Re: CMS Report (Revision 0) – AOC 586, Zone E

Dear Mr. Scaturo:

Enclosed please find four copies of the CMS Report (Revision 0) for AOC 586 in Zone E of the Charleston Naval Complex (CNC). This report has been prepared pursuant to agreements by the CNC BRAC Cleanup Team for completing the RCRA Corrective Action process.

The principal author of this document is Sam Naik. Please contact him at 770/604-9182, ext. 255, if you have any questions or comments.

Sincerely,

CH2M HILL

Dean Williamson, P.E.

VOC	Volatile organic compound
yd^3	Cubic yard

Section 1.0

1.0 Introduction

In 1993, Naval Base (NAVBASE) Charleston was added to the list of bases scheduled for closure as part of the Defense Base Realignment and Closure Act (BRAC), which regulates closure and transition of property to the community. The Charleston Naval Complex (CNC) was formed as a result of the dis-establishment of the Charleston Naval Shipyard and NAVBASE on April 1, 1996.

Corrective Action (CA) activities are being conducted under the Resource Conservation and Recovery Act (RCRA), with the South Carolina Department of Health and Environmental Control (SCDHEC) as the lead agency for CA activities at the CNC. All RCRA CA activities are performed in accordance with the Final Permit (Permit No. SC0 170 022 560). In April 2000, CH2M-Jones was awarded a contract to provide environmental investigation and remediation services at the CNC.

A RCRA Facility Investigation (RFI) Report Addendum and Corrective Measures Study (CMS) Work Plan (RFIRA/CMSWP) was prepared for Area of Concern (AOC) 586 in Zone E of the CNC (CH2M-Jones, 2002). The RFIRA/CMSWP presented the remedial action objectives (RAOs) and media cleanup standards (MCSs) proposed for AOC 586. This CMS report has been prepared by CH2M-Jones to complete the next stage of the CA process for AOC 586.

1.1 Corrective Measures Study Report Purpose and Scope

This CMS report evaluates corrective measure (remedial) alternatives for preventing unacceptable exposure to contamination by the polychlorinated biphenyl (PCB) Aroclor-1260, which was found in the surface soil at AOC 586. Aroclor-1260 in surface soil is the only chemical of concern (COC) identified at AOC 586 under the unrestricted (i.e., residential) land use scenario. No COCs were identified for non-residential land use scenarios. Figure 1-1 illustrates the original location of AOC 586 within Zone E. Figure 1-2 is an aerial photograph showing the layout of AOC 586.

This CMS report consists of: 1) the identification of a set of corrective measure alternatives that are considered to be technically appropriate for addressing the PCB-impacted soil; 2) an evaluation of the alternatives using standard criteria from the U.S. Environmental Protection Agency (EPA) RCRA guidance; and 3) the selection of a recommended (preferred) corrective measure alternative for the site.

This focused CMS evaluates the options for meeting the RAOs, which are described in Section 2.0 of this CMS report. The two remedies considered for achieving the RAOs are: 1) soil excavation and offsite disposal with land use controls (LUCs), and 2) LUCs. The remedial activities associated with soil removal include excavation, backfilling, (replacing) pavement, and offsite disposal of excavated material. The remedial activities that are associated with LUCs include maintaining the existing site use (commercial/ industrial) and site controls (pavement/building), an LUC Management Plan (LUCMP) created in agreement with the Navy and the State of South Carolina, and long-term monitoring and review.

1.2 Background Information

This section of the CMS report presents background information on the facility, site history, and a summary of the nature and extent of the COCs at the site. This information is important to the understanding of the remedial goal options (RGOs), MCSs, and ultimately the evaluation of corrective measure alternatives for AOC 586. Additional information on the site and hydrogeology in the Zone E area of the CNC is provided in the *Zone E RFI Report, Revision 0* (EnSafe Inc. [EnSafe], 1997).

1.2.1 Facility Description

AOC 586 consisted of a temporary powerhouse built in 1905 that was designated as Building 1014. AOC 586 is located approximately 300 feet west of the intersection of Necessary Lane and River Road in Zone E of the CNC, as shown in Figure 1-1.

