protective of surficial groundwater. Pages 10.2.42 and 10.2.45 of the Zone A RFI Report are
14 included in Appendix A-4. Based on these data, the risk assessment did not identify any
15 COCs for subsurface soil at SWMUs 1 or 2.

16 **2.1.4 Groundwater**

17 Results of ground water analyses were compared in the RFI to BRCs and tap water RBCs as
18 screening criteria.

19 Analytes that exceeded the screening criteria were considered COPCs and were further
20 evaluated in the risk assessment to determine which of these parameters were considered
21 COCs. Page 10.1.39 and Table 10.1.16 of the SWMU 1 investigation (Appendix B), and page
22 10.2.108 and Table 10.2.27 (Appendix A-5) of the SWMU 2 investigation, present the
23 screening results. This analysis resulted in the identification of the following COCs for
24 SWMU 2 groundwater for future residential use:

- 25 • Arsenic
- 26 • Manganese
- 27 • Silver

- 1 The Zone A RFI Report for SWMU 1 indicated manganese as the sole COC for site
2 groundwater. These data will be evaluated along with the SWMU 2 data as a single site
3 (SWMU 2).
- 4 Table 2-2 presents a summary of the groundwater COC data for samples collected at
5 SWMU 2; Figure 2-3 illustrates the locations of the monitor wells used in the SWMU 2
6 analysis. Each of the COCs is discussed in Section 3.0.
- 7 The Zone A RFI Report concluded that: *“Based on the analytical results and the risk assessment,*
8 *COCs requiring further evaluation through the CMS process were identified for surface soil and*
9 *shallow groundwater. Detections of COCs in the subsurface soil also justify inclusion in the CMS*
10 *process.”*
- 11 The Zone A RFI Report presented potential corrective measures for the impacted media and
12 respective COCs.

TABLE 2-1
 Surface Soil Data for Selected Compounds
 CMS Work Plan, SWMU 2, Zone A, CNC

Station	Sample		Aluminum		Antimony		Arsenic		Beryllium		Lead		Thallium		BEQs		Aroclor-1260		
	ID	Date	Result (mg/kg)	Qualifier															
			RBC		78,000		31		0.43		160		400		6.3		0.087		0.32
			RC		12,800		NC		9.44		NC		140		NC		1304		NRC
			SSL		555,074		2.7		15		32		400		0.36		NSSL		1

Bolded and outlined values are exceedances of both the RBCs and background values.

* Sample location was excavated during DET's IM.

= The analyte was detected; the reported value is equal to the sample concentration.

J The analyte was detected; the reported value is an estimated concentration.

BEQ Benzo(a)pyrene equivalent

BRC Background reference concentration

NA Analyte was not analyzed for in the sample

NC A BRC was not calculated because more than 90 percent of the samples collected for the BRC were reported as nondetect.

NCG No reference concentration is available because the constituent is not a naturally occurring element.

NRC An SSL was not calculated for the constituent(s).

NSSL A cleanup goal is not available or not appropriate.

RBC Risk-based concentration.

SSL Soil screening level.

U The analyte was not detected; the reported value is the detection limit.

UJ The analyte was not detected; the reported value is an estimated detection limit.

SECTION 3.0

**Interim Measure for Remediation of
Lead-Contaminated Soil**

3.0 Interim Measure for Remediation of Lead-Contaminated Soil

This section provides information on the delineation sampling and the subsequent IM conducted by the DET at SWMU 2.

Following completion of the RFI, the Southern Division Naval Facilities Engineering Command (SOUTHDIR) decided that an IM would be performed by the Supervisor of Shipbuilding, Conversion and Repair (SUPSHIP), United States Navy (USN), Portsmouth, Virginia, DET. In 1998, at the request of the Navy, the DET first collected additional samples to further delineate lead concentrations in surface soil exceeding the residential cleanup level of 400 mg/kg. The DET collected approximately 335 soil samples in a grid configuration around sample locations identified in the Zone A RFI Report as exceeding the residential cleanup level. In the sample-grid system, samples were collected every 20 feet in the north-south and east-west directions. Because this effort was initiated after the completion of the Zone A RFI, these data were not included in the Zone A RFI Report. Figure 2 of the DET's Completion Report illustrates the sample locations. The delineation sample locations used to define the excavation area are shown on Figure 3-1. The DET's completion report is included in Appendix C. It includes a full-sized drawing illustrating the DET's sample location and results; the data for the delineation samples are included Appendix D-1. A brief explanation of the method for identifying these data is also presented in the front of Appendix D.

The DET found that the grid samples collected by the DET generally appeared to correlate with the RFI sampling results. However, lead samples collected in the southwest area of the site, near the former intermittent wetland area, varied significantly between the 1998 DET sampling event and earlier sampling events. Five samples collected from the intermittent wetland area during the 1995 RFI sampling effort contained lead in concentrations ranging from 441 to 1,500 mg/kg. Of the 60 samples collected in the area of the intermittent wetland (see Figure 3-1) by the DET in 1998, the maximum concentration was reported at 120 mg/kg.

1 In 1999, after completion of the delineation sampling, the IM was performed with the
2 objective to remove and dispose of lead-contaminated soil with concentrations above 400
3 mg/kg. The area of the soil removal was determined based on the results of the delineation
4 sampling conducted by the DET in 1998 (described above).

5 The IM removed approximately 9,600 tons of lead-contaminated soil and concrete. Of this
6 total, 8,300 tons were disposed of as hazardous waste; 1,300 tons were disposed of as non-
7 hazardous debris. The excavated areas appear to have included the locations of 13 RFI soil
8 boring locations (A002SB008; A002SB009; A002SB011; A002SB014; A002SB015; A002SB023;
9 A002SB033; A002SB035; A002SB036; A002SB039; AS02SB009; AS02SB011; and AS02SB021).
10 The removal areas and the excavated sample locations are illustrated on Figure 3-2. Figure
11 3-2 also provides the reported lead concentrations of the RFI surface soil samples.

12 Following the removal of the contaminated soil, confirmatory samples were collected by the
13 DET along the sidewalls and the bottom of the excavation. The locations of the confirmatory
14 samples are illustrated on Figure 3 of the IM Completion Report (see Appendix C). The DET
15 reported that confirmatory sample results indicated that remaining site soil met the IM
16 objective of removing lead-contaminated soil with concentrations above 400 mg/kg (DET,
17 1997). The confirmation data are presented in Appendix D-2. A brief explanation of the
18 method to identify this data is also presented in the front of Appendix D.

19 Review of the DET's confirmation sample results collected from the bottom of the
20 excavation indicate that all of the confirmation samples contained lead concentrations below
21 the cleanup level of 400 mg/kg, except samples Sport0228-5 (565 mg/kg) and Sport0215-2
22 (657 mg/kg) collected on July 14, 1999, and July 7, 1999, respectively. Sample Sport0234-1
23 was collected very close to Sport0228-5 six days later (July 20, 1999) and indicated a lead
24 concentration of 1.2 mg/kg. This information suggests that, after sample Sport0228-5 was
25 reported, additional excavation activities were performed and a second confirmatory
26 sample (Sport0234-1) was collected. Based on this information, the soil at this location meets
27 the cleanup goal of 400 mg/kg.

28 Sample Sport0226-1 was collected near Sport0215-2 six days later (July 13, 1999). Figure 3 of
29 the DET's completion report shows the excavation boundary ending at Sport 215-2 and
30 confirmation sample Sport0226-1 outside the excavation. It is likely that, after the results of

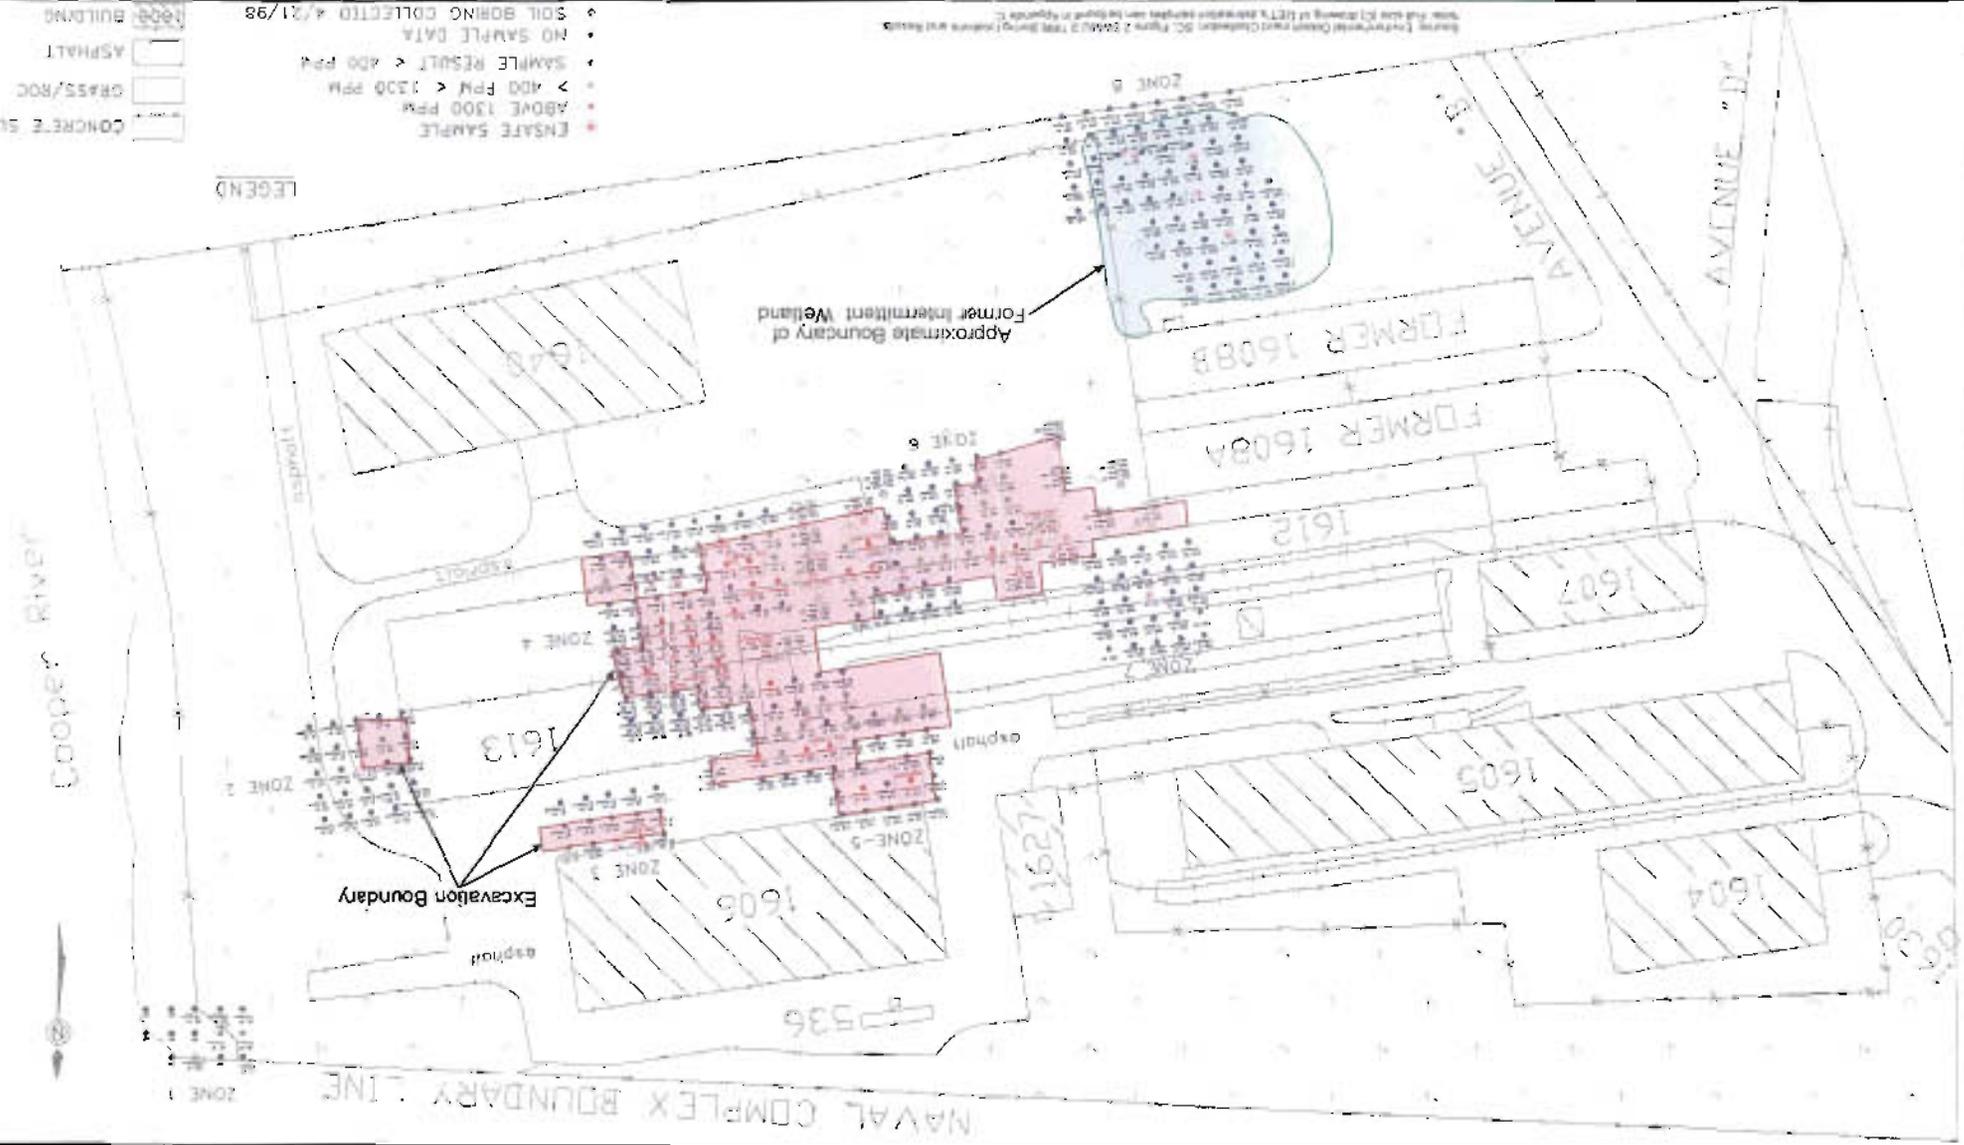

- 1 Sport0215-2 were reported, additional excavation was performed and another confirmation
- 2 sample (Sport0226-1) was collected. The results of Sport0226-1 indicate that remaining soil
- 3 in this area meets the cleanup goal of 400 mg/kg.

- 4 Based on this information, remaining soil at SWMU 2 meets the cleanup criteria, and
- 5 existing subsurface lead concentrations are below levels that would be expected to impact
- 6 groundwater. Confirmation sample locations and results are illustrated on Figure 3-3.

SECTION 4.0

Review and Refinement of COCs

4.0 Review and Refinement of COCs

4.1 Surface Soil

Surface soil COCs identified during the RFI are further discussed in this section. Where appropriate, this section also includes data that were collected after completion of the RFI.

4.1.1 Lead

Lead was detected in 67 of 68 surface soil samples collected and analyzed for lead as part of the RFI at SWMU 2. It was detected at concentrations above the generally accepted residential cleanup level (400 mg/kg) in 16 sample locations and the adult (site worker) soil cleanup level of 1,000 mg/kg in 9 samples. Lead-contaminated soil was removed as part of an IM conducted by the DET in 1999. The IM is discussed in Section 2.3 of this CMS WP.

