Subject: Soil Sampling Letter Report  
For Solid Waste Management Unit (SWMU) 45  
Naval Station (NAVSTA) Mayport, Mayport, Florida

Dear Ms. Wilson:

Tetra Tech NUS, Inc. (TtNUS) is providing this transmittal letter to address a misprint in the original Soil Sampling Letter Report dated April 16, 2004. The last sentence in the Conclusions section stated, "The SCTL exceedances in soil samples A1 (TRPH), B3 (TRPH), and D3 (PAHs and TRPH) will not be covered by the temporary building or its associated parking lot." Soil sample A1 should be replaced by soil sample A4 so that the final sentence in the Conclusions section reads: "The SCTL exceedances in soil samples A4 (TRPH), B3 (TRPH), and D3 (PAHs and TRPH) will not be covered by the temporary building or its associated parking lot."

If you have any questions regarding this correction, or if I can be of assistance in any way, please contact me at (850) 385-9866 or via e-mail at [hansent@ttnus.com](mailto:hansent@ttnus.com).

Sincerely,

Terry Hansen P.G.  
Task Order Manager

Subject: Soil Sampling Letter Report  
Solid Waste Management Unit (SWMU) 45  
Naval Station (NS) Mayport, Mayport, Florida

Dear Ms. Wilson:

Tetra Tech NUS, Inc. (TtNUS) is pleased to submit the Soil Sampling Letter Report for the field activities that were performed at SWMU 45. This soil sampling letter report was prepared for the United States Navy (Navy) Southern Division, Naval Facilities Engineering Command under CTO 0091 for the Comprehensive Long-term Environmental Action Navy (CLEAN) Contract Number N62467-94-D-0888. The objective of this letter report will be to provide SWMU 45 surface and subsurface soil data that was collected in support of the Group IV SWMUs Resource Conservation Recovery Act (RCRA) Facility Investigation (RFI). The appendices for the letter report will be included on compact disc only.

**Background Information**

The NS Mayport wastewater treatment facility was expanded in 1972 to include a secondary treatment facility using an activated sludge system and two sludge drying beds. Both sludge drying beds were constructed with concrete curbs and sand bottoms and were to have received digested sludge from the wastewater treatment plant's aerobic digesters. Effluent that passed through the drying beds was intended to be collected by an underdrain system, which flowed to the influent pumping station. However, personnel from the NS Mayport wastewater treatment plant indicated that the underdrain system did not exist [ABB Environmental Services, Inc. (ABB-ES), 1996]. The sludge drying beds were identified as SWMU 45 during the RCRA Facility Assessment (RFA).

SWMU 45, shown on Figure 1, occupies an approximate 200 feet by 110 feet area adjacent to the wastewater treatment plant. Attachment A contains information on SWMU 45 from the RFI Report Group III SWMUs (ABB-ES, 1996) and provides previous investigation results. The SWMU 45 area contained two sludge drying beds prior to the beds being demolished and the associated debris removed in May 2003. The report for the sludge drying beds removal is included as Attachment B. Soil sampling was proposed in the area of the former sludge drying beds to confirm if contaminants were present following excavation of the drying beds. During the March 2004 Mayport Partnering Team meeting, it was stated that a temporary building is scheduled to be constructed on SWMU 45 during the summer of 2004.

### **TtNUS Field Activities**

Surface [0 to 2 feet below land surface (bls)] and subsurface (4 to 5 feet bls) soil samples were collected on January 5, 2004 from the 20 locations that are shown on the SWMU 45 Site Map, Figure 1. A grid sampling pattern, also shown on Figure 1, was used to provide a representative summary of the surface and subsurface soil contaminant levels at SWMU 45. Soil samples were collected using a stainless steel hand auger. Decontamination of the hand auger was performed according to the Florida Department of Environmental Protection (FDEP) Standard Operating Procedures (SOPs) between each sampling point. Field conditions prevented the collection of 5 surface samples (D1, D2, E1, E2, and E3) and 19 subsurface samples. Limestone gravel and concrete debris in the soil prevented TtNUS personnel from hand-augering to the depths stated in soil sampling work plan. Therefore, a total of 15 surface soil samples and 1 subsurface soil sample were collected and sent to Katahdin Analytical Laboratory on January 8, 2004. Soil Sample Log Sheets are included as Attachment C, Field Forms. The samples were analyzed for target compound list (TCL) semi-volatiles, pesticides, polynuclear aromatic hydrocarbons (PAHs), polychlorinated biphenyl (PCB) organic compounds, target analyte list (TAL) metals and cyanide, and total residual petroleum hydrocarbons (TRPH). Additionally, synthetic precipitation leaching procedure (SPLP) extracts were analyzed from samples in excess of leachability standards [Florida Administrative Code (FAC). 62-777]. The laboratory data reports are provided as Attachment D.

### **Soil Analytical Results**

The analytical results for the 15 surface and 1 subsurface soil sample are provided in Table 1. Only exceedances of FDEP (SCTLs) are shown in Table 1. Five contaminants were detected in excess of FDEP Soil Cleanup Target Levels (SCTLs) in the surface soil samples collected from locations A1, A2, A4, B1, B3 and D3. The pesticide dieldrin was detected in the surface soil samples from locations A1 and A2 at concentrations exceeding SCTLs for leachability criteria. The PAH benzo(a)pyrene was detected in excess of its SCTL, based on commercial/industrial exposure, in surface soil samples B1 and D3. The PAHs dibenzo(a,h)anthracene and benzo(a)anthracene were detected above SCTLs in sample D3 based on commercial/industrial exposure and leachability criteria, respectively. TRPH exceedances of SCTL leachability criteria were reported for samples collected from A4, B3, and D3.

### **Conclusions**

A pesticide, three PAHs, and TRPH exceedances of FDEP SCTLs were detected in the surface soil samples collected from SWMU 45. These SCTL exceedances were based on either leachability into groundwater or commercial/industrial exposure criteria. No samples exceeding SCTL leachability criteria that were tested for SPLP exceeded groundwater cleanup target levels (GCTLs). The subsurface soil delineation was obstructed due to physical limitations of the sampling method.

As stated in the March 2004 Mayport Partnering Team meeting, a temporary building is scheduled to be constructed on SWMU 45. The footprint of the proposed building and associated parking lot were shown on Figure 1. Three of the five SCTL exceedances (locations A1, A2, and B1) will be covered by the parking lot to the temporary building. The SCTL exceedances in soil samples A1 (TRPH), B3 (TRPH), and D3 (PAHs and TRPH) will not be covered by the temporary building or its associated parking lot.

**SWMU 45 INFORMATION FROM RFI REPORT**

## EXECUTIVE SUMMARY

ABB Environmental Services, Inc., has been contracted by the Department of the Navy, Southern Division, Naval Facilities Engineering Command to conduct a Resource Conservation and Recovery Act Facility Investigation (RFI) for Naval Station (NAVSTA), Mayport. The RFI is being conducted in accordance with the Hazardous and Solid Waste Amendment permit no. FL9 170 024 260, issued by the U.S. Environmental Protection Agency (USEPA) on June 15, 1993. This RFI report presents the findings, conclusions, and recommendations for each solid waste management unit (SWMU) or groups of SWMUs investigated.

This report summarizes the RFI for the Group III SWMUs; 1, 14, 17, 18, 23, 24, 25, 44 and 45. SWMUs 1, 23, 24, 25, 44 and 45 were evaluated as one area because they are contiguous sites associated with the industrial Shipyard Area (SWMUs 1, 23, 24, and 25) and the stations wastewater treatment plant (SWMUs 44 and 45). SWMU 1 was reported to be the original landfill at the station. SWMUs 23, 24 and 25 are areas where land-based repair activities are conducted for ships berthed at Mayport Turning Basin. SWMU 44 are clarifiers used to contain water used in firefighting training activities, and SWMU 45 are sludge drying beds for the Stations Federally-owned wastewater treatment plant. These sites share a similar topographic and hydrogeologic setting, and similar contaminants.

SWMU 17 was a furnace used to reduce the volume of domestic solid waste using diesel fuel or waste oil as auxiliary fuels and, because it was not located near the other Group III SWMUs, was evaluated singularly.

SWMUs 14 and 18 were evaluated together because they share a similar topographic and hydrogeologic setting, and similar contaminants. SWMU 14 was reported to have drums of mercuric nitrate formerly stored at the site and is the site of firefighting training activities. SWMU 18 is a concrete containment pad for collection of stormwater at a diesel powered electrical generator.

The purpose of the RFI is to provide the information necessary to conduct a human health and ecological risk assessment and to design corrective measures, if required, for each of the SWMUs that required an RFI. The following conclusions for each of the SWMUs investigated are based on the results of the site characterization and human health and ecological risk assessments.

SWMUs 1, 23, 24, 25, 44 and 45. The following presents a summary of the site characterization, risk assessments, and recommendations for SWMUs 1, 23, 24, 25, 44 and 45:

Site Characterization. Shallow soil in the vicinity of the Shipyard Area consists of fine grained, well-sorted sand which typically contain shell fragments. At some of the soil boring locations, thin (less than 1 foot) seams of clay or clayey-to-silty fine sand were encountered.

Geophysical surveys and soil borings were conducted to confirm the location of SWMU 1. Geophysical anomalies were detected that could not be readily explained by cultural interferences. The anomalies were investigated with ground-penetrating radar and interpreted to be related to buried utilities, not landfilled materials. Landfill materials were not discovered during the drilling of soil borings at the reported location of SWMU 1.

The direction of groundwater flow is generally to the north, toward the Mayport Turning Basin entrance channel (Plate 1). Groundwater in the water table zone at and north of the northern boundaries of the Shipyard Area may be affected by tidal fluctuations. It is likely that the effect in the water table zone of the surficial aquifer is limited to areas located less than 330 feet from the shoreline of the St. Johns River.

Results of water quality indicator parameters suggest that groundwater in the vicinity of the Shipyard Area do not meet the criteria of a Class G-I or G-II drinking water supply. An appropriate designation for the surficial aquifer beneath the Shipyard Area would be Class G-III.

Human Health Risk Assessment. Risk characterization was conducted for potential exposures to surface and subsurface soil, and groundwater under current and future land-use scenarios. The sludge drying beds at SWMU 45 were evaluated under current-use scenarios, as it is assumed that the material is to be excavated and disposed of sometime in the future.

None of the excess lifetime cancer risk (ELCR) exceed the U.S. Environmental Protection Agency's (USEPA) target risk range ( $1 \times 10^{-4}$  to  $1 \times 10^{-6}$ ), however, the Florida Department of Environmental Protection Agency's (FDEP) target risk level ( $1 \times 10^{-6}$ ) was exceeded for current and future land-use exposure scenarios for surface soil. Noncancer risks associated with surface soil exposure pathways for current and future land use are below the USEPA's and FDEP's target hazard index (HI) of 1. The chemicals (semivolatile organic compounds [SVOCs], pesticides, and metals) that result in the ELCR are likely the result of industrial activities.

Human Health Chemicals of Potential Concern (HHPC) were determined to not exist for subsurface soil during the screening evaluation, therefore, a risk characterization was not conducted for this medium.

None of the ELCR exceed the USEPA's target risk range or the FDEP target risk level for the sludge drying beds at SWMU 45.

Currently, the surficial aquifer is not used as a water supply, however, under a hypothetical future-use scenario the ELCR exceeds USEPA's target risk range and FDEP's target risk level. In addition, the HI for the hypothetical future use (ingestion) of groundwater exceeds the USEPA and FDEP target level of 1.

Ecological Risk Assessment. Exposure pathways evaluated for aquatic receptors include direct contact with the groundwater as it discharges to surface water. Exposures associated with potential contamination in surface soil to terrestrial receptors were not evaluated. Terrestrial ecological receptors are not expected to occur in the vicinity of the Shipyard Area because the majority of the site is paved with asphalt or concrete and is located in an industrialized area.

Maximum and average exposure concentrations for two ecological chemicals of potential concern (ECPC), cyanide and iron, in groundwater slightly exceed the Florida surface water quality standards Standard and Federal ambient water quality criteria (AWQC).

Maximum and average exposure concentrations for iron detected in groundwater samples from monitoring wells at SWMUs 1, 23, 24, 25, 44, and 45 and background

FTC = Fleet Training Center.

a highly variable set of lithologic units that are horizontally and vertically anisotropic throughout the study area. Because the undifferentiated post-Hawthorn deposits include eroded and redeposited sediments from the Upper Hawthorn Group, it was not possible to determine exactly where the Upper Hawthorn Group was encountered. Various factors, such as lithologic description and lithologic resistance to split-spoon sampling, were used to estimate that the Upper Hawthorn Group was encountered at a depth of approximately 70 to 72 feet bls in the Group III Area.

The paragraph below presents a description of the shallow soil encountered at Group III SWMUs 1, 14, 17, 18, 23, 24, 25, 44, and 45. These summaries are based on lithologic descriptions from the boring logs which are included in Appendix A of the NAVSTA Mayport GIR (ABB-ES, 1995a). Except as noted, these summaries describe the interval from land surface to approximately 15 feet (ft) bls.

Shipyard Area SWMUs 1, 23, 24, 25, 44, and 45. Shallow soil in the vicinity of the Shipyard Area consists of fine-grained, well-sorted sands which typically contain shell fragments. At some of the soil boring locations, thin (less than 1 foot) seams of clay or clayey to silty-fine sand were encountered. These seams appear to be restricted in areal extent.

Seven shallow borings to the water table were conducted at SWMU 1 to assess whether or not landfill materials were present. Landfilled materials were not encountered.

Four deep borings drilled to install monitoring wells MPT-1-MW01D, MPT-23-MW05D, MPT-44-MW01D, and MPT-45-MW01D were terminated at depths ranging from 70 to 72 ft bls, respectively. Tables 3-1, 3-2, 3-3 and 3-4 describe the lithology (including the associated USCS symbol) of subsurface materials encountered at each of the four monitoring wells.

SWMU 17 (Carbonaceous Fuel Boiler). Shallow soil in the vicinity of the Carbonaceous Fuel Boiler plant consists of relatively uniform, light-tan to tan, brown to dark-brown, or gray, very fine to fine-grained sand and silty sand with shell fragments that may make up to approximately 20 percent of the soil sample. These sands are interpreted to primarily be dredge material. A minor amount of these materials may be engineered fill that was constructed over the last 55 years.

SWMUs 14 (Mercury/Oil Waste Spill Area and SWMU 18 the Fleet Training Center Diesel Generator Sump). Shallow soil in the vicinity of the Mercury/Oily Waste Spill and Fleet Training Center Diesel Generator Sump, collectively referred to as the Fleet Training Center Area, typically consists of various shades from light-tan to brown, dark-gray, or black fine-grained sand or silty sand. Minor amounts of shell material are present in some of the borings. This description is similar to the soil found in Group I and II and is consistent with natural sand dunes and the placement of dredge material observed in aerial photographs dating from the early 1940s and historical descriptions of the area.

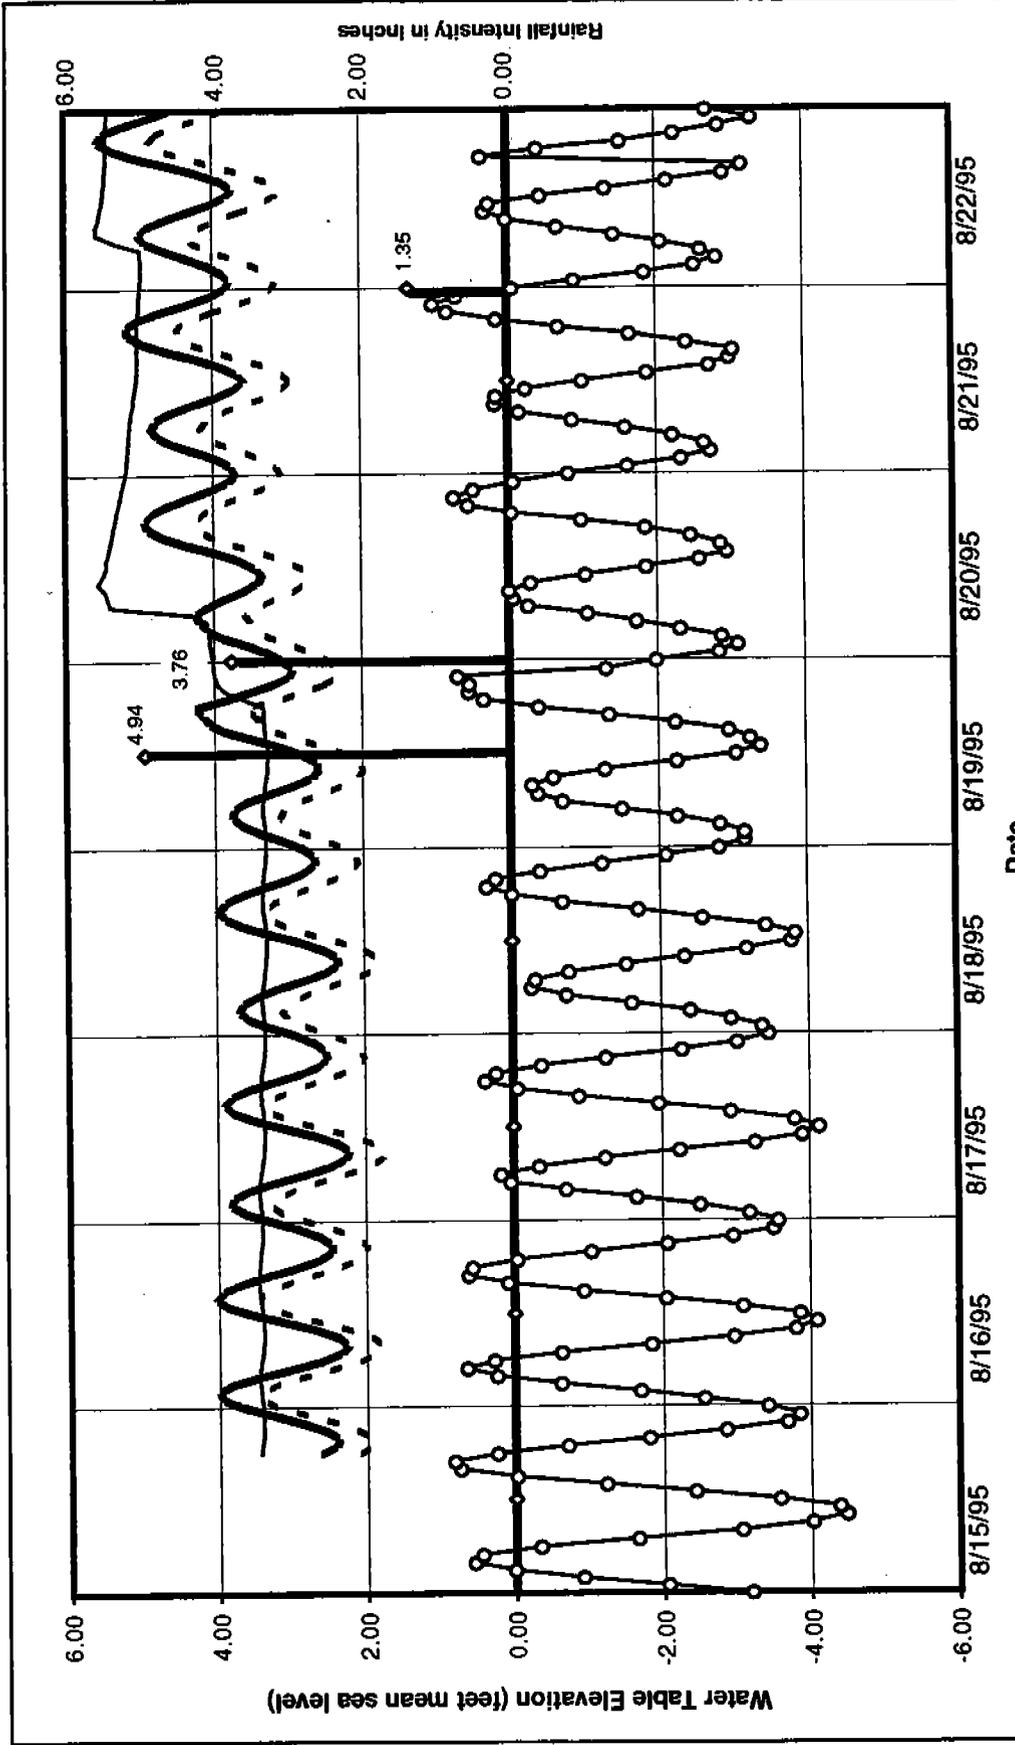

Minor differences were observed in soil samples collected from borings drilled for the installation of monitoring wells MPT-14-MW01S, MPT-14-MW02S, MPT-14-P01S, and MPT-14-P02S. These wells are located along the southern bank of the St. Johns River north of SWMUs 14 and 18. Soil samples from these locations exhibit features that differ from soil samples collected from locations to the south or

water table zone of the surficial aquifer is limited to areas located less than 330 feet from the shoreline of the St. Johns River at the Shipyard Area, and 400 feet at the Fleet Training Center (based on half of the distance between MPT-14-MW05S and MPT-14-MW10S).

**3.2.2 Potentiometric Surface** A discussion of the potentiometric surface on a stationwide basis was summarized in Subsection 3.2.5 in the NAVSTA Mayport GIR (ABB-ES, 1995a). Monitoring of water levels was conducted on a monthly basis during 1993 and most of 1994. The 1993 data were plotted, and stationwide maps of the potentiometric surface of the surficial aquifer are included in Appendix B, Volume II of the NAVSTA Mayport GIR.

Within the horizontal and vertical extent of subsurface explorations at Group III SWMUs, no confining unit of sufficient areal extent and thickness was found to indicate that the geologic units described in Section 3.1 are hydraulically isolated; therefore, the dredge material, undifferentiated post-Hawthorn deposits, and the Upper Hawthorn deposits appear to be in direct hydraulic connection and comprise the surficial aquifer in the vicinity of the Group III Area.

In general, groundwater flow in the surficial aquifer at NAVSTA Mayport is recharged by, or originates from, four localized hydrologic mounds (refer to Figure 3-19, NAVSTA Mayport GIR). The mound associated with Group III is assumed to be oriented north/south, with discharge zones in the Group III area roughly coincident with the Mayport Turning Basin, St. Johns River, and the Atlantic Ocean located to the west, north, and east, respectively. Despite localized influences on groundwater flow, the overall flow direction of the surficial aquifer at Group III SWMUs is north toward the Mayport Turning Basin Channel and St. Johns River with minor components to the east and west (Plate 1). It should also be noted that the retaining walls for Mayport Turning Basin may limit the amount of water that could discharge to the particular site area.

The Group III SWMUs are divided into three subgroups for the following discussion of the potentiometric surface. These groupings are SWMUs 1, 23, 24, 44, and 45, the Shipyard Area; SWMU 17, the Carbonaceous Fuel Boiler; and SWMUs 14 and 18, the Fleet Training Center Area. The rationale for grouping the SWMUs was the separation of the Shipyard Area from SWMU 17 by approximately 2,000 feet, and 1,800 feet separation between the Shipyard Area and the Fleet Training Center Area. The hydrogeologic setting for these three areas are dissimilar relative to the position of the groundwater mound.

The potentiometric surface of the surficial aquifer in the vicinity of Group III SWMUs has been estimated from data collected on July 19, 1995 (Table 3-5). Below is an assessment of groundwater directions for each of the three Group III SWMU subgroups: the Shipyard Area, the Fleet Training Center Area, and the Carbonaceous Fuel Boiler.

The Shipyard Area (SWMUs 1, 23, 24, 25, 44, and 45). The SWMUs comprising the Shipyard Area are located due south of the Mayport Turning Basin entrance channel. The direction of groundwater flow is generally to the north, toward the Mayport Turning Basin entrance channel (Plate 1). The hydraulic position of monitoring wells in relation to the Shipyard Area SWMUs are provided in Table 3-6. Tidal influence of the water table zone of the surficial aquifer was observed to occur in an area north of the Shipyard Area SWMUs, approximately 330

Average K for the Carbonaceous Fuel Boiler Area					24.3

Notes: RCRA = Resource Conservation and Recovery Act.  
 SWMUs = solid waste management units.  
 bls = below land surface.  
 Range of K = range of radial hydraulic conductivity values obtained from each test.  
 ft/d = foot per day.  
 Average K = arithmetic mean of radial hydraulic conductivity values.

Shipyard Area (SWMUs 1, 23, 24, 25, 44, and 45). Radial hydraulic conductivity values in the vicinity of the Jacksonville Shipyard Area ranged from approximately 1.2 to 46 ft/d, with an average of 8.6 ft/d. The average value for the monitoring well screened in the intermediate aquifer zone was approximately 1.3 ft/d and for the deep aquifer zone was approximately 0.6 ft/d.

Fleet Training Center (SWMUs 14 and 18). Radial hydraulic conductivity values in the vicinity of the Fleet Training Center ranged from approximately 7.2 to 22.1 ft/d with an average of approximately 12.2 ft/d. No monitoring wells have been screened in the intermediate or deep aquifer zones at the Fleet Training Center area.