This area of Zone E is zoned M-2 (industrial land use). The CNC RCRA Permit identified AOC 586 as requiring a Confirmatory Sampling Investigation (CSI).

1.2.2 Site History

In 1944, Building 1014 was connected to Building 1077. In 1953, an annex was added to Building 1014. The combined structure was used for industrial salvage, which included a battery shop. Building 1014 was demolished around 1957. Currently, AOC 586 consists of a concrete slab adjacent to the southeast corner of Building 11. Railroad lines run through the middle of the site.

The materials of concern identified in the *Final Zone E RFI Work Plan, Revision 1* (EnSafe Inc. [EnSafe]/Allen & Hoshall, 1995) which are based on historical operations for AOC 586, include acids, solvents, dielectric fluid, lead-acid batteries, coal by-products, and petroleum hydrocarbons.

Following fieldwork conducted for the RFI, the *Zone E RFI Report, Revision 0* (EnSafe, 1997) was prepared and submitted during 1997. Regulatory review was conducted on the RFI report and draft responses to the comments from SCDHEC were prepared by the Navy/EnSafe team. The RFI Report Addendum prepared by CH2M-Jones identified Aroclor-1260 as a COC in surface soil at AOC 586. Detailed information on the analytical results and the screening of those results for the determination of COCs can be found in the *Zone E RFI Report, Revision 0* (EnSafe, 1997), and the *RFI Report Addendum and CMS Work Plan for AOC 586, Zone E, Revision 0* (CH2M-Jones, 2002a).

1.2.3 Soil COC Summary

A single soil sampling event was conducted at AOC 586 during the RFI at the locations shown in Figure 1-3. Surface and subsurface soil samples were collected beneath the concrete slab and gravel covering AOC 586, and were analyzed for volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), metals, polychlorinated biphenyl compounds (PCBs), and pH. No field duplicate samples were collected.

The COCs identified in the RFI report (prior to the RFI Report Addendum) for surface soil at AOC 586 were the following:

- Unrestricted (i.e., residential) Land Use – Aroclor-1260, benzo[a]pyrene equivalents (BEQs), and manganese
- Commercial/Industrial Land Use – Aroclor-1260

Aroclor-1260 was identified as a COC in the RFI Report Addendum at AOC 586, under an unrestricted (i.e., residential) land use scenario. This CMS focuses on Aroclor-1260 in surface soil at AOC 586.

The Aroclor-1260 results in surface soil at AOC 586 are presented in Figure 1-4. Detailed information on the analytical results and the screening of those results for the determination of COCs can be found in the *Zone E RFI Report, Revision 0* and the *RFI Report Addendum and CMS Work Plan for AOC 586, Zone E, Revision 1* (CH2M-Jones, 2002b).

1.3 Report Organization

This CMS report consists of the following sections, including this introductory section:

1.0 Introduction — Presents the purpose of and background information relating to this CMS report.

2.0 Remedial Goal Options and Proposed Media Cleanup Standards— Defines the RGOs and proposed MCSs for AOC 586, in addition to the criteria used in evaluating the corrective measure alternatives for the site.

3.0 Overall Approach for Evaluating Focused Alternatives for AOC 586 – Describes the alternative development process and presents the detailed evaluation criteria.

4.0 Description of Candidate Corrective Measure Alternatives — Describes each of the candidate corrective measure alternatives for addressing Aroclor-1260 in surface soil.

5.0 Evaluation and Comparison of Corrective Measure Alternatives -- Evaluates each alternative relative to standard criteria, then compares the alternatives and the degree to which they meet or achieve the evaluation criteria.

6.0 Recommended Corrective Measure Alternative — Describes the preferred corrective measure alternative to achieve the MCSs and RGOs for Aroclor-1260 in soil based on a comparison of the alternatives.

7.0 References— Lists the references used in this document.

Appendix A contains cost estimates developed for the proposed corrective measure alternatives.

All tables and figures appear at the end of their respective sections.