The limits of the DET's IM excavation were determined based on 335 soil samples collected by the DET in 1998 for lead delineation. Nine sample locations (AS02SB015; AS02SB016; A002SB020; A002SB021; A002SB028; A002SB029; A002M003; A002M004; and A002M005) identified in the RFI as exceeding the residential cleanup level were outside the footprint of the soil excavation IM performed by the DET. The lead concentrations at these locations, as well as other RFI samples, are presented on Figure 4-1.

Former Intermittent Wetland Area

Five of these samples (A002SB028; A002SB029; A002M003; A002M004; and A002M005) were collected in the intermittent wetland located to the southwest of SWMU 2 (see Figure 2-1 for sample locations). The DET collected 60 grid samples in this area with no results reported above 120 mg/kg. The location of these samples is shown on Figure 4-2.

The lead clean up standard is established using EPA's Integrated Exposures and Uptake Biokinetic (IEUBK) Model, which estimates blood lead concentrations based on exposure averages. Based on application of the IEUBK, a mean exposure concentration was calculated for a one-half acre exposure area around these sample locations, as recommended by the EPA. Excavated sample locations were not included in the calculation; however, delineation

1 samples that were used to define the extent of the excavation were used. Delineation
2 samples that were outside the area of the excavation were also used, in addition to the RFI
3 data.

4 The mean lead concentration in the intermittent wetland area was calculated to be 105.6
5 mg/kg, which is below the 400 mg/kg cleanup level. Figure 4-2 illustrates the exposure area
6 and samples associated with the exposure area. Table 4-1 lists the sample IDs and
7 corresponding analytical results that were used for the calculation. Based on this
8 information, no significant source area of lead is present in the intermittent wetland area to
9 the southwest of SWMU 2.

10 Additionally, the intermittent wetland area was evaluated in Section 8, ecological risk
11 assessment (ERA) section of the Zone A RFI Report (EnSafe, 1998). The intermittent wetland
12 was identified as subzone A-1 in the ERA. The ERA found that existing concentrations of
13 metals, including lead, and PAHs were not indicative of excessive risk to representative
14 terrestrial wildlife species, invertebrates, or plants. The conclusion of the ERA was: "*Based*
15 *on the assessment of risk to ecological receptors from soil/sediment exposure found within subzone A-*
16 *1, no further work is recommended.*" Based on this information, a significant source of lead is
17 not present in the intermittent wetland area regardless of whether the area is considered a
18 wetland.

19 **Other Samples Exceeding 400 mg/kg**

20 Two residual RFI sample locations adjacent to the major area excavated by the DET
21 (A002SB020 and A002SB021) reported lead concentrations of 3,870 and 584 mg/kg,
22 respectively. The DET's delineation effort collected extensive samples around these
23 locations with no adjacent sample reporting lead concentrations above the residential
24 cleanup level, indicating a limited area of approximately 730 square feet of soil with lead
25 concentrations above 400 mg/kg. The calculated mean lead concentration for the half-acre
26 area around these locations is 304 mg/kg. Figure 4-3 illustrates the exposure area and
27 samples associated with the exposure area. Table 4-2 lists the sample IDs and corresponding
28 analytical results that were used for the calculation. The mean lead concentration is below
29 the residential cleanup level. Based on this information, no significant source area of lead is
30 present at this location.

1 Sample AS02SB016 (1,100 J mg/kg) was collected between the railroad tracks near the
2 location of former Building 1608A. The DET collected 24 grid-based samples centered on
3 this location. The lead concentrations in the DET's delineation sampling were all reported at
4 levels (from 2.25 mg/kg to 351 mg/kg) below the residential cleanup level of 400 mg/kg.
5 Based on these data, the area of lead-impacted soil above 400 mg/kg is estimated to be
6 approximately 565 square feet. The calculated mean lead concentration for a half-acre area
7 around soil boring AS02SB16 is 92.9 mg/kg, which is also below the residential cleanup
8 level. Figure 4-4 illustrates the exposure area and samples associated with the exposure area.
9 Table 4-3 lists the sample IDs and corresponding analytical results that were used for the
10 calculation. Based on these data, a significant source area of lead is not present at this
11 location.

12 Sample AS02SB015 (1,400 J mg/kg) was collected at the northeast corner of SWMU 2. The
13 delineation sampling conducted by the DET included six samples collected near this
14 location. Two of the DET's samples (06-01: 862 mg/kg and 02-01: 429 mg/kg) reported lead
15 concentrations above 400 mg/kg. These two sample locations were excavated as part of the
16 DET's IM. Soil at soil boring AS02SB015 was not removed. To further investigate this
17 sample location, a CH2M-Jones field team visited the site to locate soil boring AS02SB015
18 using a global positioning system (GPS). The field team determined that this sample
19 location is below the water level of the Cooper River during high tide. As such, this sample
20 should be considered a sediment sample and included in the Zone J investigation. Based on
21 this information, the surface soil in the northeast corner of SWMU 2 is considered to have
22 been adequately remediated by the DET's IM.

23 **4.1.2 Arsenic**

24 Arsenic was identified as a COC based on the projected child non-carcinogenic hazard
25 quotient (HQ) of 0.48 (see Appendix A-5, Table 10.2.27 of the Zone A RFI Report) and the
26 projected future resident incremental lifetime cancer risk (ILCR) of 2.1E-6. Arsenic was
27 detected above the RBC of 0.43 mg/kg, HI=1, in 14 surface soil samples collected at SWMU
28 2 and the Zone A BRC of 9.4 mg/kg (see Table 2-1). Of these, six sample locations
29 (A002SB006; A002SB023; A002SB028; A002SB037; AS02SB011; and AS02SB018) were
30 reported above the SSL of 15 mg/kg using a dilution attenuation factor (DAF) of 10.

1 The DET's IM excavation area (see Figure 2-3) included 6 of the 14 locations where arsenic
2 was detected above its surface soil BRC of 9.4 mg/kg. Eight surface soil sample locations
3 (A002SB001: 12.7 mg/kg; A00SB006: 15.4 mg/kg; A002SB026: 11 mg/kg; A00SB028: 21.5
4 mg/kg; A002SB029: 13.6 mg/kg; A00SB037: 21.5 mg/kg; AS02SB010: 12 mg/kg; and
5 AS02SB018: 20 J mg/kg) and two sediment sample locations (A002M0003: 19.6 mg/kg and
6 A002M0004: 18.3 mg/kg) remain that contained arsenic concentrations above the BRC. As
7 previously discussed, these sediment samples were included as surface soil samples because
8 the area is no longer saturated. Figure 4-5 illustrates the residual arsenic concentrations at
9 SWMU 2.

10 Arsenic concentrations ranged from 1.7 J mg/kg to 30.1 mg/kg in the grid-based
11 (background) samples collected from Zone A. Reported residual arsenic concentrations at
12 SWMU 2 are all within or below the range of background concentration. Additionally,
13 arsenic was not reliably detected in site groundwater above its MCL of 50 µg/L, indicating
14 that existing soil concentrations are protective of surficial groundwater. Based on this
15 information, arsenic is not considered a COC at SWMU 2.

16 **4.1.3 Antimony**

17 Antimony was identified as a COC based on the projected child non-carcinogenic HQ of
18 0.41 (see Appendix A-5, Table 10.2.27 of the Zone A RFI Report). Arsenic was detected in 23
19 of 68 surface soil samples collected at SWMU 2. Three samples (A002SB03601: 470 mg/kg;
20 A002SB02001: 54.4 mg/kg; and A002SB01101: 40.0 mg/kg) were reported above the RBC
21 (HI=1) of 31 mg/kg.

22 The DET's IM excavation area (see Figure 3-2) included two of the three locations where
23 antimony was detected above its RBC of 31 mg/kg, including the highest reported
24 concentration (A002SB036, 470 mg/kg). The only remaining location where antimony was
25 detected above its RBC is A002SB020 (54.4 mg/kg). Figure 4-6 illustrates the residual
26 antimony concentrations at SWMU 2. Reported antimony concentrations in residual
27 samples collected near A002SB020 were all less than half the RBC value, indicating a small
28 area of impacted soil (less than 450 square feet [0.01 acre]).

1 An upper threshold limit (UTL) for antimony was not calculated for Zone A due to a large
2 percentage (>90%) of non-detects. For the purpose of comparison, two times the mean and a
3 UCL₉₅ calculation (assuming a normal distribution of data) was compared to the RBC of 31
4 mg/kg. These methods are considered appropriate because the UTL calculation assuming a
5 log-normal data distribution and the non-parametric method both default to the maximum
6 detected value as a UTL for small data sets. This would be appropriate for calculating a
7 background UTL; however, an individual at SWMU 2 would not be exposed continuously
8 to the maximum concentration.

9 Sample results within a half-acre area around A002SB020 are considered as the exposure
10 area, as recommended by the EPA. Sample locations that were removed as part of the IM
11 were not included in the analysis. Samples included in the analysis were A002SB019 (11.3 U
12 mg/kg); A002SB020 (54.4 mg/kg); A002SB021 (5.2 J mg/kg); A002SB022 (7.6 mg/kg);
13 A002SB025(11.1 U mg/kg); and A002SB041(0.37 J mg/kg). The mean antimony
14 concentration of these residual samples was calculated to be 13.13 mg/kg using one-half the
15 detection limit for non-detects ("U" data). Twice the mean concentration is 26.26 mg/kg,
16 which is below the RBC of 31 mg/kg.

17 Calculation of the UCL₉₅ is based on the same exposure area, and the same samples are
18 included in the analysis. The UCL₉₅ was calculated to be 29.3 mg/kg. This value is similar to
19 the results obtained from the two times the mean calculation and is also below the RBC of
20 31 mg/kg.

21 Based on the above information, antimony is not considered a surface soil COC at SWMU 2

22 **4.1.4 Aluminum**

23 Aluminum is a naturally occurring metal and is abundant in the environment. It is not
24 considered a carcinogen. Aluminum was identified as a COPC based on its RBC
25 exceedances. Aluminum was detected in all 68 samples (see Appendix A-1, Table 10.2.6 of
26 the Zone A RFI Report) collected at SWMU 2 and exceeded the residential RBC of 7,800
27 mg/kg, based on an HI of 0.1 in 20 of 62 samples. Aluminum concentrations were reported
28 to range from 1,280 to 40,100 mg/kg in SWMU 2 surface soil. These concentrations were
29 compared to a RBC of 7,800 mg/kg in the RFI (see Appendix A-2, page 10.2.107 of the Zone

1 A RFI). This RBC corresponds to a HI of 0.1 to provide a conservative screening criterion.
2 The RBC is 78,000 mg/kg, based on a HI of 1. None of the surface soil concentrations
3 exceeded the RBC for aluminum corresponding to a HI of 1.

4 The range of aluminum background concentrations was between 3,640 to 11,800 mg/kg for
5 13 grid-based samples from Zone A. SWMU 2 aluminum background levels are considered
6 to be consistent with these background concentrations. Throughout the CNC, aluminum
7 background levels ranged from 261 to 55,500 mg/kg. Comparison to the basewide
8 background concentrations is appropriate because aluminum BRCs in site surface soil
9 would be expected to correlate with basewide BRCs if an equal number of samples were
10 collected from the site as from the CNC. No samples collected at SWMU 2 reported
11 aluminum concentrations above 55,500 mg/kg.

12 Based on the above information, detected levels of aluminum appear to be within the range
13 of aluminum background concentrations and below the health-based RBC based on a HI of
14 1. Therefore, aluminum is not considered a COC at SWMU 2.

15 **4.1.5 Aroclor 1260**

16 The polychlorinated biphenyl (PCB) Aroclor 1260 was identified as a COC, based on the
17 projected future resident ILCR of 1.6E-6. Aroclor 1260 was detected above its RBC of 0.32
18 mg/kg in one sample (A002M000401, 0.5 mg/kg) collected at SWMU 2. This sample does
19 not exceed the PCB action level for residential land use of 1 mg/kg (1,000 µg/kg)
20 [*Requirements for PCB Spill Cleanup*, 40 CFR 761.125 (c)(4)(v)]. Therefore, Aroclor 1260 is not
21 considered a COC at SWMU 2.

22 **4.1.6 BEQs**

23 Polynuclear aromatic hydrocarbons (PAHs), expressed as BEQs, were identified as a COC in
24 SWMU 2, based on exceedances of the RBC of 88 micrograms per kilogram (µg/kg) (see
25 Appendices A-3 and A-5, page 10.2.107 and Table 10.2.27 of the Zone A RFI Report,
26 respectively). PAHs were detected in one sample (A002M000401, 90.9 µg/kg) at a
27 concentration that resulted in the calculated BEQ concentration exceeding the RBC.

28 PAHs are routinely detected in non-impacted as well as impacted areas of the CNC. The
29 detected PAHs, and resulting calculated BEQs, in the non-impacted areas (grid-based

1 samples) of the CNC were used to calculate a BEQ value to be used as a basewide reference
2 concentration. The data and analysis were presented to the BCT in the *Background PAHs*
3 *Study Report - Technical Information for Development of Background BEQ Values, Revision 0*
4 (CH2M HILL, February 2001). The BEQ reference concentration is 1,304 µg/kg for surface
5 soil. The BEQ concentration at SWMU 2 is well below this background value. Therefore,
6 BEQs are not considered a COC in surface soils at SWMU 2.

7 **4.1.7 Beryllium**

8 Beryllium was identified as a COC at SWMU 2, based on exceedances of the RBC of 0.15
9 mg/kg at the time the RFI was completed. However, review of site data and comparison to
10 the most recent EPA RBC (EPA Region III RBC Table, April 13, 2000) value of 160 mg/kg for
11 beryllium (see Table 2-1) indicates that beryllium does not exceed the current RBC value at
12 any location within SWMU 2. Therefore, beryllium is not considered a COC in surface soil at
13 SWMU 2.

14 **4.1.8 Thallium**

15 Thallium was identified as a COC, based on the projected child non-carcinogenic HQ of 0.13
16 (see Appendix A-5, Table 10.2.27 of the Zone A RFI Report). Thallium was not detected
17 above its RBC (6.3, HI=1) in any of the 68 surface soil samples collected at SWMU 2.
18 Therefore, thallium is not considered a COC in surface soils at SWMU 2.

19 **4.2 Subsurface Soil**

20 Because the RFI did not identify any subsurface COCs, no discussion of subsurface soil is
21 warranted.

22 **4.3 Groundwater**

23 This section presents a detailed discussion of COCs identified in SWMUs 1 and 2
24 groundwater. Groundwater data for COCs are presented in Table 2-2.

25 **4.3.1 Arsenic**

26 Arsenic was detected in 4 of 29 groundwater samples collected at SWMU 2 as part of the
27 RFI. One sample from monitor well A002G000501 (November 1996, 89 µg/L) was reported

1 above the MCL of 50 µg/L. Arsenic was not detected in any of the 3 subsequent sampling
2 events at the same well. Based on these data, arsenic is not considered a COC in
3 groundwater at SWMU 2.

4 **4.3.2 Manganese**

5 Manganese was reported to have been detected in 25 of 29 samples collected at SWMU 2 as
6 part of the RFI and 6 of 6 samples collected after the RFI. Manganese exceeded its BRC of
7 577 µg/L and its RBC of 840 µg/L in six occasions at two locations (A002GW001: 1,990
8 µg/L; A002GW002: 3,370 µg/L, 3,210 µg/L, 3,350 µg/L, 3,000 µg/L, and 3,410 µg/L). It
9 was also detected above its BRC and RBC at A002GW002 (2,450 µg/L) in the October 1998
10 sampling effort that was performed after the completion of the RFI.

11 The detected concentrations of manganese in these wells appear consistent with the range of
12 background concentrations (183 – 2,660 µg/L) from the Zone A deep grid wells. The deep
13 groundwater BRC was established at 2,660 µg/L, based on the deep groundwater grid-
14 based sample results. A comparison with the deep groundwater BRC is warranted because
15 review of the well boring logs for monitor wells A039GW017 (shallow, intermediate, and
16 deep) and A039GW021 (shallow, intermediate, and deep), in addition to the results of the
17 SWMU 39 CMS Technical Memorandum (EnSafe, 1999) indicate that Quaternary
18 interbedded sands and clays in this area comprise a single unconfined aquifer system that
19 overlies the Tertiary Ashley Formation. The boring logs for monitor wells A039GW017 and
20 A039GW021 and Figure 3.1B from the technical memorandum are provided in Appendix E.