Carbonaceous Fuel Boiler SWMU 17. Radial hydraulic conductivity values in the vicinity of the Carbonaceous Fuel Boiler Plant ranged from approximately 7.2 to 72.2 ft/d, with an average of 24.3 ft/d. No monitoring wells have been screened in the intermediate or deep aquifer zones at the Carbonaceous Fuel Boiler area.

Laboratory permeability test to determined vertical hydraulic conductivity values were conducted in accordance with test method American Society for Testing and Materials (ASTM)-D5084. Two soil samples, collected from Group III soil borings drilled for the installation of monitoring wells, were analyzed by this procedure. The soil sample collected from monitoring well location MPT-1-MW01I at a sample interval from 33 to 35 feet bls is a silty fine sand and the soil sample collected from monitoring well location MPT-44-MW01D at 44 to 46 ft bls is very sandy silt. Each sample was selected to represent a zone of low permeability. The results of the analyses are provided in Table 3-13. The average of the two values was calculated to be 0.34 ft/d. Based on this limited and biased data, the vertical hydraulic conductivity has the potential of being several orders of magnitude less than the horizontal radial hydraulic conductivity values where fine-grained materials predominate.

**Table 3-13**

SWMUs = solid waste management units.  
bls = below land surface.  
cm/sec = centimeters per second.  
ft/d = foot per day.

**3.2.4 Groundwater Flow Velocity** Groundwater flow velocities are expressed as average linear groundwater velocities, calculated from a modified form of Darcy's equation, and represent the ratio of linear travel distance to travel time. Refer to Subsection 3.2.6 of the NAVSTA Mayport GIR (ABB-ES, 1995a) for the formula used and the assumptions made to calculate velocities.

Horizontal and vertical groundwater flow velocities were calculated for the surficial aquifer beneath the Group III SWMUs using the groundwater level data obtained on July 19, 1995, the average values for radial hydraulic conductivity in Table 3-11 and an effective porosity of 0.35. The groundwater flow velocities were calculated for the three Group III Subgroups: the Shipyard Area, the Fleet Training Center Area, and the Carbonaceous Fuel Boiler (Table 3-14).

Shipyard Area (SWMUs 1, 23, 24, 25, 44, and 45). Horizontal groundwater flow velocities in the surficial aquifer beneath the Shipyard Area SWMUs are estimated to range from approximately 0.05 ft/d (18 feet per year [ft/yr]) to 0.15 ft/d (54 ft/yr).

Fleet Training Center (SWMUs 14 and 18). Horizontal groundwater flow velocities in the surficial aquifer beneath the Fleet Training Center Area, SWMUs 14 and 18 are estimated to range from approximately 0.03 ft/d (10 ft/yr) to 0.14 ft/d (51 ft/yr).

The Carbonaceous Fuel Boiler (SWMU 17). The horizontal groundwater flow velocity in the surficial aquifer beneath the Carbonaceous Fuel Boiler Area is estimated to be approximately 0.1 ft/d (35 ft/yr).

The horizontal groundwater flow rates for Group III are within the range of values for the Group I and II SWMUs presented in Table 3-9 in the NAVSTA Mayport GIR, (ABB-ES, 1995a). The values presented for Group III in this report are lower than the single value presented in the NAVSTA Mayport GIR. The values for horizontal groundwater flow velocities presented in this report are considered to be more representative of the hydrogeologic setting at Group III SWMUs than the value previously presented in the NAVSTA Mayport GIR.

Vertical linear flow velocities were calculated from data collected from a single nested well cluster, MPT-23-MW05S, MPT-23-MW05I and MPT-23-MW05D located on the north side of the Shipyard Area SWMUs. Screen depths for the monitoring wells in this cluster are 3 to 13 feet bls for the shallow well, 39 to 44 feet bls for the intermediate well, and 60 to 70 feet bls for the deep well. The estimated vertical flow rate at the Shipyard Area was 0.11 ft/d or approximately 41 ft/yr from the shallow surficial aquifer to the intermediate zone and 0.03 ft/d or approximately 13 ft/yr from the intermediate zone to the deep zone of the surficial aquifer (Table 3-15) (compare Table 3-10, NAVSTA Mayport GIR). Based on this limited data, values for the vertical linear groundwater flow rate are likely similar to the horizontal linear groundwater flow rates in the Shipyard Area. However, the higher transmissivity of deep portions of the surficial aquifer that was suggested by the tidal influence study data is not confirmed because of the limited number of intermediate and deep wells installed at Group III SWMUs.

Assuming a value of 36 ft/yr (Table 3-14) for the horizontal linear groundwater velocity and no retardation of contaminants, the time for contaminants to migrate from the Shipyard Area, which ranges from 200 to 1,050 feet from the St. Johns River, would be approximately 6 to 29 years.

#### 4.0 THE SHIPYARD AREA, SWMUs 1, 23, 24, 25, 44, and 45

RFI SWMU 1 and Resource Conservation and Recovery Act (RCFA) Facility Assessment (RFA) sampling visit (SV) SWMUs 23, 24, 25, 44, and 45 (SWMUs requiring confirmatory sampling) were grouped together for RFI field investigations and reporting and are collectively referred to as the Shipyard Area. The Shipyard Area is an industrial area located in the northeastern part of NAVSTA Mayport (Figure 1-2). RFA SWMUs 23, 24, 25, 44, and 45 are located adjacent to RFI SWMU 1 (Landfill A) (Figure 1-2) and are being assessed with SWMU 1 because they share similar topographic and hydrogeologic settings and contaminants.

Additionally, SWMU 23 (Jacksonville Shipyard, Inc. [JSI]) and the two SWMUs at the domestic Federally-owned Wastewater Treatment Plant (FOWTP) (SWMU 44, Wastewater Treatment Facility Clarifiers 1 and 2 and SWMU 45, Wastewater Treatment Facility Sludge Drying Beds) occupy part of what used to be Landfill A. SWMU 1 (Landfill A) includes an area of approximately 4 acres located approximately 600 feet to the south of the entrance to Mayport Turning Basin (Figure 4-1).

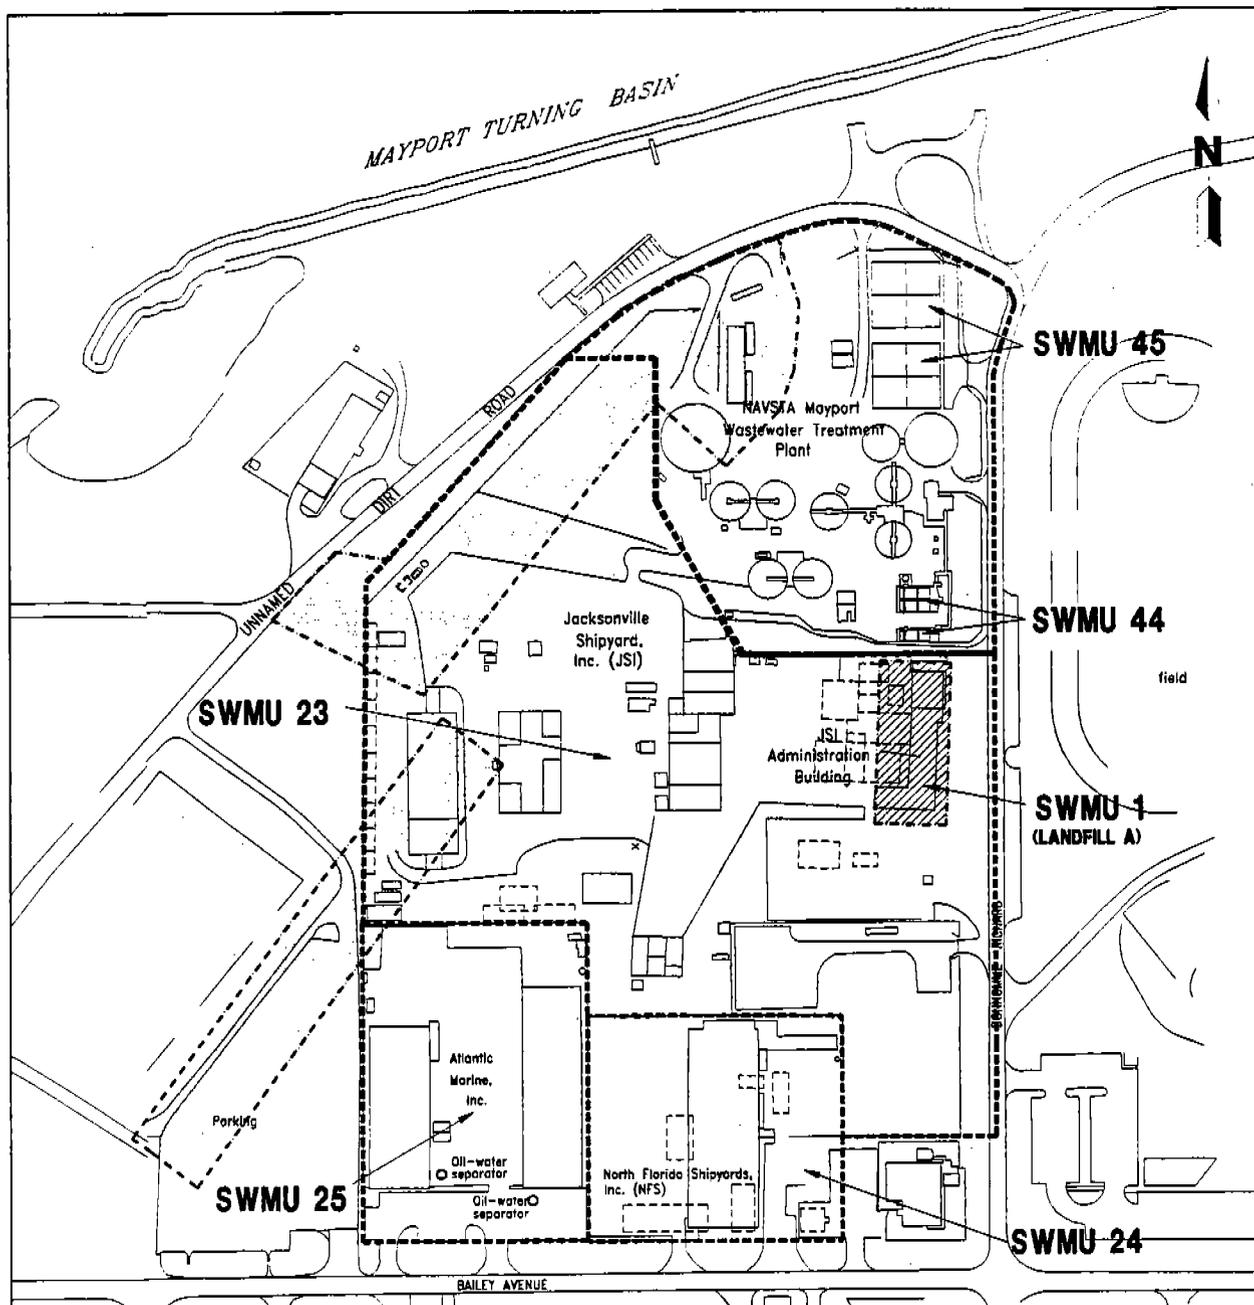

SWMU 24 (North Florida Shipyard, Inc. [NFSI]) and SWMU 25 (Atlantic Marine, Inc. [AMI]) were also added to this investigation because of their proximity to SWMU 1 and the similarity of ship repair activities among SWMUs 23, SWMU 24, and SWMU 25.

This chapter provides a description and history of each SWMU (including previous investigations), a summary of the Group III field investigations at each SWMU, results and interpretation of environmental sample analysis, and human health and ecological risk assessments.

4.1 SITE DESCRIPTION AND BACKGROUND. This section describes historical information for SWMUs 1, 23, 24, 25, 44, and 45; previous investigations; and a summary of the Group III field investigations conducted from March through October 1995. Historical information concerning the operation of SWMUs 1, 23, 24, 25, 44 and 45 was obtained from the RFA conducted by A.T. Kearney in 1989 on behalf of the USEPA. A current land-use description of each SWMU is presented below. More detailed information on the flora and fauna at the Shipyard Area SWMUs may be obtained from the NAVSTA Mayport GIR (ABB-ES, 1995a).

SWMU 1, Landfill A. The RFA report described Landfill A as consisting of a series of trenches approximately 15 feet wide, 400 feet long, and 8 feet deep. Industrial and sanitary wastes disposed of in the landfill included waste oils, paints, solvents, sanitary garbage, and construction rubble (A.T. Kearney, Inc., 1989). The landfill's operating routine was reported in the RFA report to consist of filling a part of a trench, then each Monday through Friday afternoon the flammable materials were burned. Once the trenches were filled to the approximate 400-foot length, they were covered with soil. The Navy operated the landfill from 1942 to 1960 (A.T. Kearney, Inc., 1989).

Anecdotal evidence from the NAVSTA Mayport Public Works Department, obtained during research for the NAVSTA Mayport RFI Workplan Addendum 5 (ABB-ES, 1994b), indicated that in 1989 landfill material was uncovered in the area of the new clarifiers being constructed at the FOWTP. Uncovered in the excavation for the clarifiers were scrap metal, sheeting, pipes, and 27 empty drums previously containing xylene. This suggests that SWMU 1, Landfill A, probably extends

Two oil-water separators are also present at the AMI site; however, neither is currently being used. Both oil-water separators are connected from the two buildings onsite by underground pipes to underground sumps and waste oil accumulation tanks.

A review of aerial photographs dated from the mid 1960s to late 1970s suggests the occurrence of extensive areas of disturbed vegetation and soil in the southwestern parts of the AMI site next to the site's western boundary (Figure 4-5). The disturbed area includes the paved parking lot adjacent to the western property boundary of AMI. Some of the disturbed areas are likely from vehicular traffic associated with using a dirt road that was located in the southwestern corner of the AMI site. It could not be confirmed from the review of the aerial photographs, but this area may have been used as either a laydown yard or possibly a landfill.

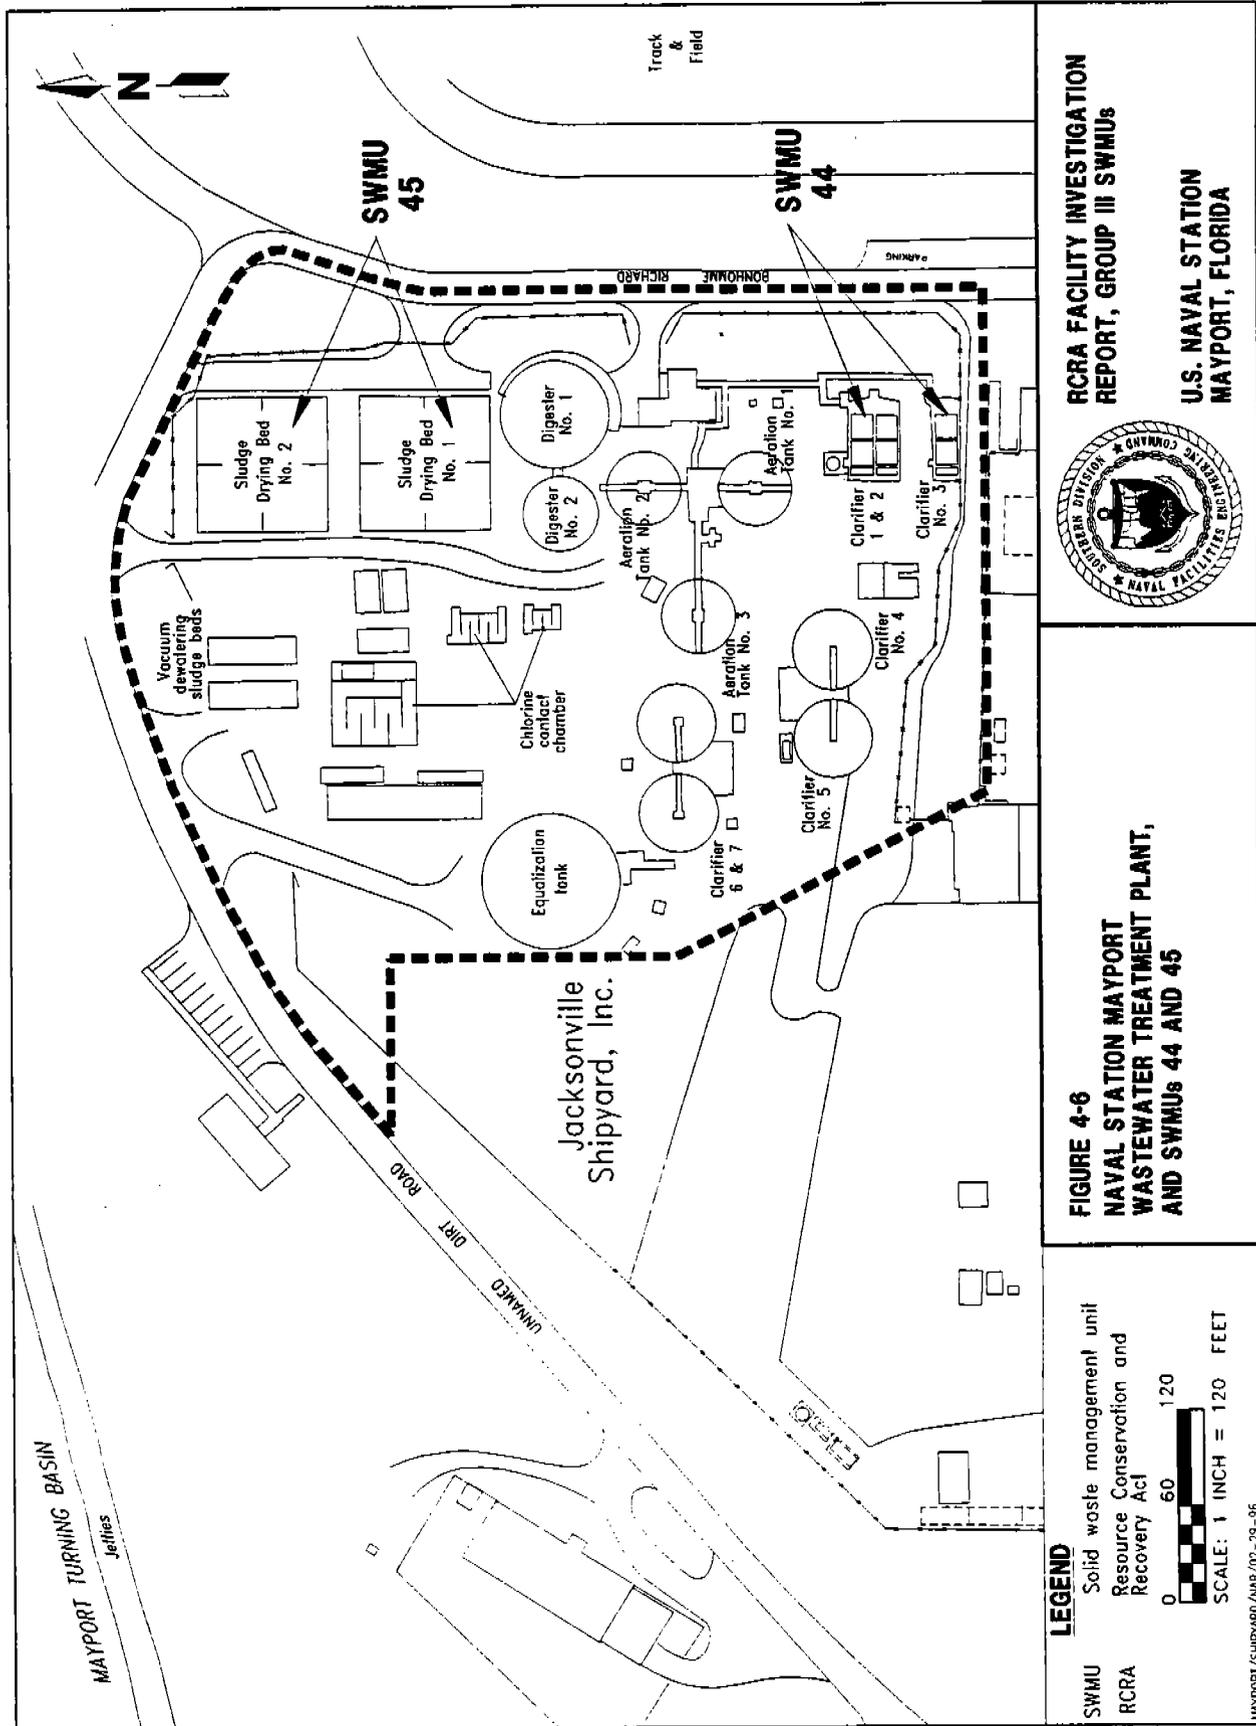

SWMU 44. Wastewater Treatment Facility Clarifiers 1, 2, and 3. Wastewater treatment facility clarifiers 1 and 2 were constructed in 1962, and clarifier 3 was added in the 1970s as part of the NAVSTA Mayport FOWTP. The clarifiers are located east of and within 500 feet of Mayport Turning Basin, along the northern boundary of JSI (Figure 1-2). The clarifiers are aboveground, square concrete tanks each having a nominal capacity of approximately 40,500 gallons (Figure 4-6).

The RFA report indicated that during the VSI in 1989, clarifiers 1, 2, and 3 were reported to have oily stains on the outside of the tanks. The staining was reported to be along the location of small hairline fractures. Based on the appearance of the clarifiers, A.T. Kearney concluded that some oily material may have been released around each clarifier.

Beginning in 1987, the clarifiers were used to contain and remove floating free-phase oil from firefighting training wastes from the FTC and effluent from these tanks was discharged into the FOWTP influent stream (A.T. Kearney, Inc., 1989). The floating free-phase oil was manually skimmed from the surface and transported by gravity flow into one of the Group IV waste oil storage tanks (SWMU 51) (A.T. Kearney, Inc., 1989).

Currently, the clarifiers are being used for temporary storage of firefighting training waste liquids from the FTC. The firefighting training wastes are stored in the clarifiers prior to treatment at the Oily Waste Treatment Plant (OWTP) (Group II, SWMU 9). Effluent from the OWTP is returned to the FOWTP.

SWMU 45. Wastewater Treatment Facility Sludge Drying Beds. The NAVSTA Mayport wastewater treatment facility was expanded in 1972 to include a secondary treatment facility using an activated sludge system and two sludge drying beds, each divided into four cells (Figure 4-6). The sludge beds, each composed of four cells, have an area of approximately 14,000 square feet. The RFA report indicated that the sludge drying beds are constructed with concrete curbs and sand bottoms and were reported to have received digested sludge from aerobic digesters 1 and 2 (Figure 4-7) (A.T. Kearney, Inc., 1989). During sludge drying, the effluent that passed through the sand bottom was collected by an underdrain system, which flowed to the influent pumping station (A.T. Kearney, Inc., 1989). However, NAVSTA Mayport personnel at the FOWTP indicate that the underdrain system does not exist. Between 1972 and 1985, the sludge drying beds were cleaned once every quarter, with the dewatered sludge discarded in the onsite

samples from the following JSI areas: Administration Building and adjacent grounds, parking lot south of the Administration Building, shop and warehouse area west of the Administration Building, and a grassy area west of the FOWTP. In addition, surface and subsurface soil samples were collected from around the JSI Administration Building. The soil samples were analyzed for a selected subset of 40 CFR, Part 264, Appendix IX, groundwater monitoring list parameters (USEPA, 1986a). Figure 4-9 illustrates the sampling locations and Tables 4-1 and 4-2 present the concentrations of target analytes detected in surface and subsurface soil samples, respectively.

Because the highest detected concentrations of lead and mercury could potentially present an unacceptable exposure risk to a construction worker at the JSI Administration Building site, a second sampling event was conducted. The objective of the second sampling event was to assess whether or not the observed concentrations of lead and mercury represented an isolated occurrence or were indicative of a larger contaminated area (ABB-ES, 1994c). Figure 4-10 illustrates the location of the soil samples collected during the second sampling event and Table 4-3 presents the concentrations of detected target analytes (ABB-ES, 1994c). The analytical results from the second sampling event suggest that the highest detected concentrations of lead and mercury were isolated occurrences.

The analytical results for the special-purpose investigation have not been validated and are, therefore, subject to qualification (ABB-ES, 1994c).

4.1.2 Group III RFI Field Activities Group III RFI field activities were conducted at the Shipyard Area (SWMUs 1, 23, 24, 25, 44, and 45) from March through October 1995. Chapter 2.0 provides an overview of the analytical program for the Group III SWMUs. Sampling procedures, background sampling information, and other stationwide sampling information is provided in the NAVSTA Mayport GIR (ABB-ES, 1995a).

Field activities conducted at the Shipyard Area included the following:

- conducting a geophysical survey;
- collecting surface soil, subsurface soil, and sludge samples;
- groundwater screening (TerraProbe<sup>SM</sup>);
- installing monitoring wells; and
- collecting groundwater samples.

The Shipyard Area contains several potential sources of contamination. The SWMUs within the Shipyard Area share a similar hydrogeologic setting and similar functions as the base's industrial area. The six SWMUs were grouped to facilitate a comprehensive investigative approach consisting of the collection of environmental samples at locations where potential contaminants may emanate from multiple sources with overlapping contaminant plumes. Potential contaminants from these SWMUs include petroleum fuels and oils, PCBs, chlorinated solvents, non-chlorinated solvents, paint wastes, and metals. Figures 4-1 and 4-3 through 4-6 illustrate the locations of potential sources of contamination at the Shipyard Area SWMUs (SWMUs 1, 23, 24, 25, 44, and 45).