Section 2.0

2.0 Remedial Goal Options and Proposed Media Cleanup Standards

RGOs and MCSs are typically developed at the end of the risk assessment in the RFI. RGOs can be based on a variety of criteria, such as drinking water maximum contaminant levels (MCLs), specific incremental lifetime cancer risk (ILCR) target levels (e.g., 1E-04, 1E-05, or 1E-06), target hazard index (HI) levels (e.g., 0.1, 1.0, 3.0), or site background concentrations. When area background concentrations are higher than the health protection-based concentrations, the background levels are the target MCSs. Achieving these goals should protect human health and the environment, while achieving compliance with applicable state and federal standards.

2.1 Remedial Action Objectives

RAOs are medium-specific goals that protect human health and the environment by preventing or reducing exposures under current and future land use conditions. In the *RFI Report Addendum and CMS Work Plan for AOC 586*, (CH2M-Jones, 2002a), the RAO for surface soil is to prevent ingestion and direct/dermal contact with soil containing COCs at unacceptable levels.

2.2 Media Cleanup Standards

The MCSs for AOC 586 were presented in the *RFI Report Addendum and CMS Work Plan, Revision 1* (CH2M-Jones, 2002b). For Aroclor-1260 within Zone E, the target MCS for surface soil is the U.S. Environmental Protection Agency (EPA) Region III residential risk-based concentration (RBC) of 0.32 milligrams per kilogram (mg/kg) for unrestricted (i.e., residential) land use.

The pattern of distribution of Aroclor-1260 in surface soil at this site indicates one area of exceedance, at the RFI soil boring location E586SB001 where the Aroclor-1260 concentration in the surface soil sample was 0.87 mg/kg.

The focus of this CMS is to evaluate alternatives that will achieve the RAOs described above. The corrective measure alternatives evaluated include:

1) Soil removal and offsite disposal with land use controls (LUCs), and
2) LUCs

These alternatives are discussed in Section 4.0 of this CMS report.

Section 3.0

3.0 Overall Approach for Evaluating Focused Alternatives for AOC 586

3.1 Preferred Remedies

A variety of corrective measure approaches are conceptually feasible for addressing Aroclor-1260 in surface soil at AOC 586. However, remedy selection at the CNC has focused on a few demonstrated technologies. For contaminants in soil that are limited in area, the preferred technologies that are expected to be effective at the CNC include: 1) soil excavation and offsite disposal with LUCs, and 2) LUCs.

Generally, at sites with limited soil contamination, a preference exists for implementing one of these remedies to expedite the remedy selection and implementation processes, improve predictability of the remedy, and lower costs. These candidate alternatives are screened and evaluated using the conventional criteria presented below.

In this focused CMS, these two alternatives will be described (Section 4.0), evaluated in detail (Section 5.0), and one will be proposed as a recommended alternative (Section 6.0).

3.2 Evaluation Criteria

According to the EPA RCRA CA guidance, corrective measure alternatives should be evaluated using the following five criteria:

1. Protection of human health and the environment
2. Attainment of MCSs
3. The control of the source of releases to minimize future releases that may pose a threat to human health and the environment
4. Compliance with applicable standards for the management of wastes generated by remedial activities
5. Other factors, including (a) long-term reliability and effectiveness; (b) reduction in toxicity, mobility, or volume of wastes; (c) short-term effectiveness; (d) implementability; and (e) cost

Each of these criteria is defined in more detail below:

1. **Protection of human health and the environment.** The alternatives will be evaluated on the basis of their ability to protect human health and the environment. The ability of an alternative to achieve this criterion may or may not be independent of its ability to achieve the other criteria. For example, an alternative may be protective of human health, but may not be able to attain the MCSs if the MCSs were not developed based on human health protection factors.

2. **Attainment of MCSs.** The alternatives will be evaluated on the basis of their ability to achieve the MCS defined in this CMS. Another aspect of this criterion is the time frame required to achieve the MCS. Estimates of the time frame for the alternatives to achieve RGOs will be provided.

3. **The control of the source of releases.** This criterion deals with the control of releases of contamination from the source (the area in which the contamination originated) and the prevention of future migration to uncontaminated areas.

4. **Compliance with applicable standards for management of wastes.** This criterion deals with the management of wastes derived from implementing the alternatives (i.e., treatment or disposal of contaminated soil removed from excavations). Corrective measure alternatives will be designed to comply with all standards for management of wastes. Consequently, this criterion will not be explicitly included in the detailed evaluation presented in the CMS, but such compliance would be incorporated into the cost estimates for which this criterion is relevant.

