### PROFESSIONAL REVIEW CERTIFICATION

The Site Assessment contained in this report was prepared using sound hydrogeologic principles and judgement. This assessment is based on the geologic investigation and associated information detailed in the text and appended to this report. If conditions are determined to exist that differ from those described, the undersigned geologist should be notified to evaluate the effects of any additional information on the assessment described in this report. This Site Assessment Report was developed for the Old Gasoline Station (UST 14) at Naval Air Station Jacksonville, Jacksonville, Florida, and should not be construed to apply to any other site.

## EXECUTIVE SUMMARY

Tetra Tech NUS, Inc. (TtNUS) has completed a Site Assessment (SA) at the above-referenced facility in accordance with the requirements of Chapter 62-770, Florida Administrative Code (FAC). This assessment report is being submitted to the Florida Department of Environmental Protection (FDEP) for approval.

TtNUS performed the following tasks during the SA:

- Reviewed available United States Navy (Navy) documents and identified potential sources and receptors for petroleum hydrocarbons in the vicinity, evaluated private potable wells within a 0.25-mile radius and public water supply wells within a 0.5-mile radius, located nearby surface water bodies, and determined surface hydrology and drainage.
- Conducted a site survey to construct a site plan and collected two rounds of depth to groundwater measurements to evaluate the groundwater flow direction and gradient.
- Advanced 32 soil borings using Direct-Push Technology (DPT) and analyzed the soil and groundwater with a mobile laboratory.
- Installed nine shallow monitoring wells and two deep well for analysis of the constituents included in the Gasoline and Kerosene Analytical Groups.
- Surveyed monitoring well top of casing elevations.
- Referenced and obtained the appropriate aquifer data from the United States Geological Survey (USGS) to determine aquifer characteristics at Naval Air Station (NAS) Jacksonville.

The results of the soil vapor analysis during the SA revealed "excessively contaminated" soil, as defined by Chapter 62-770.200, FAC in two areas: the former pump island and UST 26-4. Soil samples collected for laboratory analysis at these two locations confirmed soil vapor analysis results. At the former pump island and UST 26-4, confirmatory soil sample analytical results exceeded the residential direct exposure soil cleanup target levels (SCTLs) for total recoverable petroleum hydrocarbons (TRPH). At the same locations, soil samples exceeded leachability based SCTLs for volatile and semi-volatile compounds and for TRPH. An estimated soil contamination plume has been illustrated on Figure 3-1 on this document.

The results of the SA revealed hydrocarbon-impacted groundwater that exceeded groundwater cleanup target levels (GCTLs) in MW-01 and MW-03, but less than the natural attenuation default source concentration standards.

Based on the results of the SA, TtNUS recommends that a Remedial Action Plan be prepared for the removal of soil at the locations of the former pump island and UST 26-4 as a result of the exceedance of residential direct exposure SCTLs. TtNUS recommends that a Natural Attenuation Monitoring Plan be implemented for groundwater.

## 1.0 INTRODUCTION

### 1.1 PURPOSE AND SCOPE

A SA was conducted by TtNUS for the Navy Southern Division, Naval Facilities Engineering Command (SOUTHNAVFACENGCOM) under Contract Task Order (CTO) 0145, for the Comprehensive Long-term Environmental Action Navy (CLEAN III), Contract Number N62467-94-D-0888. The SA was conducted at the Old Gas Station (UST 14) site located near the northeast corner of Birmingham Avenue and Langley Street at NAS Jacksonville.

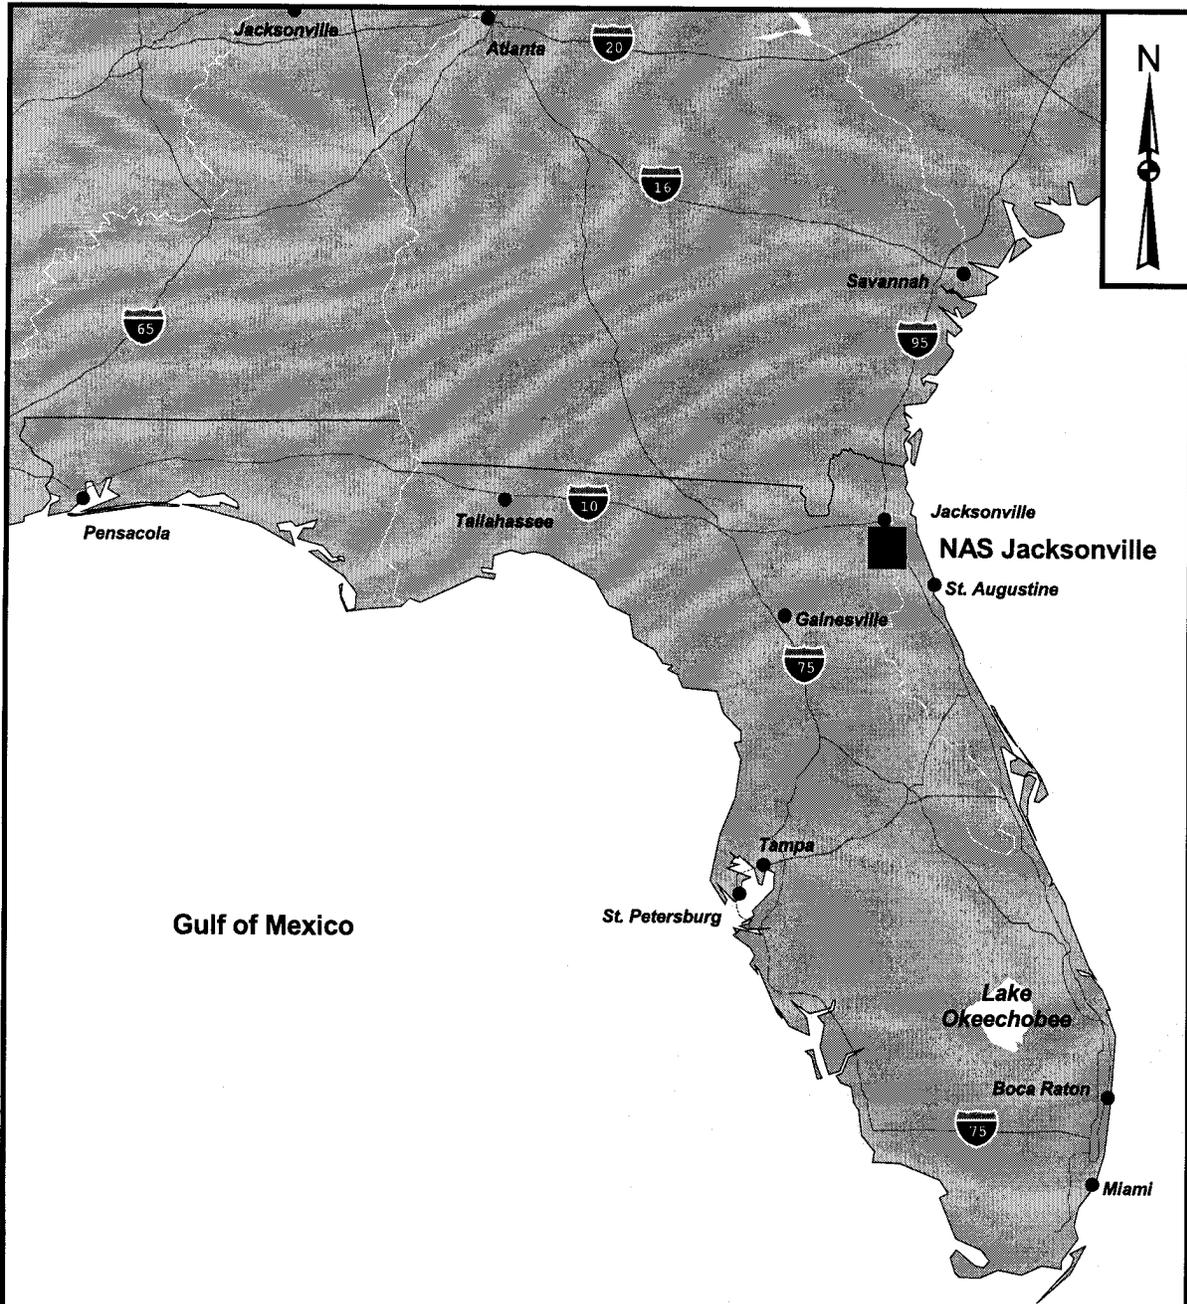

The purpose of this SA was to evaluate the extent of petroleum hydrocarbons in subsurface soils and groundwater in accordance with the requirements of Chapter 62-770, FAC. The Old Gas Station (UST 14) was previously investigated under the Installation Restoration Program as Potential Source of Contamination (PSC) 19 due to the presence of abandoned underground storage tanks (USTs) in close proximity to a potable water well, which was also abandoned. The tanks were reportedly installed in 1940 and were in operation until approximately 1970.

A SAR Summary Sheet is included in Appendix A.

### 1.2 SITE DESCRIPTION

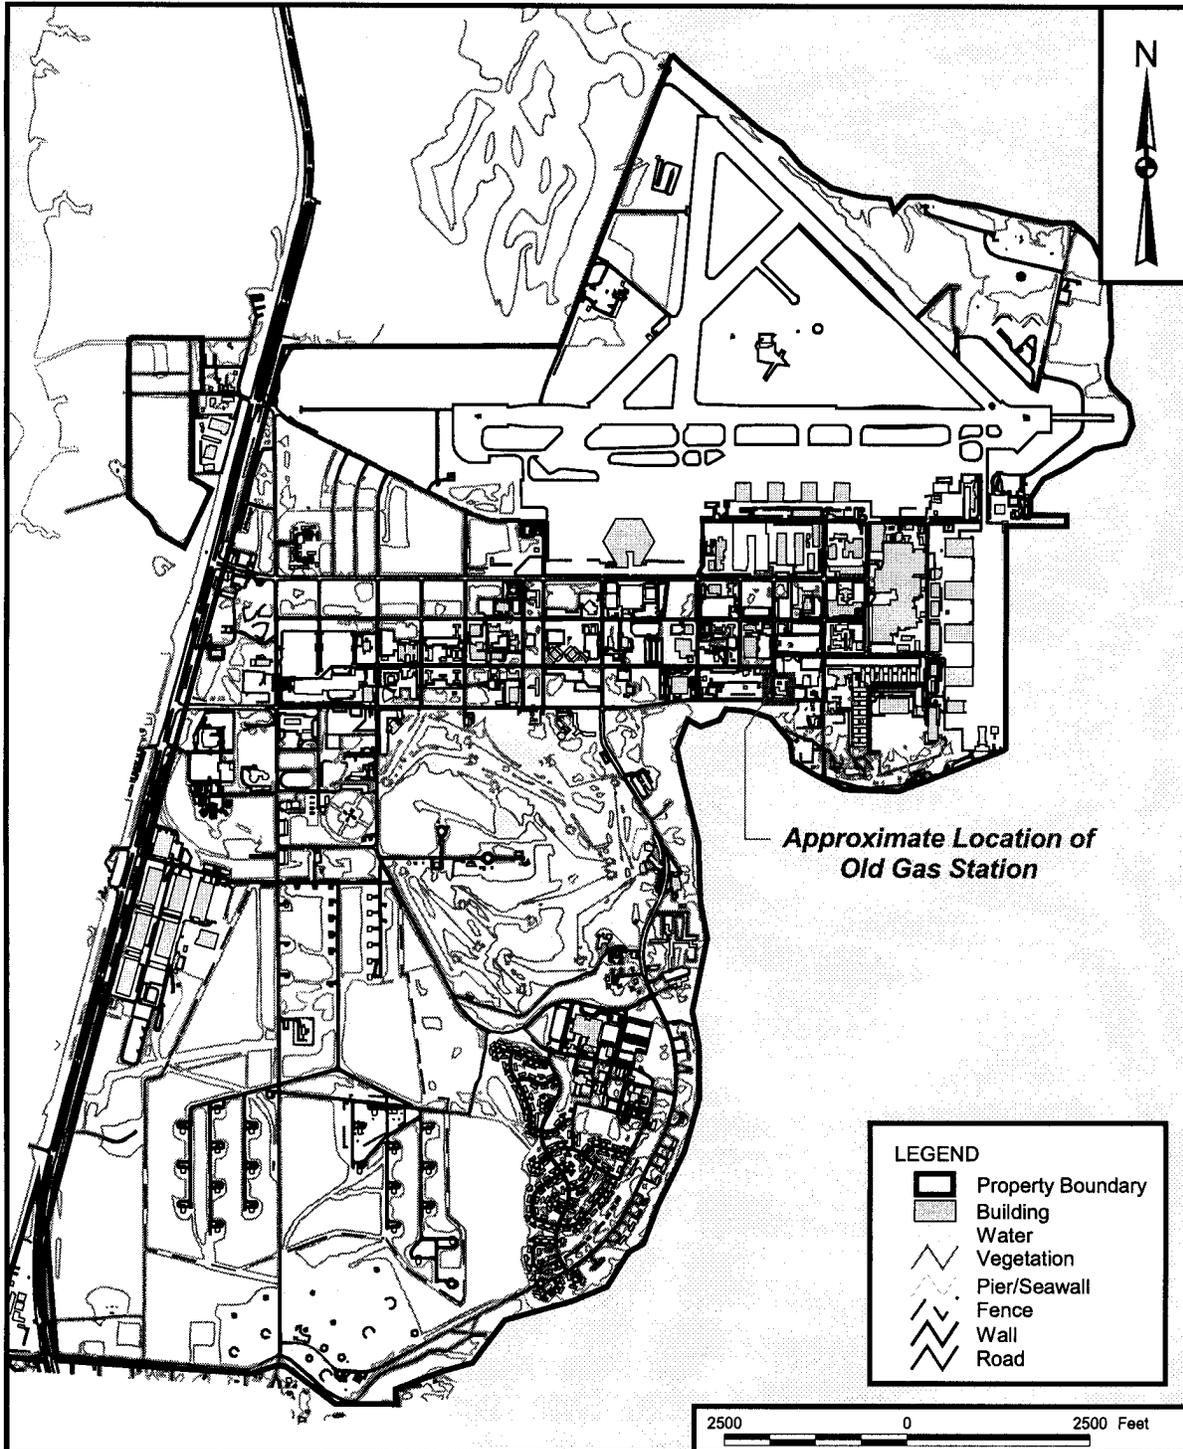

#### 1.2.1 Location

NAS Jacksonville is located in northeast Florida on the west bank of the St. Johns River, southwest of downtown Jacksonville, Florida as depicted on Figure 1-1. The St. Johns River borders the facility to the west and Highway 17 borders the facility to the east. Communities border the facility to the south, and a golf course borders the facility to the north. The Old Gas Station (UST 14) is located in the east-central portion of the base near the northeast corner of Birmingham and Langley Street as indicated on Figure 1-2. Mostly pavement and buildings cover this area of the base.

### **1.2.2 Topography and Drainage**

According to the USGS Map (Orange Park Quadrangle, Orange Park, Florida), the land surface elevation at the Old Gas Station (UST 14) varies from approximately 2 feet (ft) above mean sea level in the southern section, to a high of 10 ft above mean sea level just north of Building 26. The overall topography at the Old Gas Station (UST 14) slopes to the south towards the St. Johns River. Figure 1-3 is a photocopy of the USGS Physiographic Map.