Group III field investigative activities included a geophysical survey, a groundwater screening program, a surface and subsurface soil sampling program, and monitoring well installation and groundwater sampling program.

The field activities and laboratory methods used for analyzing the environmental samples collected at the Shipyard Area are discussed below.

Geophysical Survey. A geophysical survey was conducted in open areas where landfilled materials were suspected to be present in and around SWMU 1 (Figure 4-11). The purpose of the geophysical survey was to assess subsurface conditions, identify areas where buried materials may exist and to delineate the boundaries of Landfill A, if possible. Information gathered during the geophysical survey was also used in the design of a monitoring well network. The three geophysical survey methods employed included magnetometry (with vertical gradient capability), terrain conductivity instrumentation, and ground penetrating radar. The survey was conducted in March and April 1995.

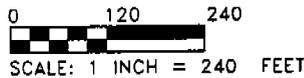

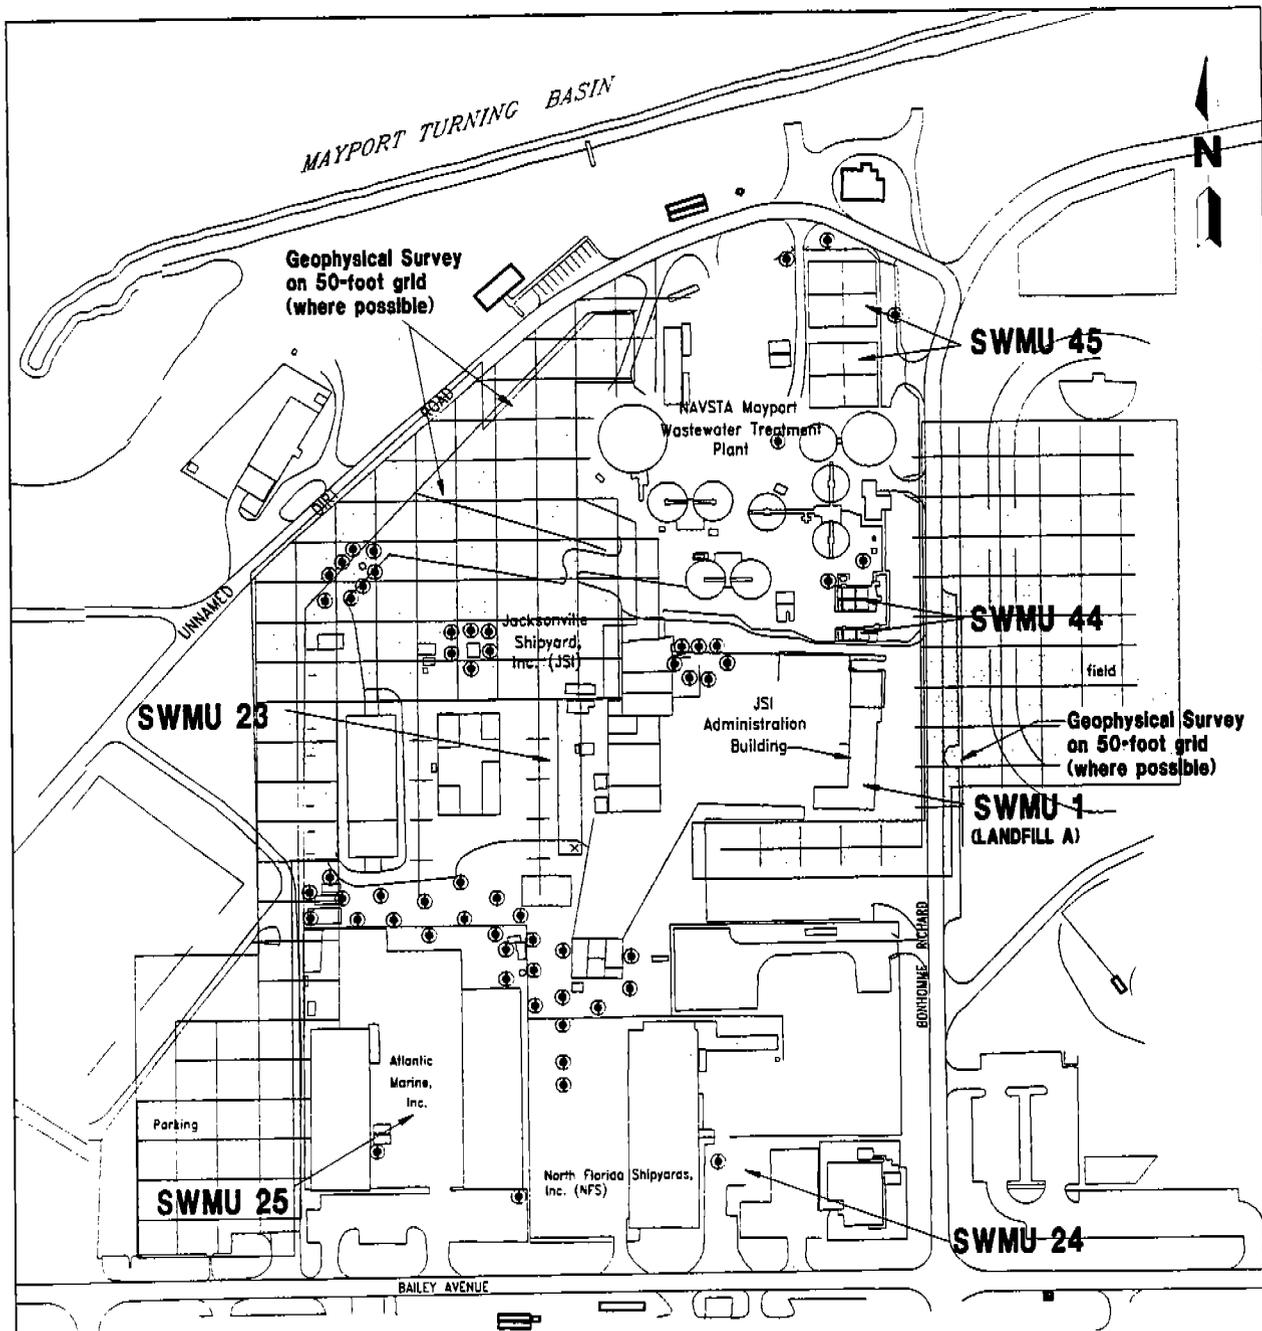

A grid with 20-foot spacing was surveyed in open spaces adjacent to the JSI Administration Building, the western part of the JSI, the western part of the FOWTP, an open area to the east of AMI, and the parking lot area next to SWMU 25 (Figure 4-11). Geophysical measurements were collected from each intersecting node. A more detailed description of the techniques employed and the results of the geophysical survey are presented in Appendix C.

Groundwater Field Screening Program. A groundwater field screening program was conducted using a direct-push technology (TerraProbe<sup>SM</sup>) to collect groundwater field-screening samples in areas that once were used to store petroleum fuels and/or solvents. The groundwater field-screening program was an iterative process designed to assess whether or not petroleum-related or solvent contamination is present and to delineate any contamination that is found. The groundwater field screening program was also used to assist in determining the location of Group III groundwater monitoring wells. Based on the results of the field screening program, confirmatory (groundwater) samples were collected to assess the nature and extent of contaminants, human health and ecological risk, and to provide fundamental engineering properties data to support development of potential corrective measures. A total of 63 TerraProbe<sup>SM</sup> soundings were conducted in the Shipyard Area to collect the groundwater field screening samples (Plate 2).

Groundwater samples were collected using the TerraProbe<sup>SM</sup> system to drive a threaded 1-inch OD hollow steel rod assembly attached to a threaded 1-inch OD hollow steel perforated screen to the proper sampling depth at each sampling location. A peristaltic pump was used to collect the groundwater sample, which was immediately containerized for transport to either the onsite screening laboratory or the offsite laboratory for confirmatory analyses.

Analyses of groundwater field screening samples was conducted using a field GC with 10 percent laboratory confirmation by USEPA Methods 8010 and 8020. The DQO for the groundwater field screening sample level accuracy is NEESA Level E (USEPA DQO Level 1). This DQO was selected because the purpose of this screening program was to assist in locating monitoring wells from which confirmatory groundwater samples were collected.

Sludge Sampling. Sixteen composited sludge/soil (mostly composed of sand and gravel) samples and two duplicates were collected from SWMU 45, FOWTP Sludge Drying Beds (Plate 3). Two composite samples were collected from each of the four quadrants of the two sludge drying beds; one sample from each of two

the middle of the screened interval using a peristaltic pump to remove stagnant water without causing the resuspension of silts and clays. Temperature, pH, conductivity, salinity, dissolved oxygen, oxidation potential, and turbidity were measured during purging to ensure good conductance between the well and the surrounding matrix. The monitoring well was purged until temperature, pH, and conductivity, salinity, dissolved oxygen, oxidation potential stabilized and a minimum of three well volumes of water had been removed. Purging also continued until a turbidity of 5 nephelometric turbidity units (NTUs) or less was achieved.

The groundwater samples were collected using a peristaltic pump and disposable Teflon™ tubing. The samples were collected before the material came in contact with the pump. The samples were collected by pumping water at less than one liter per minute from the middle of the well screen interval. Samples for inorganics, SVOCs, pesticides, and PCBs were collected first. VOCs were collected last with the sampler, preventing agitation of the water in the monitoring well by slowly pulling the Teflon™ tubing out of the well and carefully transferring the contents of the tube into a VOC vial with a Teflon™ septa cap for shipment to the offsite laboratory. Groundwater samples were placed in a cooler, refrigerated with ice, and sent overnight under chain-of-custody protocol to an offsite laboratory for analysis.

Environmental Sample Laboratory Analyses. Groundwater field screening samples (NEESA Level E, USEPA Level I DQO) were analyzed in the field using a portable GC and 10 percent were submitted to a laboratory for analyses using USEPA Methods 8010, 8020 and 8015 (Modified). Surface and subsurface soil, sludge, and groundwater samples collected at the Shipyard Area (SWMUs 1, 23, 24, 25, 44, and 45) were analyzed for target analytes selected from both the Groundwater Monitoring List (contained in 40 CFR 264, Appendix IX) and USEPA's CLP TCL and TAL parameters. The analytical data package for these samples was NEESA Level C for aqueous and nonaqueous matrices for VOCs, SVOCs, pesticides, and PCBs.

Field QA/QC samples also were collected during sampling activities at the Shipyard Area and were analyzed for the same parameters as the corresponding environmental samples. QA/QC requirements are presented in detail in the NAVSTA Mayport RFI Workplan, Appendix A, Volume II (ABB-ES, 1991).

4.2 FINDINGS. The subsections below present the findings from the geophysical survey and the nature and distribution of target analytes detected in surface soil, subsurface soil, sludge, and groundwater samples. The data are described as previously presented based on the following rationale: SWMUs 1, 23, 24, 25, 44, and 45 are potential sources of contamination and thus, the SWMUs may have released contamination to the underlying subsurface soils; surface soil data are presented and discussed first, followed by findings for the subsurface soil, and then SWMU 45 sludge data; groundwater is discussed last to assess whether or not target analytes have migrated beyond the boundaries of the industrial Shipyard Area.

4.2.1 Geophysical Survey The geophysical survey was conducted to assess areas of potential concern that were noted in aerial photographs from 1952 to 1989 and, if possible, confirm the location of SWMU 1 (Figure 4-11). The areas of concern were based on the appearance of possible disturbed vegetation or soil. A technical memorandum presenting the results of the Geophysical Survey is provided in Appendix C.

**Table 4-4 (Continued)**  
**Organic Analytes Detected in Surface Soil Samples at SWMUs 1, 23, 24, 25, 44, and 45**

RCRA Facility Investigation, Group III SWMUs  
 U.S. Naval Station  
 Mayport, Florida

Notes: SWMU = solid waste management unit.  
 RCRA = Resource Conservation and Recovery Act.  
 DUP = duplicate.  
 \* = 01S00201 was reextracted and reanalyzed. The reanalysis was recommended for use by the data validators. The original analysis was rejected because of extremely low acid fraction surrogate recoveries.  
 ft bis = feet below land surface.  
 µg/kg = microgram per kilogram.  
 -- = concentration of analyte, if present, was less than the detection limit.  
 J = estimated value.  
 PCBs = polychlorinated biphenyls.  
 4,4'-DDE = dichlorodiphenyldichloroethene.  
 4,4'-DDD = dichlorodiphenyldichloroethane.  
 4,4'-DDT = dichlorodiphenyltrichloroethane.  
 \*\* = 4,4'-DDT was reported from a diluted reanalysis. The original result was above the linear range of the calibration curve.

Zinc	74/74	4.7	5,910	235	N/A	23S02001

<sup>1</sup> Frequency of detection is the number of samples in which the analyte was detected, divided by the total number of samples analyzed (excluding rejected samples).  
<sup>2</sup> Indicates the value is the average of a sample concentration and its duplicate. For nondetected values, 1/2 the contract-required quantitation limits/contract-required detection limit is used as a surrogate.  
<sup>3</sup> The mean of detected concentrations is the arithmetic mean of all samples in which the analyte was detected. It does not include those samples in which the analyte was not detected.

Notes: SWMUs = solid waste management units.  
 RCRA = Resource Conservation and Recovery Act.  
 µg/kg = micrograms per kilogram.  
 mg/kg = milligram per kilogram.  
 PCBs = polychlorinated biphenyls.  
 4,4'-DDT = dichlorodiphenyltrichloroethane.  
 4,4'-DDE = dichlorodiphenyldichloroethane.  
 4,4'-DDD = dichlorodiphenyldichloroethane.  
 N/A - not applicable.  
 DUP = duplicate.

SWMU 25. The pesticide, dieldrin, was detected in surface soil sample MPT-25-SS07 in the southern part of the SWMU at a concentration that exceeded the FDEP industrial soil cleanup goal. Dieldrin was detected in three other samples (MPT-25-SS03, MPT-25-SS06, and MPT-25-SS08) at concentrations less than the USEPA Region III and FDEP residential benchmarks.

SWMU 44. Two SVOCs were detected at concentrations exceeding the USEPA Region III and FDEP residential benchmarks in surface soil samples collected at SWMU 44. One sample, MPT-44-SS01, was located at the east side of the northern clarifier, and the other, MPT-44-SS07, was located 80 feet to the northwest of the northern clarifier. Benzo(a)pyrene and dibenz(a,h)anthracene were detected at concentrations exceeding their respective residential benchmarks in sample MPT-44-SS01, and only benzo(a)pyrene was detected at a concentration exceeding the residential benchmark in sample MPT-44-SS07.

SWMU 45. Two SVOCs, a pesticide and a PCB, were detected at concentrations that exceed the residential benchmarks in surface soil samples collected at SWMU 45. The SVOCs, benzo(a)pyrene and dibenz(a,h)anthracene, were detected at concentrations that exceeded USEPA Region III RBCs and FDEP soil cleanup goals in a surface soil sample (MPT-45-SS01) located between the two sludge drying beds. Benzo(a)pyrene was also detected at concentrations exceeding the residential benchmark in the surface soil sample collected at monitoring well location MPT-45-MW02S, approximately 40 feet north of the sludge drying beds (Plate 3). Benzo(a)pyrene and dibenz(a,h)anthracene were not detected in these two samples at concentrations that exceed their respective FDEP industrial soil cleanup goal.

A pesticide (chlordan) and PCB (Aroclor-1260) were detected at concentrations exceeding the USEPA Region III RBCs in a sample (MPT-45-SS06) collected at the northern end of the northernmost sludge drying bed. The FDEP residential and industrial soil cleanup goals were not exceeded.

**4.2.2.2 Inorganics** Eighteen inorganic analytes were detected in surface soil samples (Table 4-5). Antimony, arsenic, cobalt, cyanide, lead, mercury, nickel, silver, and tin were detected in the environmental samples collected from the Shipyard Area, but not in the background surface soil samples. Seven other inorganic analytes (barium, beryllium, cadmium, chromium, copper, vanadium, and zinc) were detected at concentrations that exceed background screening concentrations (Table 4-7).

Nine of the inorganic analytes (antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, and zinc) were detected at concentrations that exceed either the USEPA Region III RBC or FDEP Soil Cleanup Goal benchmarks (Table 4-7). Five of the inorganic analytes (antimony, cadmium, chromium, mercury, and zinc) exceeded the USEPA Region III RBC but not their respective FDEP soil cleanup goals.

Arsenic and beryllium were detected at a higher frequency of occurrence at concentrations exceeding the benchmarks relative to the other inorganic analytes. Arsenic was detected at concentrations exceeding the USEPA Region III RBC and FDEP soil cleanup goal in the majority of the soil samples collected at the Shipyard Area. The highest concentrations of arsenic, which also exceed the FDEP industrial soil cleanup goal of 3.7 mg/kg, were detected at sampling locations in SWMUs 1 and 23. The following describes the locations where surface soil samples contained arsenic at concentrations that approach or exceed the FDEP

**4.2.3 Subsurface Soil Assessment** The subsurface soil analytical results are described as a group, the Shipyard Area, SWMUs 1, 23, 24, 25, 44, and 45. Twenty-one subsurface soil samples and one duplicate were collected from the Shipyard Area (Plate 3). Tables 4-8 and 4-9 present concentrations of the chemicals detected in the subsurface soil samples, and Table 4-10 lists statistics for each analyte detected. Table 4-11 compares detected concentrations of target analytes with background screening values and benchmarks. Subsurface soil analytical results are compared to background screening values for subsurface soil (ABB-ES, 1995a) and residential use benchmarks values from USEPA Region III risk-based concentrations (USEPA, 1995a) and industrial worker concentrations for Florida soil cleanup goals (FDEP, 1995a; 1995b; and 1996).

**4.2.3.1 Organics** Target analytes detected in the subsurface soil samples consist of three VOCs, one SVOC, and two pesticides (Table 4-8). None of the organics were detected at concentrations that exceed benchmarks (Table 4-11).

**4.2.3.2 Inorganics** Sixteen inorganic analytes were detected in subsurface soil samples (Table 4-9). Ten inorganic analytes (arsenic, barium, beryllium, chromium, copper, lead, mercury, tin, vanadium, and zinc) were detected at concentrations that exceed background screening concentrations (Table 4-11). Antimony, cadmium, nickel, and selenium were detected in the environmental samples collected from the Shipyard Area, but not in the subsurface background samples. None of the inorganic analytes were detected at concentrations that exceed benchmark concentrations (Table 4-11).

**4.2.4 SWMU 45 Sludge Assessment** Sixteen sludge samples and two duplicates were collected from SWMU 45 (Plate 3). Tables 4-12 and 4-13 present concentrations of the chemicals detected in the sludge samples, and Table 4-14 lists statistics for each analyte detected. Table 4-15 compares detected concentrations of target analytes with background screening values and benchmarks. Composite sludge sample analytical results are compared to background screening values for subsurface soils (ABB-ES, 1995a) and residential use benchmarks values from USEPA Region III risk-based concentrations (USEPA, 1995a) and Florida soil cleanup goals (FDEP, 1995a; 1995b; and 1996).

**4.2.4.1 Organics** Target analytes detected in the sludge samples consist of 3 VOCs, 16 SVOCs, and 7 pesticides (Table 4-12). PCBs were not detected in the sludge samples. None of the VOCs or pesticides were detected at concentrations that exceed benchmarks. Only one SVOC, benzo(a)pyrene, was detected at concentrations that exceed residential human health-based benchmarks (Table 4-15). Benzo(a)pyrene was detected in samples collected from 0 to 1 foot bls at concentrations exceeding the USEPA Region III RBC in two samples (MPT-45-SL01 and MPT-45-SL02) and the FDEP residential soil cleanup goal in one sample, MPT-45-SL02. This frequency of occurrence for benzo(a)pyrene, exceeding the FDEP residential soil cleanup goal, is based on an average concentration for sludge sample MPT-45-SL01 which has a corresponding duplicate. The sample designated as 45L001001 contained benzo(a)pyrene at 100  $\mu\text{g}/\text{kg}$ . It also should be noted that the concentrations detected for benzo(a)pyrene did not exceed the FDEP industrial soil cleanup goal of 500  $\mu\text{g}/\text{kg}$ , and that benzo(a)pyrene was not detected in the samples collected at 1 to 2 feet bls.

**4.2.4.2 Inorganics** Seventeen inorganic analytes were detected in sludge samples (Table 4-13). Four inorganic analytes (barium, chromium, copper, and zinc) were detected at concentrations that exceed background screening concen-

**Table 4-10 (Continued)**  
**Summary of Analytes Detected in Subsurface Soil at Shipyard Area SWMUs 1, 23, 24, 25, 44, and 45**

RCRA Facility Investigation, Group III SWMUs  
 U.S. Naval Station  
 Mayport, Florida

Analyte	Frequency of Detection <sup>1</sup>	Minimum Detected Concentration	Maximum Detected Concentration	Mean of Detected Concentrations <sup>2</sup>	Range of Instrument Reporting Limits	Sample with Maximum Concentration
<b>Inorganics (mg/kg) (Continued)</b>						
Tin	2/21	3.3	62	32.7	1.9 - 5.6	24B00707
Vanadium	21/21	0.86	11.2	2.5	N/A	01B00508
Zinc	16/21	3.7	59.1	22	2.5 - 2.8	01B00508

<sup>1</sup> Frequency of detection is the number of samples in which the analyte was detected, divided by the total number of samples analyzed (excluding rejected samples).

<sup>2</sup> An asterisk indicates the value is the average of a sample concentration and its duplicate. For nondetected values, 1/2 the contract-required quantitation limits/contract-required detection limit is used as a surrogate.

<sup>3</sup> The mean of detected concentrations is the arithmetic mean of all samples in which the analyte was detected. It does not include those samples in which the analyte was not detected.

Notes: SWMUs = solid waste management units.

RCRA = Resource Conservation and Recovery Act.

µg/kg = micrograms per kilogram.

PCBs = polychlorinated biphenyls.

4,4'-DDE = dichlorodiphenyldichloroethane.

mg/kg = milligram per kilogram.

NA = not applicable.

**Table 4-14 (Continued)**  
**Summary of Analytes Detected in Sludge Samples at SWMU 45**

RCRA Facility Investigation, Group III SWMUs  
 U.S. Naval Station  
 Mayport, Florida

Analyte	Frequency of Detection <sup>1</sup>	Minimum Detected Concentration <sup>2</sup>	Maximum Detected Concentration <sup>2</sup>	Mean of Detected Concentrations <sup>3</sup>	Range of Instrument Reporting Limits	Sample with Maximum Concentration
<sup>1</sup> Frequency of detection is the number of samples in which the analyte was detected divided by the total number of samples analyzed (excluding rejected samples). <sup>2</sup> Indicates the value is the average of the detected concentrations in a sample and its duplicate. For nondetected values, 1/2 the contract-required quantitation limits/contract-required detection limit is used as a surrogate. <sup>3</sup> The mean of detected concentrations is the arithmetic mean of all samples in which the analyte was detected. It does not include those samples in which the analyte was not detected.						
Notes: SWMUs = solid waste management units. RCRA = Resource Conservation and Recovery Act. µg/kg = micrograms per kilogram. PCBs = polychlorinated biphenyls. 4,4'-DDD = dichlorodiphenyldichloroethane. 4,4'-DDE = dichlorodiphenyldichloroethane. mg/kg = milligram per kilogram. N/A = not applicable.

**Table 4-15 (Continued)**  
**Comparison of Analytes Detected in SWMU 45 Sludges**  
**to Background Screening and Benchmark Concentrations**

RCRA Facility Investigation, Group III SWMUs  
 U.S. Naval Station  
 Mayport, Florida

Analyte	Maximum Concentration	Background Screening Concentration <sup>2</sup>	Frequency Above Background Screening Concentration	Florida Soil Cleanup Goal <sup>3</sup>	Frequency above Florida Soil Cleanup Goal	Risk-Based Screening Concentration <sup>4</sup>	Frequency Above Risk-Based Screening Concentration
<b>Inorganics mg/kg (Continued)</b>							
Tin	25.3	NSC	N/A	44,000	0/16	4,700	0/16
Vanadium	3	4	0/16	490	0/16	55	0/16
Zinc	372	2.6	16/16	23,000	0/16	2,300	0/16

<sup>1</sup> Indicates the value is the average of the detected concentrations in a sample and its duplicate. For nondetected values, 1/2 the contract-required quantitation limits/contract-required detection limit is used as a surrogate.

<sup>2</sup> The background screening concentration is twice the mean of detected concentrations for inorganic analytes.

<sup>3</sup> Soil Cleanup Goals for Florida, September 29, 1995 (residential for sludge.)

<sup>4</sup> The value is from U.S. Environmental Protection Agency Region III Risk-based Concentrations tables dated February 9, 1995. Concentrations for non-carcinogenic risks are adjusted to a Hazard Index of 0.1.

<sup>5</sup> Soil Cleanup Goals for Florida, January 1996 (residential for sludge).