5. **Other factors.** Five other factors are to be considered if an alternative is found to meet the four criteria described above. These other factors are as follows:

    a. Long-term reliability and effectiveness

    Corrective measure alternatives will be evaluated on the basis of their reliability, and the potential impact should the alternative fail. In other words, a qualitative assessment will be made as to the chance of the alternative's failing and the consequences of that failure.

    b. Reduction in the toxicity, mobility, or volume of wastes

    Alternatives with technologies that reduce the toxicity, mobility, or volume of the contamination will be generally favored over those that do not. Consequently, a qualitative assessment of this factor will be performed for each alternative.

    c. Short-term effectiveness

Alternatives will be evaluated on the basis of the risk they create during the implementation of the remedy. Factors that may be considered include fire, explosion, and exposure of workers to hazardous substances.

d. Implementability

The alternatives will be evaluated for their implementability by considering any difficulties associated with conducting the alternatives (such as the construction disturbances they may create), operation of the alternatives, and the availability of equipment and resources to implement the technologies comprising the alternatives.

e. Cost

A net present value of each alternative will be developed. These cost estimates will be used for the relative evaluation of the alternatives, not to bid or budget the work. The estimates will be based on information available at the time of the CMS and on a conceptual design of the alternative. They will be "order-of-magnitude" estimates with a generally expected accuracy of -50 percent to +100 percent for the scope of action described for each alternative. The estimates will be categorized into capital costs and operations and maintenance costs for each alternative.

Section 4.0

4.0 Description of Candidate Corrective Measure Alternatives

4.1 General Description of Alternatives

Two candidate corrective measure alternatives were selected for this site:

- Alternative 1: Soil Excavation and Offsite Disposal with LUCs
- Alternative 2: LUCs

The implementation of Alternative 1 would involve the removal of soil at locations where Aroclor-1260 concentrations exceed the MCS. Based on an evaluation of Aroclor-1260 in site soil, one area at the site will require surface soil removal in order for site soils to meet the MCS for Aroclor-1260:

- Sample location E586SB001. This location is beneath concrete/asphalt pavement, and removal and replacement of the pavement would be required to complete the soil removal.

The approximate soil area estimated to be necessary for removal to achieve the MCS for Alternative 1 is 100 square feet (ft^2), as shown in Figure 4-1. A 20-percent scope contingency is also assumed and included in the cost for this alternative.

Additionally, because AOC 586 is located within Zone E of the CNC, LUCs will be applied to this site even after excavation and removal of the PCB-impacted soil. Thus, LUCs will also be an integral part of the remedy for this site even after the soil excavation.

For Alternative 2, it is assumed that the LUCs will include the following administrative controls:

- Restrictions limiting the land use to non-residential uses.
- Restrictions to maintain the extent of paved area, unless a demonstration is made that changing a currently paved area to unpaved status will not cause one of the RAOs to not be met.

The sections below describe each alternative in detail.

4.2 Alternative 1: Soil Excavation and Offsite Disposal with Land Use Controls

4.2.1 Description of the Alternative

This alternative will remove contaminated soil in areas that exceed the MCS established in Section 2.0 (see Figure 4-1). Exceedance locations will involve soil removal in the area shown in Figure 4-1. It is assumed that the pavement would be removed to access surface soil exceeding the MCS and be replaced.

The excavated soil would be transported to a permitted landfill facility for long-term disposal, and the excavation would be filled with clean fill from an offsite borrow source. Once the soil is removed, the site would be acceptable for unrestricted land use, with no long-term monitoring required. However, because the site is located in Zone E, there will continue to be LUCs that apply to the entire zone. These LUCs are expected to include restrictions of the property to non-residential activities.

The proposed excavation area involves a single paved location that is approximately five feet southeast of a railroad line that is located within the boundary of AOC 586. The excavation location is under a concrete slab and gravel.