### **1.2.3 Regional Geology and Hydrogeology**

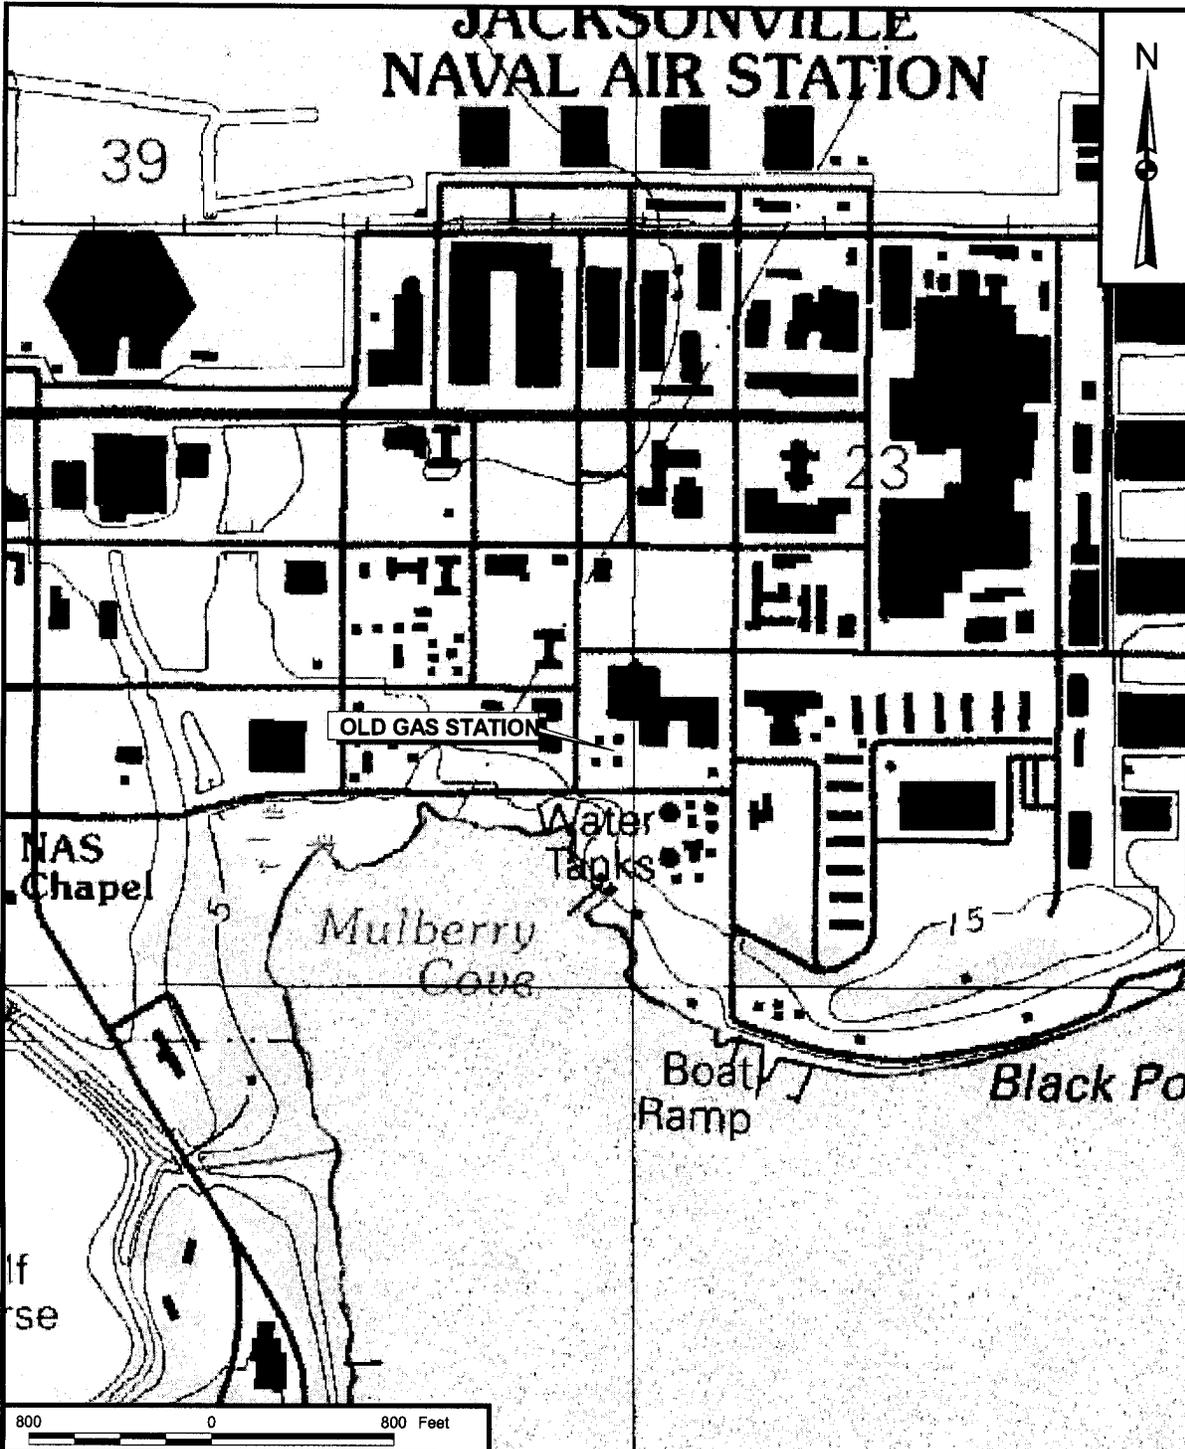

The surficial soil at the Old Gas Station (UST 14) consists of post-Miocene fluvial deposits including fine grained sand, silty sand, clayey sand, and sandy clay overlying the Hawthorn Group. The underlying Hawthorn Group is composed mainly of low permeability clays, which form the base of the surficial aquifer. The surficial aquifer is composed of Pliocene-aged sedimentary deposits. The surficial aquifer is recharged by rainfall and the average recharge rate is estimated to be 10 to 16 inches per year (USGS 1998). The depth to groundwater at the Old Gas Station (UST 14) ranged from approximately 2 to 6 ft below land surface (bls) during the investigation that occurred from March to September 2001.

### **1.2.4 Land Use**

The Old Gas Station (UST 14) site is currently used by Morale, Welfare and Recreation, and is operated by a civilian contractor that performs various maintenance activities for the Navy. The site is depicted on Figure 1-4. Access to the Old Gas Station (UST 14) site is controlled through a chain link fence. The Old Gas Station (UST 14) site was used primarily as a service station from approximately 1940 to 1970.

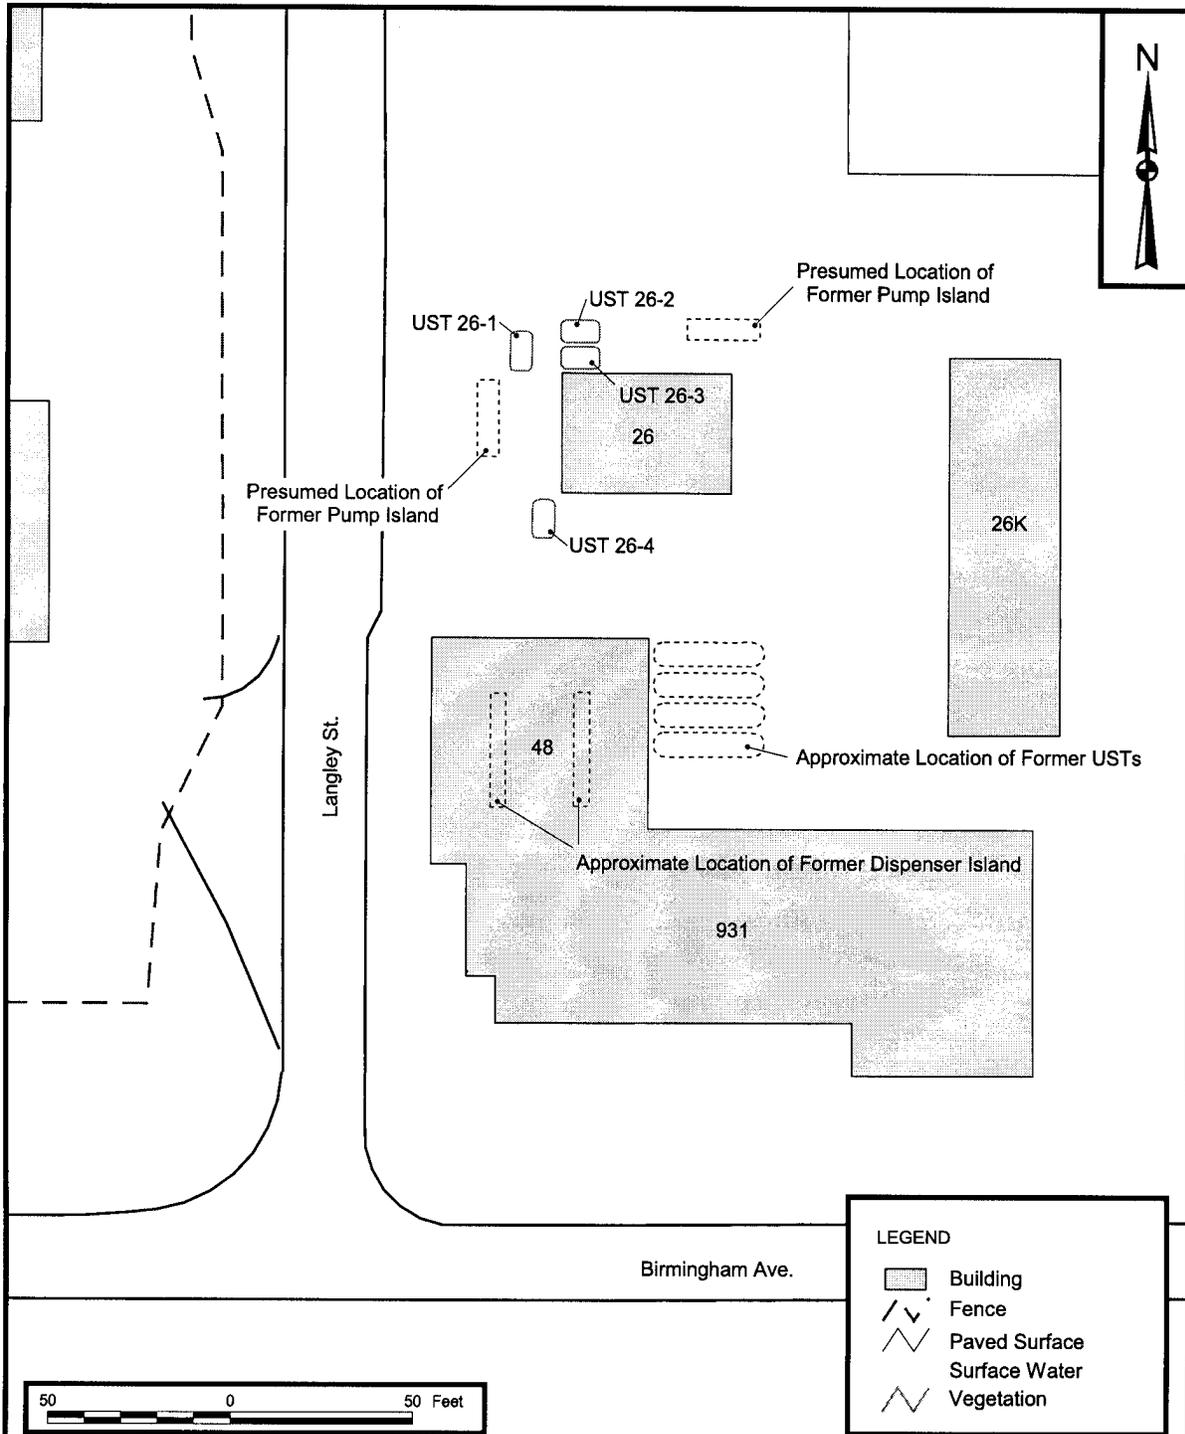

### **1.2.5 Site Description**

Mostly pavement and buildings cover the Old Gas Station (UST 14) area. The Building 48 area, which includes Building 931, is currently a canopy that appears to have been the previous location of a pump island. There is no visual evidence that the concrete in this area has been disturbed. The USTs associated with this building are believed to have been located immediately east of the building, beneath the recently constructed Building 25. The Building 26 area is also mostly paved. There are overhead utilities and the area is heavily used for small engine repair activities and storage.

### **1.2.6 Potable Water Well Survey**

The potable water supply information presented in this report was obtained through Mike Mantz, NAS Jacksonville Facilities and Environmental Department. Well construction and use data is summarized on Table 1-1. The three wells identified in close proximity are owned by the Navy Public Works Center (PWC). A map of the potable wells, in relation to the Old Gas Station site, is provided as Figure 1-5.

## **1.3 SITE HISTORY AND OPERATIONS**

### **1.3.1 Site History**

The Old Gas Station (UST 14) was built in 1957. Retail business for the station was conducted from Building 26. Four steel 2000-gallon USTs, formerly containing diesel fuel and gasoline, were situated around Building 26. These tanks were reportedly installed in 1940 and last used in 1970. The UST closure documentation indicates that the tanks were removed in February 1998. During closure, liquids were observed in each UST. Analytical results of the liquid indicated that USTs 26-2 and 26-3 had elevated concentrations of benzene. USTs 26-1, 26-2, and 26-3 were heavily corroded with numerous holes around the tank. UST 26-4 was moderately corroded. Elevated Flame Ionization Detector (FID) readings were noted in soil samples collected during the tank removals.

Three temporary monitoring wells were installed and sampled during the tank removal activities. Monitoring well TW-26-1 was installed in the excavation for UST 26-1. TW-26-2 was installed in the excavation for USTs 26-2 and 26-3. TW-26-3 was installed in the excavation for UST 26-4. The analytical results of the groundwater sampled from TW-26-3 reported ethylbenzene at 10 micrograms per liter ( $\mu\text{g/L}$ ), trichloroethene at 2  $\mu\text{g/L}$ , total xylenes at 26  $\mu\text{g/L}$ , petroleum range organics at 0.36 milligrams per liter ( $\text{mg/l}$ ), and lead at 0.004  $\text{mg/l}$ . No other constituents were detected in the three samples collected.

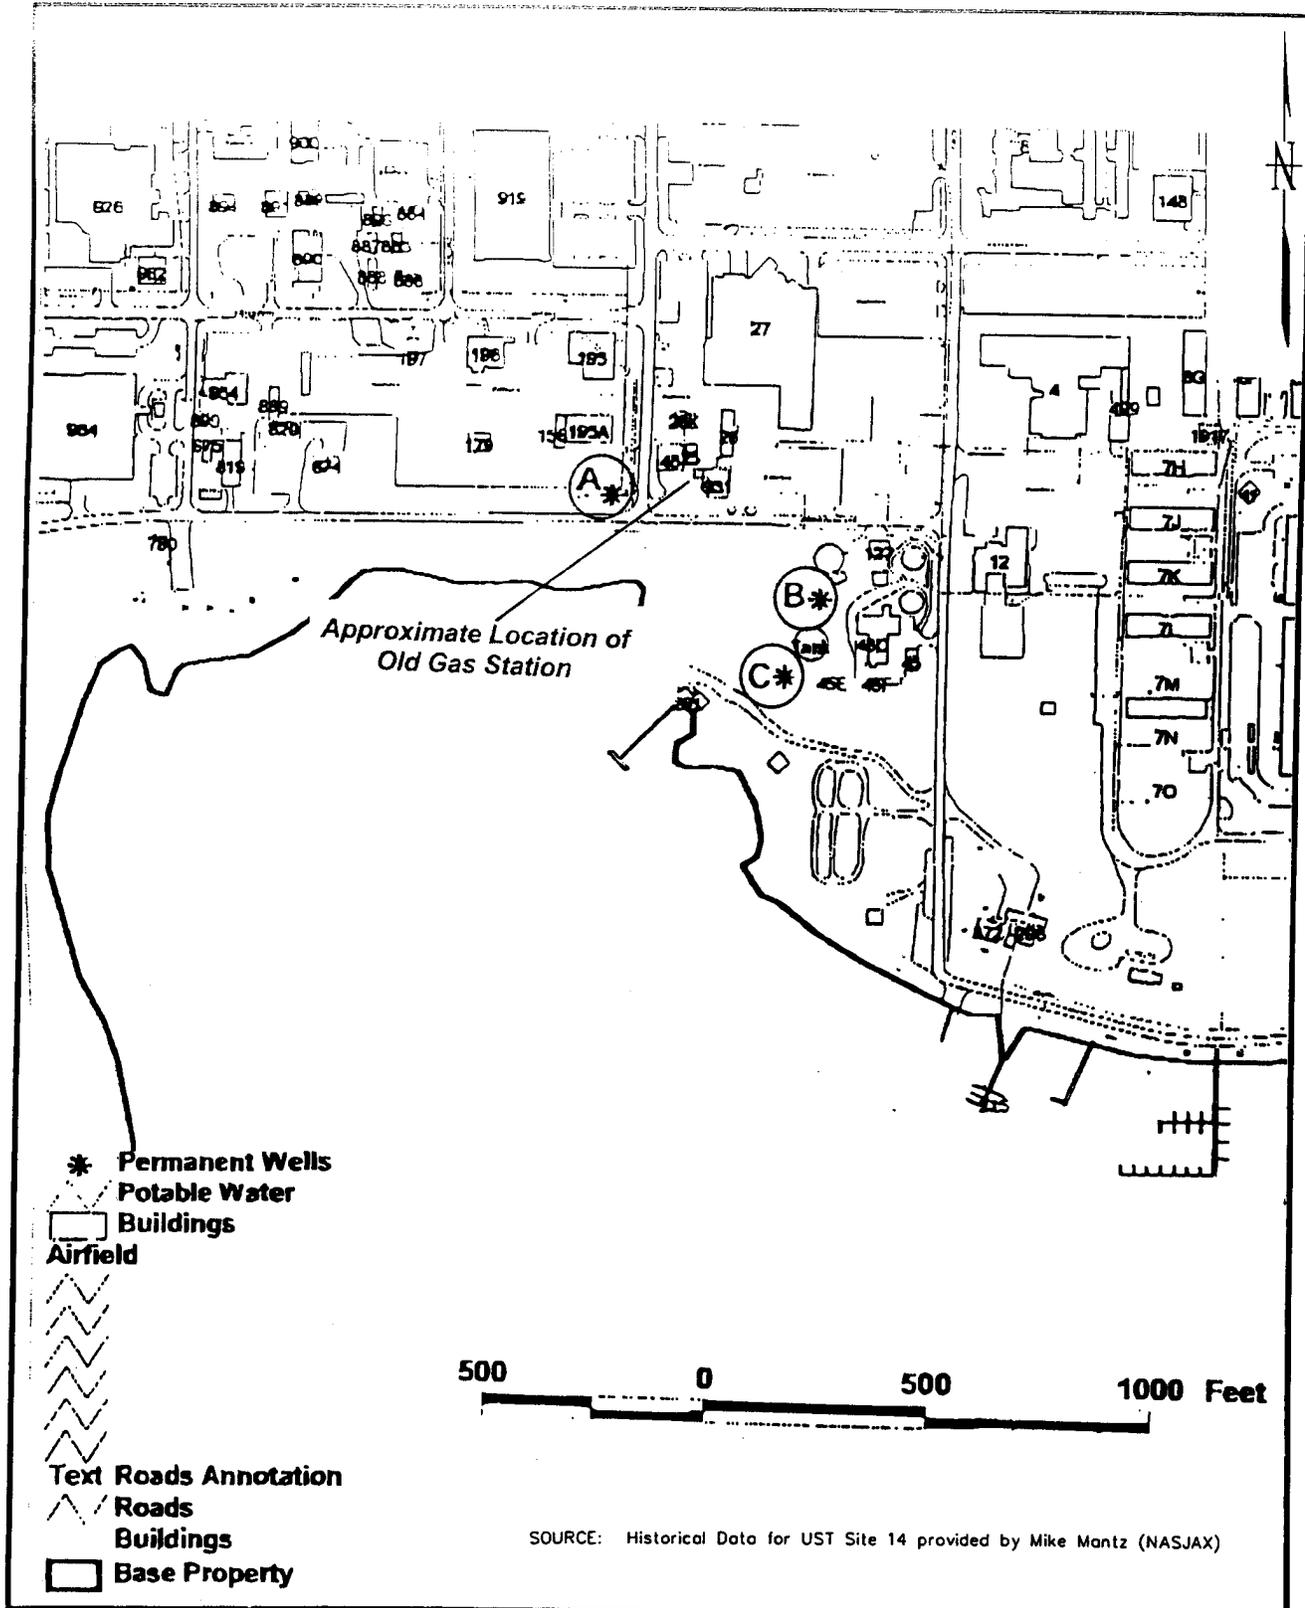

Four additional steel USTs, each with 10,000-gallon capacities, are associated with Building 48 and are located approximately 40 ft south of Building 26. In 1980, these USTs were taken out of service and closed when the fire department filled each tank with water. All fill pipes, cross-connecting lines, and vent pipes were removed and capped at that time. According to information from base personnel, the four USTs associated with Building 48 were excavated and removed in 1988.