<sup>6</sup> Soil Cleanup Goals for the Military Sites, April 5, 1995 (residential for sludge)

Notes: SWMUs = solid waste management units.

RCRA = Resource Conservation and Recovery Act.

µg/kg = micrograms per kilogram.

NSC - no screening concentration.

N/A = not applicable.

PCBs = polychlorinated biphenyls.

4,4'-DDD = dichlorodiphenyldichloroethane.

4,4'-DDE = dichlorodiphenyldichloroethane.

mg/kg = milligram per kilogram.

<sup>1</sup> Frequency of detection is the number of samples in which the analyte was detected, divided by the total number of samples analyzed (excluding rejected samples).

<sup>2</sup> Indicates the value is the average of a sample concentration and its duplicate. For nondetected values, 1/2 the contract-required quantitation limits/contract-required detection limit is used as a surrogate.

<sup>3</sup> The mean of detected concentrations is the arithmetic mean of all samples in which the analyte was detected. It does not include those samples in which the analyte was not detected.

Notes: SWMUs = solid waste management units.

RCRA = Resource Conservation and Recovery Act.

µg/l = micrograms per liter.

N/A - not applicable.

mg/l = milligram per liter.

CaCO<sub>3</sub> = calcium carbonate.

Antimony was detected in five groundwater samples collected from monitoring wells (MPT-1-MW02S, MPT-1-MW03S, MPT-44-MW01S, MPT-44-MW02S, and MPT-45-MW02S) screened in the water table zone of the surficial aquifer. The concentrations detected exceed Florida Groundwater Guidance Concentrations.

Arsenic was detected in four samples from monitoring wells screened in the deep zone of the surficial aquifer at concentrations that exceed the Florida Groundwater Guidance Concentration.

Manganese was detected in groundwater samples collected from monitoring wells screened in the intermediate and deep zones of the surficial aquifer and nine water table zone monitoring wells at concentrations that exceed its Florida Groundwater Guidance Concentration.

Vanadium was detected in groundwater samples from two monitoring wells (MPT-23-MW05S and MPT-44-MW02S) screened in the water table zone of the surficial aquifer at concentrations that exceed the Florida Groundwater Guidance Concentrations.

Concentrations of copper, lead and nickel detected in groundwater samples collected from monitoring wells installed in the water table zone did not exceed either USEPA Region III RBC or Florida Groundwater Guidance Concentrations. However, the distribution of their highest detected concentrations is similar to antimony and vanadium in monitoring wells MPT-1-MW02S, MPT-1-MW03S, MPT-23-MW06S, MPT-23-MW05S, MPT-44-MW01S, MPT-44-MW02S, MPT-44-MW03S, and MPT-45-MW02S. The occurrence of antimony, vanadium, copper, lead and nickel and possibly manganese and arsenic in the water table zone of the surficial aquifer tend to occur in areas that are hydraulically downgradient from the areas where they were detected in surface soil samples at concentrations that exceeded the FDEP industrial soil cleanup goals. This distribution suggests that a release to the environment has occurred.

The concentrations of arsenic, iron, magnesium, and sodium detected in groundwater samples from monitoring wells screened in the deep zone of the surficial aquifer are likely naturally occurring. This is based on groundwater in the surficial aquifer beneath NAVSTA Mayport becoming more saline with depth (Franks, 1980).

4.3 Human Health Risk Assessment for the Shipyard Area, SWMUs 1, 23, 24, 25, 44, and 45. SWMUs 23, 24, 25, 44, and 45 are located adjacent to SWMU 1, Landfill A, and share similar topographic and hydrogeologic settings, and have similar contaminants. Therefore, SWMUs 1, 23, 24, 25, 44, and 45, collectively called the Shipyard Area in this section, were evaluated together. Industrial (e.g., waste oils, paints, solvents) and sanitary wastes were disposed of at SWMU 1 (Landfill A), the former location of which is thought to be under and around the existing JSI Administration Building. JSI has gone out of business and currently their area of the station is not being used for repair activities. Additionally, the JSI Administration Building is currently being renovated and is to be used as office space. SWMU 23 encompasses most of the JSI Shipyard Area. Possible contaminants at SWMU 23 include fuels and oils, metals, and solvents. The NFSI, SWMU 24 and AMI, SWMU 25 are commercial shipyard companies that may have contaminants similar to those at SWMU 23. SWMU 44 is the FOWTP clarifiers 1 and 2; possible contaminants include oily material from firefighter training

on the findings and conclusion of this risk assessment. A summary of validation of the analytical data is presented in the PARCC report provided in Appendix B.

Table 4-21 presents the analytes detected in and the HHCPCs selected for surface soil at the Shipyard Area. Seven SVOCs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene); two PCBs (Aroclor-1254 and Aroclor-1260); two pesticides (chlordane and dieldrin); and nine inorganic compounds (antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, and zinc) were selected as HHCPCs.

**4.3.1.2 Subsurface Soil** During the Group III RFI field activities, eight subsurface soil samples and one duplicate were collected from SWMU 1; seven subsurface soil samples were collected from SWMU 23; one subsurface soil sample was collected from SWMU 24; three subsurface soil samples were collected from SWMU 44; and two subsurface soil samples were collected from SWMU 45. Data from SWMUs 1, 23, 24, 44, and 45 were evaluated together.

Subsurface soil sampling locations that were evaluated in the HHRA include MPT-1-SB01 through MPT-1-SB07, including a duplicate from MPT-1-SB06 (Plate 3). The evaluation of subsurface soil samples also included samples from monitoring well locations MPT-1-MW01D, MPT-23-MW01S through MPT-23-MW07S, MPT-24-MW01S, MPT-44-MW01S through MPT-44-MW03S, MPT-45-MW01D, and MPT-45-MW02S (Plate 3).

Table 4-22 presents the analytes detected in subsurface soil. No HHCPCs were selected for subsurface soil.

**4.3.1.3 Sludge** During the Group III RFI field activities, eight composite sludge samples were collected from SWMU 45 at zero to 1 foot bls and eight composite sludge samples were collected at 1 to 2 feet bls. Analytical data from both depths were evaluated together. Sludge sample locations that were evaluated in the HHRA include MPT-45-SL01 through MPT-45-SL08 [two depths were sampled at each location] and two duplicates [one at each depth] were collected at MPT-45-SL01 (Plate 3).

Table 4-23 presents the analytes detected in and the HHCPCs selected for sludge at SWMU 45. Six SVOCs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, and indeno(1,2,3-cd)pyrene); one pesticide (endrin ketone); and three inorganic compounds (antimony, arsenic, and copper) were selected as HHCPCs. Endrin ketone was retained as an HHCPC because neither a risk-based screening value nor a Florida Clean-up Goal was available for this substance. Inclusion of endrin ketone as an HHCPC does not suggest that it substantially contributes to potential risks associated with exposure to sludge.

**4.3.1.4 Groundwater** During the Group III RFI field activities, five unfiltered groundwater samples were collected from SWMU 1, nine unfiltered groundwater samples and two duplicates were collected from SWMU 23, one unfiltered groundwater sample was collected from SWMU 24, five unfiltered groundwater samples were collected from SWMU 44, and four unfiltered groundwater samples and two duplicates were collected from SWMU 45. Groundwater samples were collected using the low-flow method. Data from SWMUs 1, 23, 24, 44, and 45 were evaluated together.

Groundwater sampling locations that were evaluated in the HHRA include MPT-1-MW01S, MPT-1-MW01I, MPT-1-MW01D, MPT-1-MW02S, MPT-1-MW03S, MPT-23-MW01S through MPT-23-MW05S, MPT-23-MW05I, MPT-23-MW05D, MPT-23-MW06S, MPT-23-MW07S, MPT-24-MW01S, MPT-44-MW01S, MPT-44-MW01I, MPT-44-MW01D, MPT-44-MW02S, MPT-44-MW03S, MPT-1-PO1S, MPT-45-MW01I, MPT-45-MW01D, MPT-45-MW02S, and four duplicates from locations MPT-23-MW01S, MPT-23-MW04S, MPT-45-MW01I, and MPT-45-MW02S (Plates 1 and 2).

Groundwater data for antimony were rejected for the following sample locations: MPT-23-MW01S and the duplicate, MPT-23-MW02S, MPT-23-MW03S, MPT-23-MW06S, and MPT-23-MW07S (Please refer to Subsection 2.2.2). The analytical results were qualified because the percent recovery of spiked compounds in MS samples was less than 30 percent. Non-detect values for these samples were rejected. The rejection of this data, assuming that they are not false negative values, should not have an adverse impact on conclusions and recommendations contained in this report.

Table 4-24 presents the analytes detected in and the HHCPGs selected for unfiltered groundwater associated with the Shipyard Area. One VOC (1,1-dichloroethene), one SVOC (bis(2-ethylhexyl)phthalate), and seven inorganic compounds (antimony, arsenic, iron, magnesium, manganese, sodium, and vanadium) were selected as HHCPGs.

**4.3.2 Exposure Assessment** Medium-specific receptors and exposure scenarios are identified in Paragraphs 4.3.2.1 through 4.3.2.4 for current and future land use. The information is also summarized in Table 4-25 and on Figure 4-15. Receptor-specific exposure parameters for each exposure scenario are presented in Appendix D-3 to the NAVSTA Mayport GIR (ABB-ES, 1995a). The risk calculation spreadsheets in Appendix D-2 to this report also contain the exposure parameters for each exposure scenario.

Although permission is required to obtain access to NAVSTA Mayport, the Shipyard Area and the surrounding area are accessible to Navy personnel and their adult and child dependents.

**4.3.2.1 Surface Soil** Currently, adult and adolescent trespassers, site maintenance workers, and occupational workers could be exposed to contaminants in surface soil. In addition, ongoing construction in the Shipyard Area could result in exposure of excavation workers to surface soil contaminants. Therefore, exposure of these receptors (i.e., ingestion, dermal contact, and inhalation of particulates) is evaluated in the HHRA. No humans currently reside at the Shipyard Area; however, the Shipyard Area could at some time be developed for residential use. Therefore, exposure of future residents to contaminants in surface soil is also evaluated in the HHRA.

**4.3.2.2 Subsurface Soil** Exposure of an excavation worker (i.e., ingestion, dermal contact, and inhalation of particulates) is evaluated at sites where ongoing or future construction could result in their exposure to contaminants in subsurface soil.

**4.3.2.3 Sludge** Exposure to the dried sludge would be similar to exposure to surface soil. Currently, adult and adolescent trespassers, occupational workers, site maintenance workers, and excavation workers could be exposed under current site usage to sludge at SWMU 45; therefore, exposure of these receptors is

**Table 4-25**  
**Summary of Potential Exposure Pathways**  
**Shipyard Area (SWMUs 1, 23, 24, 25, 44 and 45)**

RCRA Facility Investigation, Group III SWMUs  
 U.S. Naval Station  
 Mayport, Florida

Medium of Exposure	Route of Exposure	Potentially Exposed Population	Selected for Evaluation?	Reason for Selection or Exclusion
<b>Current Land Use</b>				
<b>Surface Soil</b>	Dermal contact with soil, ingestion of soil, and inhalation of fugitive dust.	Resident (child and adult) Trespasser (adolescent and adult) Occupational worker (adult) Site maintenance worker (adult) Excavation worker (adult)	No Yes Yes Yes Yes	No humans currently reside at the Shipyard Area. Adolescents and adults may be exposed to contaminants in the surface soil while trespassing. Both occupational workers and site maintenance workers may be exposed to contaminants in surface soil. Excavation workers may be exposed to contaminants in surface soil during ongoing construction activities at the Shipyard Area.
<b>Subsurface Soil</b>	Dermal contact with soil, ingestion of soil, and inhalation of fugitive dust.	Excavation worker (adult)	Yes	No HHCPs were identified in subsurface soil.
<b>Sludge (SWMU 45)</b>	Dermal contact with dried sludge, ingestion of dried sludge, and inhalation of fugitive dust.	Resident (child and adult) Trespasser (adolescent and adult) Occupational worker (adult) Site maintenance worker (adult) Excavation worker (adult)	No Yes Yes Yes Yes	No humans currently reside at the Shipyard Area. Adolescents and adults may be exposed to contaminants in the sludge while trespassing. Both occupational workers and site maintenance workers may be exposed to contaminants in sludge. Excavation workers may be exposed to contaminants in sludge during ongoing construction activities at the Shipyard Area.
<b>Groundwater: Surficial Aquifer</b>	Ingestion of groundwater as drinking water and inhalation of volatiles while showering.	Resident (adult)	No	There are no current exposures to groundwater.
<b>Future Land Use</b>				
<b>Surface Soil</b>	Dermal contact with soil, ingestion of soil, and inhalation of fugitive dust.	Resident (child and adult) Trespasser (adolescent and adult) Occupational worker (adult) Site maintenance worker (adult) Excavation worker (adult)	Yes No No No No	If the Shipyard Area is developed for residential use, child and adult residents could be exposed to contaminants in surface soil. Future industrial use, though unlikely, may result in occupational exposures. Site maintenance workers could be exposed to contaminants in surface soil during everyday activities. Excavation workers could be exposed to contaminants in surface soil during construction or utility work. However, occupational worker, site worker, and excavation worker exposure scenarios are evaluated under current land use.
<b>Subsurface Soil</b>	Dermal contact with soil, ingestion of soil, and inhalation of fugitive dust.	Excavation worker (adult)	No	Excavation workers could be exposed to contaminants in subsurface soil during construction or utility work. However, excavation worker exposure scenarios are evaluated under current land use.

See notes at end of table.

<sup>1</sup> A hazard index could not be calculated for inhalation exposures because neither inhalation reference doses nor reference concentrations were available for the HHCPs.

Notes: SWMUs = solid waste management units.  
 RCRA = Resource Conservation and Recovery Act.  
 NC = not calculated.  
 HHCP = human health chemical of potential concern.

does not appear to be a numerical pattern for the distribution of organic compounds in groundwater samples collected from the surficial aquifer (Subsection 4.2.5).

Inclusion of antimony, arsenic, and manganese in the RGO table is not intended to be a statement that remediation of these chemicals is necessary. The RGO for antimony is less than the Federal MCL and Florida Guidance Concentration, as well as the CRDL/CRQL. Thus, remediation to the RGO for antimony may not be required or confirmable using current analytical technologies. Arsenic was detected in 13 of 17 groundwater samples at concentrations less than the Federal and State drinking water standard of 50  $\mu\text{g}/\ell$ . The RGOs for arsenic are all below the Federal MCL, Florida Guidance Concentration, and the background screening concentration. In addition, all but one of the RGOs for arsenic are less than the CRDL/CRQL. Therefore, remediation to the RGOs for arsenic may not be required or confirmable using current analytical techniques.

Manganese was detected in 10 of 24 groundwater samples at concentrations less than the Florida Guidance Concentration of 50  $\mu\text{g}/\ell$ . The RGO associated with an HQ of 0.1 for manganese is less than the Florida Guidance Concentration, which suggests that remediation to this RGO may not be required. The distribution of inorganic analytes detected in groundwater samples collected from the surficial aquifer appears to be random (Subsection 4.2.5).

**4.4 ECOLOGICAL ASSESSMENT FOR THE SHIPYARD AREA (SWMUs 1, 23, 24, 25, 44, and 45).** The subsections below describe the results of the ecological risk assessment (ERA) for the Shipyard Area (SWMUs 1, 23, 24, 25, 44, and 45). Anecdotal evidence suggests SWMU 1, Landfill A, was located approximately 600 feet to the south of the entrance to the Mayport Turning Basin. Results from surface geophysics, soil borings, and laboratory analysis of environmental samples do not confirm the existence of Landfill A at this location. SWMU 23 (JSI) and the two SWMUs at the domestic Wastewater Treatment Plant (FOWTP) (SWMU 44, Wastewater Treatment Facility Clarifiers 1 and 2, and SWMU 45, Wastewater Treatment Facility Sludge Drying Beds) occupy part of what was previously believed to be Landfill A. SWMU 24 (NFSI) and SWMU 25 (AMI) have been added because of their proximity to SWMU 1 and the similarity of ship repair activities among SWMUs 23, 24, and 25. The ERA for SWMU 1 and the adjacent SWMUs will be conducted as a single comprehensive effort. These SWMUs are collectively referred to as the Shipyard Area. The ERA was completed according to the methodology described in Section 2.4 of the GIR (ABB-ES, 1995a), including selection of ECPCs (Subsection 4.4.1), exposure assessment (Subsection 4.4.2), ecological effects assessment (Subsection 4.4.3), risk characterization (Subsection 4.4.4), and uncertainty analyses (Subsection 4.4.5).

Exposure pathways for ecological receptors evaluated in the assessment are summarized in a Site Conceptual Model (Figure 4-20). Exposure pathways at the Shipyard Area are limited to groundwater. Exposure pathways evaluated for aquatic receptors include direct contact with the groundwater as it discharges into surface water. Exposures associated with potential contamination in surface soil to terrestrial receptors were not evaluated. Terrestrial ecological receptors are not expected to occur in the vicinity of the Shipyard Area because the majority of the site is paved with asphalt or concrete and is located in an industrialized area.

## 7.0 CONCLUSIONS AND RECOMMENDATIONS

The following sections summarize the results of the Group III RFI and present recommendations for the Group III SWMUs.

7.1 THE SHIPYARD AREA, SWMUs 1, 23, 24, 25, 44, and 45. RFI SWMU 1 and RFA SV SWMUs 23, 24, 25, 44, and 45 (SWMUs requiring confirmatory sampling) were grouped together for RFI field investigations and reporting and are collectively referred to as the Shipyard Area. The Shipyard Area is an industrial area located in the northeastern part of NAVSTA Mayport.

Shallow soil in the vicinity of the Shipyard Area consists of fine grained, well-sorted sands which typically contain shell fragments. At some of the soil boring locations, thin (less than 1 foot) seams of clay or clayey to silty fine sand were encountered. These seams appear to be restricted in areal extent. The relatively low CEC and TOC values suggest that the soil at the Shipyard Area SWMUs has a limited ability to retard contaminant migration; therefore, contaminants, if present, in the surficial aquifer may migrate at rates near linear groundwater flow velocities.

The SWMUs comprising the Shipyard Area are located due south of the Mayport Turning Basin entrance channel. The direction of groundwater flow is generally to the north, toward the Mayport Turning Basin entrance channel (Plate 1). Groundwater in the water table zone at and north of the northern boundaries of the Shipyard Area may be affected by tidal fluctuations. It is likely that the effect in the water table zone of the surficial aquifer is limited to areas located less than 330 feet from the shoreline of the St. Johns River.

Horizontal groundwater flow velocities in the surficial aquifer beneath the Shipyard Area SWMUs are estimated to range from approximately 0.05 ft/d (18 feet per year [ft/yr]) to 0.15 ft/d (54 ft/yr). Assuming a value of 36 ft/yr for the horizontal linear groundwater velocity and no retardation of contaminants, the time for contaminants to migrate from the Shipyard Area, which ranges from 200 to 1,050 feet from the St. Johns River, would be approximately 6 to 29 years.

Geophysical anomalies were detected that could not be readily explained by cultural interferences. The anomalies were investigated with ground-penetrating radar and interpreted to be related to buried utilities and not landfilled materials. The location of SWMU 1 was not confirmed by the geophysical survey. Seven shallow borings to the water table were conducted at SWMU 1 to assess whether landfill materials were present. Landfilled materials were not encountered.

VOCs were not detected in surface soil samples at concentrations that exceed benchmarks; however, five SVOCs, two pesticides, two PCBs and nine inorganics were detected at concentrations that exceed residential benchmarks. Five of the analytes, two SVOCs (benzo(a)pyrene, dibenz(a,h)anthracene), one pesticide (dieldrin), and two inorganics (arsenic and beryllium) were also detected at concentrations that exceed their respective industrial values for FDEP soil cleanup criteria. The SVOCs, pesticides, PCBs, and inorganics that exceeded the benchmarks were detected at various locations in the Shipyard Area and likely represent "hot spots."

None of the organic or inorganic analytes were detected in subsurface soil samples at concentrations that exceed benchmark concentrations.

None of the VOCs or pesticides were detected in the sludge samples collected at SWMU 45 at concentrations that exceed benchmarks. Only one SVOC, benzo(a)pyrene, was detected at concentrations that exceeded residential human health-based benchmarks, but not the FDEP industrial soil cleanup goal of 500  $\mu\text{g}/\text{kg}$ . Three of the inorganic analytes (antimony, arsenic, and copper) were detected at concentrations that exceed residential human health-based benchmark concentrations. However, the sludge samples only contained arsenic at concentrations exceeding the FDEP residential soil cleanup goal, but did not exceed the FDEP industrial soil cleanup goal (3.1  $\text{mg}/\text{kg}$ ).

Results of water quality indicator parameters suggest that groundwater in the vicinity of the Shipyard Area does not meet the criteria of a Class G-I or G-II drinking water supply. An appropriate designation for the surficial aquifer beneath the Shipyard Area would be Class G-III.

Pesticides and PCBs were not detected in the groundwater samples. One VOC (1,1-dichloroethene) and one SVOC (bis(2-ethylhexyl)phthalate) were detected at concentrations that exceed their respective USEPA Region III RBCs, but not their Florida Groundwater Guidance Concentrations.

There does not appear to be a discernible areal and numerical distribution for the organic target analytes, nor does there appear to have been significant release of volatile organic compounds to the environment based on comparison of the analytical results with Florida Groundwater Guidance Concentrations.

Seven inorganic analytes (antimony, arsenic, iron, magnesium, manganese, sodium, and vanadium) were detected in groundwater samples at concentrations that exceed benchmark concentrations. Currently, a promulgated primary or secondary standard has not been established for magnesium.

The occurrence of antimony, vanadium, copper, lead, and nickel and possibly manganese and arsenic in the water table zone of the surficial aquifer tend to occur in areas that are hydraulically downgradient from the areas where they were detected in surface soil samples at concentrations that exceeded the FDEP industrial soil cleanup goals. This distribution suggests that a release has occurred to the environment.

The concentrations of iron, magnesium, manganese, and sodium detected in groundwater samples from monitoring wells screened in the deep zone of the surficial aquifer are likely naturally occurring. This is based on groundwater in the surficial aquifer beneath NAVSTA Mayport becoming more saline with depth (Franks, 1980).

**7.1.1 Human Health Risk Assessment** Risk characterization was conducted for potential exposures to surface and subsurface soil, sludge, and groundwater under current and future land use scenarios. HHCPs were determined not to exist for subsurface soil during the screening evaluation; therefore, a risk characterization was not conducted for this medium. The following paragraphs summarize the human health risk assessment for surface soil, sludge, and groundwater.

Surface Soil. The cancer risk associated with current land use, including surface soil ingestion, dermal contact, and fugitive dust inhalation, is  $2 \times 10^{-6}$  for the trespasser,  $4 \times 10^{-6}$  for the occupational worker,  $1 \times 10^{-6}$  for the site maintenance worker, and  $1 \times 10^{-7}$  for the excavation worker. The cancer risk for a hypothetical future land use is  $2 \times 10^{-5}$  for the resident. None of the ELCRs exceed USEPA's target cancer risk range; however, FDEP's target cancer risk of  $1 \times 10^{-6}$  is exceeded by some of the exposure scenarios.

The total cancer risks to the resident (ingestion, dermal contact, and inhalation) associated with benzo(a)pyrene ( $5.5 \times 10^{-6}$ ), dibenz(a,h)anthracene ( $5.4 \times 10^{-6}$ ), arsenic ( $4.5 \times 10^{-6}$ ), and beryllium ( $5 \times 10^{-6}$ ) exceed FDEP's target cancer risk of  $1 \times 10^{-6}$ . It should be noted that five PAHs were detected in the sample designated as the duplicate to surface soil sample, MPT-24-SS06, but were not detected in the sample designated as the environmental sample. The samples was located in a sandy area adjacent to a paved road and an area where vehicles are commonly parked.

Noncancer risks associated with surface soil ingestion, dermal contact, and inhalation of fugitive dust for current and future land use (adolescent trespasser, adult trespasser, occupational worker, site maintenance worker, excavation worker, child resident, and adult resident) are below USEPA's and FDEP's target HI of 1.

Sludge. The cancer risk associated with current land use for sludge ingestion, dermal contact, and fugitive dust inhalation is  $6 \times 10^{-7}$  for the trespasser,  $1 \times 10^{-6}$  for the occupational worker,  $3 \times 10^{-7}$  for the site maintenance worker, and  $3 \times 10^{-8}$  for the excavation worker. None of these ELCRs exceed USEPA's target cancer risk range or FDEP's target cancer risk of  $1 \times 10^{-6}$ .

Noncancer risks for sludge ingestion, dermal contact, and fugitive dust inhalation for current land use (adolescent trespasser, adult trespasser, occupational worker, site maintenance worker, and excavation worker) are all below USEPA's and FDEPs target HI of 1.

Groundwater. The cancer risk associated with hypothetical future ingestion of unfiltered groundwater as drinking water and inhalation of volatiles while showering is  $8 \times 10^{-4}$  for the adult resident. Arsenic ( $8.3 \times 10^{-4}$ ) and 1,1-dichloroethene ( $2.1 \times 10^{-5}$ ) are the major contributors to this ELCR, which exceeds USEPA's target cancer risk range. In addition, the total cancer risks associated with 1,1-dichloroethene and arsenic exceed FDEP's target cancer risk of  $1 \times 10^{-6}$ .