21 Because the shallow and deeper aquifer zones in Zone A appear interconnected, the
22 concentrations of manganese reported in monitor wells A002GW001 and A002GW002 were
23 likely associated with aquifer background concentrations observed in deep monitor wells.
24 The detected concentrations were also comparable to the background range of nearby Zone
25 B (shallow: 21.1 – 3,430 µg/L; deep: 31.8 – 894 µg/L). Based on this information, the detected
26 concentrations of manganese appear consistent with background values. Therefore,
27 manganese is not considered a COC at SWMU 2.

1 **4.3.3 Silver**

2 Silver was identified as a COC at SWMU 2, based on comparison of the single detected
3 concentration to its RBC of 18 µg/L (based on an HI of 0.1). Silver was detected in one
4 (A002GW004: 39.8 µg/L) of 19 samples collected at SWMU 2 as part of the RFI. It did not
5 exceed its secondary MCL (SMCL) of 100 µg/L in any site groundwater sample. Silver did
6 not exceed its RBC, based on a HI of 1, in any sample collected at SWMU 2.

7 Silver was not detected in any of the other five samples collected from monitor well
8 A002GW004, including the most recent sample (October 1998, 4.5 U µg/L) that was
9 collected after the completion of the RFI. Therefore, the single detection of silver in
10 groundwater is considered anomalous. Because silver was not detected above its RBC
11 (HI=1) or its SMCL in any groundwater sample collected at SWMU 2, it is not considered a
12 groundwater COC.

13 **4.4 Summary**

14 Surface soil samples collected as part of the SWMU 2 investigation were found to contain
15 lead, arsenic, and antimony at concentrations above their RBCs or BRCs, but below levels
16 that represent a risk to shallow groundwater. Residual arsenic concentrations were
17 determined to be within the range of background concentrations within Zone A. The
18 calculated exposure concentrations of antimony (2 x mean and UCL₉₅) are below its RBC.
19 Lead was identified above its residential cleanup level of 400 mg/kg, but was adequately
20 removed as part of the IM completed at SWMU 2. The excavation also included two of the
21 locations where antimony was detected and six locations where arsenic was detected.

22 Aluminum was identified as a COC in the Zone A RFI Report for site surface soil.
23 Aluminum concentrations were found to be within the range of background concentrations.
24 Aroclor 1260 was detected in site surface soil at concentrations that exceeded its RBC, but
25 below the action level of 1 mg/kg. BEQs were detected above the RBC, but below the
26 basewide BRC. Both beryllium and thallium were found at concentrations below their
27 respective RBCs (HI=1).

- 1 Site groundwater was found to contain several metals above conservative screening criteria.
- 2 However, after evaluating these constituents, no COCs were identified in site groundwater.
- 3 With the reduction of arsenic, antimony, and lead levels at SWMU 2 as part of the DET's IM
- 4 in 1999, SWMUs 1 and 2 are suitable for future unrestricted land use. As such, CH2M-Jones
- 5 recommends NFA for SWMUs 1 and 2.

Summary of Information Related to Site Closeout Issues

SECTION 5.0

5.0 Summary of Information Related to Site Closeout Issues

5.1 Presence of Inorganics in Groundwater

For the purpose of site closeout documentation, the inorganics in groundwater issue refers to the occasional or intermittent detection of several metals, primarily arsenic, thallium, and antimony, in groundwater at concentrations above the applicable MCL, preceded or followed by detections of these same metals below the MCL, or below the practical quantitation limit.

Groundwater samples collected in the SWMU 2 vicinity (A002GW001 to -005; A002GW007; A002GW008; A039GW006; and A039GW007) were evaluated groundwater quality as part of this CMS WP. Monitor well A039GW021 is also located within SWMU 2, but samples collected from this well were not analyzed for metals. DPT groundwater samples were also collected near SWMU 2, but were not compared to groundwater criteria as they contained suspended solids. (Suspended solids can cause elevated results that are not representative of actual groundwater quality.) The DPT samples collected near SWMU 2 are also hydraulically upgradient of the site. Data from the groundwater wells are presented in Table 5-1. A brief discussion of the presence of these analytes is presented below.

5.1.1 Arsenic

As discussed in Section 3.3, arsenic was not reliably detected in groundwater samples at SWMU 2. As such, further investigation of arsenic in groundwater is not warranted.

5.1.2 Antimony

The data presented in Table 5-1 indicate that antimony was not detected in any groundwater sample collected at SWMU 2. Therefore, antimony in groundwater does not require further evaluation at SWMU 2.

1 **5.1.3 Thallium**

2 Thallium was not detected in any groundwater sample collected at SWMU 2 (see Table 5-1).
3 Therefore, further evaluation of thallium at SWMU 2 is not warranted.

4 **5.2 Potential Linkage to Sanitary Sewers (SWMU 37)**

5 The investigation of the sanitary sewer was designed to include segments of the sewer
6 where releases of contamination were known or considered likely to have occurred. There
7 were no investigated sanitary sewer lines near SWMU 2. There are no known connections of
8 SWMUs 1 or 2 to the sanitary sewer. The nearest investigated sanitary sewer line is located
9 more than 400 feet to the south of SWMU 2. Consequently, further evaluation of a potential
10 linkage of SWMU 2 to the sanitary sewers is not warranted.

11 **5.3 Potential Linkage to Storm Sewers (AOC 699)**

12 Potential linkage of a SWMU or AOC to the storm sewer refers to the possibility of a
13 groundwater plume at a SWMU or AOC migrating into a stormwater sewer from within
14 which it would subsequently migrate to the water bodies around the CNC or to the
15 presence of a cross-connection between the sanitary sewer and storm sewer, which could
16 transport pollutants directly to surface waters. Regarding the first of these potential
17 linkages, because the most recent data suggest that there are no contaminants currently
18 present above their respective MCLs in site groundwater, there is no excessively
19 contaminated groundwater plume to migrate to a storm sewer. Therefore, no potential
20 linkage of this SWMU to a storm sewer exists.

21 Regarding the second potential linkage issue, there is no data or information indicating that
22 SWMU 2 has impacted the sanitary sewer. The nearest investigated storm sewer line is
23 approximately 3,500 feet to the south of SWMU 2. Therefore, there is no data indicating that
24 a cross-connection exists between the sanitary and storm sewers. As such, further evaluation
25 of a potential linkage between SWMU 2 and the storm sewers is not warranted.

1 **5.4 Potential Linkage to Railroad Lines (AOC 504)**

2 The potential linkage of a SWMU or AOC to a railroad potentially applies only to SWMUs
3 or AOCs at which an investigated portion of the railroad system, identified as AOC 504 in
4 the *Zone L RFI Work Plan*, passes through or directly adjacent to the AOC or SWMU.

5 Although investigated railroad lines are present within SWMU 2, additional samples were
6 not proposed for this segment of the railroad as part of the AOC 504 investigation in the
7 *Zone L RFI Work Plan*. The SWMU 2 investigative sampling was considered sufficient to
8 characterize this section of the railroad (AOC 504-AQ, *Zone L RFI Work Plan*). Because
9 SWMU 2 data were used in the evaluation of the railroad (AOC 504), it is unlikely that any
10 linkage between the SWMU and the railroad line could be overlooked.

11 The data analyzed as part of the SWMU 2 investigation did not indicate the presence of
12 contamination at concentrations that would require remedial action. Additionally, the only
13 COC identified in the Zone L (Subzone A) RFI was BEQs. BEQs were identified as a COC in
14 the SWMU 2 investigation; however, they were based on a single exceedance
15 (A002M000401: 90.9 µg/kg) of the RBC (88 µg/kg). Subsequent analysis of basewide BEQ
16 values indicated that this concentration was below the newly established BRC for BEQs
17 (1,304 µg/kg). Based on this information, further evaluation of a potential linkage between
18 the AOC 504 and the subject site is not necessary.

19 **5.5 Potential Migration Pathways to Surface Water Bodies**

20 Surface water was studied separately as part of the *Zone J Draft RCRA Facility Investigation*
21 *Report* (EnSafe, 2000). The *Zone J Draft RCRA Facility Investigation Report* includes the
22 investigated surface water bodies. The nearest investigated surface water body to SWMU 2
23 is the Cooper River, which is adjacent to the site, towards the east.

24 There are two possible migration pathways for contaminants to affect surface water:
25 overland flow via stormwater runoff and subsurface flow via groundwater. The fact that a
26 significant source area of contamination is not currently present at SWMU 2 indicates that
27 surface water runoff from SWMU 2 would not be an ecological concern at the Cooper River.

1 Therefore, further evaluation of a potential pathway for contaminant migration via
2 stormwater runoff is not warranted.

3 A groundwater contaminant plume above applicable MCLs was not reliably identified at
4 SWMU 2. Therefore, further evaluation of a potential contaminant migration via
5 groundwater migration is not warranted.

6 **5.6 Potential Contamination in OWSs**

7 The potential contamination of OWSs issue refers to the possible presence of an OWS that
8 has not yet been investigated at a SWMU or AOC as part of the RCRA or underground
9 storage tank (UST) process.

10 Neither the RFA nor the RFI refers to the presence or possible presence of an OWS at
11 SWMU 2. Additionally, as part of a sitewide evaluation of the presence of OWSs, during
12 2000, the Navy completed a comprehensive review of its records and facilities to identify the
13 presence of OWSs. A list of 27 known OWSs was provided to the BCT members, including
14 DHEC staff, at the BCT meeting in September 2000. A copy of this list is provided in
15 Appendix F. This lists represents all known OWSs at the CNC. No OWS was identified at
16 SWMU 2. On this basis, further evaluation of this issue for SWMU 2 is not warranted.

17 **5.7 Land-Use Control Management Plan**

18 Evaluation of the data associated with SWMU 2 indicates that contaminant concentrations
19 are consistent with levels that are considered acceptable for unrestricted use. Therefore,
20 land-use controls are not expected to be necessary at SWMU 2.

Notes:

- a = Number of samples exceeding both RBC and RC in upper interval or number of samples exceeding the reference concentration (RC) in the lower interval.
- b = RBC not available for lead. USEPA (1994) residential soil cleanup level used for comparison (OSWER Directive 9355.4-12).
- ** = Number of nondetects prevented determination of UTL.

A-2

Surface Soils

Hypothetical Site Residents

Aluminum, antimony, Aroclor 1260, arsenic, benzo(a)pyrene equivalents, beryllium, and thallium were identified as the soil pathway COCs based on their contribution to cumulative ILCR and/or HI projections. Lead was identified as a soil COC based on the Lead Model results.

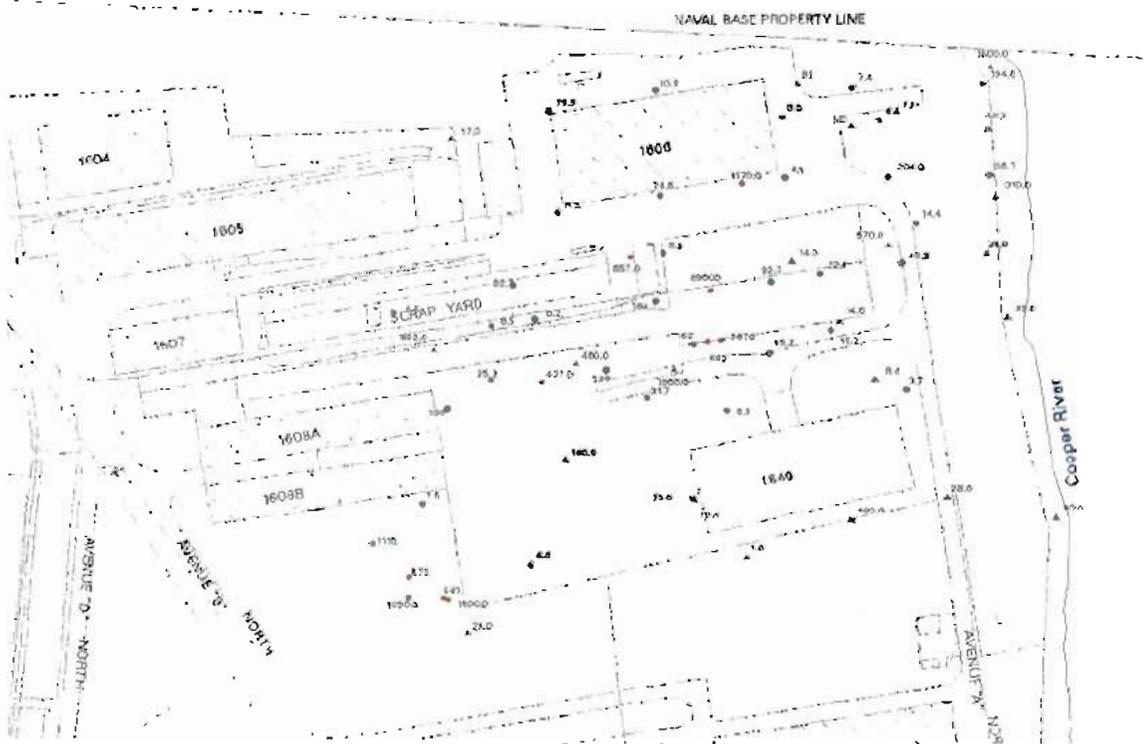

Hypothetical Site Workers

Arsenic was identified as the a pathway COC based on its contribution to cumulative ILCR projections. Lead was identified as a soil COC based on the results of the Adult Lead Model.

The extent of the COCs identified in surface soil is briefly discussed below. To facilitate this discussion of the extent of COC concentrations, residential soil RBCs were compared to each reported concentration for each COC identified above. Aluminum was detected above its residential RBC (7,800 mg/kg) in 20 of 62 surface soil samples, and was detected above its background concentration (12,800 mg/kg) in only four surface soil samples. Antimony was detected above its residential RBC in 13 of 62 surface soil samples. Arsenic was detected above its residential soil RBC (0.43 mg/kg) in 60 of 62 surface soil samples. However, the background concentration for arsenic was exceeded only 15 times and the mean concentration for SWMU 2 surface-soil (7.7 mg/kg) is less than the background concentration (9.44 mg/kg). Beryllium was detected above its residential soil RBC in 12 of 62 surface soil samples. Surface soil concentrations of lead exceeded both the residential soil cleanup level of 400 mg/kg (16 of 68 samples) and the adult (site worker) soil cleanup level of 1,300 mg/kg (5 of 62 samples). Thallium was detected above its residential RBC in only six of 68 surface soil samples. One surface soil sample collected from the former wetland area was analyzed for organic parameters. The concentrations of Aroclor 1260 and benzo(a)pyrene equivalents reported in this sample exceeded their respective residential RBCs. Risk maps are presented in Section 10.2.8.7, Risk Summary, that illustrate the extent of the surface soil COCs.

10.2.7 Fate and Transport Assessment for SWMU 2 (includes SWMU 1)

SWMU 1 was formerly used by the Defense Reutilization and Marketing Office (DRMO) as a storage area for waste material amassed as a result of local armed forces activities. The portion of this waste considered hazardous was stored in a shed formerly known as Building 1617. SWMU 2 was formerly used to store lead recovered from lead-acid submarine batteries. Both SWMU 1 and SWMU 2 were the foci of previous investigations. SWMU 1 was granted clean closure for soils in 1993 based on human health risk-based clean-up goals developed in *Risk Assessment and Development of Risk-based Clean-up Goals for the Charleston Naval Shipyard* (Gradient 1991 and subsequent revisions). Results from the SWMU 1 soil and groundwater samples collected during the Zone A RFI substantiated the 1993 clean closure decision. SWMU 2 lead contamination was investigated in 1986 and again in 1993 in addition to the RFI.