### **1.3.2            Initial Verification Study**

During a verification study performed by Geraghty & Miller, Inc. in 1985, four USTs were identified, each having a capacity of 10,000 gallons. According to the verification study report, the tanks were abandoned in 1980 when the fire department completely filled each tank with water. All fill pipes, cross-connecting lines, and vent pipes were removed and capped. Although this action occurred prior to the 1984 promulgation of Chapter 17-61, FAC, which outlined the requirements for stationary tanks, Geraghty & Miller, Inc. recommended these tanks be abandoned or removed in accordance with this regulation. In addition, they recommended that all water contained in the tanks be pumped out for treatment at the wastewater treatment plant.

### **1.3.3            Closure Assessment**

According to NAS Jacksonville Facilities and Environmental Department Personnel and existing literature, the four USTs associated with Building 48 were removed in 1988.

In February 1998, Environmental Detachment Charleston was contracted to perform the closure of USTs 26-1, 26-2, 26-3, and 26-4 located near Building 26 at NAS Jacksonville. The USTs and their associated piping and vents were removed on February 23, 1998. A Closure Assessment Report and Closure Assessment Form were filed in March 1998. The report stated the USTs were removed, drained, cut open at both ends, and cleaned with a steam cleaner. The USTs were then cut up for recycling as scrap metal and delivered to the NAS Jacksonville Recycling Center. Base personnel noted that UST 26-1 was heavily corroded and had numerous holes. The worst areas were noted to be on the west side and north end at approximately 1 ft above the bottom of the UST. USTs 26-2 and 26-3 were also noted to be heavily corroded, but had no visible holes. UST 26-4 was noted as being mildly corroded with four or five holes and pitting on the south end of the tank. NAS Jacksonville personnel sampled fluid in UST 26-1 through 26-4. Results indicated high levels of benzene in USTs 26-2 and 26-3. The fluid was pumped out by a contractor and transported to a treatment facility. After removal, soil samples were collected in each corner of the excavation and sent to Navy PWC Pensacola Laboratory for analysis. The results indicated no soil contamination was identified at a depth of 3 ft or less in the samples analyzed.

## **1.4                PURPOSE**

The objective of the proposed field investigation is to determine if soil and/or groundwater have been adversely impacted by previous operations at the site. The data collected during the investigation was used to prepare this Site Assessment Report (SAR) as required by Chapter 62-770.600, FAC. This SAR provides a characterization of site conditions from which to base future courses of action.

## **2.0 SUBSURFACE INVESTIGATION METHODS**

### **2.1 QUALITY ASSURANCE**

The site investigation was conducted in accordance with the Standard Operating Procedures prescribed by the FDEP Quality Assurance Section Document DER-001/92 and adopted by the TtNUS Comprehensive Quality Assurance Plan (CompQAP) Number 980038.

### **2.2 SOIL BORING AND SAMPLING PROCEDURES**

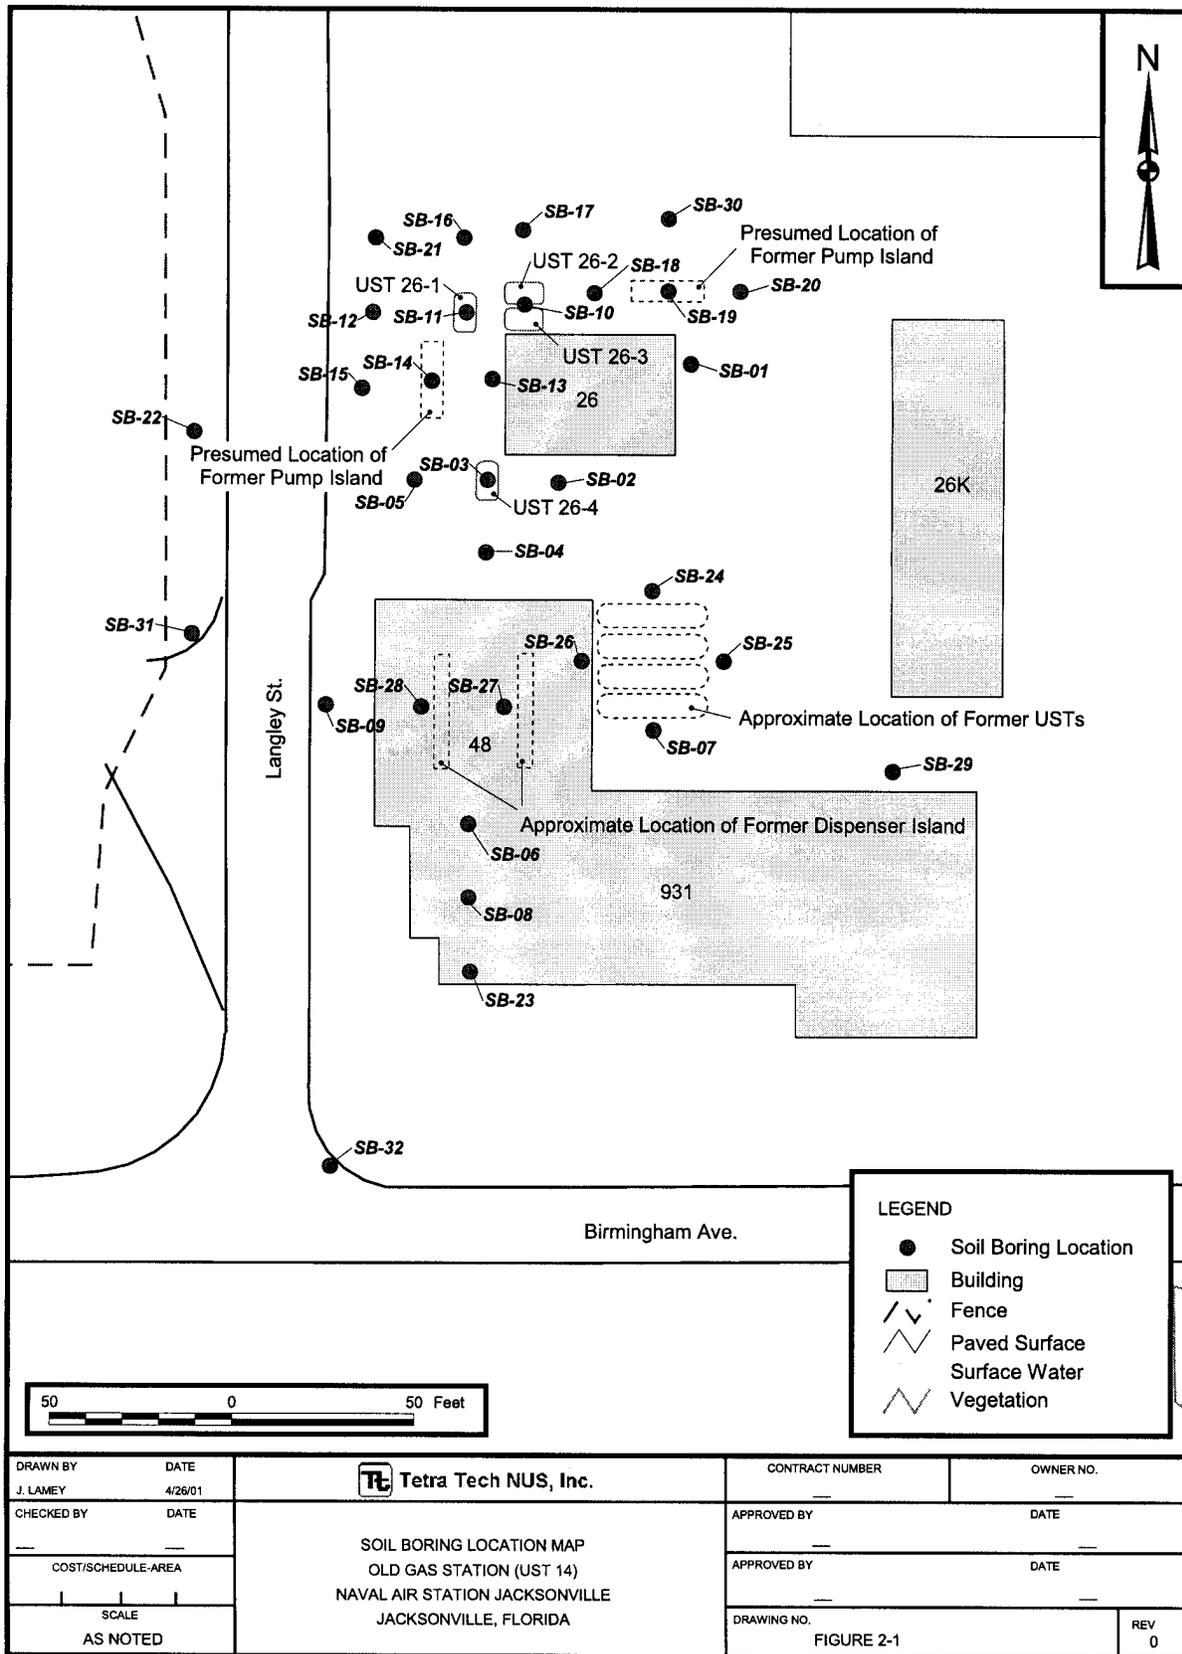

#### **2.2.1 Direct-Push Soil Borings**

A soil vapor assessment was conducted between March 5 and March 7, 2001. Thirty-two soil borings were advanced in and around the Old Gas Station (UST 14) area. Soil borings were advanced using a truck mounted, direct-push, hydraulic soil probe. Soil cores were collected using 2-ft long stainless steel split barrel samplers lined with plastic sleeves beginning at approximately 1 ft bls and continued at 2-ft intervals until approximately 1 ft into the saturated zone, typically at 4 to 6 ft in depth. Soil boring locations are depicted on Figure 2-1.

The cores were visually inspected and classified for lithology and evidence of staining. Soil samples were collected from each soil core and screened with an Organic Vapor Analyzer (OVA)-FID. Soil vapor analysis was performed in accordance with the headspace screening methodology prescribed by Chapter 62-770.200(2), FAC. This method of headspace screening is described in detail in Appendix B. A duplicate of the sample from the split spoon interval with the highest OVA-FID reading from above the water table was retained and analyzed by an onsite mobile laboratory for benzene, toluene, ethylbenzene, and xylenes (BTEX); methyl tert-butyl ether (MTBE); naphthalene; 1-methylnaphthalene; 2-methylnaphthalene; and screening diesel range organics (DRO).

#### **2.2.2 Hand Augered Soil Borings**

On March 6, 2001, TtNUS advanced three soil borings (SB-26, SB-27, and SB-28), under the canopy area, using a stainless steel, 3-inch, inside diameter (ID) hand-auger. The soil borings were advanced to a depth of 5 ft bls, and soil samples were collected at 2-ft intervals and screened with an OVA-FID. Headspace data is discussed in Section 3.0. Soil vapor analysis was performed in accordance with the headspace screening method prescribed by Chapter 62-770.200(2), FAC. A duplicate sample from the interval with the highest OVA-FID reading was retained and analyzed by the mobile laboratory for BTEX, MTBE, naphthalene, 1-methylnaphthalene, 2-methylnaphthalene, and screening DRO.

P:\GIS\JACKSONVILLE\_NAS\APR\PROGS\APR SOIL BORING LOCATION MAP 11/2/01 JAL

Investigation derived waste (IDW) was containerized in 55-gallon drums and removed by Florida Environmental Compliance Corporation (FECC). A copy of the manifest provided by FECC is included in Appendix C.