The HI for groundwater ingestion is 8 for the adult resident. This HI exceeds USEPA's and FDEP's target HI of 1. The risk drivers are arsenic (HQ = 2.3) and manganese (HQ = 1.6).

It should be noted that the cancer risk and HQ associated with arsenic at its background screening concentration ( $8.6 \mu\text{g}/\ell$ ) are  $1 \times 10^{-4}$  and 0.8, respectively (future resident ingestion of groundwater). The HQ associated with manganese at its background screening concentration ( $198.6 \mu\text{g}/\ell$ ) is 1.1 (future resident ingestion of groundwater).

Currently, there is no exposure to groundwater from the surficial aquifer under current land use.

7.1.2 Ecological Risk Assessment Exposure pathways evaluated for aquatic receptors include direct contact with the groundwater as it discharges to surface water. Exposures associated with potential contamination in surface soil to terrestrial receptors were not evaluated. Terrestrial ecological receptors are not expected to occur in the vicinity of the Shipyard Area because the majority of the site is paved with asphalt or concrete and is located in an industrialized area.

Thirteen of 24 analytes detected in groundwater samples collected from the Shipyard Area were selected as ECPCs. The predicted maximum and average concentrations of groundwater ECPCs in the St. Johns River are compared to the State of Florida surface water quality standards for Class III marine water (FAC 62-302), AWQC (USEPA, 1986b), and the lowest reported adverse effect concentration in AQUIRE. Maximum exposure point concentrations are less than the lowest toxicity benchmark concentrations for all ECPCs in the groundwater samples, with the exception of cyanide and iron.

Maximum and average exposure concentrations for cyanide in the groundwater samples slightly exceed the Florida surface water quality standard and Federal AWQC. However, the maximum exposure point concentration of cyanide at 1.9  $\mu\text{g}/\ell$  is within the range of concentrations detected in background surface water samples collected from the St. Johns River (1.1 to 3.9  $\mu\text{g}/\ell$ ). This suggests that the discharge of cyanide from groundwater to surface water would not result in an increase risk to aquatic receptors under the current conditions.

Maximum and average exposure concentrations for iron in the groundwater samples exceed the sample Florida surface water quality standard and the lowest reported adverse effect reported in AQUIRE (dinoflagellate population growth). The maximum detected concentration of iron detected in groundwater samples from the background monitoring wells is 3,540  $\mu\text{g}/\ell$ ; this concentration also exceeds the aquatic toxicity benchmarks. Iron in groundwater is not expected to present a risk for aquatic receptors in the St. Johns River because it is expected that advection, dispersion, mixing, and retardation, will occur as the groundwater from the Shipyard Area is discharged to surface water and the exposure concentration will be lower than the benchmarks.

Based on these assumptions, groundwater discharges from the Shipyard Area to the surface water of the St. Johns River do not pose a risk to aquatic receptors.

7.1.3 Recommendations The following recommendations are based on the current use of the Shipyard Area as an industrial area and the assumption that this use will not change in the foreseeable future. The basis for the recommendations is the detection of chemicals in surface soil and groundwater beneath SWMUs 1, 23, 24, 25, 44, and 45 at concentrations that exceed residential use criteria. Therefore, the SWMU areas should be designated for industrial use only and groundwater from the surficial aquifer beneath these SWMUs should not be used as a source of potable water. Should use of the Shipyard Area change in the future, the recommendations presented in this report should be reevaluated.

Surface Soil. Additional investigation under an RFI or a corrective measures study for surface soil is not warranted at this time under a current industrial use scenario, as it is unlikely the Shipyard Area would be developed for residential use in the immediate or near future. However, an interim measure should be considered for eliminating the "hot spots" where SVOCs and inorganics

exceed FDEP's industrial soil cleanup goals. The goal of the interim measure should be to reduce the risk under current use for trespasser, occupational worker, and hypothetical residential exposure scenarios to levels that are less than or near the FDEP target cancer risk of  $1 \times 10^{-6}$  for industrial exposure.

Additional investigation is warranted for the interim measure to collect surface soil samples for analysis of analytes that exceed the benchmarks at a specific "hot spot." This information should be used to assess the horizontal and vertical extent of the specific chemicals at a "hot spot" and minimize the amount of surface soil requiring remediation.

An ecological risk assessment of terrestrial receptors was not conducted for surface soil at SWMUs 1, 23, 24, 25, 44, and 45. This would be considered a data gap in the RFI should use of the site change from industrial to residential.

Subsurface Soil. Additional investigation under an RFI or a corrective measures study for subsurface soil is not warranted at this time under a current industrial use scenario. The target analytes detected in subsurface soil samples did not exceed benchmarks for industrial exposure.

Sludge. Additional investigation under an RFI or a corrective measures study for sludge is not warranted at this time under a current industrial use scenario, as it is unlikely the Shipyard Area would be developed for residential use in the immediate or near future. Currently, the Navy Public Works Center in Jacksonville, Florida, is developing plans for removal of the sludge drying beds. This removal action would eliminate "hot spots" where SVOCs and inorganics exceed FDEP's residential soil cleanup goals. Upon completion of the removal action, documentation should be provided to regulatory agencies and the site should be reviewed for placement on the no further action list.

The risk assessment completed for SWMU 45 included receptor pathways that may reasonably occur under the current industrial setting. A complete baseline human health risk assessment and possibly an ecological risk assessment would be considered data gaps should the removal of the SWMU 45 Sludge Drying Bed not occur, or the site usage change from industrial to residential. However, it is not likely that the site usage would change to residential without an assessment and demolition of the FOWTP.

Groundwater. Additional investigation under an RFI or a corrective measures study for groundwater is not warranted at this time under a current industrial use scenario, as it is unlikely the Shipyard Area would be developed for residential use in the immediate or near future. The recommendation is based on the following: water in the surficial aquifer beneath the Shipyard Area has characteristics similar to Class G-III; organic chemicals did not exceed Florida Groundwater Guidance Concentrations; the highest concentrations of arsenic, iron, magnesium, manganese, and sodium, which exceed Florida groundwater guidance concentrations, were detected in groundwater samples from monitoring wells screened in the deep zone of the surficial aquifer are likely naturally occurring; groundwater discharges from the Shipyard Area to the surface water of the St. Johns River do not pose a risk to aquatic receptors; and cancer risk is associated with the hypothetical future use of groundwater; however, the surficial aquifer beneath the Shipyard Area is not currently used as a source of potable water.

7.2 THE CARBONACEOUS FUEL BOILER, SWMU 17. SWMU 17, the Carbonaceous Fuel Boiler (CFB), is located in the north central part of NAVSTA Mayport. The Carbonaceous Fuel Boiler, SWMU 17, was a furnace used to reduce the volume of domestic solid waste using diesel fuel or waste oil as auxiliary fuels, and provide steam for NAVSTA Mayport.

Shallow soil in the vicinity of the CFB plant consists of relatively uniform, light tan to tan, brown to dark brown, or gray very fine to fine-grained sand and silty sand with shell fragments that may make up to approximately 20 percent of the soil sample. The relatively low CEC and TOC values suggest that the soil at SWMU 17 has a limited ability to retard contaminant migration; therefore, contaminants, if present, in the surficial aquifer may migrate at rates near linear groundwater flow velocities.

The Carbonaceous Fuel Boiler plant is located on the southwestern side of Mayport Turning Basin (Plate 1). This location is not directly affected by the groundwater mound that dominates flow patterns in the rest of the Group III Area. Groundwater flow in the area near SWMU 17 appears to be to the northeast toward Mayport Turning Basin. Retaining walls constructed for the ship berthing piers may also divert groundwater around the retaining walls, flow beneath the wall, or through stormwater outfalls. Tidal influence of the shallow aquifer in the vicinity of the Carbonaceous Fuel Boiler plant is not likely due to the presence of the Mayport Turning Basin retaining walls (ABB-ES, 1993).

The horizontal groundwater flow velocity in the surficial aquifer beneath the CFB Area is estimated to be approximately 0.1 ft/d (35 ft/yr). Assuming a value of 35 ft/yr for the horizontal linear groundwater velocity and no retardation of contaminants, the time of travel for contaminants from SWMU 17 to Mayport Turning Basin (approximately 300 feet) is estimated to be approximately 9 years.

Two organic analytes (benzo(a)pyrene and dibenz(a,h)anthracene) and two inorganic analytes (arsenic and beryllium) were detected in surface soil samples at concentrations exceeding benchmarks for residential exposure scenarios, but did not exceed the FDEP industrial soil cleanup goal. A likely source for benzo(a)pyrene and dibenz(a,h)anthracene, which were detected in surface soil samples, is residues from vehicle exhaust and/or engine fluids on the parking lot of the Carbonaceous Fuel Boiler. Because the land features at NAVSTA Mayport are influenced by the deposition of dredge material from the Mayport Turning Basin, it cannot be determined whether the concentrations of arsenic and beryllium are related to a release at SWMU 17 or are residual concentrations from the dredge material.

Results of water quality indicator parameters suggest that groundwater in the vicinity of the Carbonaceous Fuel Boiler meet the criteria of a Class G-I or G-II drinking water supply.

VOCs, pesticides, and PCBs were not detected in groundwater samples. One organic, bis(2-ethylhexyl)phthalate, was detected in a groundwater sample at a concentration that exceeded benchmarks. Bis(2-ethylhexyl)phthalate is a common field and laboratory contaminant and is unlikely to be from a release at SWMU 17.

Three inorganic analytes (arsenic, iron, and manganese) were detected in the SWMU 17 groundwater samples at concentrations that exceed benchmarks. The highest detected concentrations of arsenic, iron, and manganese were from monitoring

wells located hydraulically upgradient or crossgradient from SWMU 17; this suggests that these chemicals are not site located. Because the land features at NAVSTA Mayport are influenced by the deposition of dredge material from the Mayport Turning Basin, it is possible that residual concentrations of inorganics from the dredge material have contributed to the inorganic concentrations detected in groundwater samples.

Based on comparison the data collected during the Group III RFI field activity with regulatory benchmarks, there does not appear to have been a significant release of chemicals, if any, to the environment from the Carbonaceous Fuel Boiler at SWMU 17.

7.2.1 Human Health Risk Assessment Risk characterization was conducted for potential exposures to surface and subsurface soil, and groundwater under current and future land-use scenarios. Risks for residential exposure to surface soil and groundwater were not estimated for current land use because no exposures are expected. Additionally, HHCPs were determined not to exist for subsurface soil during the screening evaluation; therefore, a risk characterization was not conducted for this medium. The following paragraphs summarize the risk characterization for human health risk associated with exposure to surface soil and groundwater.

Surface Soil. The excess lifetime cancer risk (ELCR) for a hypothetical future land use for surface soil ingestion, dermal contact, and fugitive dust inhalation is  $1 \times 10^{-6}$  for the trespasser,  $1 \times 10^{-5}$  for the resident,  $2 \times 10^{-6}$  for the occupational worker,  $6 \times 10^{-7}$  for the site maintenance worker, and  $6 \times 10^{-8}$  for the excavation worker. None of the ELCRs exceed the USEPA acceptable cancer risk range. The ELCR for a hypothetical future resident exceeds FDEP's risk management goal of  $1 \times 10^{-6}$ .

The total cancer risks (ingestion, dermal contact, and inhalation) for a hypothetical future resident is associated with benzo(a)pyrene ( $3.9 \times 10^{-6}$ ), dibenz(a,h)anthracene ( $2 \times 10^{-6}$ ), arsenic ( $3.1 \times 10^{-6}$ ), and beryllium ( $3.9 \times 10^{-6}$ ), which exceed FDEP's target cancer risk of  $1 \times 10^{-6}$ .

The noncancer risks associated with surface soil ingestion, dermal contact, and inhalation of fugitive dust for future land use (adolescent trespasser, adult trespasser, child resident, adult resident, occupational worker, site maintenance worker, and excavation worker) are all below USEPA's and FDEP's target HI of 1.

Groundwater. The cancer risk associated with a hypothetical future ingestion of groundwater as drinking water is  $1 \times 10^{-6}$  for the adult resident. This ELCR is within USEPA's acceptable cancer risk range and is at FDEP's target level. The cancer risk associated with bis(2-ethylhexyl)phthalate, the only contributor to the ELCR for the future resident, exceeds or is equal to FDEP's target cancer risk of  $1 \times 10^{-6}$ . The noncancer risk associated with groundwater ingestion is below USEPA's and FDEP's target HI of 1.

7.2.2 Ecological Risk Assessment Exposure pathways evaluated for aquatic receptors include direct contact with the groundwater as it discharges to surface water. Exposures associated with potential contamination in surface soil to terrestrial receptors were not evaluated. Terrestrial ecological receptors are not expected to occur in the vicinity of the Carbonaceous Fuel Boiler because the

majority of the site is paved with asphalt or concrete and is located in an industrialized area.

Three of 11 analytes detected in groundwater samples collected from the SWMU 17 were selected as ECPCs. The three analytes include one semivolatile (bis[2-ethylhexyl]phthalate), and two inorganics (iron and manganese). The predicted maximum and average concentrations of groundwater ECPCs in the St. Johns River are compared to the State of Florida surface water quality standards for Class III marine water (FAC 62-302), AWQC (USEPA, 1986b), and the lowest-reported adverse effect concentration in AQUIRE. With the exception of iron, maximum exposure point concentrations are less than the lowest toxicity benchmark concentrations for all ECPCs in groundwater.

Maximum and average exposure concentrations of iron in groundwater exceed both the Florida surface water quality standard and the lowest-reported adverse effect concentration in AQUIRE (dinoflagellate population growth) of 100  $\mu\text{g}/\text{l}$ . However, the maximum exposure point concentration of iron in groundwater from SWMU 17 (2,220  $\mu\text{g}/\text{l}$ ) is less than the maximum detected concentration of iron in groundwater from NAVSTA Mayport background samples. Maximum and average detected concentrations of iron from the background monitoring wells also exceed toxicity benchmarks. Iron in groundwater is not expected to present a risk for aquatic receptors in the St. Johns River because it is expected that advection, dispersion, mixing, and retardation will occur as the groundwater from SWMU 17 is discharged to surface water and the exposure concentration will be lower than the benchmark.

Based on these assumptions, groundwater discharges from SWMU 17 to the surface water of the St. Johns River do not pose a risk to aquatic receptors.

7.2.3 Recommendations The following recommendations are based on the current use of the Carbonaceous Fuel Boiler building area as an industrial area and the assumption that this use will not change in the foreseeable future. The basis for the recommendation is the detection of chemicals in surface soil and groundwater beneath SWMU 17 at concentrations that exceed residential use criteria. Therefore, SWMU 17 should be designated for industrial use only, and groundwater from the surficial aquifer beneath the SWMU should not be used as a source of potable water. Should use of the CFB building area change in the future, the recommendations presented in this report should be reevaluated.

Surface Soil. Additional investigation under an RFI or a corrective measures study for surface soil is not warranted at this time under a current industrial use scenario, as it is unlikely the CFB building area would be developed for residential use in the immediate or near future. The target analytes detected in surface soil samples did not exceed benchmarks for industrial exposure scenarios and exposures for the trespasser, occupational worker, site maintenance worker, and excavation worker are less than  $1 \times 10^{-6}$ .

An ecological risk assessment of terrestrial receptors was not conducted for surface soil at SWMU 17. This may be considered a data gap in the RFI should use of the site change from industrial to residential.

Subsurface Soil. Additional investigation under an RFI or a corrective measures study for subsurface soil is not warranted at this time under a current industrial use scenario, as it is unlikely the CFB building area would be

developed for residential use in the immediate or near future. The target analytes detected in subsurface soil samples did not exceed benchmarks for industrial exposure.

Groundwater. Additional investigation under an RFI or a corrective measures study for groundwater is not warranted at this time under a current industrial use scenario, as it is unlikely the CFB building area would be developed for residential use in the immediate or near future. The recommendation is based on the following: the organic chemical bis(2-ethylhexyl)phthalate detected at concentrations exceeding Florida Groundwater guidance concentrations is likely from cross-contamination of the sample in the field or laboratory; bis(2-ethylhexyl)phthalate was the only contributor to ELCR for the future resident, and exceeds or is equal to FDEP's target cancer risk of  $1 \times 10^{-6}$ ; noncancer risk associated with groundwater ingestion is below USEPA's and FDEP's target HI of 1; groundwater discharges from SWMU 17 to the surface water of Mayport Turning Basin do not pose a risk to aquatic receptors; and cancer risk is associated with the hypothetical future use of groundwater; however, the surficial aquifer beneath SWMU 17 is not currently used as a source of potable water.

7.3 THE FLEET TRAINING CENTER, SWMUs 14 AND 18. SWMU 14, the Mercury/Oil Waste Spill Area and SWMU 18, the Fleet Training Center Diesel Generator Sump, are located at the FTC which is near the mouth of the St. Johns River in northeast NAVSTA Mayport. Associated with SWMU 14 at the FFTA are drains that connect to an oil-water separator, a stormwater collection system, a petroleum storage area, and an area that was reported to have been used for storage of mercuric nitrate (A.T. Kearney, 1989). SWMU 18 consists of a diesel-powered electrical generator within a surrounding concrete containment curb approximately 6 inches high. The two SWMUs share a similar geologic and hydrogeologic setting and therefore were grouped to facilitate a comprehensive approach to the investigation of the sites.

Shallow soil in the vicinity of SWMUs 14 and 18 typically consists of various shades from light tan to brown, dark gray, or black fine-grained sand or silty sand. Minor amounts of shell material are present in some of the borings. The relatively low CEC and TOC values suggest that the soil at the FTC SWMUs has a limited ability to retard contaminant migration; therefore, contaminants, if present, in the surficial aquifer may migrate at rates near linear groundwater flow velocities.

The SWMUs comprising the Fleet Training Center Area are located due south of the St. Johns River, and approximately 1,000 feet west of the Atlantic Ocean in the northeastern part of NAVSTA Mayport. The direction of groundwater flow is generally to the north, toward the St. Johns River (Plate 1). Tidal influence of the water table zone of the surficial aquifer was observed to occur in an area north of the Fleet Training Center Area SWMUs, approximately 400 feet or less from the shoreline.

Radial hydraulic conductivity values in the vicinity of the FTC ranged from approximately 7.2 to 22.1 ft/d with an average of approximately 12.2 ft/d. Horizontal groundwater flow velocities in the surficial aquifer beneath the Fleet Training Center Area SWMUs are estimated to range from approximately 0.03 ft/d (10 ft/yr) to 0.14 ft/d (51 ft/yr).

Five SVOCs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz-(a,h)anthracene, and indeno(1,2,3-cd)pyrene) and one pesticide (dieldrin) were detected in surface soil samples at concentrations that exceed benchmark values for residential exposure scenarios. None of the organic analytes were detected in subsurface soil samples at concentrations that exceed benchmark values. It should be noted that soil samples were not collected directly beneath the two aircraft mockups and the concrete detention basin because these structures were in use.

Three SVOCs that exceeded the residential benchmark values were all detected in sediment samples collected from the stormwater drop inlet on the north side of the unnamed dirt road.

Dieldrin was detected in the duplicate to the surface soil sample collected at monitoring well MPT-18-MW01S at a concentration which exceeded the FDEP soil cleanup goal and the USEPA Region III RBC. Dieldrin was detected in the associated surface soil sample at a concentration that did not exceed either the FDEP soil cleanup goal or the USEPA Region III RBC.

Arsenic and beryllium were detected at concentrations that exceeded residential exposure scenarios for FDEP soil cleanup goals and USEPA Region III RBCs. Copper was detected in one sample at a concentration that exceeded the USEPA Region III RBCs for residential exposure. Arsenic and beryllium were not detected at concentrations that exceed their respective FDEP soil cleanup goal for industrial exposure.

There is no apparent numerical or spatial distribution to the occurrence of arsenic or beryllium at SWMUs 14 and 18. Because the land features at NAVSTA Mayport are influenced by the deposition of dredge material from Mayport Turning Basin, it cannot be determined whether or not the concentrations of arsenic and beryllium are related to a release at SWMUs 14 or 18, or are residual concentrations from the dredge material.

Concentrations of chloride detected in the two surface water samples suggest that surface water in the vicinity of SWMUs 14 and 18 could be classified as predominantly marine water (concentrations of chloride greater than 1,500 mg/l) according to FAC, 62-302, Surface Water Quality standards.

There were no organic target analytes detected in the surface water samples. Three target analytes (lead, magnesium, and sodium) were detected at concentrations that exceed background screening values. None of the inorganic analytes were detected at concentrations that exceed the Ambient Water Quality Criteria (USEPA, 1986b) and Class III Marine surface water quality criteria (FAC, 62-302.530) benchmarks.

PAHs were detected in the sediment samples collected from the drainage pathway leading from the drainage culvert headwall to the jetties. Pesticides were detected in one of the two sediment samples collected from the tidal pool area. The benchmarks for the sediment samples are the TELs in *Approach to the Assessment of Sediment Quality in Florida Coastal Waters*, (MacDonald, 1994), ER-L values in the National Oceanic, and Atmospheric Administration (NOAA) document *Incidence of Adverse Biological Effects within Ranges of Chemical Concentrations in Marine and Estuarine Sediments* (Long et. al., 1994). The PAHs and pesticides

exceeded the benchmark values. None of the inorganic analytes detected in the sediment samples exceeded the benchmarks.

The sources of the SVOCs are possibly from the historic use of SWMU 14 for firefighter training activities and/or emission and fluid residues from vehicles at parking lots that contribute surface water runoff to the drainage ditch system at the FTC. The source of the pesticide is likely the historic applications of pesticides.

Results of water quality indicator parameters suggest that groundwater in the vicinity of the SWMUs 14 and 18 meets the criteria of a Class G-I or G-II drinking water supply.

Only the groundwater sample from monitoring well MPT-14-WM09S contained the SVOC 2-methylnaphthalene, which was detected in a groundwater sample hydraulically downgradient from the airplane mockup, at a concentration that exceeds the Florida groundwater guidance concentration, but not the USEPA Region III RBC. The detection of this and other SVOCs in monitoring wells located hydraulically downgradient of the firefighter training mockup suggests that there has been a release from SWMU 14.

The groundwater field screening sample from location MPT-14-TP04 was observed to contain free-phase hydrocarbons; this is the same location as monitoring well MPT-14-MW09S. However, floating free-phase hydrocarbons have not been measured or observed at this monitoring well location.

Four inorganic analytes, antimony, arsenic, iron, and manganese, were detected at concentrations that exceeded the benchmarks from Florida groundwater guidance concentrations (FDEP, 1994) and USEPA Region III RBCs (USEPA, 1995a).

Antimony was detected as a single occurrence in the groundwater sample collected from monitoring well MPT-14-MW06S, which approximately 170 feet hydraulically downgradient from SWMU 14. Antimony was not detected in groundwater samples from the other monitoring wells at SWMUs 14 and 18.

Arsenic exceeded the USEPA Region III RBC in 16 of 17 groundwater samples. Iron exceeded the FDEP groundwater guidance concentration in 9 of 17 samples. Manganese was detected in 12 of 17 samples at concentrations that exceed Florida groundwater guidance concentrations. The detections of arsenic, iron, and manganese appear to represent a random pattern with some of the highest-detected concentrations in groundwater samples from monitoring wells located hydraulically upgradient or sidegradient from SWMUs 14 and 18. The distribution of antimony, arsenic, iron, and manganese suggests that they are not likely site related.

**7.3.1 Human Health Risk Assessment** Risk characterization was conducted for potential exposures to surface and subsurface soil, surface water, sediment, and groundwater under current and future land-use scenarios.

**Surface Soil.** The cancer risk associated with current land use for surface soil ingestion, dermal contact, and fugitive dust inhalation is  $2 \times 10^{-6}$  for the trespasser and  $3 \times 10^{-7}$  for the excavation worker. The cancer risk for hypothetical future land use is  $2 \times 10^{-5}$  for the resident,  $4 \times 10^{-6}$  for the occupational worker, and  $1 \times 10^{-6}$  for the site maintenance worker. None of the ELCRs exceed USEPA's target cancer risk range.

Noncancer risks associated with surface soil ingestion, dermal contact, and inhalation of fugitive dust for current land use (adolescent trespasser, adult trespasser, and excavation worker) are all below USEPA's and FDEP's target HI of 1. Noncancer risks associated with surface soil for future land use (child resident, adult resident, occupational worker, and site maintenance worker) are also below the USEPA's and FDEP's target HI of 1.

Subsurface Soil. HHCPs were determined not to exist for subsurface soil during the screening evaluation; therefore, a risk characterization was not conducted for this media.

Sediment. The ELCR for current land use including incidental ingestion of and dermal contact with sediment is  $2 \times 10^{-6}$  for the trespasser. The cancer risk under a hypothetical future land use is  $5 \times 10^{-6}$  for the resident. Neither of the ELCRs exceeds USEPA's target cancer risk range.

Noncancer risk associated with sediment ingestion and dermal contact under current and future land use (adolescent trespasser, adult trespasser, child resident, and adult resident) is below USEPA's and FDEP's target HI of 1.