10.2.7.1 SWMU 2 – Soil to Groundwater Cross-Media Transport

Tables 10.2.11 and 10.2.12 compare the maximum detected concentrations of organic and inorganic chemicals reported in soil (68 surface samples and 57 subsurface samples) to the risk-based soil screening levels considered protective of groundwater. As shown on Table 10.2.11, none of the organic constituents was reported at a concentration exceeding its soil-to-groundwater SSL. As shown on Table 10.2.12, ten inorganics — antimony, arsenic, cadmium, chromium, lead, manganese, mercury, nickel, selenium, and thallium — were identified for further evaluation of soil-to-groundwater migration based on the screening process presented in Section 6. Except for lead and manganese, none of these inorganics was detected in SWMU 2 groundwater (including all four quarters) at a concentration above its tap water RBC or background reference concentration. Soil-to-groundwater SSL exceedences were noted in more surface soil samples than subsurface soil samples for antimony (18 surface soil and two subsurface soil samples), arsenic (eight surface soil and one subsurface soil samples), cadmium (seven surface soil and one subsurface soil samples), and lead (16 surface soil and one subsurface soil samples). Soil-to-groundwater exceedences for manganese (one exceedence), nickel (one exceedence), and

mercury (five exceedences) were reported from only a few surface soil samples. Exceedences of selenium were found in only three subsurface soil samples. Antimony, mercury, and selenium were not detected in groundwater through four quarters of sampling. Groundwater concentrations of arsenic, cadmium, and nickel were reported below their tap water RBCs or background reference concentrations. Lead was reported in only one groundwater sample (the second-quarter sample from well NBCA-002-005) at a concentration above its TTAL. Manganese was reported in groundwater sampled during all four quarters at concentrations exceeding both its tap water RBC and its background reference concentration. These findings indicate that soil concentrations of antimony, arsenic, cadmium, lead, mercury, nickel, and selenium do not present a substantial or widespread threat to SWMU 2 groundwater. Although manganese was reported in SWMU 2 groundwater at levels exceeding screening concentrations, soil is not a likely source for these concentrations because the only manganese SSL exceedance was in surface soil. Additionally, it is not uncommon to find naturally occurring manganese in groundwater in the estuarine environments of NAVBASE.

Thallium was reported in nine surface soil samples and seven subsurface soil samples at concentrations exceeding its soil-to-groundwater SSL; however, it was reported as nondetect in groundwater (including all four quarters). Similarly, chromium was reported in 27 surface soil samples and 23 subsurface soil samples but was not detected in groundwater at concentrations exceeding its tap water RBC (including all four quarters). Chromium was screened assuming it to be hexavalent, a more soluble (and toxic) form of chromium. Trivalent chromium is considered by USEPA's Soil Screening Guidance to be highly immobile. Surface and subsurface soil samples analyzed for hexavalent chromium indicate that it comprises a very small percentage of total chromium. As a result, soil concentrations of chromium and thallium do not present a substantial threat to groundwater.

Figures 10.2.9 through 10.2.16 summarize all SSL exceedences and groundwater detections for the ten metals discussed in this section.

A-5

Groundwater

Hypothetical Site Residents (future land use)

Arsenic, manganese, and silver were identified as shallow groundwater COCs based on their contribution to cumulative risk and/or hazard index.

Hypothetical Site Workers (future land use)

Arsenic was identified as a shallow groundwater COC based on its contribution to cumulative ILCR.

The extent of the COCs identified in shallow groundwater is briefly discussed below. Arsenic was detected in 4 of 19 groundwater samples with the highest concentrations in samples collected from monitoring well NBCA-002-004 during the first, third and fourth quarters. Manganese was detected in 17 of 19 groundwater samples with the highest concentrations in samples collected from monitoring well NBCA-002-002. Silver was detected in only one of 19 groundwater samples; specifically, the fourth quarter sample collected from monitoring well NBCA-002-004.

10.2.8.6 Risk Uncertainty

Characterization of Exposure Setting and Identification of Exposure Pathways

The potential for high bias is introduced through the exposure setting and pathway selection due to the highly conservative assumptions (i.e., future residential use) recommended by USEPA Region IV when assessing potential future and current exposure. The exposure assumptions made in the site worker scenario are highly protective and would tend to overestimate exposure.

Residential use of the site would not be expected, based on current site uses and the nature of surrounding buildings. Current reuse plans call for continued commercial/industrial use of Zone A, specifically as a marine cargo terminal. If this area were to be used as a residential site, the buildings and other structures would be demolished, and the surface soil conditions would

Notes:

ND Indicates not determined due to the lack of available risk information.

ILCR Indicates incremental excess lifetime cancer risk

HI Indicates hazard index

1- Chemical is a COC by virtue of projected child residence noncarcinogenic hazard.

2- Chemical is a COC by virtue of projected future resident lifetime ILCR.

3- Chemical is a COC by virtue of projected site worker noncarcinogenic hazard.

4- Chemical is a COC by virtue of projected site worker ILCR.

* - Lead identified as a COC based future residential and current commercial exposure scenarios

APPENDIX B

**Section 10.2 (SWMU 1)
from Zone A RFI**

10.1 SWMU 1, DRMO Storage

SWMU 1 was used by the Defense Reutilization and Marketing Office to store property turned in from local armed forces activities. The property included some products that could not be reutilized by other commands and were consequently classified as waste. Those which were considered hazardous waste were stored until the early 1990s in a covered storage shed formerly known as Building 1617, which no longer exists.

Materials of concern at SWMU 1, identified in the *Final Zones A and B RFI Work Plan*, are VOCs, hydrazine, metals, and characteristic hazardous wastes. Potential receptors include current and future site users involved in invasive activities. The Cooper River is also a potential receptor of contaminated surface water runoff and groundwater discharges.

Soil and groundwater were sampled in accordance with the *Final Zones A and B RFI Work Plan* and as discussed in Section 3 of this report to fulfill RFI objectives for SWMU 1.

10.1.1 Soil Sampling and Analysis

Previous investigations of SWMU 1 culminated in the certification of clean closure for soil of the DRMO Storage Shed. However, documentation is not available to verify that closure certification sampling was conducted in a manner acceptable for risk assessment procedures.

Therefore, additional samples were collected to corroborate the results of the earlier sampling event. In the autumn of 1993, this confirmatory sampling was conducted in the vicinity of SWMU 1. Two soil borings, with two samples each (upper interval and lower interval), were sampled for the complete TCL/TAL list. As outlined in the *Final Zones A and B RFI Work Plan*, one additional soil boring was installed in 1995 at SWMU 1 for the collection of both upper and lower interval samples. All SWMU 1 soil sample locations are shown on Figure 10.1.1.

The 1995 soil samples from within the SWMU 1 boundary were analyzed for the standard suite of parameters, which includes: metals, VOCs, SVOCs, cyanide, pesticides, and PCBs at DQO Level III. Table 10.1.1 summarizes soil sampling at SWMU 1.

Table 10.1.1

	Lower	3/3	9.4 - 65.3	44.6	165	NA	0

Notes:

- a = Number of samples exceeding both RBC and RC in upper interval or number of samples exceeding the reference concentration (RC) in the lower interval.
- b = RBC not available for lead. USEPA (1994f) residential soil cleanup level used for comparison (OSWER Directive 9355.4-12).
- ** = Number of nondetects prevented determination of UTL.

Volatile Organic Compounds in Soil

No VOCs were detected above their respective RBC in upper-interval soil at SWMU 1. Also, none of the lower-interval detections exceeded the respective SSL.

Semivolatile Organic Compounds in Soil

Benzo(a)pyrene was detected above the RBC in one soil sample at SWMU 1, sample number S01SB00201. This location is shown on Figure 10.1.1 earlier in this section. In accordance with recent USEPA cPAH guidance and Section 7 of this report, BEQs were calculated for cPAHs at SWMU 1. BEQs for sample S01SB00201 exceeded the benzo(a)pyrene RBC of 88 µg/kg with a detection of 148 µg/kg. Also, no SVOCs were detected in lower-interval samples.

Pesticides/PCBs

No pesticides or PCBs were detected above their respective RBC at SWMU 1. Also, no pesticides or PCBs were detected in lower-interval samples.

Inorganics in Soil

Twenty metals were detected in soil samples collected at SWMU 1. One (arsenic) was detected at concentrations greater than its RBC and equal to its RC (for upper interval only). Also, no lower-interval metals detections exceeded both the RC and SSL.

Arsenic was detected in sample S01SB00201 at a concentration of 9.4 mg/kg, which is greater than the RBC (0.43 mg/kg) and equal to the RC (9.4 mg/kg).

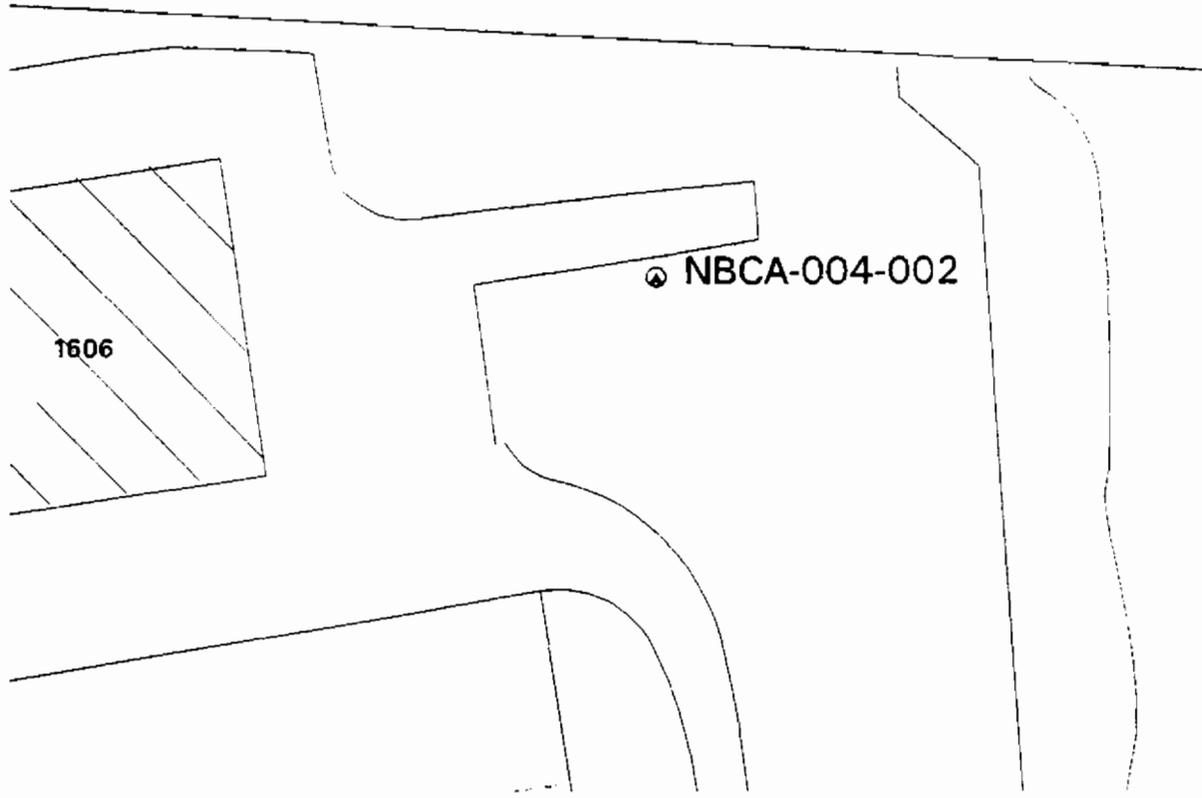

10.1.3 Groundwater Sampling and Analysis

The *Final Zones A and B RFI Work Plan* proposed redeveloping and sampling the one existing shallow monitoring well installed at SWMU 1 during the 1993 investigation at SWMU 2. Figure 10.1.2 illustrates the location of this well, NBCA-002-002. A permit application was submitted in 1996 to SCDHEC to change this monitoring well ID to the current format. For example, this well that was installed as CNSY-02-02 is now NBCA-002-002.

There have been five groundwater sampling events to date at SWMU 1. Table 10.1.4 summarizes this sampling. The first sampling event was conducted after installation of the well in November 1993. The sample was submitted for the standard suite of analyses which includes VOCs, SVOCs, metals, pesticides, PCBs, and cyanide.

LEGEND

⊙ Shallow Monitoring Well

Zone A RCRA Facility
Investigation Report
Naval Base Charleston
Charleston, SC

FIGURE 10.12 - SWMU 1

After redeveloping the well in September 1995, the first round RFI sample was collected. NBCA-002-002 was again sampled for the standard suite. Because metals were the only constituents detected in this well, second- and third- quarter samples were collected for metals analysis only. The fourth-quarter sample was collected for metals, TDS, sulfate, and chloride.

Second-, third-, and fourth-round samples were collected by the Charleston Environmental and Engineering Remediation Detachment (CEERD) in April, June, and October 1996, respectively.

Table 10.1.4
SWMU 1
Groundwater Sampling Summary

Event	Samples Proposed	Samples Collected	Analyses Proposed	Analyses Performed	Deviations
Nov. 1993	1	1	Standard Suite ^a	Standard Suite ^a	None
Sept. 1995 (1st round)	1	1	Standard Suite ^a	Standard Suite ^a	None
Apr. 1996 (2nd round)	1	1	Metals ^b	Metals ^b	None
Jun. 1996 (3rd round)	1	1	Metals ^b	Metals ^b	None
Oct. 1996 (4th round)	1	1	Metals, TDS, sulfate, chloride	Metals, TDS, sulfate, chloride	None

Notes:

- a = VOCs, SVOCs, metals, cyanide, pesticides, and PCBs
- b = Second- and third-quarter sampling analyses were based on detections in the first quarter.

This shallow monitoring well was installed at 15 feet bgs in the upper sand aquifer. The well was installed as described in Section 3.3 of this report.

10.1.4 Nature and Extent of Contamination in Groundwater

No organic compounds were detected in any groundwater samples from SWMU 1. Table 10.1.5 summarizes groundwater inorganic analytical results. Appendix D is a complete analytical data report for all samples collected in Zone A, including those collected at SWMU 1.

Volatile Organic Compounds in Groundwater

No VOCs were detected in groundwater at SWMU 1.

Semivolatile Organic Compounds in Groundwater

No SVOCs were detected in groundwater at SWMU 1.

Pesticides and PCBs in Groundwater

No pesticides or PCBs were detected in groundwater at SWMU 1.

Inorganics in Groundwater

Sixteen metals were detected in groundwater samples collected at SWMU 1. One metal (manganese) was detected at concentrations greater than both its RBC and RC.

10.1.5 Fate and Transport for SWMU 1

SWMU 1 was formerly used by the Defense Reutilization and Marketing Office (DRMO) as a storage area for waste material amassed as a result of local armed forces activities. The portion of this waste considered hazardous was stored in a shed formerly known as Building 1617. SWMU 1 was granted clean closure for soils in 1993 based on human health risk-based clean-up goals developed in *Risk Assessment and Development of Risk-based Clean-up Goals for the Charleston Naval Shipyard* (Gradient 1991 and subsequent revisions). Results from the SWMU 1 soil and groundwater samples collected during the Zone A RFI substantiated the 1993 clean closure decision.