The extent of excavation in the paved area is approximately 10 feet by 10 feet for a total excavated area of 100 ft^2 (see Figure 4-1). The removal and replacement of the gravel and concrete pavement will be required to access all of the soil proposed for removal. For an assumed average depth of soil excavation of 1 ft below land surface (bls), the total in-place volume of soil to be removed from the area is about 3.7 cubic yards (yd^3), plus an approximately 1-ft thick pavement structure with a volume of 3.7 yd^3. Confirmation sampling would involve five samples (four sidewall samples and one floor sample). An equal amount of clean backfill will be required to replace the volume of soil removed from the excavated area and bituminous asphalt to replace the volume of asphalt pavement removed from this area.

4.2.2 Other Considerations

Coordination with the CNC Redevelopment Authority (RDA) would be required for site restrictions during excavation and traffic control for the haul trucks. The potential for expansion of scope during confirmation testing is moderate. Thus, a 20-percent scope contingency is assumed.

4.3 Alternative 2: Land Use Controls

4.3.1 Description of the Alternative

This alternative involves leaving the contaminated soil (and co-located overlying pavement) in place, and instituting administrative/legal controls to restrict future use of the land. The controls would limit land use to activities that present less frequent exposure by sensitive populations to surface soil and preclude uncontrolled disturbance to the contaminated soil, thus minimizing the potential for human exposure to the contamination. The addition of restrictions on soil disturbance and site occupancy would minimize potential for human exposure that could occur in a residential or industrial setting. The controls may be in the form of deed restrictions and/or easements (property interests retained by the Navy during property transfer to assure protectiveness of the remedy). Periodic monitoring would be required to assure controls are maintained; periodic site inspections would be required to assure the institutional controls are complied with. Controls may be layered (multiple controls at the same time) to enhance protectiveness. The Navy is negotiating a comprehensive LUC Implementation Plan (LUCIP) for the CNC.

4.3.2 Other Considerations

Currently, the Navy is the property owner and land use in Zone E of the CNC is restricted to non-residential use. Existing engineering controls include pavement and structures that prevent or limit access to contaminated soil. The location and proximity of the site to other industrial properties make residential use highly unlikely, and the presence of pavement across the site hinders or precludes access to the soil by commercial/industrial users. Periodic monitoring of the deed controls and the site would be required. For the purpose of developing a representative cost estimate for this process, an annual evaluation that would include a site inspection is assumed.

Section 5.0

5.0 Evaluation and Comparison of Corrective Measure Alternatives

The corrective measure alternatives were evaluated relative to the criteria previously described in Section 2.0, and then subjected to a comparative evaluation. A cost estimate for each alternative was also developed; the assumptions and unit costs used for these estimates are included in Appendix A of this CMS report.

5.1 Alternative 1: Soil Excavation and Offsite Disposal with Land Use Controls

The following assumptions were made for Alternative 1:

- A single area would be targeted for soil excavation, as shown in Figure 4-1.
- A total of 3.7 yd^3 of soil (in-place measurement) would be excavated for offsite disposal at a Subtitle D facility, and replaced with clean backfill.
- Approximately 100 ft^2 of pavement with an approximate volume of 3.7 yd^3 would be removed/replaced.
- Excavations would include known exceedances plus extrapolated areas to account for uncertainty.
- Confirmation testing will validate that the extent of contaminated soil is limited to that shown in Figure 4-1, plus a maximum contingency of 20 percent.
- LUCs that apply to all of Zone E will also be applied to this site after the soil removal.

5.1.1 Protection of Human Health and the Environment

This alternative is effective at protecting human health and the environment because it removes soil with Aroclor-1260 concentrations that exceed the MCS from the site. The replacement soil will have concentrations of Aroclor-1260 below the MCS.

5.1.2 Attain MCS

This alternative will permanently remove soil with Aroclor-1260 concentrations that exceed the MCS. The MCS will be achieved at the completion of soil removal actions.

5.1.3 Control the Source of Releases

There are no ongoing sources of releases at AOC 586, therefore this issue is not applicable.

5.1.4 Compliance with Applicable Standards for the Management of Generated Wastes

Excavated soil will be sampled and analyzed for waste characterization prior to disposal. Soil, decontamination waste, and personal protective equipment (PPE) will be disposed of in accordance with applicable regulations and permits. Offsite transportation and disposal will be performed by properly permitted and licensed subcontractors.