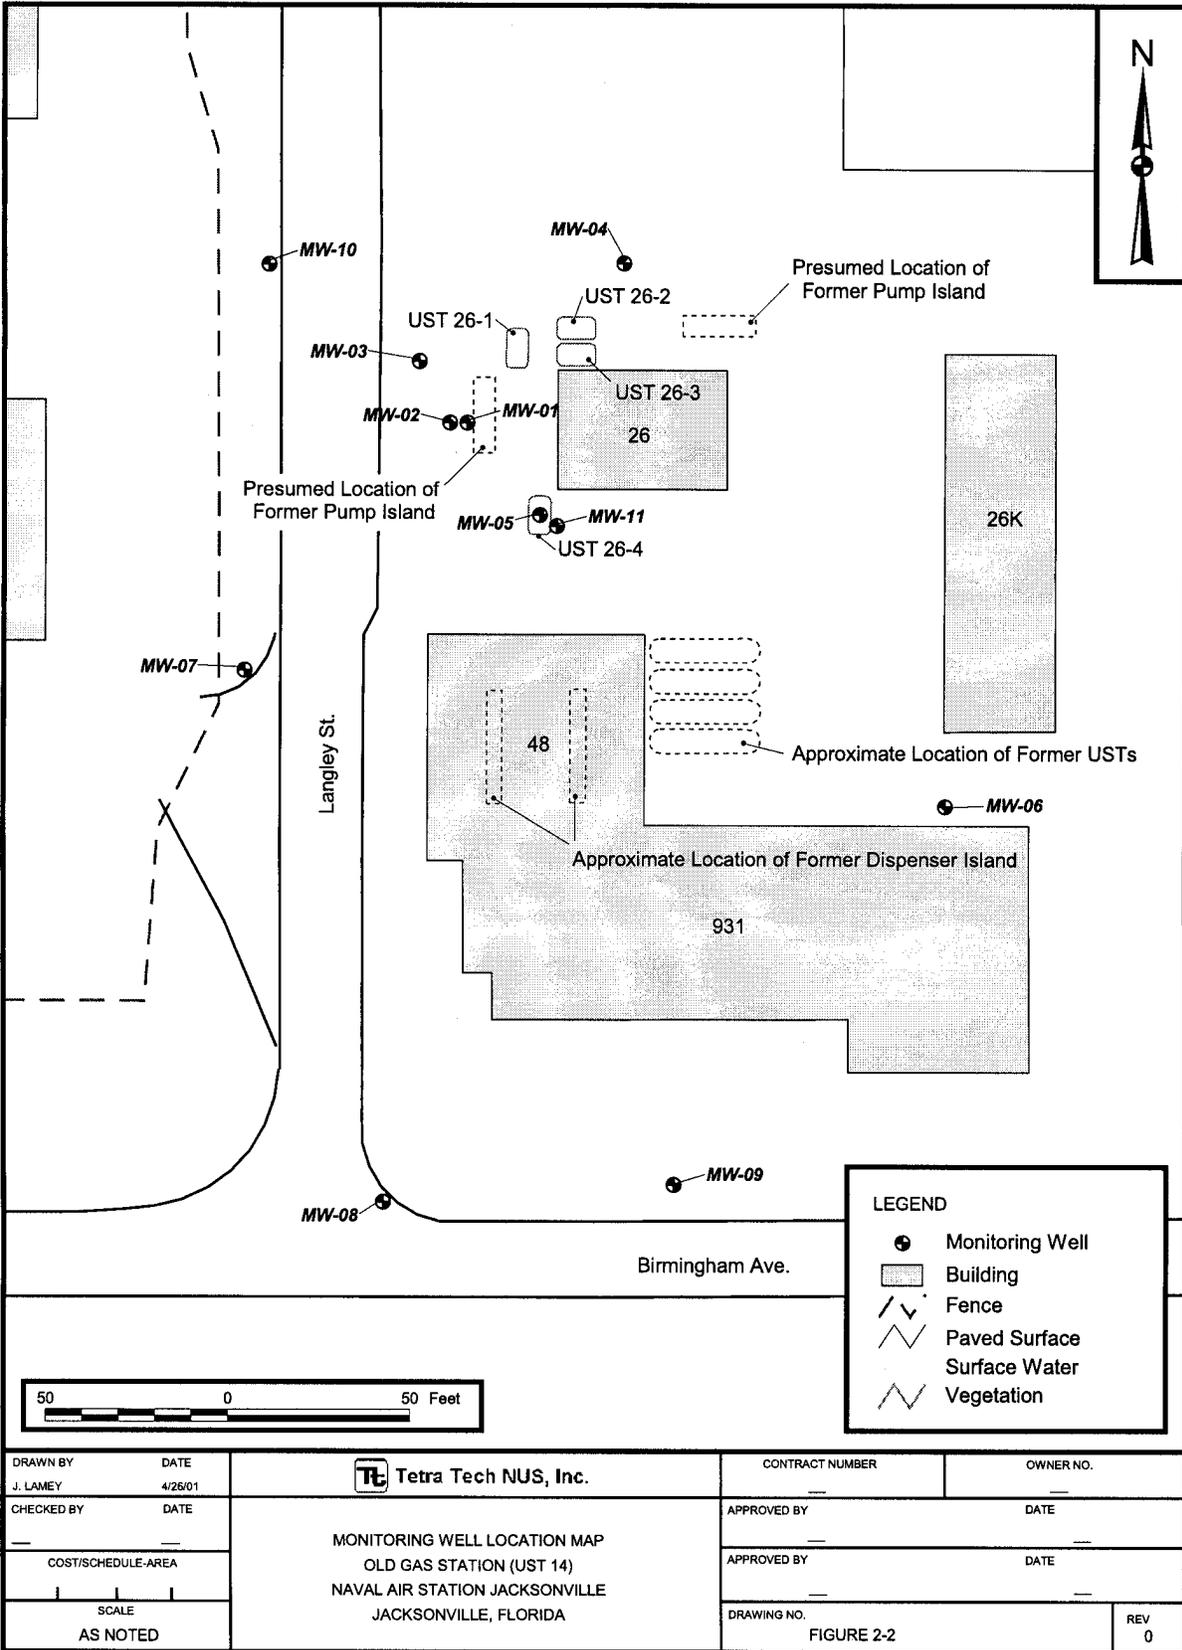

### **2.2.3            Monitoring Well Soil Borings**

On March 8 and 9, 2001, nine monitoring wells (MW-01, MW-02, MW-03, MW-04, MW-05, MW-06, MW-07, MW-08, and MW-09) were drilled by Partridge Well Drilling under the supervision of TtNUS personnel. Soil grab samples collected during borehole advancement were used to characterize the site lithology and to provide additional assessment data. The locations of the monitoring wells are shown on Figure 2-2. Soil boring logs are included in Appendix D.

On July 2, 2001, TtNUS personnel installed two additional monitoring wells (one upgradient well and one vertical extent monitoring well) at the Old Gas Station Site. The upgradient shallow well (MW-10) was installed across Langley Street approximately 60 ft northwest of MW-3 for further delineation to the northwest. The prior advanced boring (SB-33) was used for lithologic description to a depth of approximately 20 ft bls. MW-11, approximately 5 ft to the southeast of MW-5, was installed to a depth of 18 ft bls to further delineate the vertical extent of contamination from the previous Tank 26-4 location.

Underground utilities were cleared by base personnel and also investigated at each boring location by advancing the boring with a post hole digger from 0 to 4 ft bls. The borings were continued with a truck-mounted drill rig using 4 ¼-inch ID hollow-stem augers.

Soil cuttings generated during the well installations were placed in 55-gallon steel drums. A composite soil sample was collected from the drums and analyzed for BTEX, MTBE, and Resource Conservation and Recovery Act metals for pre-disposal characterization.

P:\GIS\JACKSONVILLE\_NAS\APR\PROGS.APR MONITORING WELL LOCATION MAP 11/2/01 JAL

## **2.3 WELL CONSTRUCTION**

### **2.3.1 Monitoring Well Construction and Development**

Monitoring wells were installed in select locations based on the DPT screening results. The monitoring wells were placed to provide spatial coverage around the site and to confirm the nature and extent of the hydrocarbon plume at the Old Gas Station (UST 14) area.

Monitoring wells MW-01, MW-02, MW-03, MW-04, MW-05, MW-06, MW-07, MW-08, MW-09, MW-10 and MW-11 were advanced using 4 ¼-inch ID hollow-stem augers. Each well was constructed of 2-inch ID flush threaded, schedule 40 polyvinyl chloride (PVC) solid riser and 0.010-inch slot well screen with a silt trap and well bottom cap.

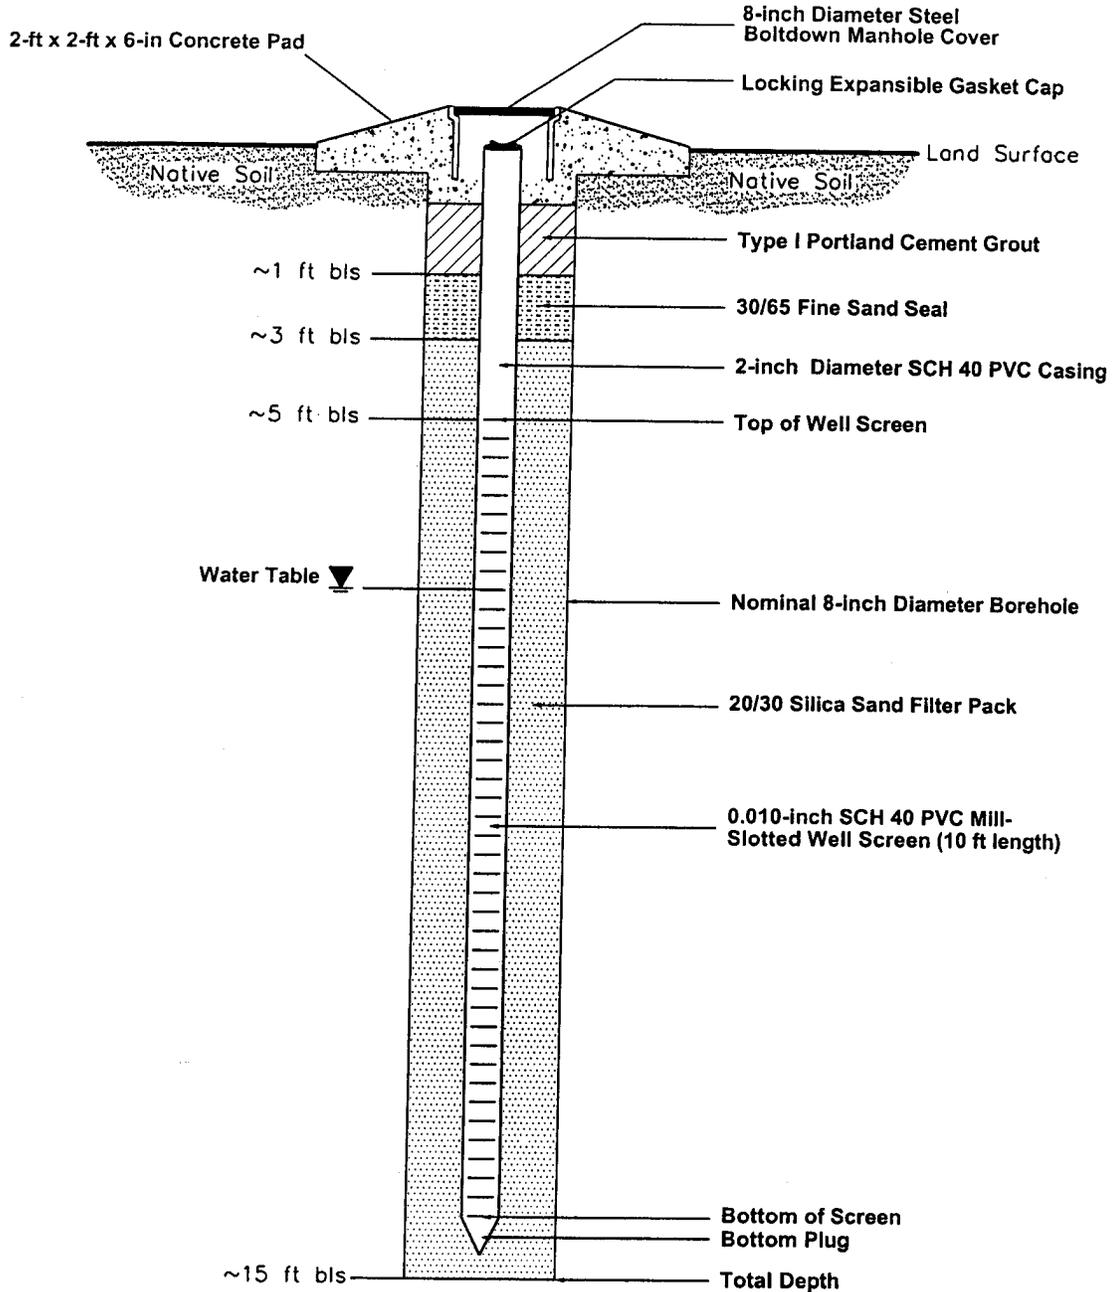

The shallow wells (MW-02 through MW-10) were installed to approximately 13 ft with a 10-ft screened interval. The deep wells MW-01 and MW-11 were installed to 22 ft bls and 18 ft bls respectively, with a 5-ft screened interval. Each annulus was filled to approximately 2 ft above the well screen with US Standard Sieve size 20/30 silica sand. The 20/30 sand was capped to about 1 ft bls with 30/65 sand. The remainder of the annulus was grouted to the surface with a cement/bentonite grout. Each well was secured with a locking, watertight cap within a steel, 8-inch diameter steel manhole. The manhole was set within a 24-inch square apron finished slightly above grade. A well construction diagram is included as Figure 2-3. Well completion logs are provided in Appendix E.

Each well was developed using a submersible pump. During well development, field measurements of pH, temperature, and specific conductance were monitored from the purge water generated. The wells were developed under supervision of a geologist up to a maximum of 1 hour or until the field measurements became stable and the purge water clear. Water quality stabilization was determined using the following criteria: temperature  $\pm 5$  degrees Celsius ( $^{\circ}\text{C}$ ), pH  $\pm 0.1$  unit, and specific conductance  $\pm 10$  micro-ohms per centimeter ( $\mu\text{mhos/cm}$ ). All development water was containerized for disposal in 55-gallon steel drums. The water in the drums was sampled prior to disposal.

## **2.4 LITHOLOGIC SAMPLING**

Representative soil samples were collected during the DPT boring advancement to assess the shallow subsurface geologic conditions at the site. Samples used for lithologic description were collected from a stainless steel split spoon sampler lined with plastic sleeves. Grab samples from soil cuttings generated during monitoring well installations were also used for lithologic description. Seven split spoon samples were collected during the installation of MW-01 and six split spoon samples were collected from the

southernmost well (MW-09) for lithologic description of the area. Four split spoon samples were collected during the installation of well (MW-10) and used for lithologic description of the upgradient area.

## **2.5 SOIL VAPOR ANALYSIS**

Headspace analysis was conducted on soil samples collected during the soil vapor assessment (direct push borings) using an OVA-FID. The soil vapor analysis was performed according to the head space method prescribed in Rule 62-770.200 (2), FAC.

## **2.6 SOIL ANALYSIS**

Upon completion of each direct push soil boring, the soil sample from the interval above the water table that exhibited the highest OVA reading was retained for mobile laboratory analysis. The sample was placed in a 4-ounce glass jar and immediately provided to KB Labs (the onsite mobile laboratory) for screening of BTEX, MTBE, naphthalene, 1-methylnaphthalene, 2-methylnaphthalene, and screening DRO. Data reports for the mobile laboratory are included in Appendix F. Duplicate soil samples for fixed-based laboratory analysis were collected at soil borings SB-01, SB-03, SB-07, SB-09, SB-14, and SB-25 and analyzed using United States Environmental Protection Agency (USEPA) Method 8021B for BTEX and MTBE, USEPA Method 8310 for polynuclear aromatic hydrocarbons (PAHs), and Florida Petroleum Range Organics (FL-PRO) for total petroleum hydrocarbons (TPH)

On July 25, 2001, TtNUS personnel advanced two soil borings at locations SB-03, and SB-14 to collect soil samples for SPLP analysis. Samples were collected from SB-03 and SB-14 at approximately 5 ft bls and sent to Katahdin Laboratories in Westbrook, Maine for analysis. All analyses were conducted in accordance with the Naval Facilities Engineering Service Center quality assurance/quality control criteria using SW-846 8260B, 8310, and FL-PRO methodology. The soil laboratory data reports are included in Appendix G.

## **2.7 HYDROGEOLOGIC INVESTIGATION**

### **2.7.1 Water Level Measurements**

Water level measurements were collected to determine the depth to water in the surficial aquifer and to determine the relative groundwater flow direction. The depth to water measurements for shallow monitoring wells MW-01 through MW-9 were measured on March 20, 2001, and for deep monitoring wells MW-10 and MW-11 on July 12, 2001. Measurements were collected from the north rim of the top of well casings using an electronic water level indicator.

The elevation of the north rim for each top of well casing (MW-01, MW-02, MW-03, MW-04, MW-05, MW-06, MW-07, MW-08, MW-09, MW-10 and MW-11) was surveyed by TtNUS personnel with respect to an assumed vertical datum. The top of casing elevation of each permanent monitoring well was surveyed relative to each other and referenced to site features. The groundwater elevation was calculated by subtracting the depth to water from the top of casing elevation.

On September 20, 2001, TtNUS personnel, as per the requirements of 62-770, FAC, performed a second round of water level measurements at the Old Gas Station Site.

## **2.8 WATER SAMPLING**

### **2.8.1 Groundwater Sampling Direct-Push Investigation**

During the direct-push field investigation, each soil boring was continued into the saturated zone to collect groundwater samples for mobile laboratory screening. The samples were collected using a detachable drive tip attached to a 24-inch long, retractable, stainless steel well screen encased in the lead probe tube. After the water sampler was advanced into the water bearing zone, the probe was withdrawn 24 inches to allow the retractable screen to open to the formation. For groundwater recovery, a length of Tygon tubing was inserted into the probe and connected to a peristaltic pump. Several screen volumes were then pumped from the probe in order to reduce the turbidity level and ensure a representative sample. After purging, the groundwater samples were collected by pumping directly into 40-milliliter (ml) vials. The samples were immediately delivered to the onsite mobile laboratory for screening of BTEX, MTBE, naphthalene, 1-methylnaphthalene, 2-methylnaphthalene, and screening DRO. The results of the mobile laboratory screening are summarized in Section 3.0.

### **2.8.2 Groundwater Sampling of Monitoring Wells**

Groundwater sampling of monitoring wells was performed to determine the presence or absence of dissolved petroleum hydrocarbons in groundwater in the vicinity of the Old Gas Station (UST 14). Groundwater samples were collected by TtNUS personnel from MW-01 through MW-09 on March 20 and March 21, 2001 and from MW-10 and MW-11 on July 12, 2001. The groundwater samples were analyzed using USEPA Method 239.2 for lead (unfiltered), USEPA Method 504.1 for 1,2-dibromoethane (EDB), USEPA Method 8310 for PAHs, and USEPA Method 8021 for purgeable aromatics and purgeable halocarbons, and FL-PRO for petroleum range organics. Prior to sampling, approximately three to five well volumes of groundwater were removed from each well using low flow quiescent purging methods. Temperature, pH, specific conductance measurements, and well purge volumes were recorded at the time of sample collection. Groundwater samples were placed on ice and shipped to Katahdin Analytical Services, Westbrook, Maine.

All sampling activities were performed in accordance with the procedures prescribed in the FDEP Quality Assurance Sections: Standard Operating Procedures for Laboratory Operations and Sample Collection Activities (DEP-001/92) adopted by TtNUS CompQAP Number 980038. In accordance with DEP-001/92 Section 4.4.2, sample preservation was accomplished by obtaining pre-preserved containers from a laboratory with an FDEP approved CompQAP (Katahdin Analytical Services). During the sampling events, quality control samples (e.g., equipment blanks and duplicates) were prepared and submitted to the laboratory as required by the approved CompQAP. Sampling activities were documented in a site-specific field logbook, and samples were transmitted under chain-of-custody protocols to the laboratory. Groundwater field sampling data sheets are provided in Appendix H. Groundwater laboratory data sheets are included in Appendix I.