Groundwater. No volatile organic compounds were detected in the groundwater samples collected from the monitoring wells installed at SWMU 14 and 18, therefore, cancer risk associated with the inhalation of volatiles was not evaluated.

The total cancer risk associated with hypothetical future ingestion of groundwater as drinking water is  $7 \times 10^{-5}$  for the adult resident. The cancer risk associated with arsenic, the only contributor to the ELCR for the future resident, exceeds FDEP's target cancer risk of  $1 \times 10^{-6}$ . This ELCR does not exceed USEPA's target cancer risk range.

Noncancer risk associated with groundwater ingestion is below USEPA's and FDEP's target HI of 1.

7.3.2 Ecological Risk Assessment Exposure pathways evaluated for terrestrial and aquatic receptors include direct contact with surface water, sediment, and the groundwater as it discharges to surface water. Exposures associated with potential contamination in surface soil to terrestrial receptors were not evaluated. Terrestrial ecological receptors are not expected to occur in the vicinity of SWMUs 14 and 18 because the majority of the site is paved with asphalt or concrete and is located in an industrialized area.

Risks for the representative wildlife species associated with ingestion of surface water, sediment, and aquatic life were quantitatively evaluated using HQs, which are calculated for each ECPC by dividing the estimated dietary exposure concentrations (PDE) by the toxicological benchmark (RTV). No risks to terrestrial wildlife populations are assumed because the HIs for maximum exposure point concentrations did not exceed 1.

The following paragraphs present a summary of the ecological risk characterization for potential aquatic receptors.

Surface Water. Concentrations of iron detected in surface water samples collected from the drainage ditch exceed the available aquatic toxicity

benchmarks. However, the concentrations of iron are below the Florida surface water quality standard and the maximum detected concentration of iron in the background surface water samples.

It is not likely that the concentrations of iron detected in the surface water samples pose a risk to aquatic receptors because of the ephemeral nature of the system. The surface water drainage ditch is dry during low tide and habitat utilization by aquatic receptors is limited to periods of high tide, when the area is flooded by water from the St. Johns River or Atlantic Ocean.

Sediment. Risks for aquatic receptors were identified for aquatic receptors at the three sampling locations in the drainage ditch located north of SWMU 14 that discharges to the St. Johns River. Comparison of the analytical data with the benchmarks suggests that adverse risks to aquatic receptors in the drainage ditch are associated with the PAHs and pesticides detected in the sediment samples.

PAHs were detected at concentrations exceeding the State of Florida PEL. The PEL defines the lower limit of the range of contaminant concentrations that are usually or always associated with adverse biological effects. PAHs were also detected at concentrations that exceed the State of Florida TEL, but are less than the PEL. Within this range of concentrations, adverse biological effects are possible; however, it is difficult to predict the occurrence, nature, and/or severity of these effects.

Concentrations of PAHs that exceed the PEL are considered to represent a hazard to aquatic organisms. However, where concentrations of PAHs exceed the TEL, but not the PEL, toxicity testing (survival testing with benthic organisms) using sediment from the sampling locations where this occurred would be necessary to determine if the concentrations of PAHs represent a hazard to aquatic organisms.

A sediment sample from the tidal pool area contained 4,4'-DDT at a concentration that exceeded the State of Florida PEL and the concentration of dieldrin exceeded the TEL. 4,4'-DDT and dieldrin were not detected in the sediment sample from the other sampling location at the tidal pool area. The close proximity of the two sampling locations in the tidal pool area suggest that 4,4'-DDT and dieldrin are a localized "hot spot".

Groundwater. Maximum exposure point concentrations are less than the lowest toxicity benchmark concentrations for all ECPCs in detected in the groundwater samples, with the exception of cyanide and iron. However, the maximum exposure point concentration of cyanide is within the range of concentrations detected in the St. Johns River surface water samples and the maximum exposure point concentration of iron in groundwater is less than the maximum detected concentration of iron in groundwater from the background samples (ABB-ES, 1995a).

Therefore, the discharge of groundwater containing cyanide and iron at the concentration detected in the groundwater sample to surface water would not result in increasing the current condition. No incremental increase in risks to aquatic receptors is expected to occur as a result of exposure to cyanide by the discharge of groundwater to surface water in the vicinity of SWMUs 14 and 18.

7.3.3 Recommendations The following recommendations are based on the current use of the SWMUs 14 and 18 as an industrial area and the assumption that this use will not change in the foreseeable future. The basis for the recommendation is

the detection of chemicals in sediment and groundwater beneath SWMUs 14 and 18 at concentrations that exceed residential use criteria. Therefore, the areas should be designated for industrial use only, and groundwater from the surficial aquifer beneath these SWMUs should not be used as a source of potable water. Should use of the SWMUs 14 and 18 change in the future, the recommendations presented in this report should be reevaluated.

Surface Soil. Additional investigation under an RFI or a corrective measures study for surface soil is not warranted at this time under a current industrial use scenario, as it is unlikely that SWMUs 14 and 18 would be developed for residential use in the immediate or near future. However, an interim measure should be considered for eliminating the SVOCs detected in the open drainage culverts if they exceed FDEP's industrial soil cleanup goals. The goal of the interim measure should be to reduce the risk under current use for a trespasser and hypothetical residential exposure scenarios to levels that are less than or near the FDEP target cancer risk of  $1 \times 10^{-6}$  for industrial exposure.

Additional investigation is warranted for the interim measure to collect surface soil samples for analysis of analytes that exceed the benchmarks at the open stormwater drop inlets. This information should be used to assess the horizontal and vertical extent of the specific chemicals and minimize the amount of surface soil requiring remediation.

Assessment of the soil beneath the aircraft mockups and the concrete detention basin should be conducted after firefighting training activities at SWMU 14 are discontinued in 1996. It is recommended that if chemicals are found in surface or subsurface soil samples at concentrations exceeding human health and/or ecological screening concentrations that an interim measure should be conducted. This recommendation is based on interpretation of analytical results from groundwater samples collected from monitoring wells located hydraulically downgradient from these structures. These data suggest that a release has occurred, but not at concentrations that exceed promulgated Federal or State maximum contaminant levels.

An ecological risk assessment of terrestrial receptors was not conducted for surface soil at SWMUs 14 and 18. This would be considered a data gap in the RFI should use of the site change from industrial to residential.

Subsurface Soil. Additional investigation under an RFI or a corrective measures study for subsurface soil is not warranted at this time under a current industrial use scenario, as it is unlikely the SWMUs 14 and 18 would be developed for residential use in the immediate or near future. The target analytes detected in subsurface soil samples did not exceed benchmarks for industrial exposure.

Sediment. Additional investigation under an RFI or a corrective measures study for sediments is not warranted at this time under a current industrial use scenario, as it is unlikely that SWMUs 14 and 18 would be developed for residential use in the immediate or near future. However, an interim measure should be considered for eliminating the PAHs detected in the drainage ditch north of SWMU 14 that exceed FDEP's industrial soil cleanup goals and the Florida sediment quality goals.

The goal of the interim measure should be to reduce the risk to human receptors under current use for a trespasser and hypothetical residential exposure scenarios and for ecological receptors to concentrations of PAHs less than the Florida sediment quality goal TEL.

Surface Water. Additional investigation under an RFI or a corrective measures study for surface water is not warranted at this time under a current industrial use scenario, as it is unlikely that SWMUs 14 and 18 would be developed for residential use in the immediate or near future. Concentrations of iron detected in the surface water samples are below the Florida surface water quality standard and the maximum detected concentration of iron in the background surface water samples. It is not likely that the concentrations of iron detected in the surface water samples pose a risk to aquatic receptors because of the ephemeral nature of the system.

The surface water drainage ditch is dry during low tide and habitat utilization by aquatic receptors is limited to periods of high tide, when the area is flooded by water from the St. Johns River or Atlantic Ocean.

Groundwater. Additional investigation under an RFI or a corrective measures study for groundwater is not warranted at this time under a current industrial use scenario, as it is unlikely SWMUs 14 and 18 would be developed for residential use in the immediate or near future. The recommendation is based on the following: volatile organic compounds were not detected in the groundwater samples; noncancer risk associated with groundwater ingestion is below USEPA's and FDEP's target HI of 1; groundwater discharges from the SWMUs 14 and 18 to the surface water of the St. Johns River do not pose a risk to aquatic receptors; and cancer risk is associated with the hypothetical future use of groundwater; however, the surficial aquifer beneath SWMUs 14 and 18 is not currently used as a source of potable water.

Mayport, FL 32228-0067

Re: Demolition of Primary Clarifiers and Sludge Drying Beds Domestic Wastewater Treatment Plant, Building 285 U.S. Naval Station, Mayport, Florida  
FDEP Facility ID No. FL9 170 024 260

Dear Sir:

Johnson Controls-HILL (JC-H) is pleased to submit this letter report detailing the activities conducted at the above referenced facility. As part of the Resource Conservation Recovery Act (RCRA) Facility Investigation, the former primary clarifiers and sludge drying beds associated with the Wastewater Treatment Plant at the U. S. Naval Station in Mayport, Florida, were identified as Solid Waste Management Units (SWMUs) 44 and 45, respectively (Figure 1). The U.S. Navy made the decision to remove the clarifiers and drying beds, which were no longer in use. JC-H, working with the U.S. Navy, subcontracted Enola Contracting Services, Inc. (Enola), to demolish the clarifiers and drying beds formerly used at the Wastewater Treatment Plant. The demolition project began in May 2003 and was completed by July 2003. Activities included the removal of sludge material from the drying beds, removal of rainwater from the clarifiers, and demolition of the concrete and piping associated with the clarifiers and drying beds. Prior to removal of materials, sewage sludge samples associated with the clarifiers and drying beds were collected and analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), pesticides, polychlorinated biphenyls (PCBs), metals, and cyanide to characterize the sludge material. The results of the analytical testing, which were submitted in the RCRA Facility Investigation, Group III SWMUs, U.S. Naval Station, Mayport, Florida (December 1996), are included in Appendix A.

The majority of the sludge material, characterized as non-hazardous, had been previously removed from the drying beds by others. Sludge material remained in specific locations of the beds and had to be removed before the demolition of the drying beds, concrete walls, and metal and clay piping (Figure 2). The sludge material was removed with a backhoe and placed in roll-off containers for proper disposal through Public Works Center Jacksonville (PWC JAX) Permitted Part B Facility.

As part of the drying bed demolition, waste concrete and piping was generated. The concrete rubble and clay piping was segregated from the metal piping and placed in separate roll-off containers for recycling. All soil and/or sludge was rinsed from the concrete and piping using a pressure washer and left on site prior to placement in the containers.

## HILL

Continued—

Re: Demolition of Primary Clarifiers and Sludge Drying Beds Domestic Wastewater Treatment Plant, Building 285 U.S. Naval Station, Mayport, Florida  
FDEP Facility ID No. FL9 170 024 260

After segregating all the debris, the backhoe was decontaminated in the former drying beds to prevent the spread of sludge material to other areas. Fill dirt was then brought to the site, and the land was graded and seeded.

Once the work at the drying beds was completed, Enola proceeded to demolish the clarifiers. Again, waste concrete and piping generated was segregated in separate roll-off containers for recycling. All soil was rinsed from the waste and left onsite. Additional fill dirt was brought to the site, and the land was graded and seeded.

All the concrete, including the clay piping from the drying beds, was delivered to Realco Recycling Company. Written confirmation that Realco Recycling accepted the waste is included in Appendix B. All the metal piping was taken to Naval Station Mayport Base Recycling. The forms documenting the concrete and metal recycling are included in Appendix C.

The demolition project was completed on schedule and as planned. Photographs documenting the work completed at the site are included in Appendix D.

If you have any questions or need additional information, please contact me at 904-778-3868.

Sincerely,

Kenneth J. Melchiorre (Ken), P.E.

Re: Concrete Disposal Associated with Demolition of Clarifiers and Drying Beds  
NAVSTA Mayport, Florida

Dear Mr. Melchiorre,

In response to your letter dated April 7, 2003: Realco Recycling will accept the waste concrete associated with the clarifiers and drying beds.

This material will consist only of concrete: all soil and sludge material will be washed off the concrete before placement in the roll-off container.

Pricing for the roll off container service can be discussed with Bill Hamlin at 751-1556.

Thank You,

A handwritten signature in black ink, appearing to read "Andrew Senesac", with a long horizontal line extending to the right.

Andrew Senesac  
President

Proposed Soil Sampling Locations

Project Site Name: SWMU 45 - NS Mayport  
Project No.: N0123.QM0050105

Sample ID No.: MPT-45-A1-2'  
Sample Location: A1  
Sampled By: C.Metz  
C.O.C. No.: 11223

- Surface Soil (SS)
- Subsurface Soil (SU)
- Sediment (SD)
- Other: \_\_\_\_\_
- QA Sample Type: \_\_\_\_\_

Type of Sample:  
 Low Concentration  
 High Concentration

**GRAB SAMPLE DATA:**

Date:	Depth	Color	Description (Sand, Silt, Clay, Moisture, etc.)
Time:			
Method:			
Monitor Reading (ppm):			

**COMPOSITE SAMPLE DATA:**

Date: 1-5-04	Time	Depth	Color	Description (Sand, Silt, Clay, Moisture, etc.)
Time: 1400		1 to 2 feet	light bwn to gray	Very tight dry fine sand with limestone and concrete rock
Method: hand auger				
Monitor Readings				
(Range in ppm): 0.0				

**SAMPLE COLLECTION INFORMATION:**

Analysis	Container Requirements	Collected	LAB
All analysis	(1) 1L Glass Jar	Yes	Katahdin

**OBSERVATIONS / NOTES:**

**MAP:**

Soil is extremely dry and hard. Soil was hard to hand auger in because of limestone rock and small chunks of concrete that were mixed in it. Soil was so packed that you couldn't push a straight screwdriver into it even if you put all your weight on it.

See site map for sample locations

 High Concentration

**GRAB SAMPLE DATA:**

Date:	Depth	Color	Description (Sand, Silt, Clay, Moisture, etc.)
Time:			
Method:			
Monitor Reading (ppm):			

**COMPOSITE SAMPLE DATA:**

Date:	Time	Depth	Color	Description (Sand, Silt, Clay, Moisture, etc.)
1-5-04		1 to 2 feet	light bwn to gray	Very tight dry fine sand with limestone and concrete rock
Time: 1503				
Method: hand auger				
Monitor Readings (Range in ppm): 0.0				

**SAMPLE COLLECTION INFORMATION:**

Analysis	Container Requirements	Collected	LAB
All analysis	(1) 1L Glass Jar	Yes	Katahdin

**OBSERVATIONS / NOTES:**

Soil is extremely dry and hard. Soil was hard to hand auger in because of limestone rock and small chunks of concrete that were mixed in it. Soil was so packed that you couldn't push a straight screwdriver into it even if you put all your weight on it.

**MAP:**

**ATTACHMENT D**  
**LABORATORY DATA**

MEMO TO: T. HANSEN – WU0149  
DATE: 3/2/2004 – PAGE 2

The symbol (\*) indicates that all quality control criteria were met for this parameter. Problems affecting data quality are discussed below; documentation supporting these findings is presented in Appendix C. Qualified analytical results are presented in Appendix A. Results as reported by the laboratory are presented in Appendix B.

#### PAH FRACTION

The continuing calibration on 2/19/04 at 0927 contained a percent difference (%D) that exceeded the 25% quality control limit for benzo(g,h,i)perylene. The nondetected results were qualified as estimated, UJ, in the associated samples.

#### PESTICIDES FRACTION

The continuing calibration on 1/27/04 at 0650 contained a percent difference (%D) that exceeded the 15% quality control limit for d-BHC on column RTX-CLPI and methoxychlor on column RTX-CLPII. No qualification action was taken because the reported results were nondetect and other column was compliant.

#### TPH FRACTION

The surrogate recovery of o-terphenyl fell below the lower quality control limit (82%) for samples MPT-45-B1-2' (81%) and MPT-45-D3-2' (79%). No qualification action was taken for minor surrogate recovery noncompliances.

#### ADDITIONAL COMMENTS

The chain of custodies (COCs) did not specify which samples and fractions were to undergo SPLP analysis. Therefore, data completeness could not be verified on the data reviewer level based on the information provided on the COCs. This data review was based on the information provided by the laboratory in the data package.

#### EXECUTIVE SUMMARY

**Laboratory Performance:** Several compounds exceeded the continuing calibration criteria in the PAH and pesticide fractions.

**Other Factors Affecting Data Quality:** The COCs did not specify which samples and fractions were to undergo SPLP analysis.

MEMO TO: T. HANSEN – WU0149  
DATE: 3/2/2004 – PAGE 3

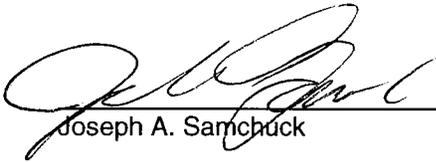

The data for these analyses were reviewed with reference to the EPA Functional Guidelines for Organic Data Validation (October 1999) and the NFESC guidelines "Navy IRCDQM" (September 1999). The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC guidelines and the Quality Assurance Project Plan (QAPP)."

Seth C. Staffen

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as Reported by the Laboratory
3. Appendix C - Support Documentation

**APPENDIX A**

**QUALIFIED ANALYTICAL RESULTS**

**Qualifier Codes:**

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
- C01 = GC/MS Tuning Noncompliance
- D = MS/MSD Recovery Noncompliance
- E = LCS/LCSD Recovery Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's  $r < 0.995$
- K = ICP Interference - includes ICS % R Noncompliance
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation Noncompliance
- N = Internal Standard Noncompliance
- N01 = Internal Standard Recovery Noncompliance Dioxins
- N02 = Recovery Standard Noncompliance Dioxins
- N03 = Clean-up Standard Noncompliance Dioxins
- O = Poor Instrument Performance (i.e., base-time drifting)
- P = Uncertainty near detection limit ( $< 2 \times$  IDL for inorganics and  $<$ CRQL for organics)
- Q = Other problems (can encompass a number of issues; i.e. chromatography, interferences, etc.)
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin
- U = % Difference between columns/detectors  $>25\%$  for positive results determined via GC/HPLC
- V = Non-linear calibrations; correlation coefficient  $r < 0.995$
- W = EMPC result
- X = Signal to noise response drop
- Y = Percent solids  $<30\%$
- Z = Uncertainty at 2 sigma deviation is less than sample activity

**Sample Receipt**

The following samples were received on January 9, 2004 and were logged in under Katahdin Analytical Services work order number WU0149 for a hardcopy due date of February 13, 2004.

<u>Sample No.</u>	<u>Sample Identification</u>
WU0149-1	MPT-45-A1-2'
WU0149-2	MPT-45-A2-2'
WU0149-3	MPT-45-A3-2'
WU0149-4	MPT-45-A4-2'
WU0149-5	MPT-45-B1-2'
WU0149-6	MPT-45-B2-2'
WU0149-7	MPT-45-B3-2'
WU0149-8	MPT-45-B4-2'
WU0149-9	MPT-45-C1-2'
WU0149-10	MPT-45-C2-2'
WU0149-11	MPT-45-C3-2'
WU0149-12	MPT-45-C4-2'
WU0149-13	MPT-45-D3-2'
WU0149-14	MPT-45-E4-2'
WU0149-15	MPT-45-E4-5'

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

**Organics Analysis**

The samples of Work Order WU0149 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA and/or Method for Determination of Petroleum Range Organics (Method #FL-PRO), Florida Department of Environmental Protection, November 1, 1995 for the

specific methods listed below or on the Report of Analysis. Some manual integrations may have been performed due to split peaks and/or corrected baselines. All have been flagged with a "M" (software-generated) on the pertinent quantitation report.

#### SPLP-8270C SIM Analysis:

There were no protocol deviations or observations noted by the organic laboratory staff for this analysis.

#### SPLP-FL-PRO Analysis

Samples WU0149-5 and 13 had recoveries for the surrogate, o-terphenyl that were low and outside of the method acceptance limits but were within the laboratory established acceptance limits. Since the recoveries for the second surrogate were acceptable, the samples were not reextracted.

The calibration verification standard (file CUB2005) had a low response for hydrocarbon C<sub>40</sub>, which resulted in a %D that was above the method acceptance limit of 25%. Since the method requirement applies to only the PRO range response, which was acceptable, the associated samples were not reanalyzed.

#### SPLP-8081 Analysis

The closing CV standard (file 8UA4152) had a high response for methoxychlor on channel B, which resulted in a %D that was outside of the method acceptance limits of 15%. Since the responses for all of the target analytes and surrogates were acceptable on one channel, the associated samples were not reanalyzed.

There were no other protocol deviations or observations noted by the organics laboratory staff.

#### Metals Analysis

The samples of Katahdin Work Order WU0149 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Aqueous Waste", SW-846, November 1986, Third Edition.

#### SPLP Extraction (EPA Method 1312)

Katahdin Sample Nos. WU0149-(1-3, 5-15) is a SPLP extract of a solid sample. The extraction dates and the associated SPLP fluid blank identification number for this sample are summarized in the following table.

Katahdin Sample Numbers	SPLP Extraction Start Date	Extraction Finish/Filter Date	Associated SPLP Fluid Blank ID
WU0149-(1-3, 5-15)	01/13/04	01/14/04	PBP608A

Inductively-Coupled Plasma (ICP) Atomic Emission Spectroscopic Analysis

Aqueous-matrix Katahdin Sample Nos. WU0149-(1-3, 5-15) were digested for ICP analysis on 01/22/04 (QC Batch UA22ICW0) in accordance with USEPA Method 3010A. Sample No. WU0149-8 was spilt during digestion. For this reason, the sample was redigested for analysis on 01/23/04 (QC Batch UA23ICW0). Redigestates are identified throughout the raw data by the suffixes "R" or "X" appended to the Katahdin sample number, e.g. "WU0149-008R".

ICP analyses of Katahdin Work Order WU0149 sample digestates were performed in accordance with USEPA Method 6010B, using a Thermo Jarrell Ash (TJA) Trace ICP spectrometer. All samples were analyzed within holding times and all QC criteria were met, with the following comments or exceptions:

Some of the results for analytical run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

  
02.20.04  
Maria Crouch  
Quality Assurance Officer

## ORGANICS DATA QUALIFIERS

- U Indicates the compound was analyzed for but not detected above the laboratory Practical Quantitation Limit.
- \* Compound recovery outside of quality control limits.
- D Indicates the result was obtained from analysis of a diluted sample. Surrogate recoveries may not be calculable.
- E Estimated value. This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis.
- J Estimated value. The analyte was detected in the sample at a concentration less than the laboratory Practical Quantitation Limit (PQL), but above the Method Detection Limit (MDL).
- B Indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample.
- N Presumptive evidence of a compound based on a mass spectral library search.
- A Indicates that a tentatively identified compound is a suspected aldol-condensation product.
- P Used for Pesticide/Aroclor analyte when there is a greater than 25% difference for detected concentrations between the two GC columns.

Executive Summary

**Laboratory Performance:** No quality control issues were noted for this SDG.

**Other Factors Affecting Data Quality:** None.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", July 2002 and the NFESC document entitled "Navy IRCDQM" (September 1999).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC Guidelines and the Quality Assurance Project Plan (QAPP)."

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

**APPENDIX A**

**QUALIFIED ANALYTICAL RESULTS**

**Qualifier Codes:**

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
- C01 = GC/MS Tuning Noncompliance
- D = MS/MSD Recovery Noncompliance
- E = LCS/LCSD Recovery Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's  $r < 0.995$
- K = ICP Interference - includes ICS % R Noncompliance
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation Noncompliance
- N = Internal Standard Noncompliance
- N01 = Internal Standard Recovery Noncompliance Dioxins
- N02 = Recovery Standard Noncompliance Dioxins
- N03 = Clean-up Standard Noncompliance Dioxins
- O = Poor Instrument Performance (i.e., base-time drifting)
- P = Uncertainty near detection limit ( $< 2 \times$  IDL for inorganics and  $<$ CRQL for organics)
- Q = Other problems (can encompass a number of issues; i.e. chromatography, interferences, etc.)
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin
- U = % Difference between columns/detectors  $>25\%$  for positive results determined via GC/HPLC
- V = Non-linear calibrations; correlation coefficient  $r < 0.995$
- W = EMPC result
- X = Signal to noise response drop
- Y = Percent solids  $<30\%$
- Z = Uncertainty at 2 sigma deviation is less than sample activity

KATAHDIN ANALYTICAL SERVICES  
TETRA TECH NUS  
CASE NS MAYPORT  
TASK ORDER MANAGER: TERRY HANSEN  
WU0149**

**Sample Receipt**

The following samples were received on January 9, 2004 and were logged in under Katahdin Analytical Services work order number WU0149 for a hardcopy due date of February 13, 2004.