5.1.5 Other Factors (a) Long-term Reliability and Effectiveness

This alternative would have long-term reliability and be effective for the site as long as all exceedances are removed. The removal of contamination from the site would be permanent. Uncertainty in the distribution of Aroclor-1260 in soil is addressed by expanding the excavations beyond the RFI delineation, thus reducing the risk of failure of this alternative. Confirmation sampling would confirm that the excavations have removed soil exceedances. It is much less likely any significant amount of soil with Aroclor-1260 concentrations above the MCS will be left in place; sitewide average concentrations will be below the unrestricted land use MCS.

5.1.6 Other Factors (b) Reduction in the Toxicity, Mobility, or Volume of Wastes

Alternative 1 reduces the mobility of the contaminated soil by transporting it to a regulated containment facility (landfill). Treatment will not be required unless the soil exhibits toxicity characteristics per 40 CFR 261.24. If required, soil will be treated (stabilized/fixated) at the disposal facility to further reduce mobility of the Aroclor-1260.

5.1.7 Other Factors (c) Short-term Effectiveness

The excavation and hauling of contaminated soil in this alternative has the potential to create dust containing contaminated soil particles. However, standard engineering controls such as dust suppression during excavation, tarp covers on trucks, and worker PPE to prevent dust inhalation will be implemented. Thus, with controls, the alternative provides short-term effectiveness in preventing ingestion of or contact with the contaminated soil, and minimizes the potential for migration of soil particles. The technologies for dust control and worker protection are well-established and robust. No unmanageable hazards would be created during implementation.

5.1.8 Other Factors (d) Implementability

This alternative will be moderately simple to implement. Most of the required activities have been routinely implemented at other nearby sites using standard equipment and procedures. Utility clearance, subcontracting, waste characterization, and base approval are

customary activities. The field implementation of this remedy is estimated to require four to six weeks, and the benefits will be immediate. There is ample offsite capacity for disposal (and treatment, if required) of the contaminated soil.

5.1.9 Other Factors (e) Cost

Appendix A presents the overall cost estimate for implementing this remedy. These costs reflect soil removal based on available RFI sample results, plus removal and replacement of loading dock and pavement. A scope contingency (20 percent) is added to cover minor additional excavation that may be required per results of confirmation testing. In summary, the costs include the following:

- Removing soil in areas at each occurrence of an MCS exceedance.
- Performing confirmation tests in each area to confirm compliance with the MCS.
- Application of 20-percent contingency for additional scope that may be required based on confirmatory sampling.
- Maintaining LUCs applied as part of the Zone E LUCs for a 30-year period.

Using the assumptions listed above, the total present value of Alternative 1 is calculated at $39,000.

5.2 Alternative 2: Land Use Controls

The assumptions for Alternative 2 include the following:

- A basewide LUCIP will be developed for the CNC. The plan will allow for restrictions on the use of land at AOC 586 and other areas, and will be developed outside the scope of this CMS.
- Periodic monitoring will be performed for 30 years. The monitoring will consist of an annual site visit to confirm that site use(s) are consistent with the LUCIP.

5.2.1 Protection of Human Health and the Environment

This alternative is effective at protecting human health because it restricts future use of the site that would be inappropriate for the MCS exceedances at the site.

5.2.2 Attain MCS

This alternative would not achieve the MCS for Aroclor-1260.

5.2.3 Control the Source of Releases

There are no ongoing sources of releases at AOC 586, therefore this issue is not applicable.

5.2.4 Compliance with Applicable Standards for the Management of Generated Wastes

Alternative 2 does not generate any wastes that would require special management.

5.2.5 Other Factors (a) Long-term Reliability and Effectiveness

This alternative provides some level of protection that has long-term reliability and effectiveness. The risk of failure is low, provided the LUCIP is enforced by the responsible entity. If LUCs were not enforced, unpermitted use of the site may result in human exposure to levels of Aroclor-1260 above the MCS.

5.2.6 Other Factors (b) Reduction in the Toxicity, Mobility, or Volume of Wastes

This alternative involves no treatment and does not reduce the toxicity, mobility, or volume of contaminated soil at AOC 586.