10.1.5.1 SWMU 1 – Soil to Groundwater Cross-Media Transport

As shown on Table 10.1.6, none of the organic constituents was reported at a concentration exceeding its soil-to-groundwater SSL. As shown on Table 10.1.7, three inorganics — antimony, chromium, and mercury — were identified for further evaluation of soil-to-groundwater migration based on the screening process presented in Section 6. None of these inorganics were detected in SWMU 1 groundwater (including all four quarters) at a concentration above its tap water RBC or background reference concentration. Antimony and mercury were each detected in a single surface soil sample at a concentration exceeding its SSL, but neither was detected in groundwater. Chromium was detected in surface and subsurface soil at concentrations exceeding its SSL, however, it was not reported at concentrations exceeding its background reference concentration in any soil sample. These findings indicate that soil concentrations of antimony, chromium, and mercury do not present a substantial or widespread threat to SWMU 1 groundwater.

10.1.5.2 SWMU 1 — Groundwater to Surface Water Cross-Media Transport

For purposes of fate and transport analysis, analytical results from the samples collected at SWMU 1 during 1993 were not evaluated along with those from the 1995-1996 sampling rounds because of the time-dependence of groundwater concentrations. Tables 10.1.6 and 10.1.7 compare maximum detected groundwater concentrations from four sampling rounds at one shallow well to tap water RBC, saltwater surface water chronic AWQCs, and background reference values for inorganics.

No organic compounds were detected in SWMU 1 groundwater samples. As shown in Table 10.1.7, manganese was detected in SWMU 1 shallow groundwater above both its tap water RBC and its background reference concentration. Additionally, zinc was detected above both its AWQCs and its background reference concentration. Manganese was reported in samples collected from monitoring well NBCA-002-002 in all four quarters at concentrations exceeding both its tap water RBC (840 $\mu\text{g/L}$) and its background reference value (2,690 $\mu\text{g/L}$). Zinc was

reported in samples collected from monitoring well NBCA-002-002 in all four quarters at concentrations exceeding both its AWQC (86 $\mu\text{g/L}$) and its background reference value (83.2 $\mu\text{g/L}$).

10.1.5.3 SWMU 1 – Soil to Air Cross-Media Transport

As shown on Table 10.1.7, mercury was reported in surface soil at concentrations exceeding its soil-to-air SSL. Mercury was detected in only one surface soil sample (S01SB002 at 14.8 mg/kg) at concentrations marginally exceeding its soil-to-air SSL (10 mg/kg). As a result, mercury was not considered to be a significant contributor via the soil-to-air pathway.

10.1.5.4 SWMU 1 – Fate and Transport Summary

No significant soil-to-groundwater constituent migration was identified for SWMU 1. Zinc was detected in groundwater at concentrations exceeding its saltwater surface water chronic AWQCs.

10.1.6 Human Health Risk Assessment for SWMU 1

10.1.6.1 Site Background and Investigative Approach

SWMU 1 was formerly used by the Defense Reutilization and Marketing Office (DRMO) as a storage area for waste material amassed as a result of local armed forces activities. The portion of this waste considered hazardous was stored in a shed formerly known as Building 1617. SWMU 1 was granted clean closure for soils in 1993 based on human health risk based clean-up goals developed in *Risk Assessment and Development of Risk-based Clean-up Goals for the Charleston Naval Shipyard* (Gradient 1991 and subsequent revisions). Results from the SWMU 1 soil and groundwater samples collected during the Zone A RFI substantiated the 1993 clean closure decision. Section 10.1.1 contains a soil sampling summary and Section 10.1.3 contains a groundwater sampling summary for SWMU 1.

10.1.6.2 COPC Identification

Soil

Based on the screening comparisons described in Section 7 of this RFI, BEQ and mercury were identified as COPCs.

Groundwater

Manganese was identified as a shallow groundwater COPC for this site.

10.1.6.3 Exposure Assessment

Exposure Setting

The future use of this SWMU is unknown, although it is in a section of NAVBASE currently slated to become a marine cargo terminal in base reuse plans.

Potentially Exposed Populations

Potentially exposed populations are current and future site workers. Additional potentially exposed populations are hypothetical future site residents. Future site resident and worker exposure scenarios were addressed in this risk assessment. The hypothetical future site worker scenario assumed continuous exposure to surface soil conditions and the use of shallow groundwater as a potable water source. Current site workers' exposure would be less than that assumed for the hypothetical future site worker scenario because of their limited soil contact and the fact that groundwater is not currently used onsite as a source of potable or process water. Therefore, future worker assessment is considered to be protective of current site users. The future site resident scenario was built on the premise that current buildings would be removed and replaced with dwellings. In addition, the future site residents were assumed to use the shallow aquifer onsite as a source of drinking water.

Exposure Pathways

Exposure pathways for the site workers are dermal contact, incidental ingestion of surface soils, and ingestion of shallow groundwater through potable use. The exposure pathways for future residential land use are the same as those for the future site worker. In addition, the hypothetical future site worker scenario assumed continuous exposure to surface soil and groundwater conditions. Uniform exposure was assumed for all sample locations. Table 10.1.8 presents the justification for exposure pathways assessed in this HHRA.

Table 10.1.8
 Exposure Pathways Summary — SWMU 1
 NAVBASE — Zone A
 Charleston, South Carolina

Potentially Exposed Population	Medium and Exposure Pathway	Pathway Selected for Evaluation?	Reason for Selection or Exclusion
Current Land Uses			
Current Site Users/Maintenance	Air, Inhalation of gaseous contaminants emanating from soil	No	No COPCs were identified based on screening comparisons summarized in the Fate and Transport Section.
	Air, Inhalation of chemicals entrained in fugitive dust	No	No COPCs were identified based on screening comparisons summarized in the Fate and Transport Section.
	Shallow groundwater, Ingestion of contaminants during potable or general use	No (Qualified)	Shallow groundwater is not currently used as a source of potable or nonresidential water at SWMU 1. Future land use assessment is considered conservatively representative of current receptors.
	Shallow groundwater, Inhalation of volatilized shallow groundwater contaminants	No (Qualified)	Shallow groundwater is not currently used as a source of domestic or process use water at SWMU 1. Future land use assessment is considered conservatively representative of current receptors.
	Soil, Incidental ingestion	No (Qualified)	Future land use assessment is considered to be conservatively representative of current receptors.
	Soil, Dermal contact	No (Qualified)	Future land use assessment is considered conservatively representative of current receptors.

Table 10.1.8
Exposure Pathways Summary — SWMU 1
NAVBASE — Zone A
Charleston, South Carolina

Potentially Exposed Population	Medium and Exposure Pathway	Pathway Selected for Evaluation?	Reason for Selection or Exclusion
Future Land Uses			
Future Site Residents (Child and Adult) and Future Site Worker	Air, Inhalation of gaseous contaminants emanating from soil	No	No COPCs were identified based on screening comparisons summarized in the Fate and Transport Section.
	Air, Inhalation of chemicals entrained in fugitive dust	No	No COPCs were identified based on screening comparisons summarized in the Fate and Transport Section.
	Shallow groundwater, Ingestion of contaminants during potable or general use	Yes	COPCs were identified subsequent to risk-based and background screening comparisons.
	Shallow groundwater, Inhalation of volatilized contaminants during domestic use	Yes	COPCs were identified subsequent to risk-based screening comparisons.
	Soil, Incidental ingestion	Yes	COPCs were identified subsequent to risk-based and background screening comparisons.
	Soil, Dermal contact	Yes	COPCs were identified subsequent to risk-based and background screening comparisons.
	Wild game or domestic animals, Ingestion of tissue impacted by media contamination	No	Hunting/taking of game and/or raising livestock is prohibited within the Charleston, South Carolina city limits.
	Fruits and vegetables, Ingestion of plant tissues grown in media	No	The potential for significant exposure via this pathway is low relative to that of other exposure pathways assessed.

Exposure Point Concentrations

As discussed in Section 7 of this RFI, UCLs were calculated for datasets consisting of at least 10 samples. Benzo(a)pyrene equivalents and mercury each had only three sample results, and as a result, the maximum concentration was used as the EPC for these constituents.

One shallow monitoring well was installed at this site and sampled once a quarter for four quarters. The maximum manganese concentration was used as the EPC.

Quantification of Exposure

Soil

CDIs for ingestion and dermal contact with soils are shown in Tables 10.1.9 and 10.1.10, respectively.

Groundwater

The CDIs for groundwater ingestion are presented in Table 10.1.11.

10.1.6.4 Toxicity Assessment

Toxicity assessment terms and methods are discussed in Section 7 of this report. Table 10.1.12 presents toxicological information specific to each COPC identified at SWMU 1. This information was used in the quantification of risk/hazard associated with soil and groundwater contaminants. Brief toxicological profiles for each COPC are provided in the following paragraphs.

Benzo(a)pyrene equivalents include the following list of polynuclear aromatic hydrocarbons:

Benzo(a)anthracene	TEF	0.1
Benzo(b)fluoranthene	TEF	0.1
Dibenz(a,h)anthracene	TEF	1.0
Benzo(k)fluoranthene	TEF	0.01
Benzo(a)pyrene	TEF	1.0
Indeno(1,2,3-cd)pyrene	TEF	0.1
Chrysene	TEF	0.001

Some PAHs are toxic to the liver, kidney, and blood. However, the toxic effects of the PAHs above have not been well established. There are no RfDs for the PAHs above due to a lack of data. All PAHs listed above are classified by USEPA as B2 carcinogens, and their carcinogenicity is addressed relative to that of benzo(a)pyrene, having an oral SF $7.3 \text{ (mg/kg-day)}^{-1}$. Toxicity Equivalency Factors, also set by USEPA, are multipliers that are applied to the detected concentrations, which are subsequently used to calculate excess cancer risk. These multipliers are discussed further in the exposure and toxicity assessment sections. Most carcinogenic PAHs have been classified as carcinogenic due to animal studies using large doses of purified PAHs. There is some doubt as to the validity of these listings, and the SFs listed in USEPA's RBC table are provisional. However, these PAHs are carcinogens when the exposure involves a mixture of other carcinogenic substances (e.g., coal tar, soot, cigarette smoke). As listed in IRIS, the basis for the benzo(a)pyrene B2 classification is human data specifically linking benzo(a)pyrene to a carcinogenic effect are lacking. There are, however, multiple animal studies in many species demonstrating benzo(a)pyrene to be carcinogenic by numerous routes.

Benzo(a)pyrene has produced positive results in numerous genotoxicity assays. At the June 1992 CRAVE Work Group meeting, a revised risk estimate for benzo(a)pyrene was verified (see Additional Comments for Oral Exposure). This section provides information on two aspects of the carcinogenic risk assessment for the agent in question: the USEPA classification and quantitative estimates of exposure. The classification reflects a weight-of-evidence judgment of the likelihood that the agent is a human carcinogen. The quantitative risk estimates are presented in application of a low-dose extrapolation procedure and presented as the risk per $(\text{mg/kg})\text{-day}$. The unit risk is the quantitative estimate in terms of either risk per $\mu\text{g/L}$ drinking water or risk per $\mu\text{g/m}^3$ air breathed. The third form in which risk is presented is drinking water or air concentration providing cancer risks of 1 in 10,000 or 1 in 1,000,000. The Carcinogenicity Background Document provides details on the carcinogenicity values found in IRIS. Users are

referred to the Oral Reference Dose and Reference Concentration sections for information on long-term toxic effects other than carcinogenicity.

As listed in IRIS, the basis for the dibenz(a,h)anthracene and benzo(b)fluoranthene B2 classification is no human data and sufficient data from animal bioassays. Benzo(b)fluoranthene produced tumors in mice after lung implantation, intraperitoneal or subcutaneous injection, and skin painting. As listed in IRIS (search date 6/28/95), the basis for the benzo(a)anthracene B2 classification is no human data and sufficient data from animal bioassays. Benzo(a)anthracene produced tumors in mice exposed by gavage; intraperitoneal, subcutaneous or intramuscular injection; and topical application. Benzo(a)anthracene produced mutations in bacteria and in mammalian cells, and transformed mammalian cells in culture. As listed in IRIS (search date 6/28/95) the basis for the benzo(k)fluoranthene B2 classification is no human data and sufficient data from animal bioassays. Benzo(k)fluoranthene produced tumors after lung implantation in mice and when administered with a promoting agent in skin-painting studies. Equivocal results have been found in a lung adenoma assay in mice. Benzo(k)fluoranthene is mutagenic in bacteria. (Klaassen, et al., 1986).

Other PAHs — those not classified by USEPA as carcinogens — are toxic to the liver, kidney and blood. This group of PAHs includes compounds such as *pyrene*, *acenaphthene*, *acenaphthylene*, *benzo(g,h,i)perylene*, and *phenanthrene*. USEPA determined RfDs for only two of these compounds: pyrene's RfD_o of 0.03 mg/kg-day is also used as a surrogate RfD_o for phenanthrene. The RfD_o for acenaphthene was 0.06 mg/kg-day.

Manganese is an essential nutrient. Chronic exposure to manganese, 0.8 mg/kg-day, causes mental disturbances and various central nervous system effects. Studies have shown that manganese uptake from water is greater than manganese uptake from food, and the elderly appear to be more sensitive than children. The oral RfD is 0.14 mg/kg-day with uncertainty and

modifying factors of 1. When assessing the potential for adverse health effects from nondietary intakes (ingestion of soil or drinking water) of manganese, a modifying factor of 3 is used which gives an oral RfD of 0.047 mg/kg-day. Inhalation of manganese dust causes neurological effects and increased incidence of pneumonia, and an inhalation RfD was set to 0.0000143 mg/kg-day. According to USEPA, manganese can not be classified as to its carcinogenicity. Therefore, the cancer class for manganese is group D. The typical vitamin supplement dose of manganese is 2.5 mg/day (Klaassen, et al, 1986) (Dreisbach, et al, 1987).

Mercury The major source of this element is the degassing of the earth's crust. Target organs of mercury include the kidney, nervous system, fetus, and neonate. In other words, this inorganic can be toxic to a fetus if the mother is exposed during pregnancy. Mercury is toxic to all cells in the body- it binds to enzymes in the cells and disrupts their function, usually causing the cell to be useless or die. Because this inorganic is concentrated in the kidney prior to excretion, the kidney is a major target organ for mercury ingestion. The primary target of mercury vapor is the brain. USEPA has set an inhalation RfD of 8.6E-05 mg/kg-day. Some forms of mercury are drawn towards fats in the body (such as the nervous system), where the form is changed into its toxic form. This causes the nervous disorder known as Minimata disease, overexposure to mercury through ingestion of contaminated fish. The weight of evidence classification for mercury is "D" not classifiable as to human carcinogenicity. USEPA set mercury's oral RfD to 0.0003 mg/kg-day (mercuric chloride). Mercury is liquid at room temperature, and is poorly absorbed in this form if ingested. Typical daily exposure is less than 1 μ g/l-day (Klaassen, et al, 1986) (Dreisbach, et al, 1987).

10.1.6.5 Risk Characterization

Surface Soil Pathways

Exposure to surface soil onsite was evaluated under both residential and site worker scenarios. For these scenarios, incidental ingestion and dermal contact exposure pathways were evaluated.

For noncarcinogenic contaminants evaluated for future site residents, hazard was computed separately to address child and adult exposure. Tables 10.1.13 and 10.1.14 present the computed carcinogenic risks and/or HQs associated with incidental ingestion of and dermal contact with site surface soils, respectively.

Hypothetical Site Residents

The ingestion ILCR (based on the adult and child lifetime weighted average) for SWMU 1 surface soils is $2E-06$. The dermal pathway ILCR is $8E-07$. Benzo(a)pyrene equivalents were the primary contributors to both the ingestion and dermal pathways.

The computed hazard indices for the adult resident were 0.07 for the soil ingestion pathway and 0.01 for the dermal contact pathway. The computed hazard indices for the child ingestion and dermal contact pathways were 0.6 and 0.05, respectively. The primary contributor to the hazard index was mercury.

Hypothetical Site Workers

Site worker ILCRs are $2E-7$ and $3E-7$ for the ingestion and dermal contact pathways, respectively. Benzo(a)pyrene equivalents were the primary contributors for each pathway. Hazard indices for the ingestion and dermal pathways were both projected to be less than 0.1 for the hypothetical site worker scenario.