<u>KATAHDIN</u> <u>Sample No.</u>	<u>TTNUS</u> <u>Sample Identification</u>
WU0149-1	MPT-45-A1-2'
WU0149-2	MPT-45-A2-2'
WU0149-3	MPT-45-A3-2'
WU0149-4	MPT-45-A4-2'
WU0149-5	MPT-45-B1-2'
WU0149-6	MPT-45-B2-2'
WU0149-7	MPT-45-B3-2'
WU0149-8	MPT-45-B4-2'
WU0149-9	MPT-45-C1-2'
WU0149-10	MPT-45-C2-2'
WU0149-11	MPT-45-C3-2'
WU0149-12	MPT-45-C4-2'
WU0149-13	MPT-45-D3-2'
WU0149-14	MPT-45-E4-2'
WU0149-15	MPT-45-E4-5'

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

**Organics Analysis**

The samples of Work Order WU0149 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA and/or Method for Determination of Petroleum Range Organics (Method #FL-PRO), Florida Department of Environmental Protection, November 1, 1995 for the

specific methods listed below or on the Report of Analysis. Some manual integrations may have been performed due to split peaks and/or corrected baselines. All have been flagged with a "M" (software-generated) on the pertinent quantitation report.

#### SPLP-8270C SIM Analysis:

There were no protocol deviations or observations noted by the organic laboratory staff for this analysis.

#### SPLP-FL-PRO Analysis

Samples WU0149-5 and 13 had recoveries for the surrogate, o-terphenyl that were low and outside of the method acceptance limits but were within the laboratory established acceptance limits. Since the recoveries for the second surrogate were acceptable, the samples were not reextracted.

The calibration verification standard (file CUB2005) had a low response for hydrocarbon C<sub>40</sub>, which resulted in a %D that was above the method acceptance limit of 25%. Since the method requirement applies to only the PRO range response, which was acceptable, the associated samples were not reanalyzed.

#### SPLP-8081 Analysis

The closing CV standard (file 8UA4152) had a high response for methoxychlor on channel B, which resulted in a %D that was outside of the method acceptance limits of 15%. Since the responses for all of the target analytes and surrogates were acceptable on one channel, the associated samples were not reanalyzed.

There were no other protocol deviations or observations noted by the organics laboratory staff.

#### Metals Analysis

The samples of Katahdin Work Order WU0149 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Aqueous Waste", SW-846, November 1986, Third Edition.

#### SPLP Extraction (EPA Method 1312)

Katahdin Sample Nos. WU0149-(1-3, 5-15) is a SPLP extract of a solid sample. The extraction dates and the associated SPLP fluid blank identification number for this sample are summarized in the following table.

Katahdin Sample Numbers	SPLP Extraction Start Date	Extraction Finish/Filter Date	Associated SPLP Fluid Blank ID
WU0149-(1-3, 5-15)	01/13/04	01/14/04	PBP608A

Inductively-Coupled Plasma (ICP) Atomic Emission Spectroscopic Analysis

Aqueous-matrix Katahdin Sample Nos. WU0149-(1-3, 5-15) were digested for ICP analysis on 01/22/04 (QC Batch UA22ICW0) in accordance with USEPA Method 3010A. Sample No. WU0149-8 was spilt during digestion. For this reason, the sample was redigested for analysis on 01/23/04 (QC Batch UA23ICW0). Redigestates are identified throughout the raw data by the suffixes "R" or "X" appended to the Katahdin sample number, e.g. "WU0149-008R".

ICP analyses of Katahdin Work Order WU0149 sample digestates were performed in accordance with USEPA Method 6010B, using a Thermo Jarrell Ash (TJA) Trace ICP spectrometer. All samples were analyzed within holding times and all QC criteria were met, with the following comments or exceptions:

Some of the results for analytical run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

detected results for 2,4-dinitrophenol and diethylphthalate were qualified as estimated (UJ) in all samples except MPT-45-A1-2', MPT-45-A2-2', MPT-45-A3-2', MPT-45-A4-2', and MPT-45-B1-2'. The positive result for diethylphthalate in sample MPT-45-B2-2' was qualified as estimated (U) due to method blank contamination.

The continuing calibration performed on January 15 at 13:18 on the GCMS-U instrument exceeded the 25% difference quality control criteria for phenol, bis(2-chloroethyl)ether, 2,2'-oxybis(1-chloropropane), hexachloroethane, N-nitroso-di-n-propylamine, 4-methylphenol, nitrobenzene, isophorone, 2-nitroaniline, 4-nitrophenol, butylbenzylphthalate, and bis(2-ethylhexyl)phthalate. Positive and non-detected results for the aforementioned compounds were qualified as estimated (J and UJ), respectively, in samples MPT-45-C4-2', MPT-45-D3-2', MPT-45-D4-2', and MPT-45-E4-5'. No qualifications were made to samples MPT-45-C3-2' and MPT-45-E4-2' on this basis because the re-analyses of these samples were used for validation and were associated with the following CCAL.

The continuing calibration performed on January 16 at 10:51 on the GCMS-U instrument exceeded the 25% difference quality control criteria for phenol, bis(2-chloroethyl)ether, 2,2'-oxybis(1-chloropropane), N-nitroso-di-n-propylamine, nitrobenzene, isophorone, 2-nitroaniline, 4-nitrophenol, diethylphthalate, butylbenzylphthalate, and bis(2-ethylhexyl)phthalate. No qualifications were made to diethylphthalate in sample MPT-45-B2-2' on this basis because it was qualified for method blank contamination. Positive and non-detected results for the remaining aforementioned compounds were qualified as estimated (J and UJ), respectively, in samples MPT-45-B2-2', MPT-45-B3-2', MPT-45-B4-2', MPT-45-C1-2', MPT-45-C3-2', MPT-45-E4-2', and MPT-45-C2-2'.

The continuing calibration performed on January 15 at 16:24 on the GCMS-X instrument exceeded the 25% difference quality control criteria for 4-methylphenol. Non-detected results for 4-methylphenol were qualified as estimated (UJ) in samples MPT-45-A1-2', MPT-45-A2-2', MPT-45-A3-2', MPT-45-A4-2', and MPT-45-B1-2'.

The following compound was detected in the method blank:

<u>Compound</u>	<u>Maximum Concentration</u>	<u>Blank Action Level</u>
Diethylphthalate	420 µg/kg	4200 µg/kg

Sample aliquot, percent solids, and dilution factors were taken into consideration when applying the blank action levels. All positive results for diethylphthalate was qualified as non-detected (U) due to method blank contamination.

No MS/MSD was analyzed with this fraction. An LCS/LCSD was analyzed, but on a different day than all the associated samples and using a different ICAL. No qualifications were made on this basis.

The following table summarizes the SVOC non-compliant internal standard performances:

<u>Samples</u>	<u>Internal Standard Performances</u>	<u>Validated</u>	<u>Qualifications</u>
MPT-45-C3-2'	3(H), 4(H), 5(H)	N	
MPT-45-C3-2' RE	3(H)	Y	None
MPT-45-D3-2'	4(H)	Y	J
MPT-45-D3-2' RE	1(H), 2(H), 3(H), 4(H), 5(H)	N	

MPT-45-D4-2'	3(H), 4(H), 5(H), 6(H)	N	
MPT-45-D4-2' RE	2(H), 3(H), 4(H)	Y	J
MPT-45-E4-2'	3(H), 4(H), 5(H)	N	
MPT-45-E4-2' RE	2(H), 3(H), 4(H)	Y	None
MPT-45-E4-5'	5(H)	Y	None
MPT-45-E4-5' RE	1(H), 2(H), 3(H), 4(H), 5(H)	N	
MPT-45-B4-2'	1(H), 2(H), 3(H), 4(H), 5(H)	Y	J
MPT-45-B4-2' RE	1(H), 2(H), 3(H), 4(H), 5(H)	N	
MPT-45-C1-2'	1(H), 2(H), 3(H), 4(H), 5(H), 6(H)	N	
MPT-45-C1-2' RE	4(H)	Y	J
MPT-45-C2-2'	3(H), 4(H), 5(H)	Y	J
MPT-45-C2-2' RE	1(H), 2(H), 3(H), 4(H), 5(H)	N	

Internal Standards:

- 1 – 1,4-Dichlorobenzene-d4
- 2 – Naphthalene-d8
- 3 – Acenaphthene-d10
- 4 – Phenanthrene-d10
- 5 – Chrysene-d12
- 6 – Perylene-d12

(L) indicates a low performance.  
(H) indicates a high performance.

Only positive results for compounds quantitated using the out of criteria internal standards were qualified as estimated (J) in the aforementioned samples.

#### PAH

The results for samples MPT-45-D4-2' and MPT-45-E4-2' on the Form Is did not match the EDD. The validator contacted the laboratory to determine which results were correct because the samples were marked as re-analyses on the Form Is. The laboratory informed the validator that the aforementioned samples along with samples MPT-45-D3-2' and MPT-45-E4-5' were originally analyzed beyond 12-hours of the associated instrument tune. The original analyses were not reported and no comment was made in the case narrative. This explains why the aforementioned samples were marked as re-analyses, but no original analysis is reported. The validator was also informed that the results on the Form Is for samples MPT-45-D4-2' and MPT-45-E4-2' were incorrect. The data was re-processed and new Form Is were generated for samples MPT-45-D4-2' and MPT-45-E4-2'. The laboratory re-issued the case narrative with an explanation of this error. No qualifications were made on this basis.

Several results in sample MPT-45-C4-2' greatly exceeded (1500-4300 ug/kg) the linear calibration range of the instrument. The sample was re-analyzed at a 10X dilution. All positive results were below the calibration range of the instrument (8.5-69 ug/kg). The validator contacted the laboratory to determine which results were correct because no explanation was given in the narrative, the result sets were both outside the linear calibration range of the instrument, and were two orders of magnitude different. The laboratory re-analyzed the un-diluted extract within holding time and found that the results were within calibration range. The results were consistent with the diluted analysis. The laboratory could not explain the initial over-range analysis. The validator used the re-analyzed un-diluted analysis of sample MPT-45-C4-2' for validation. The laboratory re-issued the case narrative addressing this error. No qualifications were made on this basis.

The following compound was detected in the method blank:

<u>Compound</u>	<u>Maximum Concentration</u>	<u>Blank Action Level</u>
Naphthalene	1.3 µg/kg	6.5 µg/kg

Sample aliquot, percent solids, and dilution factors were taken into consideration when applying the blank action levels. All positive results for naphthalene were qualified as non-detected (U) due to method blank contamination.

The continuing calibration performed on January 19 at 11:28 exceeded the 25% difference quality control criteria for pyrene and indeno(1,2,3-cd)perylene. Positive and non-detected results for the aforementioned compounds were qualified as estimated (J, UJ) in samples MPT-45-A3-2', MPT-45-A4-2', MPT-45-B1-2', and MPT-45-D3-2'.

All surrogates were diluted out of samples MPT-45-B1-2', MPT-45-D3-2', and MPT-45-C4-2'. No qualifications were made on this basis because the samples were analyzed at 20X, 100X, and 10X dilutions respectively. The surrogates in the un-diluted samples were recovered within QC criteria.

Internal standard 6 (perylene-d12) exceeded the +100% recovery quality control criteria in the diluted samples MPT-45-B2-2', MPT-45-C1-2', MPT-45-C2-2', and MPT-45-C3-2'. Internal standard 5 (chrysene-d12) also exceeded the +100% recovery quality control criteria in the diluted samples MPT-45-B2-2' and MPT-45-C1-2'. Positive results for compounds quantitated using the out of criteria internal standards were qualified as estimated (J) in the aforementioned samples.

The following table summarizes the remaining PAH non-compliant internal standard performances:

<u>Samples</u>	<u>Internal Standard Performances</u>	<u>Validated</u>	<u>Qualifications</u>
MPT-45-A1-2'	6(H)	Y	J
MPT-45-A1-2' RE	5(H), 6(H)	N	
MPT-45-A3-2'	3(H), 4(H), 5(H), 6(H)	N	
MPT-45-A3-2' RE	5(H), 6(H)	Y	J
MPT-45-A4-2'	3(H), 4(H), 5(H)	N	
MPT-45-A4-2' RE	5(H), 6(H)	Y	J

MPT-45-D3-2'	5(H), 6(H)	Y	None
MPT-45-D4-2'	5(H), 6(H)	Y	J
MPT-45-E4-2'	5(H), 6(H)	Y	J
MPT-45-E4-5'	5(H), 6(H)	Y	J
MPT-45-B1-2'	3(H), 4(H), 5(H)	Y**	J
MPT-45-A2-2'	5(H), 6(H)	Y	J
MPT-45-A2-2' DL	5(H), 6(H)	Y	J Benzo(b)fluoranthene

\*\* Positive results for acenaphthene and fluorene were qualified for internal standards non-compliances in sample MPT-45-B1-2' because they did not require dilution.

Internal Standards: 1 – 1,4-Dichlorobenzene-d4  
2 – Naphthalene-d8  
3 – Acenaphthene-d10  
4 – Phenanthrene-d10  
5 – Chrysene-d12  
6 – Perylene-d12

(L) indicates a low performance.  
(H) indicates a high performance.

Samples MPT-45-A2-2', MPT-45-B1-2', MPT-45-B2-2', MPT-45-C1-2', MPT-45-C2-2', MPT-45-C3-2', MPT-45-C4-2', and MPT-45-D3-2' were re-analyzed at dilutions because the concentration of target analytes exceeded the linear calibration range of the instrument. The results from the diluted analyses were transposed to the un-diluted analyses and used for validation for the over-range analytes.

#### Pesticide

The continuing calibration analyzed on January 15 at 18:13 exceeded the 15%D quality control criteria for alpha-BHC on the RTX-CLPI column. No action was taken on this basis because the RTX-CLPII column was compliant.

The continuing calibration analyzed on January 16 at 05:31 exceeded the 15%D quality control criteria for alpha-BHC, heptachlor, delta-BHC, and 4,4'-DDE on the CLPI column. No action was taken on this basis because the RTX-CLPII column was compliant.

The continuing calibration analyzed on January 16 at 09:00 exceeded the 15%D quality control criteria for alpha-BHC and delta-BHC on the CLPI column. No action was taken on this basis because the RTX-CLPII column was compliant.

The continuing calibration analyzed on January 16 at 17:09 exceeded the 15%D quality control criteria for alpha-BHC on the CLPI column. No action was taken on this basis because the RTX-CLPII column was compliant.

The surrogate decachlorobiphenyl was below the percent recovery quality control criteria on both columns in sample MPT-45-D4-2'. The sample was not re-analyzed. Non-detected results were qualified as estimated (UJ) in sample MPT-45-D4-2'.

The blank spike / blank spike duplicate recovery of endosulfan II was below the quality control criteria. Non-detected results for endosulfan II were qualified as estimated (UJ) in all samples.

The following table details pesticide % difference between analytical columns non-compliances.

Sample	Compound	% Difference	Qualification
MPT-45-A1-2'	alpha-Chlordane	40.2	J
MPT-45-A2-2'	alpha-Chlordane	38.5	J
MPT-45-A3-2'	alpha-Chlordane	45.3	J
MPT-45-A4-2'	gamma-Chlordane	43.0	J
MPT-45-B4-2'	alpha-Chlordane	41.5	J
MPT-45-C2-2'	4,4'-DDT	42.7	J
MPT-45-C4-2'	4,4'-DDT	31.1	J

#### PCB

The continuing calibrations analyzed on January 16 at 01:08 and 08:40 exceeded the 15%D quality control criteria for Aroclor 1016 on the RTX-35 column. No action was taken on this basis because the RTX-5 column was compliant.

The surrogate tetrachloro-m-xylene exceeded the percent recovery quality control criteria on the RTX-35 column in the method blank, LCSD, and sample MPT-45-C3-2'. No qualifications were made on this basis because only one surrogate was non-compliant.

The surrogate decachlorobiphenyl was below the percent recovery quality control criteria on both columns in sample MPT-45-D4-2'. Non-detected results were qualified as estimated (UJ) in the sample.

The result for Aroclor 1260 exceeded the 25% difference between analytical columns quality control criteria in sample MPT-45-C2-2'. The result for Aroclor 1260 was qualified as estimated (J) in sample MPT-45-C2-2'.

#### TPH

Samples MPT-45-A4-2', MPT-45-B1-2', MPT-45-B3-2', and MPT-45-D3-2' were analyzed at 5X, 3X, 3X, and 5X dilutions respectively, because the concentration of TPH exceeded the linear calibration range of the instrument. No qualifications were made on this basis.

The continuing calibration analyzed on January 19 at 20:40 exceeded the 15% difference quality control criteria for TPH. Positive results were qualified as estimated (J) in samples MPT-45-A4-2', MPT-45-B1-2', MPT-45-B3-2', and MPT-45-D3-2'.

The continuing calibration analyzed on January 20 at 10:42 exceeded the 15% difference quality control criteria for TPH. Positive results were qualified as estimated (J) in samples MPT-45-A4-2', MPT-45-B1-2', MPT-45-B3-2', and MPT-45-D3-2'.

The following compound was detected in the method blank:

<u>Compound</u>	<u>Maximum Concentration</u>	<u>Blank Action Level</u>
TPH	4.5 mg/kg	22.5 mg/kg

Sample aliquot, percent solids, and dilution factors were taken into consideration when applying the blank action levels. All positive results for TPH less than the blank action level were qualified as non-detected (U) due to method blank contamination.

Additional Comments

All positive results reported below the reporting limit (RL) were qualified as estimated (J) due to uncertainty near the detection limit.

EXECUTIVE SUMMARY

**Laboratory Performance Issues:** Qualifications were made based on calibration non-compliances, percent difference between analytical columns, surrogate recovery non-compliances, blank spike recovery non-compliances, internal standard recovery non-compliances, and method blank contamination.

**Other Factors Affecting Data Quality:** None.

The data for these analyses were reviewed with reference to the EPA Functional Guidelines for Organic Data Validation (10/99) and the NFESC guidelines. The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC guidelines and the Quality Assurance Project Plan (QAPP)."

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as Reported by the Laboratory
3. Appendix C - Support Documentation

**APPENDIX A**

**QUALIFIED ANALYTICAL RESULTS**

**Qualifier Codes:**

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
- C01 = GC/MS Tuning Noncompliance
- D = MS/MSD Recovery Noncompliance
- E = LCS/LCSD Recovery Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's  $r < 0.995$
- K = ICP Interference - includes ICS % R Noncompliance
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation Noncompliance
- N = Internal Standard Noncompliance
- N01 = Internal Standard Recovery Noncompliance Dioxins
- N02 = Recovery Standard Noncompliance Dioxins
- N03 = Clean-up Standard Noncompliance Dioxins
- O = Poor Instrument Performance (i.e., base-time drifting)
- P = Uncertainty near detection limit ( $< 2 \times$  IDL for inorganics and  $<$ CRQL for organics)
- Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin
- U = % Difference between columns/detectors  $>25\%$  for positive results determined via GC/HPLC
- V = Non-linear calibrations; correlation coefficient  $r < 0.995$
- W = EMPC result
- X = Signal to noise response drop
- Y = Percent solids  $<30\%$
- Z = Uncertainty at 2 sigma deviation is less than sample activity

Dear Mr. Spada:

Attached please find the reissued narrative for Katahdin Analytical Services work order WU0050. Three paragraphs have been added to the 8270 SIM analysis section of the narrative, to address the issues you have raised regarding this work order.

Please let Andrea Colby or me know if you have any further questions.

Maria Crouch

Andrea,

I was just writing a note to see if you had a chance to check the dilution of sample MPT-45-C4-2' for the project listed above.

Thank you.

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

### Organics Analysis

The samples of Work Order WU0050 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA and/or Method for Determination of Petroleum Range Organics (Method #FL-PRO), Florida Department of Environmental Protection, November 1, 1995 and/or "Methods for the Determination of Organic Compounds in Drinking Water", U.S. EPA, Environmental Monitoring and Support Laboratory - Cincinnati (September 1995) for the specific methods listed below or on the Report of Analysis. Some manual integrations may have been performed due to split peaks and/or corrected baselines. All have been flagged with a "M" (software-generated) on the pertinent quantitation report.

### 8270 Analysis

Some method blanks may have detected one or more target analytes above the MDL. Any of these analytes that were also detected in any of the associated samples were flagged with a "B" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

There were three initial calibrations performed for this SDG. The initial calibration analyzed on the U instrument on 01/12/04 had %RSD values for several analytes that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analytes 2,4-dinitrophenol, diethylphthalate, 4-nitroaniline and the surrogate 2,4,6-tribromophenol failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model. Since none of the associated samples detected these target analytes above the PQL, the samples were not reanalyzed.

Samples WU0050-8, 9, 10, 11, 13, 14, 15, and 16 had high responses for one or more internal standards, which were outside the method acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The samples were reanalyzed with similar failures confirming a matrix effect. The results from both analyses are reported.

The CV (file U5895) had high responses for the calibration check compounds (CCCs) phenol, 4-chloro-3-methylphenol and di-n-octylphthalate, which resulted in %D's that were outside the

method acceptance limit of 20%. Since a high response would indicate a high bias and the associated samples did not detect these analytes above the PQL, the samples were not reanalyzed.

The CV (file U5907) had a high response for the CCC phenol and a low response for hexachlorobutadiene, which resulted in %D's that were outside the method acceptance limit of 20%. Since the associated samples did not detect these analytes above the PQL, the samples were not reanalyzed.

The CV (file X4122) had a low response for the CCC N-nitrosodiphenylamine, which resulted in a %D that was outside the method acceptance limit of 20%. Since a high response would indicate a high bias and the associated samples did not detect N-nitrosodiphenylamine above the MDL, the samples were not reanalyzed.

The CV's (files U5895 and X4122) had responses for the internal standard perylene-d12 which were low and resulted in %D's that were outside the method acceptance limits of -50% to +100% of the response of the mid-point standard level of the initial calibration. Since none of the associated samples detected any target analytes above the PQL that are quantitated against this internal standard, the samples were not reanalyzed.

#### 8270 SIM Analysis

Some method blanks may have detected one or more target analytes above the MDL. Any of these analytes that were also detected in any of the associated samples were flagged with a "B" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

Samples WU0050-17, 18, 19, 20, and 21 had responses for one or more internal standards which were high and outside the method acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The samples were reanalyzed with similar failures confirming a matrix effect. The results from both analyses are reported.

Samples WU0050-25, 26, 27, 28 and 29, which were analyzed at dilution, had responses for one or more internal standards which were high and outside the method acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The results from both analyses are reported.

Samples WU0050-30, 31, and 32 had responses for one or more internal standards which were high and outside the method acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. These samples were not reanalyzed due to time constraints.

The initial calibration analyzed on the K instrument on 01/17/04 had a %RSD value for the analyte benzo(b)fluoranthene that exceeded the method acceptance limit of 15%. This analyte, benzo(b)fluoranthene, failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. This compound was calibrated using the average model.

The laboratory control sample duplicate (WG5370-3RA) which was analyzed on the "K" instrument had responses for two internal standards, which were high and outside the method acceptance limit of -50% to 100% of the response of the internal standard of the daily continuing calibration standard.

The calibration verification check standard (CV) (file K6146) had responses for two internal standards which were low and outside the method acceptance limit of -50% to 100% of the response of the internal standard of the initial calibration standard.

Katahdin Analytical Services has established a laboratory policy regarding the addition of the suffix "RA" to a sample number. It is as follows: the first analysis of an undiluted sample is labeled without a suffix added to the sample number. When an undiluted sample is reanalyzed the suffix "RA" is added to the sample number. If the sample is reanalyzed more than once, the suffixes "RA2, RA3..." are used. The data software system used by the organics laboratory to process data requires each analysis to have a unique sample name. Consequently, if a sample is reanalyzed, it must be labeled with a different sample name, even if the first analysis is not reported. There are several instances where the first analysis may not be reported. These examples include: the original analysis being analyzed outside of the 12-hour analytical clock, the original analysis being scheduled for analysis but the instrument faulting out, or the original analysis being analyzed only for screening. In any of those cases, the reanalyzed samples would be labeled with a "RA" even though the original analysis is not reported.

Sample WU0050-28 was analyzed undiluted and at a dilution of 1:10. The undiluted analysis had several analytes with concentrations that were flagged with the "E" qualifier indicating they were outside of the calibration range. The diluted analysis results were flagged with the "J" qualifier. The results from the two analyses do not correlate. After further investigation, no valid reason could be determined as to why the two analyses did not correlate well to each other. Due to analyst oversight, the result from the diluted analysis was not compared with the first analysis at the time of processing to verify that the sample was analyzed at the correct dilution. At a minimum, one of the two analyses should have been reanalyzed. The sample was reanalyzed undiluted on February 19, 2004 and all target analytes were either below or within the calibration range.

The results for samples WU0050-30 and 31 that were included in the data package originally submitted to the client did not match the results reported on the EDD. Upon further review, it was determined that the EDD contained the correct sample data. The data files for samples WU0050-30RA and 31RA were initially processed with the calibrated method 827sim17.m, and printed. This was not the correct method to have used to process the data file. The two samples were then reprocessed through method 827sim18.m, the correct method. However, the two sample chromatograms were not reprinted. The chromatograms submitted in the original data package were the ones that had been processed with the incorrect method, but the data system had the correctly processed files, which is why the EDD information was correct.