5.2.7 Other Factors (c) Short-term Effectiveness

The Navy retains ownership and control of the site use until LUCs are implemented. This alternative does not involve any site activities, thus, no short-term risks are created.

5.2.8 Other Factors (d) Implementability

Alternative 2 is relatively easy to implement since it only requires the development of LUCs and an appropriate monitoring program.

5.2.9 Other Factors (e) Cost

Alternative 2 is not costly to implement since it requires no construction of treatment facilities or disposal of wastes. The cost for this alternative is for administrative/legal services and periodic monitoring/review for 30 years. Longer monitoring would likely be required, but its cost impact to present value of this alternative is minimal.

Using the assumptions described earlier, the total present value of Alternative 2 is calculated at $20,000.

5.3 Comparative Ranking of Corrective Measure Alternatives

The overall ability of each corrective measure alternative to meet the evaluation criteria is described above. In Table 5-1 below, a comparative evaluation of the degree to which each alternative meets a particular criteria is presented. Alternative 2 (LUCs) is the preferred alternative. It provides a protective and reliable remedy at a lower cost.

TABLE 5-1
Qualitative Comparison of Corrective Measure Alternatives
Corrective Measures Study Report, AOC 586, Zone E, Charleston Naval Complex

Criterion	1. Soil Excavation and Offsite Disposal	2. Land Use Controls
Overall Protection of Human Health and the Environment	Protects human health and the environment	Protects human health and the environment
Attainment of MCS	Would achieve MCS	Would not achieve MCS
Control of the source of releases	N/A	N/A
Compliance with applicable standards for the management of wastes	Complies with applicable standards	Complies with applicable standards
Long-term Reliability and Effectiveness	Reliable and effective long-term	Reliable and effective long-term, provided periodic inspections are performed
Reduction of Toxicity, Mobility, or Volume through Treatment	Reduces mobility via placement of soil in landfill	Does not reduce toxicity, mobility, or volume
Short-term Effectiveness	Effective in short-term	Effective in short-term
Implementability	Moderately simple to implement due to need to remove/replace concrete and asphalt pavement and work in busy industrial area	Easy to implement
Cost Ranking	Comparatively Expensive	Inexpensive
Estimated Cost	$39,000	$20,000

Section 6.0

6.0 Recommended Corrective Measure Alternative

Two corrective measure alternatives were evaluated using the criteria described in Section 2.0 of this CMS report. These alternatives included: Alternative 1: Soil Excavation and Offsite Disposal with LUCs; and Alternative 2: LUCs.

The preferred corrective measure alternative is Alternative 2: LUCs. The remedy would be protective at a moderate cost.

Alternative 2 would provide protection of human health and the environment by maintaining the current and planned future use of the site as industrial/commercial. Limitations would prevent residential and other unrestricted land uses that could expose sensitive populations.

Engineering controls to minimize future releases are already in place. Most of the area is paved or covered by a structure. Planning is already underway to develop and implement administrative controls that would limit future site activities to those that would not involve unrestricted exposures. The expected reliability of this alternative is good.

There are no community safety issues associated with implementation of this remedy, and the controls would be relatively easy to implement. This alternative provides long-term effectiveness for the planned industrial/commercial use, and relies on administrative controls to prevent future residential use.

Appendix A

COMPARISON OF TOTAL COST OF REMEDIAL SOLUTIONS

Site:	Charleston Naval Complex	**Base Year:**	2003
Location:	AOC 586	**Date:**	01/27/03
Phase:	Corrective Measures Study		

	Alternative Number 1	Alternative Number 2
Total Project Duration (Years)	<1	30
Capital Cost	$19,000	$6,000
Annual O&M Cost	$0	$1,100
Total Present Value of Solution	$39,000	$20,000

Disclaimer: The information in this cost estimate is based on the best available information regarding the anticipated scope of the remedial alternatives. Changes in the cost elements are likely to occur as a result of new information and data collected during the engineering design of the remedial alternative. This is an order-of-magnitude cost estimate that is expected to be within -50 to +100 percent of the actual project costs.