Groundwater Pathways

Exposure to shallow groundwater onsite was evaluated under both residential and industrial scenarios. The ingestion exposure pathway was evaluated assuming that site groundwater will be used for potable and/or domestic purposes and that an unfiltered well, drawing from the corresponding water-bearing zone, will be installed. For noncarcinogenic contaminants evaluated

- mg/kg-day milligrams per kilogram per day

relative to future site residents, hazard was computed separately for child and adult receptors. Table 10.1.15 presents the risk and hazard for the ingestion exposure pathways.

Hypothetical Site Residents

The hazard indices for the adult and child resident are 2 and 5, respectively with manganese being the primary contributor to the hazard index.

Hypothetical Site Workers

The hazard index for the ingestion exposure pathway was calculated to be 0.7.

Current Site Workers

Shallow groundwater is not currently used as a potable water source for SWMU 1 or other areas of Zone A. In the absence of a completed exposure pathway, no threat to human health is posed by reported shallow groundwater contamination.

COCs Identified

Chemicals of concern were identified based on cumulative risk and hazard projected for this site, as shown in Table 10.1.16. USEPA has established a generally acceptable risk range of 1E-4 to 1E-6, and a hazard index threshold of 1.0 (unity). In accordance with SCDHEC guidance, a COC was considered to be any chemical contributing to a cumulative risk level of 1E-6 or greater and/or a cumulative hazard index above 1.0, if its individual ILCR exceeds 1E-6 or whose hazard quotient exceeds 0.1. For carcinogens, this approach is relatively conservative, because a cumulative risk level of 1E-4 (and individual ILCR of 1E-6) is recommended by USEPA Region IV as the trigger for establishing COCs. The COC selection method presented was used to provide a more comprehensive evaluation of chemicals contributing to carcinogenic risk or noncarcinogenic hazard during the remedial goal options development process. Table 10.1.16 presents the COCs identified on a medium-specific basis.

ILCR indicates incremental lifetime cancer risk

HI indicates hazard index

1- Chemical is a COC by virtue of projected child residence noncarcinogenic hazard.

2- Chemical is a COC by virtue of projected future resident lifetime ILCR.

3- Chemical is a COC by virtue of projected site worker noncarcinogenic hazard.

4- Chemical is a COC by virtue of projected site worker ILCR.

Surface Soils

Hypothetical Site Residents

Benzo(a)pyrene equivalents were identified as the soil pathway COCs based on their contribution to cumulative ILCR projections.

Hypothetical Site Workers

No COCs were identified.

Groundwater

Hypothetical Site Residents (future land use)

Manganese was identified as a shallow groundwater COC based on its contribution to hazard index.

10.1.6.6 Risk Uncertainty

Characterization of Exposure Setting and Identification of Exposure Pathways

The potential for high bias is introduced through the exposure setting and pathway selection due to the highly conservative assumptions (i.e., future residential use) recommended by USEPA Region IV when assessing potential future and current exposure. The exposure assumptions made in the site worker scenario are highly protective and would tend to overestimate exposure.

Residential use of the site would not be expected, based on current site uses and the nature of surrounding buildings. Current reuse plans call for continued commercial/industrial use of Zone A, specifically as a marine cargo terminal. If this area were to be used as a residential site, the buildings and other structures would be demolished, and the surface soil conditions would likely change — the soils would be covered with landscaping soil and/or a house. Consequently, exposure to current surface soil conditions would not be likely under a true future residential scenario. Current site worker's contact with impacted media is much less than is assumed in the

exposure model that is used to assess this pathway. Direct contact to soil is limited due to paved areas and buildings, and groundwater is not currently used as a source of potable or process water. These factors indicate that exposure pathways assessed in this HHRA would generally overestimate the risk and hazard posed to current site workers and future site residents.

A basewide system provides drinking and process water to buildings throughout Zone A. This system is slated to remain in operation under the current base reuse plan. As a result, shallow groundwater would not be expected to be used under future site use scenarios. Therefore, the scenario established to project risk/hazard associated with shallow groundwater exposure is highly conservative, and associated pathways are not expected to be completed in the future.

Determination of Exposure Point Concentrations

The maximum soil and groundwater concentrations were used as the exposure point concentrations for this site. The maximum concentration provides a reasonable upper-bound representation of the exposure point concentration.

Groundwater

Groundwater is not currently used as a potable water source at SWMU 1, nor is it used at NAVBASE or in the surrounding area. Municipal water is readily available. As previously mentioned, it is highly unlikely that the site will be developed as a residential area, and it is unlikely that a potable-use well would be installed onsite. It is probable that, if residences were constructed onsite and an unfiltered well were installed, its salinity and dissolved solids would preclude this aquifer from being an acceptable potable water source.

10.1.6.7 Risk Summary

The risk and hazard posed by contaminants at SWMU 1 were assessed for the hypothetical site worker and the hypothetical future site resident under reasonable maximum exposure assumptions.

In surface soils, the incidental ingestion and dermal contact pathways were assessed in this HHRA. The ingestion pathway was evaluated for shallow groundwater based on four quarters of groundwater monitoring data. Table 10.1.17 presents the risk summary for each pathway/receptor group evaluated for SWMU 1.

10.1.6.8 Remedial Goal Options

Soil

Soil RGOs based on the site resident or site workers are presented in Table 10.1.18.

Groundwater

Groundwater RGOs based on site residents are shown in Table 10.1.19.

10.1.7 Corrective Measures Considerations

For SWMU 1, the environmental media investigated were surface soil and shallow groundwater. Based upon the analytical results, there is no evidence of site-related contamination associated with SWMU 1. Benzo(a)pyrene was detected above the RBC in one soil sample at SWMU 1. BEQs for this sample exceeded the benzo(a)pyrene RBC of 88 $\mu\text{g}/\text{kg}$ with a detection of 148 $\mu\text{g}/\text{kg}$. The isolated nature of this exceedance is demonstrated by other samples in the vicinity which were nondetect for BEQs. Given these facts, the risk associated with this individual sample is considered acceptable and will not require further evaluation through the CMS process.

Any COCs that may require further evaluation through the CMS process are metals that can be evaluated along with the greater SWMU 2 area of contamination. Therefore, no further action is recommended for SWMU 1, although further action at SWMU 2 could include this area.

Table 10.1.17

1. INTRODUCTION

1.1 INSTALLATION RESTORATION PROGRAM. The purpose of the Department of the Navy (DON) Installation Restoration (IR) Program is to identify, assess, characterize and clean up or control contamination from past hazardous waste disposal operations and hazardous material spills at Navy and Marine Corps Activities. The Defense Environmental Restoration Program (DERP) is codified in the Superfund Amendments and Reauthorization Act (SARA) Section 211 (10 USC 2701). The IR Program is a component of DERP.

1.1.1 Naval Complex Charleston IR Program. At Naval Complex Charleston, a Resource Conservation and Recovery Act (RCRA) Facility Assessment (RFA) was prepared which divided the Naval Base into zones and identified Solid Waste Management Units (SWMUs) and Areas of Concern (AOCs) within each zone. The RFA evaluated each SWMU and AOC and determined which sites required further investigation. Based on the RFA, a RCRA Facility Investigation (RFI) work plan has been or is being prepared for each zone containing SWMUs and AOCs requiring further investigation. On completion of the RFI for each zone, a RFI report will be prepared for that zone. The RFI reports will identify SWMUs and AOCs containing wastes requiring remediation. Eventually, Corrective Measures Studies (CMSs) will be prepared to determine the best means of remediating each site.

1.2 INTERIM MEASURES. Interim Measures (IM) performed as part of the IR Program are intended to eliminate sources of environmental contamination or limit the spread of environmental contaminants prior to the completion of the RFI Corrective Measures Study (CMS).

1.3 HISTORY. SWMU 2 is the site of the former Defense Reutilization and Marketing Office (DRMO) storage area and salvage yard located in Zone A of the Charleston Naval Complex. A site map (Figure 1) showing the SWMU 2 area is included in Appendix A. The approximately 6-acre area was used to store recovered lead from lead-acid submarine batteries from the mid-1960s until

1984. Recovered materials from other areas of the base were placed in rail cars and transferred to the site for storage until it could be sold to a salvage contractor.

Between October of 1995 and January of 1997, Ensafe/Allen & Hoshall conducted investigative sampling as part of the RFI process. The results of the investigation revealed elevated lead levels in the soil above clean levels established for the Naval Complex. Information gathered from the investigation is documented in the August 1998 Zone A RFI Report, Volume II, Section 10. Figure 2 in this document includes Ensafe/Allen & Hoshall sample locations and results as reported in the Zone A RFI report. Lead cleanup levels defined for the Naval Complex was 400 ppm for residential and 1300 ppm for industrial use.

In 1998 the Environmental Detachment Charleston (DET) was tasked by Southern Division Naval Facilities Command (SOUTHDIV) to delineate the areas exceeding clean levels found by Ensafe/Allen & Hoshall. The data gathered from the delineation by the DET was used to define the area for a remedial action. Figure 2 represents the data generated from the site delineation.

1.4 SWMU 2 INTERIM MEASURES. After the completion of the RCRA Facilities Investigation (RFI), it was decided by SOUTHDIV that an Interim Measure would be performed by Supervisor of Shipbuilding, Conversion, and Repair (SUPSHIP), United States Navy (USN), Portsmouth Virginia Environmental Detachment Charleston (DET). The objective of this Interim Measure was to remove soils and concrete greater than 400 ppm (residential clean level) from areas delineated in 1998. Waste characterized as hazardous was to be sent to a landfill certified to handle hazardous wastes. The removal of the source was to continue until the sampling program indicated with reasonable confidence that the concentrations of contaminants analyzed were within limits (residential levels) specified for this site.

This Interim Measure is consistent with the ultimate cleanup objective of the site and is not intended to circumvent the public participation process inherent within environmental cleanup under RCRA authority.

2. INTERIM MEASURE EXECUTION

2.1 ACTIONS REQUIRED BY INTERIM MEASURE WORK PLAN. The required actions per the IM Work Plan were to remove and dispose approximately 6,000 tons of contaminated soil, 850 tons of contaminated concrete and 2,450 tons of non-hazardous debris. Upon project completion, the areas excavated were to be back-filled and graded existing conditions. Excavation of contaminated sources was performed to the maximum extent possible. A total of 8,320.44 tons of contaminated soil and concrete and approximately 1,366 tons of non-hazardous debris were removed at project completion.

2.2 PROJECT SUMMARY

2.2.1 Site Delineation. In 1998, the DET was tasked by SOUTHDIV to delineate soil borings exceeding residential clean levels for lead (400 mg/kg) as reported in the August 1998 RFI Report. Figure 2 shows the locations of RFI soil borings described as “ENSAFE Sample” in the Legend. Soil boring locations exceeding 400 mg/kg were delineated using a sample-grid system. A typical sample-grid included an area encompassing the existing RFI sample location. Samples were collected by the DET within the grid area extending 20’ incrementally from the RFI sample location in the X and Y direction. Samples were collected at the first and/or second interval based on the sample areas usage and the RFI investigation results. Grid areas were grouped into eight zones as shown in Figure 2. Statistically, approximately 335 soil borings were collected and tested for Total Lead. Approximately 19 samples were analyzed for Toxicity Characteristic Leaching Procedure (TCLP) lead to determine the toxicity of the soil for waste characterization. See Figure 2 in Appendix A for soil boring locations and zones.

The data collected during the site delineation in 1998 illustrated the extent of lead contamination present at SWMU 2. This information became the footprint for the removal action at SWMU 2.

2.2.2 Rail Spur. An existing rail spur ran east to west through portions of the excavation boundary. The rail spur was used historically to transfer recovered materials to the site. An approximately 550' section of the rail spur was removed in order to access the contaminated soil. Debris generated from the removal of the rail spur, such as concrete, asphalt, and creosote timbers, was removed, placed in containers and transported to a Subtitle D landfill (Chambers) for disposal.

2.2.3 Concrete/Asphalt Removal. Concrete and asphalt covered approximately 80% of the area requiring soil removal. The project commenced on 02 July 1999 with the process of removing concrete and asphalt in the areas delineated for soil removal. Concrete and asphalt characterized as non-hazardous was placed inside containers, which were transported to Chambers Landfill. A section of concrete slab, characterized as hazardous, was left in place until soil removal operations were to begin.

Observations noted during the concrete/asphalt removal operations, was the uncovering of a small, debris-filled landfill located in the west end of Zone 5. (Refer to Figure 2 for zone locations.) The debris field encompassed an approximately 55' X 30' area and consisted of various types of debris such as scrap metal, rigging equipment, wood, and soil. This debris mixture was approximately 18 inches thick and upon further investigation rested upon another section of concrete slab. The debris field and concrete were subsequently removed and disposed later on in the project.

2.2.4 Excavation. Impacted soil removal began with the excavation of the three isolated areas located northeast and south of Building 1606 (Zones 1 and 3) and the area adjacent to Avenue A North (Zone 2). Soil was excavated to a depth of approximately 28 inches from land surface in each area. Groundwater was not encountered during the excavation of soil.

In Zone 4, based on data collected in 1998, a 7,059 square foot area was excavated to approximately 51 inches from land surface. Creosote pilings were uncovered in the vertical position at approximately 36 inches from land surface. These pilings were left in place. The remaining area of Zone 4 was excavated to depths ranging from 24 to 38 inches from the land surface. Groundwater was not encountered while excavating soil to this depth.

Personnel operating earth-moving equipment encountered numerous creosote timbers and pilings while excavating soil from the Zone 5 area. The debris was removed and disposed accordingly. The area in this zone was excavated to a depth of approximately 28 inches from the land surface. In the process of excavating soil, equipment operators uncovered an abandoned catch basin located approximately 24 inches from the land surface. The catch basin had a resin type seal that was broken during the removal of soil. Inside the catch basin was an approximately 18-inch drain line. Representatives from the Caretaker Site Office (CSO) investigated the catch basin. The CSO determined the 18-inch line could be part of the existing storm drain system. Utility drawings for the Naval Complex, however, did not identify a catch basin or storm drain line existing in the area. Upon recommendations from the CSO, the catch basin vault was backfilled with rock and sealed with a concrete cap. Later in the project, the area was backfilled with soil and graded to existing conditions.

The area in Zone 6 was excavated to depths ranging from 24 to 27 inches from the land surface. Soil removed in this area was performed without incident.

Excavation of soil was not performed in the areas of Zone 7 and 8 based on the results of the 1998 investigation. Data collected in the field during the investigation revealed lead concentrations below residential levels; therefore, soil removal was not conducted in those zones.

Earth moving equipment was required to remove contaminated sources (soil and concrete) from land to inside haul truck trailers or roll-off containers. Haul trucks and containers supplied by Will's Trucking, Inc. transported the waste to Safety-Kleen (Pinewood), Inc., a facility permitted to accept hazardous wastes. See Volume II for copies of completed manifests.

2.3 Plan Modification and Justification. Modifications to the IM Work Plan were not required.

3. INTERIM MEASURE OUTCOME

3.1 SITE CONDITIONS FOLLOWING COMPLETION OF WORK. Following completion of all site work, the DET had accomplished the removal of 8,320.44 tons of contaminated soil and concrete and approximately 1,366 tons of non-hazardous debris. Test results of the remaining soil confirmed that the conditions following the excavation met the objectives of paragraph 1.4 of this report. Site restoration included back-filling the excavations and grading the site to existing conditions with run-of-crush (ROC).

4. SAMPLING

4.1 SAMPLING EVOLUTIONS AND RESULTS.

4.1.1 Investigative Sampling and Analysis. Figure 2 in Appendix A depicts the locations and results of samples collected in 1998. All samples were transferred via a chain-of-custody form to a certified laboratory and tested for Total Lead with a total of nineteen of the samples being tested for TCLP Lead. All samples were collected using stainless steel equipment and transferred inside laboratory certified 8 oz. glass jars sealed with custody seals. See Volume III for copies of Certificates of Analyses for all sampling data.