## 3.0 RESULTS OF INVESTIGATION

### 3.1 SITE HYDROGEOLOGY

#### 3.1.1 Lithology

The site is underlain by a light brown to dark gray fine-grained sand to an average depth of 20 ft bls. Below this fine-grained sand, is moist, dense, gray clay with shell fragments. This soil type extends to 28 ft. From 28 to 32 ft, dry, tight clay was encountered. No sampling was conducted beneath 32 ft. Due to the homogeneity of the subsurface, no lithologic cross-section was constructed. Soil boring logs are included as Appendix D.

### 3.2 SOIL VAPOR MEASUREMENTS

Headspace analysis was conducted on soil samples collected during the soil vapor assessment (direct push borings) using an OVA-FID. The soil vapor analysis was performed according to the head space method prescribed in Rule 62-770.200 (2), FAC and described in Appendix C. Headspace readings ranged from 0 to 1018.3 parts-per-million (ppm) detected in SB-25. Soil OVA headspace readings are provided on Table 3-1. Soil boring locations with corresponding OVA headspace readings are depicted on Figure 3-1.

### 3.3 SOIL QUALITY

At each soil boring, a soil sample was collected for analysis by the onsite mobile laboratory for BTEX, MTBE, naphthalene, 1-methylnaphthalene, 2-methylnaphthalene, and screening DRO. The mobile laboratory soil analytical results are summarized on Table 3-2. Figure 3-2 depicts soil boring locations and corresponding mobile lab contaminant concentrations exceeding SCTLs.

Six soil borings were resampled for fixed base laboratory analysis to confirm the mobile laboratory results and confirm soil vapor analysis based on the low, medium, and high soil headspace analysis results as required by 62-770, FAC. The soil borings identified as the low, medium, and high contaminant concentrations were SB-01, SB-03, and SB-14, respectively, for the Building 26 source area and SB-09, SB-07, and SB-25, respectively, for the Building 48 source area. The soil was analyzed for USEPA method 8021B, USEPA method 8310, and FL-PRO. Tested constituents were not present in detectable concentrations in samples from SB-1, SB-7, SB-9, and SB-25. In SB-3, TRPH was detected at 3100 milligrams per kilogram (mg/kg), above the direct residential direct exposure and leachability

P:\GIS\JACKSONVILLE\_NAS\APPROGS.APR SOIL MOBILE LAB RESULTS 11/201 JAL

SCTL of 340 mg/kg. In SB-14, ethylbenzene was detected at 880 µg/kg, above the FDEP Leachability SCTL of 600 µg/kg, but below the residential direct exposure level. Total xylenes was detected at 1600 µg/kg, above the FDEP Leachability SCTL of 200 µg/kg, but below the residential direct exposure level. TRPH was detected in SB-14 at 5800 mg/kg, above both the direct exposure and leachability SCTL. Fixed based laboratory soil quality data is summarized on Table 3-3. Soil boring locations and exceedances of SCTL concentrations are depicted on Figure 3-3. The “excessively contaminated soil” located at the site is defined on Figure 3-1. Soil laboratory analytical results are provided as Appendix H.

On July 25, 2001, TtNUS personnel collected soil samples for SPLP analysis from SB-03 for TRPH and from SB-14 for ethylbenzene, xylenes, naphthalene, 1-methylnaphthalene, 2-methylnaphthalene, and TRPH. The soil samples were collected at approximately 5 ft bls for the SPLP analysis. Review of the analytical results indicates that tested constituents were not present in detectable concentrations in samples from SB-03 or SB-14. However, the method detection limits were elevated for some constituents. Specifically, in the SB-14 sample analysis, the laboratory reporting limit for ethylbenzene and xylene by USEPA Method 8260B is 5 µg/L. However the laboratory can report estimated results as “J” down to their instrument detection limits (IDLs). With the SPLP testing, there is a 1:50 dilution factor, which results in a reporting limit of 250 µg/L and an IDL of 39 µg/L for ethylbenzene and an IDL of 11 µg/L for xylene. No estimated values (J) were reported in either sampling indicating no values above the IDL were present. Soil laboratory analytical results are provided in Appendix H.

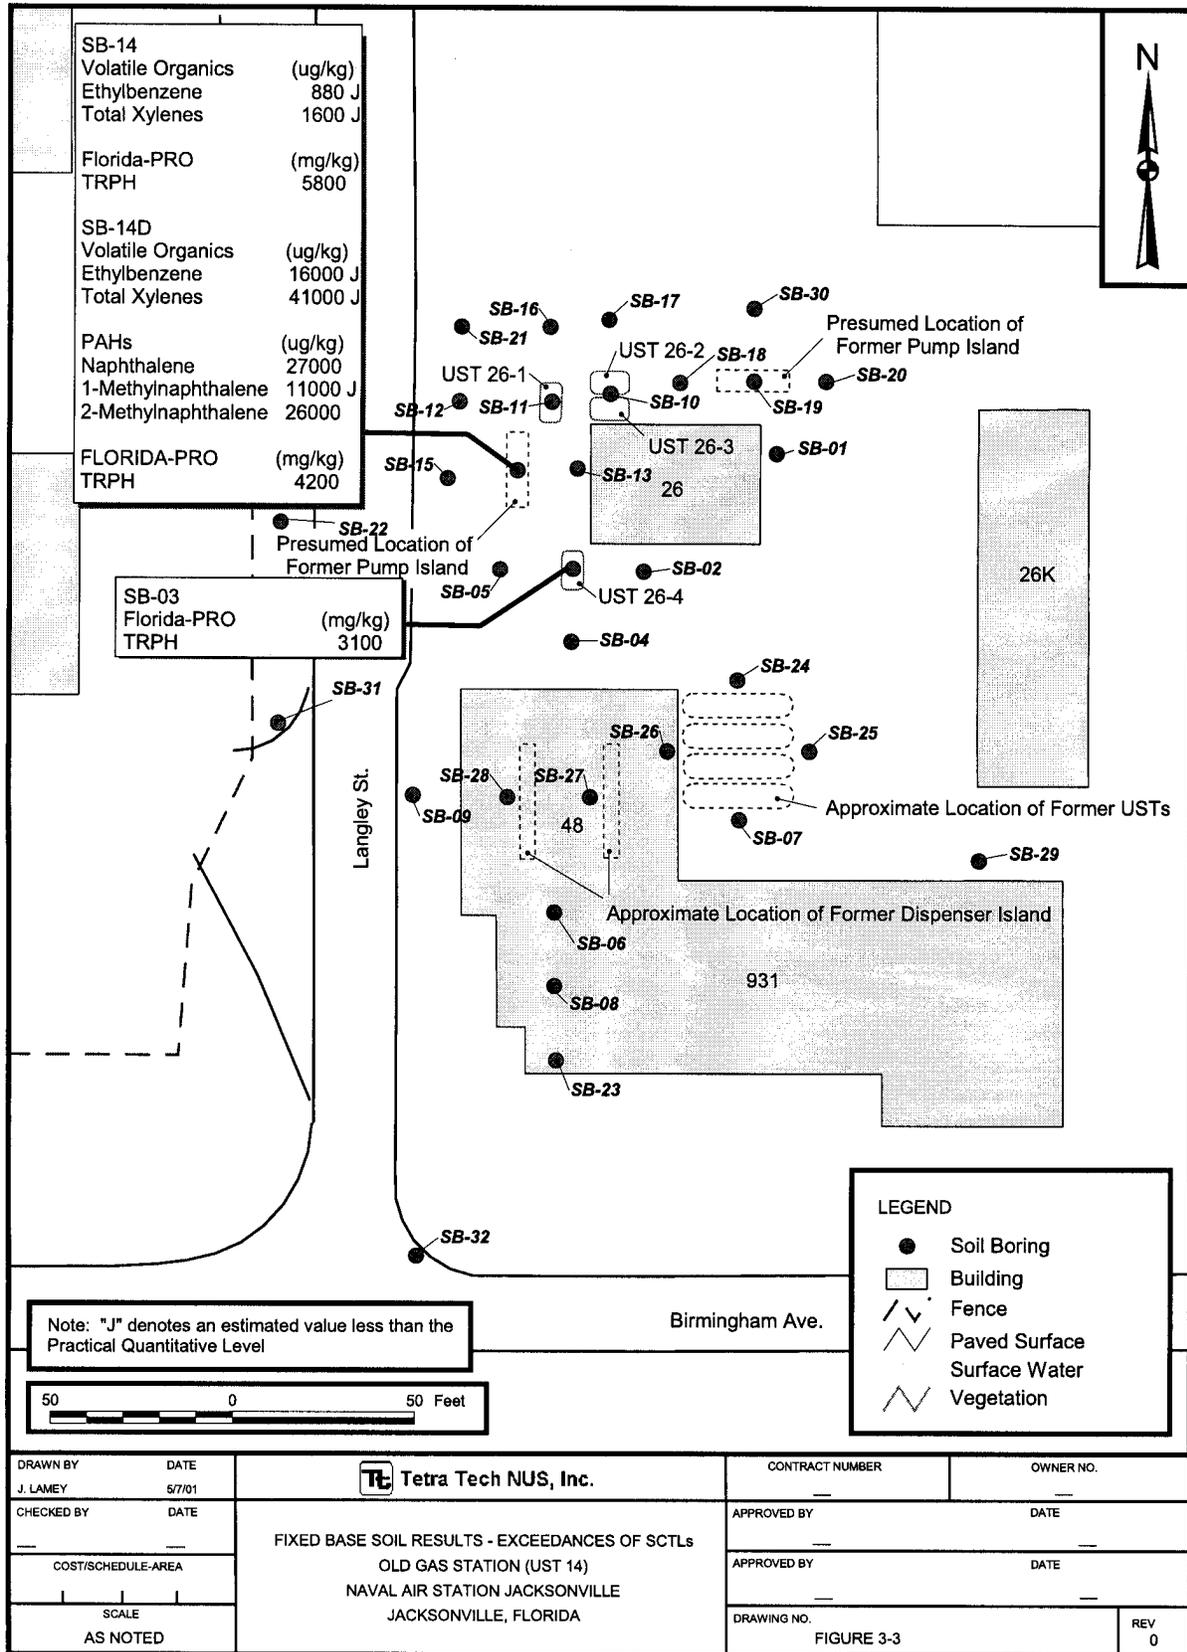

### **3.4 AQUIFER CHARACTERISTICS AND CLASSIFICATION**

The site is underlain by the surficial aquifer that is classified as a G-II aquifer by the State of Florida (Chapter 62-520.410, FAC). During the assessment, the depth to the shallow aquifer ranged from approximately 2 to 6 ft bls. The depth to groundwater measurements for the first and second events are presented in Table 3-4. A Potentiometric Surface Map for March 20, 2001 is depicted in Figure 3-4 and a Potentiometric Surface Map for September 20, 2001 is depicted in Figure 3-5.

Lithologic data and available literature indicate the effective porosity of the soils comprising the surficial aquifer is approximately 0.25 percent (Driscoll, 1986).

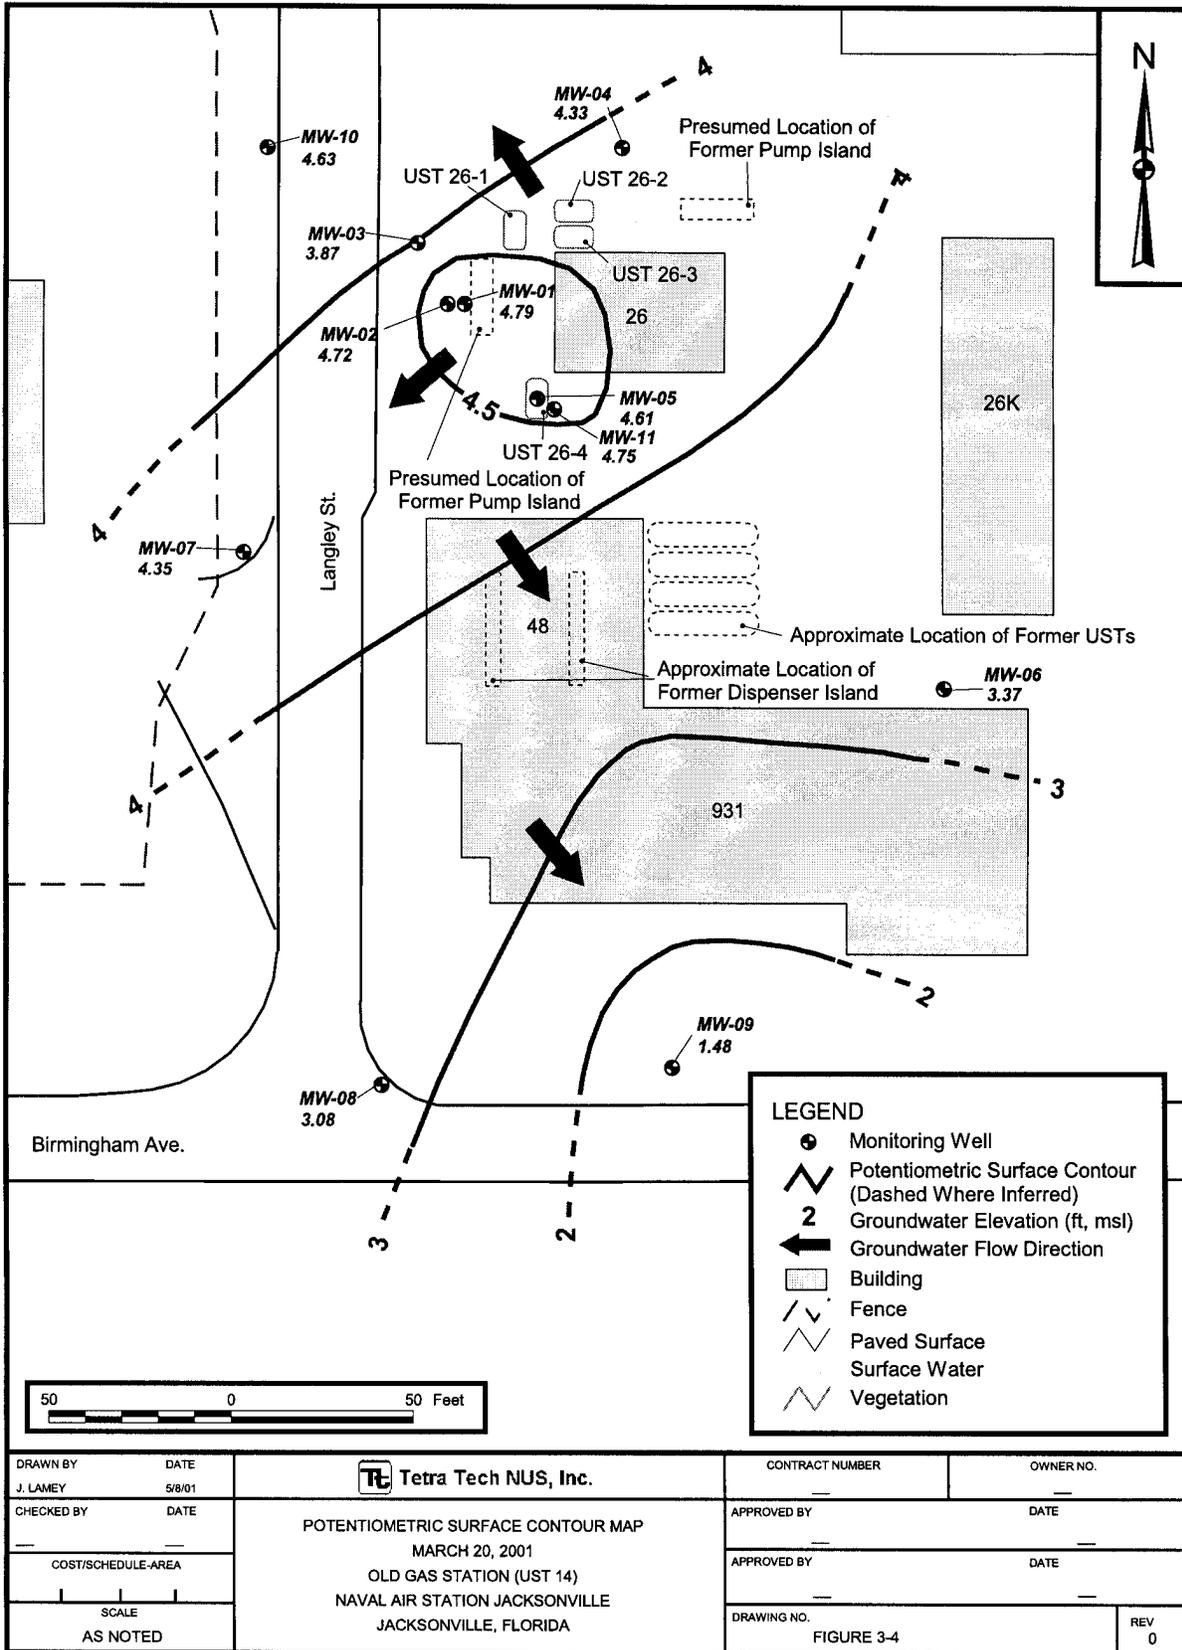

Hydrogeologic data provided by the USGS was referenced from Operable Unit (OU) 3 investigations. Aquifer data from OU 3 indicates the surficial aquifer is composed of distinct upper and intermediate layers. The upper layer extends from land surface to a depth of approximately 15 ft below sea level; the intermediate layer extends from the upper layer down to the top of the Hawthorn Group. Horizontal hydraulic conductivities in the upper layer, determined from aquifer tests, associated with nearby OU 3, range from 0.19 to 3.8 ft per day (ft/day). According to Hal Davis of the USGS, the horizontal hydraulic

conductivity, in the vicinity of the Old Gas Station (UST 14), is approximately 5 ft/day. The groundwater flow gradient at the Old Gas Station (UST 14) site, using groundwater data from MW-07 and MW-09, was calculated at 0.011 feet per foot (ft/ft) and the groundwater flow velocity at 80.3 ft per year (ft/year).