Alternative: **Number 1**
Elements: **Soil Excavation and Offsite Disposal**

COST ESTIMATE SUMMARY

Site: Charleston Naval Complex
Location: AOC 586
Phase: Corrective Measures Study
Base Year: 2003
Date: 01/27/03

Description: Excavation of contaminated soil, disposal offsite at permitted landfill, backfill with clean soil. Extent includes RFI sample points plus 20% scope contingency.

CAPITAL COSTS

DESCRIPTION	QTY	UNIT	UNIT COST	TOTAL	NOTES
Confirmation Sampling	1	EA	$1,800	$1,800	See Confirmation Worksheet
Removal, Disposal and Backfill	1	EA	$10,000	$10,000	See Excavation 1 Worksheet
				$0	
SUBTOTAL				$11,800	
Contingency	20%		$11,800	$2,360	
SUBTOTAL				**$14,160**	
Project Management	8%		$14,160	$1,133	USEPA 2000, p. 5-13, $100K-$500K
Remedial Design	15%		$14,160	$2,124	USEPA 2000, p. 5-13, $100K-$500K
Construction Management	10%		$14,160	$1,416	USEPA 2000, p. 5-13, $100K-$500K
SUBTOTAL				**$4,673**	
TOTAL CAPITAL COST				**$19,000**	

OPERATIONS AND MAINTENANCE COST

DESCRIPTION	QTY	UNIT	UNIT COST	TOTAL	NOTES
SUBTOTAL				$0	
Allowance for Misc. Items	20%		$0	$0	
SUBTOTAL				**$0**	
TOTAL ANNUAL O&M COST				**$0**	

PRESENT VALUE ANALYSIS

Discount Rate = 7%

End Year	COST TYPE	TOTAL COST	TOTAL COST PER YEAR	DISCOUNT FACTOR (7%)	PRESENT VALUE	NOTES
0	CAPITAL COST	$19,000	$19,000	1.000	$19,000	
	ANNUAL O&M COST	$0	$0	0.000	$0	
		$19,000			$19,000	
	PRESENT VALUE OF LAND USE CONTROLS COST				$20,000	
	TOTAL PRESENT VALUE OF ALTERNATIVE				**$39,000**

Alternative: Number 2
Elements: Land Use Controls

COST ESTIMATE SUMMARY

Site: Charleston Naval Complex
Location: AOC 586
Phase: Corrective Measures Study
Base Year: 2003
Date: 01/27/03

Description: Implementation of base-wide land use management plan to put institutional controls in place to restrict site use to commercial/industrial.

Assumes this site is part of a multi-site implementation, and costs are shared among all the sites.

CAPITAL COSTS

DESCRIPTION	QTY	UNIT	UNIT COST	TOTAL	NOTES
Deed Restrictions - Attorney	4	hour	$200	$800	
Record Deed	4	each	$500	$2,000	
LUC Implementation	24	hours	$75	$1,800	
SUBTOTAL				$4,600	
Contingency	20%		$4,600	$920	
SUBTOTAL				**$5,520**	
Project Management	10%		$5,520	$552	USEPA 2000, p. 5-13, <$100K
Remedial Design	0%		$5,520	$0	Not applicable.
Construction Management	0%		$5,520	$0	Not applicable.
SUBTOTAL				**$552**	
TOTAL CAPITAL COST				**$6,000**	

OPERATIONS AND MAINTENANCE COST

DESCRIPTION	QTY	UNIT	UNIT COST	TOTAL	NOTES
Annual Evaluation	12	hour	$75	$900	
SUBTOTAL				$900	
Allowance for Misc. Items	20%		$900	$180	
SUBTOTAL				$1,080	
TOTAL ANNUAL O&M COST				**$1,100**	

PRESENT VALUE ANALYSIS - 20 years

Discount Rate = 7%

End Year	COST TYPE	TOTAL COST	TOTAL COST PER YEAR	DISCOUNT FACTOR (7%)	PRESENT VALUE	NOTES
0	CAPITAL COST	$6,000	$6,000	1.000	$6,000	
30	ANNUAL O&M COST	$33,000	$1,100	12.409	$13,650	
		$39,000			$19,650