4.1.2 Confirmatory Soil Sampling and Analysis. The purpose of the confirmatory samples was to investigate and confirm the conditions of the remaining soil vertically and the extents of the excavation horizontally. Eighty-five (85) soil samples collected in 1998 and reporting less than 400 ppm were used during the project to confirm the horizontal extents of the excavation boundaries. The eighty-five sample locations are shown in Figure 3 of Appendix A and are identified as 1998 soil samples. In addition to the 1998 samples, forty-one (41) grab samples were collected during the project from areas illustrated in Figure 3. The samples identified as 1999 confirmatory soil samples were collected to confirm that the conditions of the remaining soil vertically and horizontally met the cleanup goals for this IM.

The samples were collected in the first or second intervals depending on the area. Samples were homogenized in stainless steel bowls with stainless steel spoons and then placed inside laboratory certified 4-oz glass jars sealed with custody seals. After the confirmatory samples were collected, a Chain of Custody Record was completed and the samples transferred to a certified laboratory for analysis of Total Lead. Sample collection and analyses were executed as directed per Reference (d) of the IM Work Plan. See Volume III for copies of Certificates of Analyses for sampling data and Table 1 below for sample results.

4.1.3. Waste Characterization Sampling and Analysis. Soil samples collected in 1998 were analyzed for TCLP Lead. The analysis was conducted for waste characterization purposes in order to properly dispose the material. The samples were submitted to a certified laboratory via a completed Chain-of-Custody record. The analytical results of the samples indicated TCLP values ranging from 0.02 to 65.4 ppm (see Table 2 below). The average of the TCLP values exceeded the toxicity characteristic for lead (D008) limit of 5.0 mg/L as cited in 40 CFR 261.24. As a result, the soil and a concrete characterized as waste code D008 would have to be treated before disposal into a Subtitle C landfill. Copies of "certificates of analysis" and "chain-of-custodies" are included in Volume III.

Prior to accepting the waste from SWMU 2, the Safety-Kleen (Pinewood) facility collected a composite sample load (18 CY roll-off container) to be analyzed by their facility. Based on the analysis of the composite load, Pinewood determined how to treat the waste to meet land disposal restrictions before placement into a landfill.

Table 2
Soil TCLP Data (mg/L)

Sample No.	Result (ppm)	Zone	Sample No.	Result (ppm)	Zone
Sport0608-29	8.4	3	Sport0636-23	10.2	4
Sport0630-07	0.2086	5	Sport0639-13	6.70	4
Sport0630-25	51.6	5	Sport0667-01	0.0282	Btwn 5 & 3
Sport0632-25	65.4	6	Sport0667-03	25.9	Btwn 5 & 4
Sport0667-07	24.0	Btwn 6 & 4	Sport0667-19	4.86	6

Historically, a section of concrete slab was used to store batteries. Based on this information corings were collected and analyzed for TCLP Lead from select areas of asphalt and concrete slabs targeted for removal. Each coring was crushed and homogenized before placement in a laboratory certified glass jar. A total of seven (7) samples were collected with one sample exceeding the TCLP value for Lead toxicity. Sample Sport0145-1 reported a TCLP value of 19.1 mg/L for a concrete coring collected in the vicinity of battery storage. Based on this result, an approximately 6,081 SF area of concrete was characterized as hazardous (waste code D008). The concrete was microencapsulated and disposed at the Pinewood facility. See TCLP values below in Table 3 for all concrete and asphalt samples. "Certificates of analysis" are in Volume III.

Table 3
Concrete TCLP Data (mg/L)

Sample No.	Result	Material	Sample No.	Result	Material
Sport0145-1	19.1	Concrete	Sport0165-1	0.352	Asphalt
Sport0165-2	0.234	Asphalt	Sport0165-3	0.0391	Concrete
Sport0165-4	0.0175	Concrete	Sport0165-5	0.279	Asphalt
Sport0165-6	ND	Concrete			

ND=No Detection of analyte

5. WASTE GENERATION

5.1 NON-HAZARDOUS WASTE.

5.1.1 Debris. Approximately 1,366 tons of non-hazardous debris, such as concrete, asphalt, and creosote timbers, were disposed inside 20 or 40 CY roll-off containers and transported by Fennell Container, Co. to Oakridge-Chambers Landfill. Oakridge-Chambers is a licensed Subtitle D landfill permitted to handle special wastes. Copies of completed manifests are located in Volume II.