The groundwater flow gradient was determined using the following equation with groundwater data from MW-07 and MW-09:

$$I = \frac{h_1 - h_2}{d} \text{ where:}$$

I = the hydraulic gradient

$h_1$  = the water elevation at point 1

$h_2$  = the water elevation at point 2

d = the distance between point 1 and point 2

Potential movement of groundwater at the site may be described in terms of transportation by natural flow in the saturated zone while assuming groundwater flow follows Darcy's Law. Darcy's Law may be expressed as:

$$V = \frac{(K \times I)}{n} \text{ where:}$$

V = average seepage velocity

K = hydraulic conductivity

n = effective porosity

I = average hydraulic gradient

### 3.5 WATER QUALITY

Direct-push groundwater sampling results from the mobile laboratory field screening reported exceedances of GCTLs for naphthalene (535 µg/L) and 2-methylnaphthalene (32.6 µg/L) in boring SB-12 and ethylbenzene (106 µg/L), total xylenes (355 µg/L), and naphthalene (45 µg/L) in boring SB-14. The mobile laboratory results are presented in Table 3-5 and exceedances are indicated on Figure 3-6.

Analytical results from the March 2001 sampling event reported exceedances of GCTLs in MW-1 for total xylenes (60 µg/L), above the GCTL of 20 µg/L, and in MW-3 for naphthalene (73 µg/L), above the GCTL of 20 µg/L. A review of the analytical results from monitoring wells MW-10 and MW-11 sampled on July 12, 2001 indicated no exceedances of GCTLs. A summary of groundwater analytical results is presented in Table 3-6 and exceedances are indicated on Figure 3-7. Groundwater laboratory analytical results are provided as Appendix I.

## 4.0 DISCUSSION

### 4.1 SOURCE REMOVAL

The Old Gas Station (UST 14) site was previously investigated during an Initial Assessment Study (IAS) performed by Fred C. Hart and Associates, Inc. in 1983. Building 48 and Building 26 were identified as a PSC because the site contained abandoned USTs in close proximity to a potable water well that was also abandoned. No releases were documented and no contaminants were identified at the site. However, groundwater flow indicated that if contaminants were present, the contaminants could possibly migrate from the site via groundwater flow. As a result, the IAS report recommended a confirmation (verification) study.

During the verification study (Geraghty and Miller, Inc., 1985), four USTs were identified, each having a capacity of 10,000-gallons. According to the Verification Study Report, the tanks were abandoned in 1980 when the fire department completely filled each tank with water. All fill pipes, cross-connecting lines, and vent pipes were removed and capped. Although this action occurred prior to the 1984 promulgation of Chapter 17-61, FAC, which outlined the requirements for stationary tanks, Geraghty and Miller, Inc. recommended these tanks be abandoned or removed in accordance with this regulation. In addition, they recommended that all water contained in the tanks be pumped out for treatment at the wastewater treatment plant. According to a record of a conversation between Bryan Kizer of SOUTHNAVFACENGCOM and David Ford of the NAS Jacksonville Facilities and Environmental Department, dated March 24, 1994, the Tank Inventory Management Systems showed that all four USTs associated with Building 48 had been removed in 1988.

In February 1998, Environmental Detachment Charleston was contracted to perform a closure assessment on four USTs located at Building 26. The USTs and their associated piping and vents were removed on February 23, 1998. A Closure Assessment Report and Closure Assessment Form were filed in March 1998.

### 4.2 HYDROGEOLOGY

The surficial aquifer present at the site consists of a heterogeneous mixture of fine-grained sands to a depth of 20 ft bls. A distinct dense gray clay layer was encountered at an average depth of 20 ft bls. Below the 24-ft depth, dry, tight clay was encountered to the maximum depth drilled at 32 ft bls. Based on data obtained from the USGS, the hydraulic conductivity of the upper at this site is approximately 5 ft/day. Groundwater flow velocity was calculated to be 80.3 ft/year.

The site is situated on the flank of a gentle slope trending to the south toward Mulberry Cove of the St. Johns River. Mounded groundwater is present in the vicinity of the former Building 26 pump island causing a local variation from the overall groundwater flow direction to the south to southeast. The local variation in groundwater due to this mounding effect explains the presence of hydrocarbon constituents in groundwater at SB-12 in an area to the northwest of the former pump island.

#### **4.3 SITE ASSESSMENT RESULTS**

Review of the field headspace analyses, mobile laboratory analyses, and fixed based laboratory analyses indicate that hydrocarbon constituents remain in soils and groundwater above regulatory criteria in the vicinity of the former pump island and at UST 26-4. At Building 48, elevated headspace readings were detected, although soil and groundwater samples collected from the vicinity of the Building 48 USTs did not confirm "excessively contaminated soil" and did not exceed regulatory criteria.

Based on soil screening data, "excessively" contaminated soil, as defined by chapter 62-770, FAC, appears to be localized in the former pump island associated with Building 26 and the former UST 26-4 location. Mobile laboratory results for soil samples from the Tank 26-4 boring (SB-03) exceeded only the FDEP leaching criteria for naphthalene, but are less than the residential direct exposure target level. Confirmation analyses conducted in a fixed-based laboratory indicate the presence of naphthalene in the soil, but at levels less than both leaching and residential direct exposure target levels. Ethylbenzene, total xylenes, and naphthalene exceeded leaching target levels in SB-14, but did not exceed residential direct exposure target levels. Fixed based laboratory results for SB-14 indicate that ethylbenzene, xylenes, naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene exceeded leaching target levels, but did not exceed residential direct exposure levels. Fixed based laboratory soil results for SB-14 and SB-3 exceeded both the residential and leachability SCTLs. SPLP analysis was performed on samples from the former pump island associated with Building 26 and the former UST 26-4 locations (SB-14 and SB-3, respectively). Review of the SPLP analytical results indicate that tested constituents were not present in samples collected from SB-03 and SB-14. The contaminated soil is limited to the areas of the former pump island and UST 26-4 as defined on Figure 3-1. Therefore, a source removal is recommended in the areas of the former pump island and UST 26-4.

The extent of impact to soils and groundwater at the site has been defined. Groundwater impact is restricted to 2 of the 11 installed wells, all completed in the surficial aquifer.

Mobile laboratory screening results for groundwater from this area indicate that ethylbenzene and total xylenes in SB-14 and naphthalene and 2-methylnaphthalene in SB-12 exceed GCTLs. Of these

constituents, naphthalene and total xylenes exceed natural attenuation default criteria. Fixed based laboratory results from wells installed in these locations indicate that naphthalene in MW-03 and total xylenes in MW-01 exceeded GCTLs, but did not exceed natural attenuation criteria.

Total xylenes were detected above the GCTL in the deep well MW-01. Monitoring well MW-01 was screened at 17 to 22 ft bls at the interface of the fine-grained sand and the dense clay at 20 ft bls. At 28 ft bls, a tight, dry clay is present preventing downward migration of contaminants. Therefore, the vertical extent of hydrocarbons was been defined. During subsequent phone conversations between TtNUS and FDEP discussing the vertical extent delineation, it was agreed that the vertical extent of hydrocarbon constituents in groundwater had been defined based on the presence of the clay layer.

The most commonly detected constituents consisted of ethylbenzene, total xylenes, PAH compounds, and long chain hydrocarbons (HC-57). The long chain hydrocarbons as reported by the laboratory consists of degraded hydrocarbons consistent with historic releases of motor fuel compounds. The lack of more volatile constituents, such as benzene, combined with the consistent detection of long chain hydrocarbons is evidence that natural attenuation of hydrocarbons is occurring at the site.

## 5.0 CONCLUSIONS AND RECOMMENDATIONS

The results of the SA and the additional site assessment activities at the Old Gas Station (UST 14) suggest the following:

- Headspace readings revealed “excessively contaminated soils” as defined by 62-777.200, FAC, and laboratory confirmatory soil results indicated exceedances of leachability and direct exposure SCTLs. Soil SPLP analysis revealed no exceedances of target constituents.
- Soil sample concentrations exceeding FDEP residential exposure and groundwater leaching target levels were restricted to the former dispenser island associated with Building 26 and to the UST 26-4 location.
- Groundwater impacts above GCTLs are restricted to the former dispenser island location associated with Building 26.
- The lateral and vertical extent of hydrocarbon constituents in soil and groundwater has been defined.
- Total xylenes and naphthalene were detected at levels above natural attenuation default criteria in the source areas by screening efforts with a mobile laboratory. However, monitoring wells installed in these areas using an offsite laboratory confirmed the presence of the constituents, but at levels below natural attenuation default criteria.
- The consistent detection of long chain hydrocarbons at the site combined with the lack of more volatile constituents suggest that hydrocarbons detected at the site are the result of historical releases that have subsequently undergone natural attenuation.

Based on the findings of the SAR, TtNUS recommends that a source removal be implemented for soils located at the former fuel island and UST 26-4, and a Monitoring Only for Natural Attenuation Plan be prepared and implemented for groundwater at the site upon approval of the SAR. TtNUS recommends quarterly sampling events including wells MW1, MW-2, MW-3, and MW-5, for the first year of the sampling program with the analysis of volatile organic compounds by USEPA Method 8021B, PAHs by USEPA Method 8310, and TRPHs by FL-PRO Method.

## SITE ASSESSMENT REPORT SUMMARY SHEET

Facility Name: Old Gas Station (UST 14) Reimbursement Site:   
 Location: Naval Air Station Jacksonville State Contract Site:   
 EDI #: \_\_\_\_\_ FAC I.D.# \_\_\_\_\_ Other: Non-Prog.

Date Reviewed: \_\_\_\_\_ Local Government: \_\_\_\_\_

(1) Source of Spill: Leaking USTs Date of Spill: Unknown

(2) Type of Product:	Gasoline Group	Gallons Lost	Kerosene Group	Gallons Lost
<input type="checkbox"/> Leaded	_____	_____	<input checked="" type="checkbox"/> Kerosene	<u>unknown</u>
<input checked="" type="checkbox"/> Unleaded Regular	_____	<u>unknown</u>	<input type="checkbox"/> Diesel	_____
<input type="checkbox"/> Unleaded Premium	_____	_____	<input type="checkbox"/> JP-4 Jet Fuel	_____
<input type="checkbox"/> Gasohol	_____	_____	<input type="checkbox"/> Heating Fuel	_____
<input type="checkbox"/> Undetermined	_____	_____	<input type="checkbox"/> Unknown	_____

(3) Description of IRA: Soil removed from area of tank pit and pump islands.

<input type="checkbox"/> Free product Removal:	_____ (gals)
<input checked="" type="checkbox"/> Soil Removal:	<u>unknown</u> (cubic yds)
<input type="checkbox"/> Soil Incineration:	_____ (cubic yds)

(4) Free Product still present (yes/no) No Maximum apparent product thickness: N/A (feet)

(5) Maximum Groundwater contamination levels (ppb): Total VOA: \_\_\_\_\_ benzene: \_\_\_\_\_ EDB: \_\_\_\_\_  
 lead: \_\_\_\_\_ MTBE: \_\_\_\_\_ other: 73

(6) Brief lithologic description: Medium to fine sand. No significant lithologic variations across site. Clay stringer Encountered at approximately 22 ft. in MW-1 boring.

(7) Areal and vertical extent of soils contamination defined (yes/no) Yes

Highest current soil concentration (OVA: 1018.3 ppm) or (EPA method 5030/8020: \_\_\_\_\_ ppb)

(8) Lower aquifer contaminated? (yes/no) No Depth of vertical contamination: N/A.

(9) Date of last complete round of groundwater sampling: 3/21/01 Date of last soil sampling: 3/10/01

(10) QAPP approved? (yes/no) Date: yes

(11) Direction (e.g. NNW) of surficial groundwater flow: SSE (Fig. 3-1 on page \_\_\_\_\_)

(12) Average depth to groundwater: 4 ft. (ft)

(13) Observed range of seasonal groundwater fluctuations: \_\_\_\_\_ (ft) (Based on water level data collected during the CAR investigation)

(14) Estimated rate of groundwater flow: 5 (ft/day)

(15) Hydraulic gradient across site: 0.018 (ft/ft)

(16) Aquifer characteristics:	Values	Units	Method
Hydraulic conductivity	<u>5</u>	<u>ft/day</u>	<u>Literature (USGS)</u>
Storage coefficient	<u>-</u>	<u>ft/ft</u>	<u>-</u>
Aquifer thickness	<u>-</u>	<u>ft</u>	<u>-</u>
Effective soil porosity	<u>-</u>	<u>%</u>	<u>-</u>
Transmissivity	<u>-</u>	<u>gal/day/ft</u>	<u>-</u>

(17) Other remarks: None

**APPENDIX B**  
**HEADSPACE SCREENING METHODOLOGY**

actual circumstances of exposure, diversity studies, toxicity testing or other evidence of harmful effects, as applicable. (Refer to the Development and Evaluation of Sediment Quality Assessment Guidelines, Volumes 1-4, dated November 1994, for guidance on the evaluation of concentrations of petroleum products' contaminants of concern and sediment quality conditions.)

(7) "Contaminated soil" means soil that is contaminated with petroleum or petroleum products or their chemical constituents to the extent that applicable soil cleanup target levels specified in Chapter 62-777, F.A.C., are exceeded.

(8) "Contamination" refer to the definition for "contaminated."

(9) "Discharger" means the person who has dominion or control over the petroleum or petroleum products at the time of the discharge into the environment.

(10) "Discovery" means:

(a) Observance or detection of free product in boreholes, wells, open drainage ditches, open excavations or trenches or on nearby surface water, or petroleum or petroleum products in excess of 0.01 foot in thickness in sewer lines, subsurface utility conduits or vaults, unless the product has been removed and it was confirmed that a release into the environment did not occur;

(b) Observance of visually stained soil or odor of petroleum products resulting from a discharge of used oil equal to or exceeding 25 gallons on a pervious surface;

(c) Discharges of petroleum or petroleum products equal to or exceeding 25 gallons on a pervious surface;

(d) Results of analytical test on a groundwater sample that exceed the cleanup target levels referenced in Chapter 62-777, F.A.C., Table I, groundwater criteria column; or

(e) Results of analytical test on a soil sample that exceed the lower of the direct exposure residential cleanup target levels and leachability based on groundwater criteria cleanup target levels specified in Chapter 62-777, F.A.C., Table II.

(11) "Engineering control" means a modification to a site to reduce or eliminate the potential for migration of, and exposure to, petroleum products' contaminants of concern. Examples of modifications include physical or hydraulic control measures, capping, point-of-use treatments, or slurry walls.

(12) "Excessively contaminated soil" for the purposes of Section 376.3071(11)(b)2., F.S. (unless laboratory results verify that the organic vapor analysis data are not relevant), means soil saturated with petroleum or petroleum products or soil that causes a total corrected hydrocarbon measurement of 500 parts per million (ppm) or higher for Gasoline Analytical Group or 50 ppm or higher for Kerosene Analytical Group. Readings shall be obtained at the site on an organic vapor analysis instrument with a flame ionization detector in the survey mode upon sampling the headspace in half-filled, eight-ounce or 16-ounce jars. Each soil sample shall be split into two jars, the two samples shall be brought to a temperature of between 20°C. (68°F.) and 32°C. (90°F.) and the readings shall be obtained five minutes thereafter. One of the readings shall be obtained with the use of an activated charcoal filter unless the unfiltered reading is non-detect. The total corrected hydrocarbon measurement

shall be determined by subtracting the filtered reading from the unfiltered reading. Instruments with a photo ionization detector may be used after a determination is made of that instrument's equivalent response to an instrument with a flame ionization detector. Photo ionization detectors shall not be used in situations where humidity will interfere with the instruments' sensitivity (including periods of rain, measuring wet or moist soil). Analytical instruments shall be calibrated in accordance with the manufacturer's instructions.

(13) "Free product" means petroleum or petroleum product in excess of 0.01 foot in thickness, measured at its thickest point, floating on surface water or groundwater.

(14) "Gasoline Analytical Group" means aviation gasoline, gasohol, and motor gasoline or equivalent petroleum products.

(15) "Groundwater" means water beneath the surface of the ground within a zone of saturation, whether or not flowing through known or definite channels.

(16) "Innovative technology" means a process that has been tested and used as a treatment for contamination, but lacks an established history of full-scale use and information about its cost and how well it works sufficient to support prediction of its performance under a variety of operating conditions. An innovative technology is one that is undergoing pilot-scale treatability studies, which usually are performed in the field or the laboratory and require installation of the technology, and which provide performance, cost, and design objectives for the technology prior to full scale use.

(17) "Institutional control" means a restriction on use of, or access to, a site to eliminate or minimize exposure to petroleum products' contaminants of concern. Examples of institutional controls include deed restrictions, use restrictions, or restrictive zoning.

(18) "Kerosene Analytical Group" means diesel, Jet-A, Jet-B, JP-4, JP-5, and kerosene or equivalent petroleum products.

(19) "Local program" means a county or local program established pursuant to a contract in accordance with Section 376.3073, F.S., to assist the Department in the administration of the petroleum contamination site cleanup.

(20) "Monitoring well" means a well constructed with a surface seal and a sand filter pack in accordance with accepted design practices in order to provide for the collection of representative groundwater samples for laboratory analyses. Such wells may also be used to detect the presence of free product or collect water-level elevation data to aid in determining the direction of groundwater flow.

(21) "Natural attenuation" means an approach to site rehabilitation that allows natural processes to contain the spread of contamination and reduce the concentrations of petroleum products' contaminants of concern in contaminated groundwater and soil. Natural attenuation processes may include the following: sorption, biodegradation, chemical reactions with subsurface materials, diffusion, dispersion, and volatilization.

SDG NARRATIVE  
KATAHDIN ANALYTICAL SERVICES  
TETRA TECH NUS  
CASE NAS JACKSONVILLE  
TASK ORDER MANAGER: GREGORY ROOF

Sample Receipt

The following samples were received on March 22, 2001 and were logged in under Katahdin Analytical Services work order numbers WR0833 for a hardcopy due date of April 19, 2001.

<u>Sample No.</u>	<u>Sample Identification</u>
KATAHDIN WR0833-1	TTNUS JAX-19-IDW1

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Volatile Organic Analysis

One soil/sediment sample was received by the Katahdin GC/MS laboratory on March 22, 2001, and was specified to be analyzed and quantitated for MTBE, benzene, toluene, ethylbenzene, and xylenes (total) in accordance with SW-846 method 8260B.

Analyses for this SDG were performed on the 5970-Q instrument.

Batch QC (VBLK and LCS) was performed in the twelve-hour window. The LCS QC samples were spiked with the entire list of compounds quantitated for at 50 ppb. No matrix spike/matrix spike duplicate pair was analyzed on the sample in this workorder.

Method 8000B, section 7.5.1.2.1 (Revision 2, 12/96) states, "in those instances where the RSD for one or more analytes exceeds 20%, the initial calibration curve may still be acceptable if the mean of the RSD values for all analytes in the calibration is less than or equal to 20%." Method 8260B narrows this 20% maximum to 15%.

In the calibration curve analyzed for this SDG, several analytes had %RSD values exceeding the allowed 15%. Since the average %RSD for all analytes was 8.1%, the curve was acceptable.

00000002

Several manual integrations were performed due to split peaks; all have been flagged with a "M" (software-generated) on the pertinent quantitation reports. All "M" flags have been dated and initialed by the analyst performing the integration. In addition, all "M" flags have been reviewed and approved by the GC/MS supervisor. Copies of each manual integration are included in the data package.

The volatile organic staff noted no other protocol deviations.

### Semivolatile Organics Analysis

One soil/sediment sample was received by the Katahdin Analytical Services laboratory on March 22, 2001 and was specified for analysis in accordance with 8270C for the PAH list of analytes using selected ion monitoring (SIM) to achieve low detection limits.

Extraction of the sample for SIM-PAH analyses occurred following USEPA method 3550 on March 27, 2001. A laboratory control spike/laboratory control spike duplicate pair was extracted in the batch.

Analysis of the LCS, LCSD, and sample WR0833-1 yielded internal standard area recovery deviations. Reanalysis of the sample yielded similar results.

Several manual integrations were performed due to split peaks; all have been flagged with a "M" by the data system. All manual integrations have been dated and initialed by the responsible analyst. Copies of each manual integration are included in the data package. All manual integrations have been reviewed and approved by the GC/MS supervisor.

No other protocol deviations were noted by the semivolatiles organics staff.

### Metals Analysis

The samples of Katahdin Work Order WR0833 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Solid Waste", SW-846, November 1986, Third Edition.

### Inductively-Coupled Plasma (ICP) Atomic Emission Spectroscopic Analysis

Soil-matrix Katahdin Sample No. WR0833-001 was digested for ICP analysis on 04/02/01 (QC Batch RD021CS0) in accordance with USEPA Method 3050B.

ICP analyses of Katahdin Work Order WR0833 sample digestates were performed in accordance with USEPA Method 6010B, using a Thermo Jarrell Ash Trace ICP spectrometer. All samples were analyzed within holding times and all QC criteria were met, with the following comments or exceptions:

Some of the results for run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please

0000003

note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

Soil-matrix Katahdin Sample No. WR0833-001 was digested for mercury analysis on 03/27/01 (QC Batch RC27HGS0) in accordance with USEPA Method 7471A. This sample was prepared with duplicate matrix-spiked aliquots.

Mercury analyses of Katahdin Work Order WR0833 sample digestates were performed using a Leeman Labs PS200 automated mercury analyzer. All samples were analyzed within holding times and all QC criteria were met.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager and/or his designee, as verified by the following signature.

## Summary of Report Notes

Report Note	Note Text
#	'#' flag denotes surrogate compound recovery is out of criteria.
J	'J' flag denotes an estimated value less than the Laboratory's Practical Quantitation Level.
O-13	Internal standard area(s) are out of criteria. Reanalysis confirmed matrix interference.

March 27, 2001

Greg Roof  
Tetra Tech NUS, Inc.  
7018 AC Skinner Parkway  
Suite 250  
Jacksonville, FL 32256

Dear Mr. Roof:

Enclosed is the final report of the on-site analysis performed by KB Labs, Inc. at the Od Gas Station site at Jacksonville Naval Air Station. On-site analyses were performed March 5 – March 7, 2001. Included are a hardcopy of the final analytical results in Excel spreadsheet format, a brief project narrative, tables listing quality control results, and copies of sample chain-of-custody forms. The final analytical results were also sent by E-Mail.

KB Labs is approved as a mobile laboratory for volatiles analyses and operates under an FDEP approved Comprehensive Quality Assurance Plan (CompQAP #980029 Revision 3). All data for the site referenced above were determined in accordance with published procedures Test Methods for Evaluating Solid Waste (EPA SW-846, Update III Revised May 1997), unless stated otherwise in our CompQAP under method modifications. Quality assurance and quality control procedures performed in conjunction with analysis of groundwater samples determined that the reported data met our CompQAP requirements for accuracy and precision unless otherwise indicated on the quality control narrative accompanying the data report.

If you have any questions, please do not hesitate to call me or Kelly Bergdoll at (352) 367-0073.

Sincerely,

Michael G. Winslow  
Quality Assurance Officer

**PROJECT NARRATIVE**

<b>Client :</b> Tetra Tech NUS, Inc. <b>Site :</b> Jacksonville NAS, Old Gas Station <b>Onsite Dates:</b> 03/05/01 – 03/07/01	<b>Driller/Sampler:</b> <b>KB Labs Project Manager:</b> Kelly Bergdoll <b>Client Project Manager:</b> Greg Roof	<b>Analyst:</b> Greg Lamb <b>KB Labs Project No:</b> 01008 <b>Matrix:</b> Soil/Water
---	---	--

**Project Scope**

On March 5 – March 7, 2001, a total of thirty-four (34) water samples and thirty-one (31) soil samples were collected at the Old Gas Station, Jacksonville NAS. Samples were analyzed onsite in the KB Labs mobile facility. The samples were analyzed for benzene, toluene, ethylbenzene, m&p-xylene, o-xylene, MTBE, naphthalene, 1- and 2-methylnaphthalene, and HC-57.

**Analytical Procedure**

Water - Water samples were analyzed using SW846 Method 5030/8260 for waters. Ten (10) milliliters (mL) of water were purged with helium and the volatile organic compounds (VOCs) were collected on a solid-phase adsorption trap. The adsorption trap was heated and back-purged with helium and the components were separated by capillary column gas chromatography and measured with a mass spectrometer (GC/MS) operated in the electron impact full-scan mode. The individual VOCs in the samples were measured against corresponding VOC standards.

Soil - Soil samples were analyzed using SW846 Method 5030/8260. One (1) gram of soil sample was placed in ten (10) milliliters (mL) of water and purged with helium gas. The volatile organic compounds (VOCs) were collected on a solid-phase adsorption trap. The adsorption trap was heated and back-purged with helium and the components were separated by capillary column gas chromatography and measured with a mass spectrometer (GC/MS) operated in the electron impact full-scan mode. The individual VOCs in the samples were measured against corresponding VOC standards.

**Analytical Results**

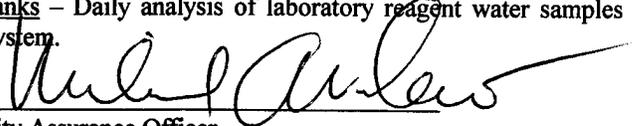

Laboratory results were provided to the client on an as-completed or next-day basis. Final results of the on-site analyses are provided in a standard Excel spreadsheet format. The data produced and reported in the field has been reviewed and approved for this final report by the KB Labs Quality Assurance (QA) Officer.

There is no analytical record for sample SB31 4'-6' Soil collected on 3/7/01.

**Quality Control (QC) Data**

Surrogate Recoveries – Tables 1.1 – 1.3 list the daily analytical sequence and percent recovery results for surrogate compounds which were added to all analyses. Four (4) surrogate compounds were added to each analysis in order to continually monitor general method performance.

Method Blanks – Daily analysis of laboratory reagent water samples was performed in order to monitor the cleanliness of the analytical system.

**TETRA TECHNUS, INC.  
NAS JACKSONVILLE  
WR0626**

**FLORIDA CERTIFICATION # E87604**

**KATAHDIN ANALYTICAL SERVICES, INC.  
340 COUNTY ROAD 5  
WESTBROOK, ME 04092**

**April 9, 2001**

Initial analyses of samples WR0626-1 and -4 yielded internal standard area and surrogate recovery deviations, as well as severe chromatographic interferences. Reanalyses occurred of the methanol aliquots. Both sets of data for each sample are included in the data package.

The initial low level analysis of sample WR0626-3 yielded no useable data due to chromatographic interferences. Only the methanol analysis is included in this data package.

Method 8000B, section 7.5.1.2.1 (Revision 2, 12/96) states, "in those instances where the RSD for one or more analytes exceeds 20%, the initial calibration curve may still be acceptable if the mean of the RSD values for all analytes in the calibration is less than or equal to 20%." Method 8260B narrows this 20% maximum to 15%.

In the calibration curves analyzed for this SDG, several analytes had %RSD values exceeding the allowed 15%. Since the average %RSD for all analytes was 12.9% and 14.2%, the curves were acceptable.

Several manual integrations were performed due to split peaks; all have been flagged with a "M" (software-generated) on the pertinent quantitation reports. All "M" flags have been dated and initialed by the analyst performing the integration. In addition, all "M" flags have been reviewed and approved by the GC/MS supervisor. Copies of each manual integration are included in the data package.

The volatile organic staff noted no other protocol deviations.

### **Semivolatile Organics Analysis**

One aqueous and seven soil/sediment samples were received by the Katahdin Analytical Services laboratory on March 8, 2001 and were specified for analysis in accordance with 8270C for the PAH list of analytes using selected ion monitoring (SIM) to achieve low detection limits.

Extraction of the soil samples for SIM-PAH analyses occurred following USEPA method 3550 on March 13, 2001. A laboratory control spike was extracted in the batch, along with a matrix spike/matrix spike duplicate pair on sample WR0626-5. The aqueous sample was extracted following USEPA method 3510 on March 13, 2001. A laboratory control spike/laboratory control spike duplicate pair was extracted in this batch.

Initial analyses of samples WR0626-1, -3, and -4 yielded target analyte concentrations over the upper limit of the calibration curve. These analyses also yielded internal standard area and/or surrogate recovery deviations. Reanalyses occurred at 1:25, 1:25, and 1:500 dilutions, respectively. For each analysis, both sets of data are included in this data package.

Several manual integrations were performed due to split peaks; all have been flagged with a "M" by the data system. All manual integrations have been dated and initialed by the responsible analyst. Copies of each manual integration are included in the data package. All manual integrations have been reviewed and approved by the GC/MS supervisor.

No other protocol deviations were noted by the semivolatiles organics staff.

SDG NARRATIVE  
KATAHDIN ANALYTICAL SERVICES  
TETRA TECH NUS  
CASE NAS JACKSONVILLE  
TASK ORDER MANAGER: GREGORY ROOF

**Sample Receipt**

The following samples were received on March 8, 2001 and were logged in under Katahdin Analytical Services work order numbers WR0626 for a hardcopy due date of April 5, 2001.

<u>Sample No.</u>	<u>Sample Identification</u>
KATAHDIN	TTNUS
WR0626-1	NASJAX-UST14-SB14-04
WR0626-2	NASJAX-UST14-SB01-04
WR0626-3	NASJAX-UST14-SB03-04
WR0626-4	NASJAX-UST14-SB-DUP1
WR0626-5	NASJAX-UST14-SB09-04
WR0626-6	NASJAX-UST14-SB25-04
WR0626-7	NASJAX-UST14-SB07-04
WR0626-8	NASJAX-UST14-SB-EB1
WR0626-9	NASJAX-UST14-SB-TB1

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

**Volatile Organic Analysis**

Two aqueous and seven soil/sediment sample was received by the Katahdin GC/MS laboratory on March 8, 2001, and was specified to be analyzed and quantitated for BTEX and MTBE in accordance with SW-846 method 8260B.

Analyses for this SDG were performed on the 5973-U instrument.

Batch QC (VBLK and LCS) was performed in each twelve-hour window. The LCS QC samples were spiked with the entire list of compounds quantitated for at 50 ppb. A matrix spike/matrix spike duplicate pair was analyzed on sample WR0626-5.

GC Laboratory

Samples WR0626-1 through -8, were received on March 7, 2001 and were analyzed for petroleum range organics according to Method # FL-PRO. Sample WR0626-5 was selected for the matrix spike (MS) and matrix spike duplicate (MSD) as per client request. All samples and QC were extracted and analyzed within hold times, and all QC criteria were met with the following comments:

PRO Analysis

Sample WR0626-1, 3 and 4 were diluted in order to bring the high PRO concentration into the calibration range. Consequently, the surrogates were diluted out of range.

The recoveries of the surrogate o-Terphenyl were low and outside of the method acceptance limits for the following samples: BF1037, LCFD1037, and WR0626-6.

The laboratory control sample, LCF1036, had a high PRO recovery that was outside of the method acceptance limits. The high recovery is likely attributable to a single peak that was laboratory introduced during the extraction process, which elutes within the retention time window of PRO.

Sample WR0626-5MS had a low PRO recovery while the recovery for WR0626-5MSD was not calculable due to the sample concentration being higher than the MSD. This is likely due to a matrix effect.

The relative percent difference (RPD) between LCF1037 and LCFD1037 was above the method acceptance limit of 25%.

There were no other protocol deviations or observations noted by the GC laboratory staff.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager and/or his designee, as verified by the following signature.

# KATAHDIN ANALYTICAL SERVICES

## Summary of Report Notes

Report Note	Note Text
#	'#' flag denotes surrogate compound recovery is out of criteria.
E	'E' flag indicates an estimated value. The analyte was detected in the sample at a concentration greater than the standard calibration range.
J	'J' flag denotes an estimated value less than the Laboratory's Practical Quantitation Level.
O-1	Sample dilution required due to matrix interference, sample viscosity or other matrix-related problem; therefore, standard laboratory Practical Quantitation Level (PQL) could not be achieved.
O-13	Internal standard area(s) are out of criteria. Reanalysis confirmed matrix interference.
O-2	Sample dilution required for quantitation of one or more target analytes; therefore, standard laboratory Practical Quantitation Level (PQL) could not be achieved.

## Summary of Report Notes

Report Note	Note Text
#	'#' flag denotes surrogate compound recovery is out of criteria.
DL	'DL' flag denotes inability to calculate surrogate recovery due to sample dilution.
E	'E' flag indicates an estimated value. The analyte was detected in the sample at a concentration greater than the standard calibration range.
J	'J' flag denotes an estimated value less than the Laboratory's Practical Quantitation Level.
O-2	Sample dilution required for quantitation of one or more target analytes; therefore, standard laboratory Practical Quantitation Level (PQL) could not be achieved.