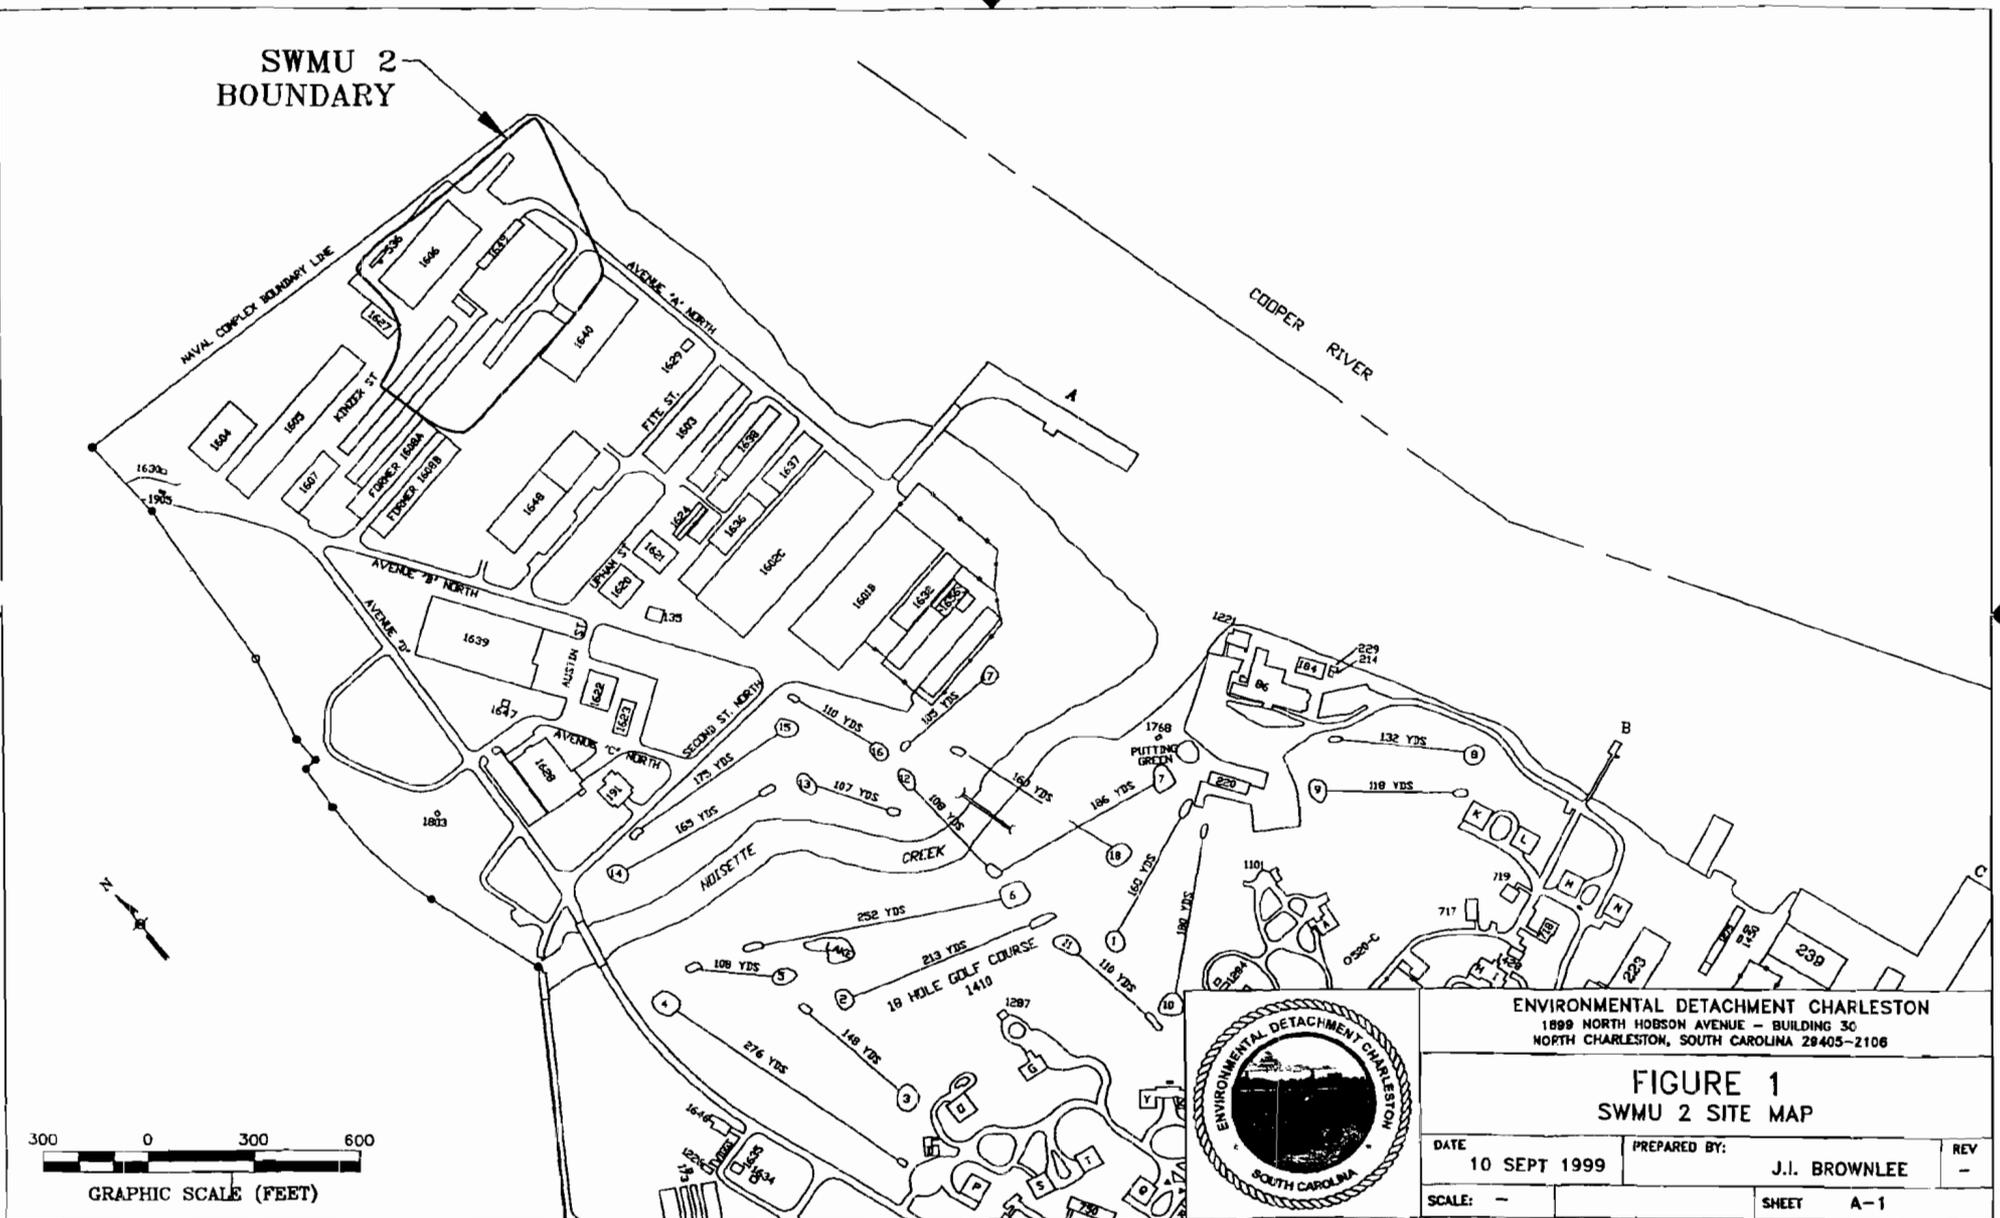

5.2 HAZARDOUS WASTE.

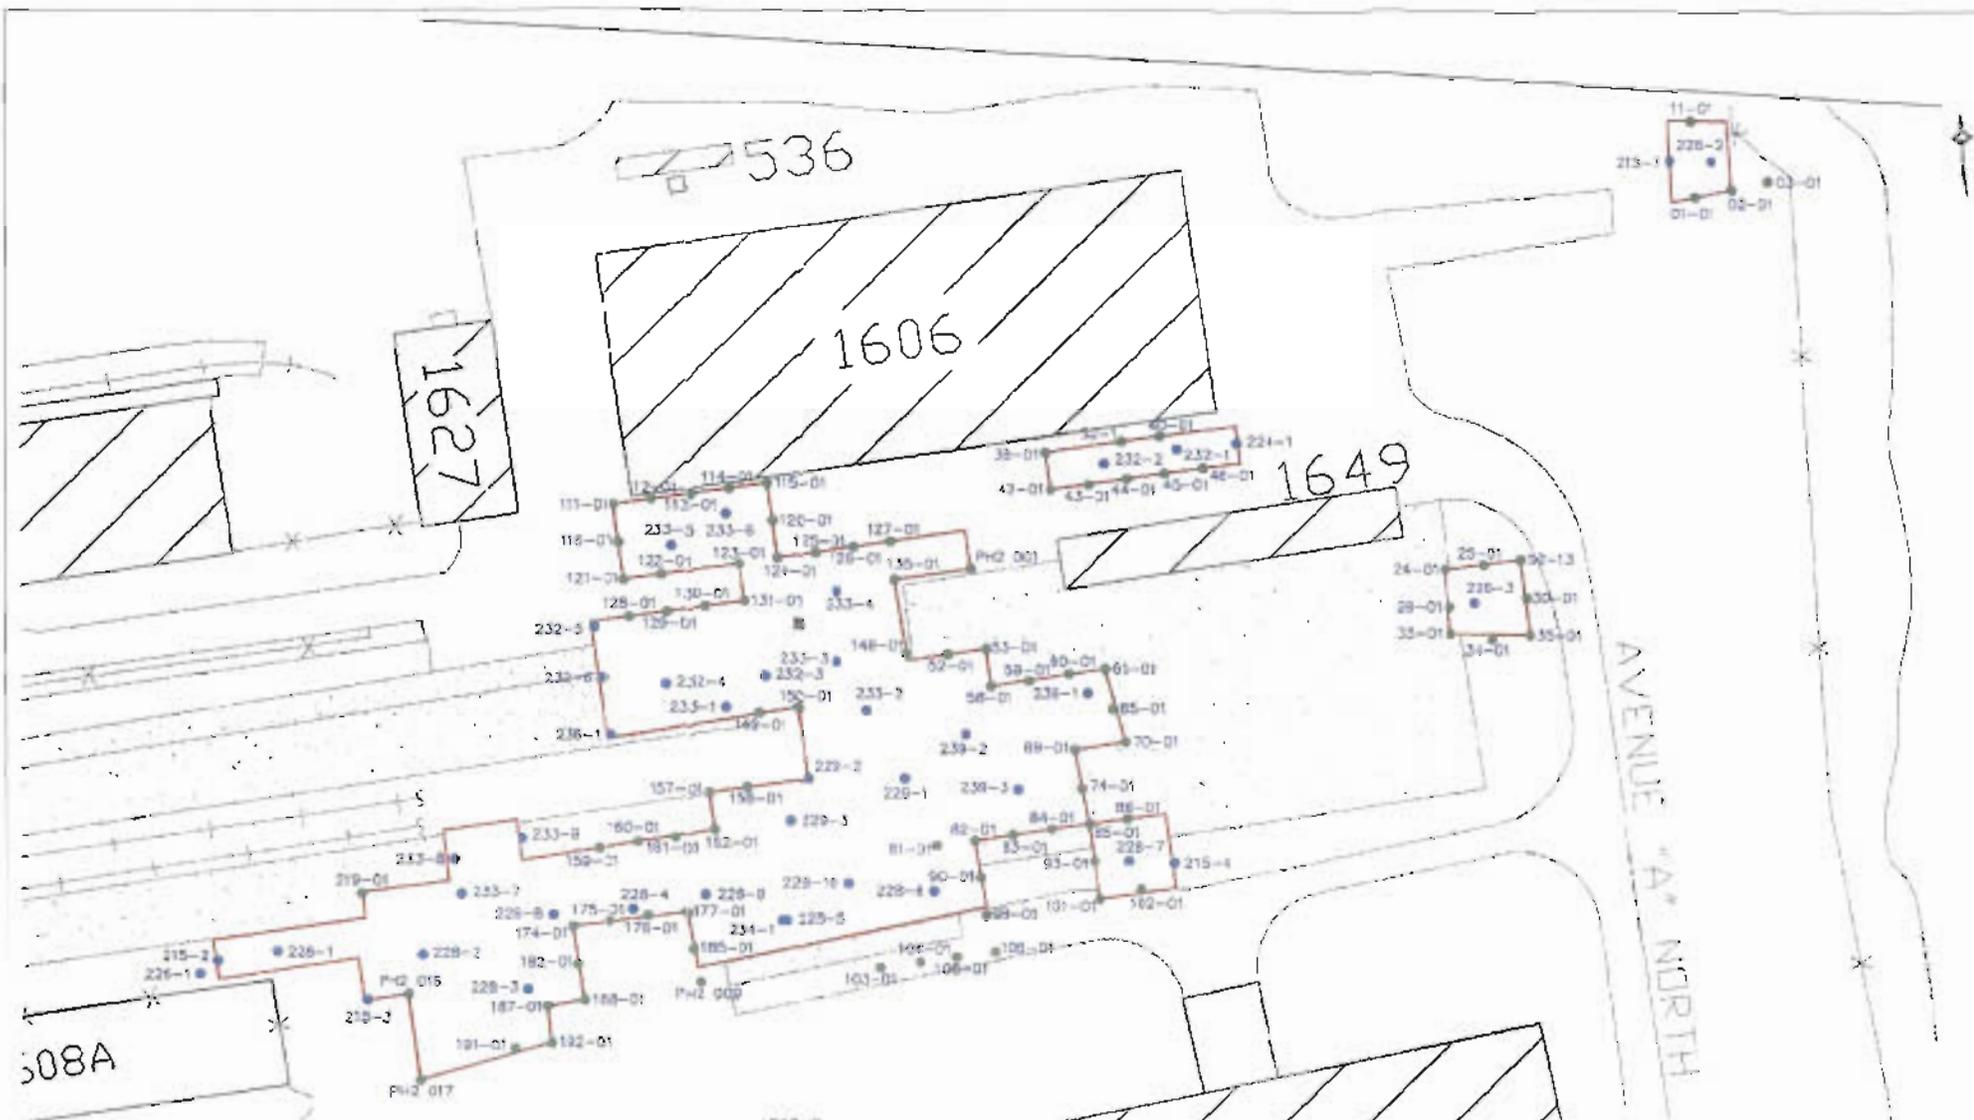

5.2.1 Soil and Concrete. Will's Trucking, Inc. transported approximately 8320.44 tons of soil and concrete characterized as hazardous (via haul trucks and roll-offs) from the site to Safety-Kleen (Pinewood), Inc. located in Pinewood, South Carolina. Upon arrival at the Pinewood facility, the waste was treated for placement in the facilities landfill. Copies of completed manifests are located in Volume II.

APPENDIX D
**DET's Delineation and IM
Confirmatory Sampling Data**

Data Identification

Because the sample identification numbers on the Form 1s do not always match the sample IDs on the DET's figures, CH2M HILL has provided this brief description on matching analytical results to sample locations.

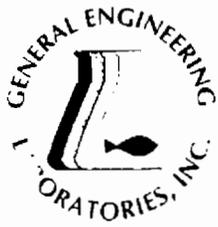

Delineation Data Identification

The delineation data presented in Appendix D-1 requires some explanation in order to find data for a particular sample location. The Form 1 lists the Sample ID as it appears on the chain of custody. Sample IDs on the DET's figures are labeled using the last four or five digits of the number found in the "Remarks" column of the chain of custody. Generally, the number in the "Remarks" column is in the form of: NBCA002xxxxyzzzz. The first three letters (NBC) refers to the facility (Naval Base Charleston). The fourth character refers to the zone and the fifth through seventh characters refer to the AOC/SWMU. The 8th through the 11th (xxxx) characters appear to denote the sample media and type. Characters 12 through 16 (yzzzz) appear to be sample IDs. When the 12th character (y) is zero (0), it is omitted on the figures. It is not clear why sample locations have more than one sample ID, but as a result of this numbering convention, the chain of custody forms are required to match lab data to sample locations provided on Figure 2 of the DET's IM Completion Report.

Confirmation Data Identification

Unlike the delineation data, the confirmation data in Appendix D-2 uses the last four characters of the sample ID found on the lab reports, and chains of custody, as the sample IDs on the figures. This simplifies finding data for a particular sample location.

Report Date: April 24, 1998

Page 1 of 1

Sample ID : SPORT0667-16
 Lab ID : 9804579-19
 Matrix : Soil
 Date Collected : 04/21/98
 Date Received : 04/22/98
 Priority : Rush
 Collector : Client

Parameter	Qualifier	Result	DL	RL	Units	DF	Analyst	Date	Time	Batch	M
Metals Analysis											
Lead		184000	65.8	485	ug/kg	2.0	MBL	04/23/98	1245	120652	1

The following prep procedures were performed:

TRACE VMM 04/22/98 1600 120652 2

M = Method	Method-Description
M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Notes:

The qualifiers in this report are defined as follows:

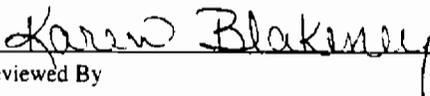

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

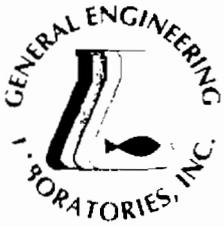

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

 Matrix : Soil
 Date Collected : 04/01/98
 Date Received : 04/01/98
 Priority : Routine
 Collector : Client

Parameter	Qualifier	Result	DL	RL	Units	DF	Analyst	Date	Time	Batch	M
Metals Analysis											
Lead		13100	63.3	467	ug/kg	2.0	MBL	04/06/98	1837	119398	1

The following prep procedures were performed:

TRACE

VMM 04/03/98 1000 119398 2

M = Method	Method-Description
M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Notes.

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Parameter	Qualifier	Result	DL	RL	Units	DF	Analyst	Date	Time	Batch	M
Metals Analysis											
Lead		9160	64.0	472	ug/kg	2.0	MBL	04/08/98	1803	119446	1

The following prep procedures were performed:

TRACE

FGD 04/07/98 0900 119446 2

M = Method

Method-Description

M 1 EPA 6010A
M 2 EPA 3050

Notes:

The qualifiers in this report are defined as follows:

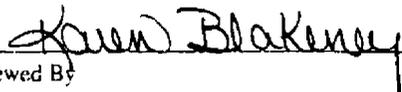

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed
 in accordance with General Engineering Laboratories
 standard operating procedures. Please direct
 any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Lead		536	63.3	467	ug/kg	2.0	MBL	04/05/98	1517	119395	1

The following prep procedures were performed:

TRACE

VMM 04/02/98 1300 119395 2

M = Method	Method-Description
M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

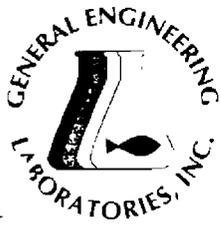

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed
 in accordance with General Engineering Laboratories
 standard operating procedures. Please direct
 any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Contact: Mr. Bill Hiers

Project Description: SUPSHIP-Portsmouth Detachment

cc: NPWC00197

Report Date: April 08, 1998

Page 1 of 1

Sample ID : SPORT0639-40
 Lab ID : 9804024-40
 Matrix : Soil
 Date Collected : 03/31/98
 Date Received : 04/01/98
 Priority : Routine
 Collector : Client

Parameter	Qualifier	Result	DL	RL	Units	DF	Analyst	Date	Time	Batch	M
Metals Analysis											
Lead		3120	62.8	463	ug/kg	2.0	MBL	04/05/98	1726	119396	1

The following prep procedures were performed:

TRACE VMM 04/02/98 1300 119396 2

M = Method	Method-Description
M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

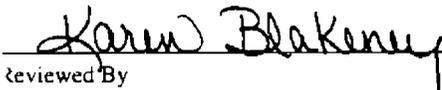

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Lead		26500	63.3	467	ug/kg	2.0	MBL	04/05/98	2108	119397	1

The following prep procedures were performed:

TRACE

VMM 04/02/98 1300 119397 2

M = Method	Method-Description
M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

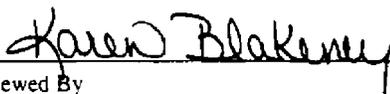

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Sample ID : SPORTO636-14
 Lab ID : 9804023-14
 Matrix : Soil
 Date Collected : 03/30/98
 Date Received : 04/01/98
 Priority : Routine
 Collector : Client

Parameter	Qualifier	Result	DL	RL	Units	DF	Analyst	Date	Time	Batch	M
Metals Analysis											
Lead		9340	64.0	472	ug/kg	2.0	MBL	04/03/98	1938	119392	1

The following prep procedures were performed:

TRACE

FGD 04/02/98 1630 119392 2

M = Method	Method-Description
M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

The qualifiers in this report are defined as follows:

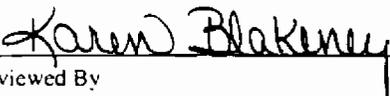

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

 North Charleston, South Carolina 29405-2106

Contact: Mr. Bill Hiers

Project Description: SUPSHIP-Portsmouth Detachment

cc: NPWC00197

Report Date: April 01, 1998

Page 1 of 1

Sample ID : SPORT0632-38
 Lab ID : 9803642-38
 Matrix : Soil
 Date Collected : 03/26/98
 Date Received : 03/26/98
 Priority : Routine
 Collector : Client

Parameter	Qualifier	Result	DL	RL	Units	DF	Analyst	Date	Time	Batch	M
Metals Analysis											
Lead		197000	65.2	481	ug/kg	2.0	MBL	03/30/98	2042	119058	1

The following prep procedures were performed:
TRACE

VMM 03/27/98 1200 119058 2

M = Method	Method-Description
M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Parameter	Qualifier	Result	DL	RL	Units	DF	Analyst	Date	Time	Batch	M
Metals Analysis											
Lead		15400	67.1	495	ug/kg	2.0	MBL	04/04/98	0102	119394	1

The following prep procedures were performed:

TRACE FGD 04/02/98 1430 119394 2

M = Method	Method-Description
M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

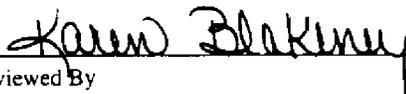

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Metals Analysis											
Lead		4160000	66.4	490	ug/kg	2.0	MBL	04/04/98	0134	119394	1

The following prep procedures were performed:

TRACE FGD 04/02/98 1430 119394 2

M = Method	Method-Description
M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

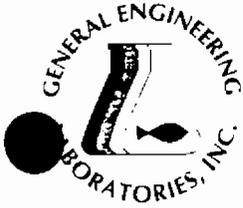

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Notes:

The qualifiers in this report are defined as follows:

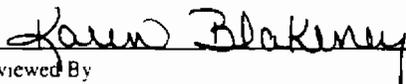

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed
 in accordance with General Engineering Laboratories
 standard operating procedures. Please direct
 any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

M = Method	Method-Description
M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Lead		7570	63.3	467	ug/kg	2.0	MBL	04/03/98	1834	119392	1

The following prep procedures were performed:

TRACE FGD 04/02/98 1630 119392 2

M = Method	Method-Description
M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

M = Method	Method-Description
M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Report Date: March 31, 1998

Page 1 of 1

Sample ID : SPORT0608-28
 Lab ID : 9803538-28
 Matrix : Soil
 Date Collected : 03/23/98
 Date Received : 03/23/98
 Priority : Routine
 Collector : Client

Parameter	Qualifier	Result	DL	RL	Units	DF	Analyst	Date	Time	Batch	M
Metals Analysis											
Lead		220000	66.4	490	ug/kg	2.0	MBL	03/27/98	1813	118921	1

The following prep procedures were performed:

TRACE

VMM 03/26/98 1500 118921 2

M = Method	Method-Description
M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

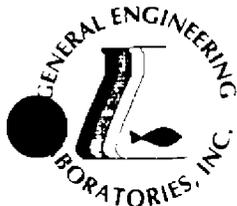

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Lead				176000		189000	ug/kg	7.05			MBL	03/30/98	0611

Notes:

The qualifiers in this report are defined as follows:

J indicates presence of analyte < RL (Report Limit)

U indicates presence of analyte < DL (Detect Limit)

J indicates that spike recovery limits do not apply when sample concentration exceeds spike conc by a factor of 4 or more

Method-Description

M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Parameter	Qualifier	Result	DL	RL	Units	DF	Analyst	Date	Time	Batch	M
Metals Analysis											
Lead		82000	65.8	485	ug/kg	2.0	MBL	03/28/98	1843	118922	1

The following prep procedures were performed:

TRACE

VMM 03/25/98 1500 118922 2

M = Method	Method-Description
M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

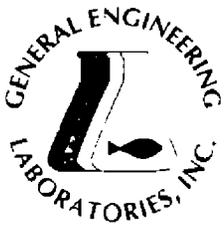

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Sample ID : SPORT0630-24
 Lab ID : 9803581-24
 Matrix : Soil
 Date Collected : 03/24/98
 Date Received : 03/24/98
 Priority : Routine
 Collector : Client

Parameter	Qualifier	Result	DL	RL	Units	DF	Analyst	Date	Time	Batch	M
Metals Analysis											
Lead		18500	67.1	495	ug/kg	2.0	MBL	03/28/98	1717	118923	1

The following prep procedures were performed:
 TRACE

VMM 03/25/98 1500 118923 2

M = Method	Method-Description
M 1	EPA 6010A
M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

Method-Description

M 1 EPA 6010A
 M 2 EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Karen Blakeney at (803) 769-7386.

M 2	EPA 1311

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Elise Hanson at 843-556-8171.

M 2	EPA 3050

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL)

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Elise Hanson at 843-556-8171.

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Elise Hanson at 843-556-8171.

Lead				3400		3290	ug/kg	3.16			AME	07/19/99	2259

Notes:

The qualifiers in this report are defined as follows:

- U indicates presence of analyte < RL (Report Limit)
- L indicates presence of analyte < DL (Detect Limit)

na indicates that spike recovery limits do not apply when sample concentration exceeds spike conc by a factor of 4 or more

M 1 EPA 6010B
M 2 EPA 3050

Notes

The qualifiers in this report are defined as follows.

ND indicates that the analyte was not detected at a concentration greater than the detection limit

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

L indicates that the analyte was not detected at a concentration greater than the detection limit

* indicates that a quality control analyte recovery is outside of specified acceptance criteria

This data report has been prepared and reviewed in accordance with General Engineering Laboratories standard operating procedures. Please direct any questions to your Project Manager, Elise Hanson at 843-556-8171.

Notes:

The qualifiers in this report are defined as follows:

J indicates presence of analyte < RL (Report Limit)

U indicates presence of analyte < DL (Detect Limit)

na indicates that spike recovery limits do not apply when

sample concentration exceeds spike conc by a factor of 4 or more