RE: Katahdin Lab Number: WR2618  
Project ID: CTO#145  
Project Manager: Ms. Andrea J. Colby  
Sample Receipt Date(s): July 26,2001

Dear Ms. Thomson:

Please find enclosed the following information:

- \* Report of Analysis
- \* Quality Control Data Summary
- \* Chain of Custody (COC)
- \* Confirmation

A copy of the Chain of Custody is included in the paginated report. The original COC is attached as an addendum to this report.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact the project manager listed above. This cover letter is an integral part of the ROA.

We appreciate your continued use of our laboratory and look forward to working with you in the future. The following signature indicates technical review and acceptance of the data.

Sincerely,

KATAHDIN ANALYTICAL SERVICES

REPORT OF ANALYTICAL RESULTS

Page 1 of 2

SAMPLE DESCRIPTION	MATRIX	SAMPLED BY		SAMPLED DATE RECEIVED			
JAX-19-SB14A	Aqueous	CLIENT		07/25/01	07/26/01		
PARAMETER	RESULT	UNITS	DF	*PQL	METHOD	ANALYZED BY	NOTES
Petroleum Range Organics							1,2,3
Petroleum Range Organics	B5400	µg/L	1.0	500	FL-PRO	09/07/01 JG	
o-Terphenyl	#61	%	1.0		FL-PRO	09/07/01 JG	
n-triacontane-D62	#41	%	1.0		FL-PRO	09/07/01 JG	

- \* PQL (Practical Quantitation Level) represents laboratory reporting limits and may not reflect sample-specific reporting limits. Sample-specific limits are indicated by results annotated with '<' values.
- (1) Sample Preparation on 08/09/01 by AB
  - (2) "#" flag denotes surrogate compound recovery is out of criteria.
  - (3) A result reported with a "B" qualifier indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample. The concentration of PRO in the method blank was 3900ug/L.

PARAMETER	RESULT	UNITS	DF	*PQL	METHOD	ANALYZED	BY	NOTES
Petroleum Range Organics								
Petroleum Range Organics	B4900	µg/L	1.0		500 FL-PRO	09/07/01	JG	1,2,3
o-Terphenyl	#46	%	1.0		FL-PRO	09/07/01	JG	
n-triacontane-D62	#33	%	1.0		FL-PRO	09/07/01	JG	

\* PQL (Practical Quantitation Level) represents laboratory reporting limits and may not reflect sample-specific reporting limits. Sample-specific limits are indicated by results annotated with '<' values.

- (1) Sample Preparation on 08/09/01 by AB
- (2) "#" flag denotes surrogate compound recovery is out of criteria.
- (3) A result reported with a "B" qualifier indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample. The concentration of PRO in the method blank was 3900ug/L.

**GROUNDWATER LABORATORY ANALYTICAL RESULTS**

Tetra Tech NUS

INTERNAL CORRESPONDENCE

TO: Mr. Greg Roof  
FROM: Elena Rodriguez  
DATE: April 30, 2001  
COPIES: DV FILE  
SUBJECT: CURSORY DATA REVIEW  
CTO 0145, NASJAX  
SDG UST14-1  
SAMPLES: 7/ Aqueous

JAX-19-MW7-01	TRIP BLANK (03/20/01)
JAX-19-MW8-01	JAX-19-MW5-01
JAX-19-MW9-01	JAX-19-MW4-01
JAX-19-MW1-01	JAX-19-DUP1-01
JAX-19-MW2-01	JAX19-MW6-01
JAX19-MW3-01	TRIP BLANK (03/21/01)

#### SUMMARY

The sample set for CTO 0145, NAS Jacksonville, SDG UST14-1 consists of 9 aqueous environmental samples and three aqueous quality control samples (one field duplicate pair: JAX-19-MW5-01 and JAX-19-DUP1-01 and two trip blanks). All groundwater samples were analyzed for the select VOCs, EDB, PAHs, TPH, and Lead. The trip blanks were analyzed for select VOCs.

The samples were collected by TetraTech NUS on March 20-21, 2001 and analyzed by Katahdin Analytical Services. All analyses were conducted in accordance with Naval Facilities Engineering Service Center (NFESC) Quality Assurance/Quality Control (QA/QC) criteria using SW-846 methods 8260B, 8270C-SIM, and 6010B, EPA 504.1, and Florida DEP Petroleum Organics (FL PRO). A cursory review of the data contained in this SDG was performed to rule out false positive or false negative results. No significant data quality issues were noted at this time.

#### COMMENTS

The reported practical quantitation limit (PQL) for the groundwater samples for EDB (1,2-dibromoethane) is 0.05 µg/L which is higher than the FDEP GCTL primary standard of 0.02 µg/L. Katahdin has a method detection limit (MDL) of 0.014 µg/L. Any confirmed detections between the PQL and the MDL would have been reported as a "J" value, however no EDB was detected in any of the samples.

KATAHDIN ANALYTICAL SERVICES  
TETRA TECH NUS  
CASE NAS JACKSONVILLE  
TASK ORDER MANAGER: GREGORY ROOF

Sample Receipt

The following samples were received on March 21 and 22, 2001 and were logged in under Katahdin Analytical Services work order numbers WR0791 and WR0804 for a hardcopy due date of April 19, 2001.

<u>Sample No.</u>	<u>Sample Identification</u>
WR0791-1	JAX-19-MW7-01
WR0791-2	JAX-19-MW8-01
WR0791-3	JAX-19-MW9-01
WR0791-4	JAX-19-MW1-01
WR0791-5	JAX-19-MW2-01
WR0791-6	JAX-19-MW3-01
WR0791-7	TRIP BLANK
WR0804-1	JAX-19-MW5-01
WR0804-2	JAX-19-MW4-01
WR0804-3	JAX-19-DUP1-01
WR0804-4	JAX-19-MW6-01
WR0804-5	TRIP BLANK

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Volatile Organic Analysis

Twelve aqueous samples were received by the Katahdin GC/MS laboratory on March 21 and 22, 2001, and were specified to be analyzed and quantitated for the priority pollutant list of volatile organics in accordance with SW-846 method 8260B.

Analyses for this SDG were performed on the 5972-F and 5972-M instruments.

0000002

Batch QC (VBLK and LCS) was performed in each twelve-hour window. The LCS QC samples were spiked with the entire list of compounds quantitated for at 50 ppb. A matrix spike/matrix spike duplicate pair was analyzed on sample WR0804-4.

Method 8000B, section 7.5.1.2.1 (Revision 2, 12/96) states, "in those instances where the RSD for one or more analytes exceeds 20%, the initial calibration curve may still be acceptable if the mean of the RSD values for all analytes in the calibration is less than or equal to 20%." Method 8260B narrows this 20% maximum to 15%.

In the calibration curves analyzed for this SDG, several analytes had %RSD values exceeding the allowed 15%. Since the average %RSD for all analytes was 13.4% and 14.2%, the curves were acceptable.

Several manual integrations were performed due to split peaks; all have been flagged with a "M" (software-generated) on the pertinent quantitation reports. All "M" flags have been dated and initialed by the analyst performing the integration. In addition, all "M" flags have been reviewed and approved by the GC/MS supervisor. Copies of each manual integration are included in the data package.

The volatile organic staff noted no other protocol deviations.

### Semivolatile Organics Analysis

Ten aqueous samples were received by the Katahdin Analytical Services GC/MS laboratory on March 21 and 22, 2001 for extraction and analysis for the PAH list of analytes in accordance with USEPA method 8270C, modified to use selected ion monitoring to achieve lower detection levels.

The samples were extracted following method 3520 on March 26 and 28, 2001, and by method 3510 on April 10, 2001. A laboratory control spike or laboratory control spike/laboratory control spike duplicate pair was extracted in each batch. A matrix spike/matrix spike duplicate pair was extracted on sample WR0804-4 in the 03/28/01 batch.

Analysis of the LCS extracted on 03/26/01 yielded no PAH or surrogate recoveries due to extraction lab error. Samples WR0804—1 and -2 also yielded no surrogate recoveries. The samples and associated QC were reextracted on April 10, 2001, outside of holding times.

Analysis of sample WR0791-6 was performed at a 1:10 dilution due to the matrix, with PAH concentrations still over the upper limit of the calibration curve, as well as internal standard area recovery deviations. Reanalysis occurred at a 1:50 dilution successfully. Both sets of data are included in this data package.

Several manual integrations were performed due to split peaks; all have been flagged with a "M" by the data system. All manual integrations have been dated and initialed by the responsible analyst. Copies of each manual integration are included in the data package. All manual integrations have been reviewed and approved by the GC/MS supervisor.

0000003

The semivolatiles organic staff noted no other protocol deviations.

### Metals Analysis

The samples of SDG UST14-1 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Solid Waste", SW-846, November 1986, Third Edition.

### Inductively-Coupled Plasma (ICP) Atomic Emission Spectroscopic Analysis

The aqueous-matrix samples of SDG UST14-1 were digested for ICP lead analysis on 03/23/01 (QC Batch RC23ICW0) and 03/28/01 (QC Batch RC28ICW1) in accordance with USEPA Method 3010A. Katahdin Sample No. WR0804-4 was prepared with duplicate matrix-spiked aliquots. Two laboratory control samples, identified as LCSWRC23ICW0 and LC2WRC23ICW0, were prepared in QC Batch RC23ICW0 at the request of another client whose samples were prepared concurrently.

ICP lead analyses of SDG UST14-1 sample digestates were performed in accordance with USEPA Method 6010B, using a Thermo Jarrell Ash Trace ICP spectrometer. All samples were analyzed within holding times and all QC criteria were met, with the following comments or exceptions:

Some of the results for run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

### GC Analysis

Samples WR0791-1 through -6 were received on March 21, 2001 and samples WR0804-1 through -4 were received on March 22, 2001. These samples were analyzed for petroleum range organics (PRO) according to Method # FL-PRO and for Ethylene dibromide (EDB) according to EPA method 504.1. Sample WR0804-4 was selected for the matrix spike (MS) and matrix spike duplicate (MSD), as per client request. All samples and QC were extracted and analyzed within hold times, and all QC criteria were met with the following comments:

### PRO Analysis

The recoveries of the surrogate o-Terphenyl were low and outside of the method acceptance limits for all the samples except LCF10149 and WR0791-5. If laboratory established acceptance limits for Total Petroleum Hydrocarbons were applied to these samples, all of the sample surrogate recoveries would be acceptable.

The laboratory control sample LCF1049 was inadvertently not spiked with the PRO components. Instead, it appears that the sample was spiked with surrogate twice, which accounts for the high surrogate recoveries and no PRO spike recoveries. Consequently, there is no LCS form

0000004

submitted. Since there was an MS and MSD performed in the batch, and the PRO recoveries were acceptable, the sample data quality should not be affected.

There were no other protocol deviations or observations noted by the GC laboratory staff.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager and/or his designee, as verified by the following signature.

Ship to Same Recipient

Use of this system constitutes your agreement to the service conditions in the current FedEx service Guide, available upon request.

FedEx will not be responsible for any claim in excess of \$100 per package, whether the result of loss, damage, delay, non-delivery, misdelivery, or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim. Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic value of the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental, consequential, or special is limited to the greater of \$100 or the authorized declared value. Recovery cannot exceed actual documented loss. Maximum for items of extraordinary value is \$500, e.g. jewelry, precious metals, negotiable instruments and other items listed in our Service Guide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

# **SAMPLE DATA PACKAGE**

SDG NARRATIVE  
KATAHDIN ANALYTICAL SERVICES  
TETRA TECH NUS  
CASE NAS JACKSONVILLE  
WR2437

Sample Receipt

The following samples were received on July 13, 2001 and were logged in under Katahdin Analytical Services work order number WR2437 for a hardcopy due date of August 10, 2001.

<u>Sample No.</u>	<u>Sample Identification</u>
WR2437-1	JAX-19-MW10-01
WR2437-2	JAX-19-MW11-01
WR2437-3	TRIP BLANK

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Volatile Organics Analysis

Three aqueous samples were received by the Katahdin GC/MS laboratory on July 13, 2001. The samples were specified to be analyzed and quantitated for a client-requested list of analytes in accordance with SW-846 method 8260B.

Method 8260 analyses for this SDG were performed on the 5972-M and 5972-Z instruments.

Batch QC (VBLK and LCS) was performed in each twelve-hour window. The method 8260 LCS QC samples were spiked with the entire list of compounds quantitated for at 50 ppb.

Method 8000B, section 7.5.1.2.1 (Revision 2, 12/96) states, "in those instances where the RSD for one or more analytes exceeds 20%, the initial calibration curve may still be acceptable if the mean of the RSD values for all analytes in the calibration is less than or equal to 20%." Method 8260B narrows this 20% maximum to 15%.

In the calibration curves analyzed for this SDG, several analytes had %RSD values exceeding the allowed 15%. Since the average %RSD for all analytes was 12.3% and 9.3%, the curves were acceptable.

Several manual integrations were performed due to split peaks; all have been flagged with a "M" (software-generated) on the pertinent quantitation reports. All "M" flags have been dated and initialed by the analyst performing the integration. In addition, all "M" flags have been reviewed and approved by the GC/MS supervisor. Copies of each manual integration are included in the data package.

The volatile organic staff noted no other protocol deviations.

### Semivolatile Organics Analysis

Two aqueous samples were received by the Katahdin Analytical Services GC/MS laboratory on July 17, 2001 for extraction and analysis for the PAH list of analytes in accordance with USEPA method 8270B, modified to use selected ion monitoring (SIM) to achieve lower detection limits. The samples were also specified to be extracted and analyzed for the TCL list of analytes in accordance with USEPA method 8270.

The samples were extracted following method 3510 on July 19, 2001 for SIM-PAH and on July 20, 2001 for the TCL list. A laboratory control spike/laboratory control spike duplicate pair was extracted in each batch.

Analysis of sample WR2482-19 for the TCL list yielded a low 2-fluorophenol surrogate recovery.

Method 8000B, section 7.5.1.2.1 (Revision 2, 12/96) states, "in those instances where the RSD for one or more analytes exceeds 20%, the initial calibration curve may still be acceptable if the mean of the RSD values for all analytes in the calibration is less than or equal to 20%." Method 8270C narrows this 20% maximum to 15%.

In the calibration curves analyzed for this workorder, several analytes had %RSD values exceeding the allowed 15%. Since the average %RSD for all analytes was 8.5 % and 8.5%, the curves were acceptable.

Several manual integrations were performed due to split peaks; all have been flagged with a "M" by the data system. All manual integrations have been dated and initialed by the responsible analyst. Copies of each manual integration are included in the data package. All manual integrations have been reviewed and approved by the GC/MS supervisor.

The semivolatiles organic staff noted no other protocol deviations.

### GC Analysis

Samples WR2437-1 and -2 were received on July 13, 2001 and were analyzed for Ethylene dibromide (EDB) according to EPA method 504.1 and Petroleum Range Organics according to Method # FL-PRO. All samples and QC were extracted and analyzed within hold times and all QC criteria were acceptable with the following comments:

### PRO Analysis

Samples BF1144, LCF1144 and WR2437-2 had recoveries for the surrogate o-Terphenyl, which were low and outside the method acceptance limits. The second surrogate was acceptable.

There were no other method deviations or observations noted by the GC laboratory staff.

### Metals Analysis

The samples of Katahdin Work Order WR2437 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Aqueous Waste", SW-846, November 1986, Third Edition.

### Inductively-Coupled Plasma (ICP) Atomic Emission Spectroscopic Analysis

Aqueous-matrix Katahdin Sample Nos. WR2437-(1, 2) were digested for ICP analysis on 07/30/01 (QC Batch RG30ICW1) in accordance with USEPA Method 3010A.

ICP analyses of Katahdin Work Order WR2437 sample digestates were performed in accordance with USEPA Method 6010B, using a Thermo Jarrell Ash Trace ICP spectrometer. All samples were analyzed within holding times and all QC criteria were met, with the following comments or exceptions:

Some of the results for run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager and/or his designee, as verified by the following signature.

Analytical Method: EPA 504

Sample Description	Matrix	Date	Date	Date	Prep			
		Sampled	Received	Prepped	Chemist	Preparative Method		
JAX-19-MW9-01	Aqueous	03/20/2001	03/21/2001	03/28/2001	JCG	EPA 504		
Analyte	Qualifier	Result	Units	DF	Sample PQL	Method PQL	Date Analyzed	Analyst
Styrene dibromide		< 0.050	ug/L	1.0	0.050	0.050	03/28/2001	JCG
2,4,5,6-Tetrachloro-meta-xylene		90	%	1.0			03/28/2001	JCG

# Katahdin Analytical Services, Inc.

## REPORT OF ANALYTICAL RESULTS

Client: AMY THOMSON  
TETRA TECH NUS, INC.  
661 ANDERSEN DRIVE  
FOSTER PLAZA VII  
PITTSBURGH, PA 15220-2745  
Proj. ID: NAS JACKSONVILLE

Lab Sample ID: WR0791-4  
SDG: UST14-1  
Report Date: 04/04/2001  
PO No.: MSA-0900-025  
Project: CTO #145  
Percent Solids: N/A  
Analytical Method: EPA 504