#### FL-PRO Analysis

Some method blanks may have detected one or more target analytes above the MDL. Any of these analytes that were also detected in any of the associated samples were flagged with a "B" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

The calibration verification standards (file CTU2085B, CTU2093 and CTU2105) had low responses for one or more individual hydrocarbons, which resulted in a %D that was above the

method acceptance limit of 25%. Since the method requirement applies to only the PRO range response, which was acceptable, the associated samples were not reanalyzed.

#### 8081 Analysis

Sample WU0050-14 had low recoveries for the surrogate DCB on both channels, which were outside of the laboratory established acceptance limits. Since the recoveries for TCX were within the acceptance limits on both channels, the sample was not reanalyzed.

The closing CV standard (files 8UA3038 and 8UA4038) had low responses for alpha-BHC, heptachlor and delta-BHC on channel A and a low response for the surrogate DCB on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses for all of the target analytes and surrogates were acceptable on one channel, the associated samples were not reanalyzed.

The opening CV standard (file 8UA3041) had a low response for alpha-BHC on channel A, which resulted in a %D that was outside of the method acceptance limits of 15%. Since all responses on the confirmation channel were within the acceptance limits, the associated samples were not reanalyzed.

The closing CV standard (file 8UA3054) had a low response for alpha-BHC on channel A, which resulted in a %D that was outside of the method acceptance limits of 15%. Since all responses on the confirmation channel were within the acceptance limits, the associated samples were not reanalyzed.

#### 8082 Analysis

Sample WU0050-14 had low recoveries for the surrogate DCB on both channels, which were outside the laboratory established acceptance limits. Since the recoveries for TCX were within the acceptance limits on both channels, the sample was not reanalyzed.

The method blank, WG5361-1, laboratory control sample duplicate WG5361-3 and sample WU0050-11 had high recoveries for the surrogate TCX on the B channel. These recoveries were outside of the laboratory established acceptance limits. Since the recoveries for DCB were within the acceptance limits on both channels, the samples were not reanalyzed.

The middle CV standard (file 6UA2190) had high responses for Aroclor 1016 and TCX on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses on the confirmation channel were within the acceptance limits, the associated samples were not reanalyzed.

The closing CV standard (file 6UA4002) had high responses for Aroclor 1016, Aroclor 1260, TCX and DCB on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses on the confirmation channel were within the acceptance limits, the associated samples were not reanalyzed.

Some of the samples were reported for Aroclor 1260, which contained some peaks that were disproportional to those from the Aroclor 1260 standard. Since most of the peaks that are present in Aroclor 1260 standard are present in the samples, the samples were identified for this aroclor.

There were no other protocol deviations or observations noted by the organics laboratory staff.

### Metals Analysis

The samples of Katahdin SDG WU0050 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Solid Waste", SW-846, November 1986, Third Edition.

### Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP)

Solid-matrix Katahdin Sample Nos. WU0050-(1-16) were digested for ICP analysis on 01/12/04 (QC Batch UA12ICS0) in accordance with USEPA Method 3050B. Katahdin Sample No. WU0050-1 was prepared with duplicate matrix-spiked aliquots.

ICP analyses of the Katahdin SDG WU0050 sample digestates were performed in accordance with USEPA Method 6010B, using a Thermo Jarrell Ash (TJA) Trace ICP spectrometer and a TJA ICAP 61E ICP spectrometer. All samples were analyzed within holding times and all QC criteria were met with the following comments or exceptions:

Some of the results for run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

### Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

Solid-matrix Katahdin Sample Nos. WU0050-(1-16) were digested for mercury analysis on 01/13/04 (QC Batch UA13HGS0) in accordance with USEPA Method 7471A. Katahdin Sample No. WU0050-1 was prepared with duplicate matrix-spiked aliquots. The measured mercury recovery for the laboratory control sample that was prepared in this batch exceeded the laboratory's acceptance limits. For this reason, Katahdin Sample Nos. WU0050-(1-16) were redigested for mercury analysis on 01/16/04 (QC Batch UA16HGS0). Redigestates are identified throughout the raw data by the suffixes "R" or "X" appended to the Katahdin sample number, e.g. "WU0050-001R". These redigestates were successfully analyzed for mercury.

Mercury analyses of the Katahdin SDG WU0050 sample digestate were performed using a Leeman Labs PS200 automated mercury analyzer. All samples were analyzed within holding times and all run QC criteria were met.

### Matrix QC Summary

One or both of the matrix-spiked aliquots of Katahdin Sample No. WU0050-1 exceeded the laboratory's acceptance criteria (75% - 125% recovery of the added element, if the native

concentration is less than four times the amount added) for the following analytes: antimony, magnesium, mercury, silver, and zinc.

Low matrix spike recoveries for antimony in soil samples are common, and are attributed to loss of insoluble antimony compounds during filtration of the digestates. Matrix spike recovery failures for other elements are attributed to sample heterogeneity, and difficulty in obtaining representative replicate aliquots of the samples.

The matrix spike duplicate analysis of Katahdin Sample No. WU0050-1 exceeded the laboratory's acceptance limit (<20% relative difference between duplicate matrix spiked aliquots) for the following elements: calcium, copper, and mercury. These failures are attributed to sample heterogeneity, and difficulty in obtaining representative replicate aliquots of the sample.

The serial dilution analyses of Katahdin Sample No. WU0050-1 was within the laboratory's ICP serial dilution acceptance limit (<10% difference between the original sample result and the result for a 5-fold dilution of the sample, if the result for the dilution is at least ten times the instrument detection limit) for all analytes.

#### Wet Chemistry Analysis

The samples of Work Order WU0050 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for cyanide were performed according to "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA.

Analyses of Work Order WT3024 samples for total solids were performed according to U.S. EPA Contract Laboratory Program Statement of Work for Inorganic Analysis, 7/88.

All Wet Chemistry results were evaluated to Katahdin Analytical Services' Method Detection Limits (MDL). Measured concentrations that fall between the MDL and Katahdin's Practical Quantitation Limit (PQL) are flagged "J". Measured concentrations that are below the MDL are flagged "U" and reported as "U PQL", where "PQL" is the numerical value of the Practical Quantitation Limit.

All analyses were performed within analytical hold time, and all quality control criteria were met. No deviations were noted by the Wet Chemistry group.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

## QUADRATIC REGRESSION APPLET

DATA	
x	y
3127	0.05
5901	0.1
13684	0.25
46792	1
107770	2.5
376160	10

CLEAR

PLOT

ANALYZE

**RESULTS**

The quadratic regression is  $y = ax^2 + bx + c$   
 where:  $a = 1.215683003189273E-11$   
 $b = 2.211556100371233E-5$   
 and  $c = -0.03838003755030783$   
 The error is: 0.0807013349970417

This applet has two functions: plotting and finding the quadratic function which best approximates the user supplied data. Use it as follows:

- Put the data to plot and analyze in the Data section. Though the variables default to x (the independent variable) and y (the dependent variable), they can be renamed. Renaming them

Applet QRegression started

Start | Inbox - Microsoft Outlook | Bechtel Idsho | WU0050 - Microsoft Word | Earth Math - Microsoft... | Internet | 9:37 AM

$$\text{Peak 1} = (1.21568 \times 10^{-11})(28720^2) + (2.211556 \times 10^{-5})(28720) - 0.03838$$

$$0.0100273 + 0.63516 - 0.03838$$

$$0.6068$$

$$\frac{(0.6068 \text{ ng})(5000 \mu\text{L})}{(15 \text{ g})(1 \mu\text{L})(0.912)} = 221.8$$

$$\text{Ave} = \frac{221.8 + 123 + 161 + 184}{4} = 172.4$$

#### Overview

The sample set for NS Mayport, CTO 091, SDG WU0050, consists of sixteen (16) soil environmental samples.

All samples were analyzed for target analyte list (TAL) metals and cyanide. The samples were collected by Tetra Tech NUS on January 5, 2004 and analyzed by Katahdin Analytical Services under Naval Facilities Engineering Service Center (NFESC) Quality Assurance/Quality Control (QA/QC) criteria. Metals analyses except for mercury were conducted using SW846 method 6010B. Mercury analyses were conducted using SW846 method 7471A. Cyanide analyses were conducted using SW846 method 9012A.

Metals analyses, with the exception of mercury, were conducted using Inductively Coupled Plasma (ICP) methodologies. Mercury analysis was conducted using Cold Vapor Atomic Absorption (CVAA) methodology.

These data were evaluated based on the following parameters:

- \* • Data Completeness
- \* • Holding Times
- \* • Calibration Verification Results
  - Laboratory Blank Analyses
  - ICP Interference Check Sample Results
  - Matrix Spike / Matrix Spike Duplicate Results
- \* • Laboratory Control Sample Results
- \* • ICP Serial Dilution Results
  - Detection Limits
- \* • Sample Quantitation

\* - All quality control criteria were met for this parameter.

TO: T. HANSEN – PAGE 2  
DATE: MARCH 3, 2004

### Laboratory Blank Analyses

The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentration:

<u>Analyte</u>	<u>Maximum Concentration</u>	<u>Action Level</u>
Aluminum	50.41 ug/L	25.205 mg/kg
Beryllium	0.51 ug/L	0.255 mg/kg
Calcium	43.93 ug/L	21.965 mg/kg
Chromium <sup>(1)</sup>	0.114 mg/kg	0.57 mg/kg
Iron	20.20 ug/L	10.1 mg/kg
Magnesium	45.90 ug/L	22.95 mg/kg
Sodium <sup>(1)</sup>	3.891 mg/kg	19.455 mg/kg
Thallium <sup>(1)</sup>	0.673 mg/kg	3.365 mg/kg

<sup>(1)</sup> Maximum concentration present in soil preparation blank.

An action level of 5X the maximum concentration was used to evaluate the sample data for blank contamination. Sample aliquot, percent solids, and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the action level reported for beryllium and thallium were qualified as non-detected (U) as a result of laboratory blank contamination. The remaining analytes were not qualified because the results were greater than the action level.

### ICP Interference Check Sample Results

The interfering analyte calcium was present in samples MPT-45-A1-2' and MPT-45-B1-2' at a concentration comparable to the concentration of calcium in the ICS solution. Several analytes, namely antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, manganese, nickel, selenium, silver, sodium, thallium, and zinc were present in the ICS solution at concentrations that exceeded the absolute value of the IDL. Interference effects exist for antimony, arsenic, cadmium, cobalt, and selenium in the affected samples. Positive results reported for antimony, arsenic, cadmium, cobalt, and selenium were qualified as estimated (J).

The interfering analyte calcium was present in samples MPT-45-A2-2', MPT-45-A3-2', and MPT-45-B2-2' at a concentration comparable to the concentration of calcium in the ICS solution. Several analytes, namely antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, manganese, nickel, selenium, silver, sodium, thallium, and zinc were present in the ICS solution at concentrations that exceeded the absolute value of the IDL. Interference effects exist for antimony, arsenic, cadmium, cobalt, nickel, selenium, and silver in the affected samples. Positive results reported for antimony, arsenic, cadmium, cobalt, nickel, selenium, and silver were qualified as estimated (J).

The interfering analyte calcium was present in samples MPT-45-A4-2' and MPT-45-B3-2' at a concentration comparable to the concentration of calcium in the ICS solution. Several analytes, namely antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, manganese, nickel, selenium, silver, sodium, thallium, and zinc were present in the ICS solution at concentrations that exceeded the absolute value of the IDL. Interference effects exist for antimony, arsenic, cadmium, cobalt, selenium, and silver in the affected samples. Positive results reported for antimony, arsenic, cadmium, cobalt, selenium, and silver were qualified as estimated (J).

The interfering analyte calcium was present in sample MPT-45-B4-2' at a concentration comparable to the concentration of calcium in the ICS solution. Several analytes, namely antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, manganese, nickel,

**TO: T. HANSEN – PAGE 3**  
**DATE: MARCH 3, 2004**

selenium, silver, sodium, thallium, and zinc were present in the ICS solution at concentrations that exceeded the absolute value of the IDL. Interference effects exist for arsenic, cadmium, cobalt, and selenium in the affected sample. Positive results reported for arsenic, cadmium, cobalt, and selenium were qualified as estimated (J).

The interfering analyte calcium was present in sample MPT-45-C1-2' at a concentration comparable to the concentration of calcium in the ICS solution. Several analytes, namely antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, manganese, nickel, selenium, silver, sodium, thallium, and zinc were present in the ICS solution at concentrations that exceeded the absolute value of the IDL. Interference effects exist for antimony, arsenic, cadmium, cobalt, nickel, selenium, and silver in the affected sample. Positive results reported for antimony, arsenic, cobalt, nickel and silver were qualified as estimated (J). Nondetected results reported for cadmium and selenium were qualified as estimated (UJ).

The interfering analyte calcium was present in sample MPT-45-C4-2' at a concentration comparable to the concentration of calcium in the ICS solution. Several analytes, namely antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, manganese, nickel, selenium, silver, sodium, thallium, and zinc were present in the ICS solution at concentrations that exceeded the absolute value of the IDL. Interference effects exist for antimony, arsenic, cadmium, cobalt, nickel, selenium, and silver in the affected sample. Positive results reported for antimony, arsenic, cadmium, cobalt, nickel, and silver were qualified as estimated (J). The nondetected result reported selenium was qualified as estimated (UJ).

The interfering analyte calcium was present in sample MPT-45-D3-2' at a concentration comparable to the concentration of calcium in the ICS solution. Several analytes, namely antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, manganese, nickel, selenium, silver, sodium, thallium, and zinc were present in the ICS solution at concentrations that exceeded the absolute value of the IDL. Interference effects exist for antimony, arsenic, cadmium, cobalt, nickel, selenium, silver, and sodium in the affected sample. Positive results reported for antimony, arsenic, cadmium, cobalt, nickel and sodium were qualified as estimated (J). Nondetected results reported for selenium and silver were qualified as estimated (UJ).

The interfering analyte calcium was present in sample MPT-45-E4-5' at a concentration comparable to the concentration of calcium in the ICS solution. Several analytes, namely antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, manganese, nickel, selenium, silver, sodium, thallium, and zinc were present in the ICS solution at concentrations that exceeded the absolute value of the IDL. Interference effects exist for antimony, arsenic, cadmium, cobalt, nickel, selenium, and silver in the affected sample. Positive results reported for antimony, arsenic, cobalt, and nickel were qualified as estimated (J). Nondetected results reported for cadmium, selenium, and silver were qualified as estimated (UJ).

#### Matrix Spike / Matrix Spike Duplicate Results

The Matrix Spike (MS) and Matrix Spike Duplicate (MSD) percent recoveries (%R's) were <30% quality control limit for mercury. However, the original sample concentration was between 3 (three) and 4 (four) times the spike level concentration. Therefore, positive results reported for mercury were qualified as estimated (J). Nondetected results reported for mercury were qualified as estimated (UJ).

The MS and MSD %R's were <75% quality control limit for antimony and silver. Positive results reported for antimony and silver were qualified as estimated (J). Nondetected results reported for antimony and silver were qualified as estimated (UJ).

The MS and MSD %R's were >125% quality control limit for magnesium. Positive results reported for magnesium were qualified as estimated (J).

**TO: T. HANSEN – PAGE 4**  
**DATE: MARCH 3, 2004**

The MSD %R was <75% quality control limit for zinc. Positive results reported for zinc were qualified as estimated (J).

Detection Limits

Results reported below the detection limit for cyanide were qualified as estimated (J).

Notes

The Chain of Custody type of analysis for the samples states all analysis. The laboratory analyzed the samples for TAL metals and cyanide which agrees with the Master Agreement Work Release.

The Practical Quantitation Limit (PQL) %R run on 01/14/04 at 9:55 am was >130% quality control limit for magnesium. No qualification action was taken based on PQL standards.

The MS and MSD %R's for aluminum, calcium, and iron, and the MS for copper were outside quality control limits. No qualification action was required due to the original sample concentration exceeding four (4) times the spike level concentration.

Katahdin Analytical Services did not perform a laboratory duplicate as part of the analysis. A MS and MSD were performed on sample MPT-45-A1-2'.

Dilutions were performed on several samples for calcium, copper, and mercury.

Executive Summary

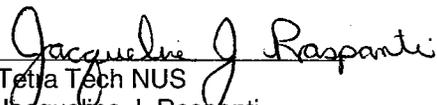

**Laboratory Performance:** Several analytes were present in the laboratory method/preparation blanks.

**Other Factors Affecting Data Quality:** Several analytes were qualified due to ICP interference. Antimony, magnesium, mercury, silver, and zinc were qualified due to MS noncompliance. Cyanide was qualified due to uncertainty near the detection limit.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Data Review" (July 2002), and the NFESC document entitled "Navy IRCDQM" (September 1999).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC Guidelines and the Quality Assurance Project Plan (QAPP)."

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

**APPENDIX A**

**QUALIFIED ANALYTICAL RESULTS**

**Qualifier Codes:**

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
- C01 = GC/MS Tuning Noncompliance
- D = MS/MSD Recovery Noncompliance
- E = LCS/LCSD Recovery Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's  $r < 0.995$
- K = ICP Interference - includes ICS % R Noncompliance
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation Noncompliance
- N = Internal Standard Noncompliance
- N01 = Internal Standard Recovery Noncompliance Dioxins
- N02 = Recovery Standard Noncompliance Dioxins
- N03 = Clean-up Standard Noncompliance Dioxins
- O = Poor Instrument Performance (i.e., base-time drifting)
- P = Uncertainty near detection limit ( $< 2 \times$  IDL for inorganics and  $<$ CRQL for organics)
- Q = Other problems (can encompass a number of issues; i.e. chromatography, interferences, etc.)
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin
- U = % Difference between columns/detectors  $>25\%$  for positive results determined via GC/HPLC
- V = Non-linear calibrations; correlation coefficient  $r < 0.995$
- W = EMPC result
- X = Signal to noise response drop
- Y = Percent solids  $<30\%$
- Z = Uncertainty at 2-sigma deviation is less than sample activity

WU0050-32	MPT-45-E4-5'

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

### Organics Analysis

The samples of Work Order WU0050 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA and/or Method for Determination of Petroleum Range Organics (Method #FL-PRO), Florida Department of Environmental Protection, November 1, 1995 and/or "Methods for the Determination of Organic Compounds in Drinking Water", U.S. EPA, Environmental Monitoring and Support Laboratory - Cincinnati (September 1995) for the specific methods listed below or on the Report of Analysis. Some manual integrations may have been performed due to split peaks and/or corrected baselines. All have been flagged with a "M" (software-generated) on the pertinent quantitation report.

### 8270 Analysis

Some method blanks may have detected one or more target analytes above the MDL. Any of these analytes that were also detected in any of the associated samples were flagged with a "B" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

There were three initial calibrations performed for this SDG. The initial calibration analyzed on the U instrument on 01/12/04 had %RSD values for several analytes that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analytes 2,4-dinitrophenol, diethylphthalate, 4-nitroaniline and the surrogate 2,4,6-tribromophenol failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model. Since none of the associated samples detected these target analytes above the PQL, the samples were not reanalyzed.

Samples WU0050-8, 9, 10, 11, 13, 14, 15, and 16 had high responses for one or more internal standards, which were outside the method acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The samples were reanalyzed with similar failures confirming a matrix effect. The results from both analyses are reported.

The CV (file U5895) had high responses for the calibration check compounds (CCCs) phenol, 4-chloro-3-methylphenol and di-n-octylphthalate, which resulted in %D's that were outside the

method acceptance limit of 20%. Since a high response would indicate a high bias and the associated samples did not detect these analytes above the PQL, the samples were not reanalyzed.

The CV (file U5907) had a high response for the CCC phenol and a low response for hexachlorobutadiene, which resulted in %D's that were outside the method acceptance limit of 20%. Since the associated samples did not detect these analytes above the PQL, the samples were not reanalyzed.

The CV (file X4122) had a low response for the CCC N-nitrosodiphenylamine, which resulted in a %D that was outside the method acceptance limit of 20%. Since a high response would indicate a high bias and the associated samples did not detect N-nitrosodiphenylamine above the MDL, the samples were not reanalyzed.

The CV's (files U5895 and X4122) had responses for the internal standard perylene-d12 which were low and resulted in %D's that were outside the method acceptance limits of -50% to +100% of the response of the mid-point standard level of the initial calibration. Since none of the associated samples detected any target analytes above the PQL that are quantitated against this internal standard, the samples were not reanalyzed.

#### 8270 SIM Analysis

Some method blanks may have detected one or more target analytes above the MDL. Any of these analytes that were also detected in any of the associated samples were flagged with a "B" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

Samples WU0050-17, 18, 19, 20, and 21 had responses for one or more internal standards which were high and outside the method acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The samples were reanalyzed with similar failures confirming a matrix effect. The results from both analyses are reported.

Samples WU0050-25, 26, 27, 28 and 29, which were analyzed at dilution, had responses for one or more internal standards which were high and outside the method acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The results from both analyses are reported.

Samples WU0050-30, 31, and 32 had responses for one or more internal standards which were high and outside the method acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. These samples were not reanalyzed due to time constraints.

The initial calibration analyzed on the K instrument on 01/17/04 had a %RSD value for the analyte benzo(b)fluoranthene that exceeded the method acceptance limit of 15%. This analyte, benzo(b)fluoranthene, failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. This compound was calibrated using the average model.

The laboratory control sample duplicate (WG5370-3RA) which was analyzed on the "K" instrument had responses for two internal standards, which were high and outside the method acceptance limit of -50% to 100% of the response of the internal standard of the daily continuing calibration standard.

The calibration verification check standard (CV) (file K6146) had responses for two internal standards which were low and outside the method acceptance limit of -50% to 100% of the response of the internal standard of the initial calibration standard.

#### FL-PRO Analysis

Some method blanks may have detected one or more target analytes above the MDL. Any of these analytes that were also detected in any of the associated samples were flagged with a "B" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

The calibration verification standards (file CTU2085B, CTU2093 and CTU2105) had low responses for one or more individual hydrocarbons, which resulted in a %D that was above the method acceptance limit of 25%. Since the method requirement applies to only the PRO range response, which was acceptable, the associated samples were not reanalyzed.

#### 8081 Analysis

Sample WU0050-14 had low recoveries for the surrogate DCB on both channels, which were outside of the laboratory established acceptance limits. Since the recoveries for TCX were within the acceptance limits on both channels, the sample was not reanalyzed.

The closing CV standard (files 8UA3038 and 8UA4038) had low responses for alpha-BHC, heptachlor and delta-BHC on channel A and a low response for the surrogate DCB on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses for all of the target analytes and surrogates were acceptable on one channel, the associated samples were not reanalyzed.

The opening CV standard (file 8UA3041) had a low response for alpha-BHC on channel A, which resulted in a %D that was outside of the method acceptance limits of 15%. Since all responses on the confirmation channel were within the acceptance limits, the associated samples were not reanalyzed.

The closing CV standard (file 8UA3054) had a low response for alpha-BHC on channel A, which resulted in a %D that was outside of the method acceptance limits of 15%. Since all responses on the confirmation channel were within the acceptance limits, the associated samples were not reanalyzed.

#### 8082 Analysis

Sample WU0050-14 had low recoveries for the surrogate DCB on both channels, which were outside the laboratory established acceptance limits. Since the recoveries for TCX were within the acceptance limits on both channels, the sample was not reanalyzed.

The method blank, WG5361-1, laboratory control sample duplicate WG5361-3 and sample WU0050-11 had high recoveries for the surrogate TCX on the B channel. These recoveries were outside of the laboratory established acceptance limits. Since the recoveries for DCB were within the acceptance limits on both channels, the samples were not reanalyzed.

The middle CV standard (file 6UA2190) had high responses for Aroclor 1016 and TCX on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses on the confirmation channel were within the acceptance limits, the associated samples were not reanalyzed.

The closing CV standard (file 6UA4002) had high responses for Aroclor 1016, Aroclor 1260, TCX and DCB on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses on the confirmation channel were within the acceptance limits, the associated samples were not reanalyzed.

Some of the samples were reported for Aroclor 1260, which contained some peaks that were disproportional to those from the Aroclor 1260 standard. Since most of the peaks that are present in Aroclor 1260 standard are present in the samples, the samples were identified for this aroclor.

There were no other protocol deviations or observations noted by the organics laboratory staff.

### Metals Analysis

The samples of Katahdin SDG WU0050 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Solid Waste", SW-846, November 1986, Third Edition.

### Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP)

Solid-matrix Katahdin Sample Nos. WU0050-(1-16) were digested for ICP analysis on 01/12/04 (QC Batch UA12ICS0) in accordance with USEPA Method 3050B. Katahdin Sample No. WU0050-1 was prepared with duplicate matrix-spiked aliquots.

ICP analyses of the Katahdin SDG WU0050 sample digestates were performed in accordance with USEPA Method 6010B, using a Thermo Jarrell Ash (TJA) Trace ICP spectrometer and a TJA ICAP 61E ICP spectrometer. All samples were analyzed within holding times and all QC criteria were met with the following comments or exceptions:

Some of the results for run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

### Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

Solid-matrix Katahdin Sample Nos. WU0050-(1-16) were digested for mercury analysis on 01/13/04 (QC Batch UA13HGS0) in accordance with USEPA Method 7471A. Katahdin Sample No. WU0050-1 was prepared with duplicate matrix-spiked aliquots. The measured mercury recovery for the laboratory control sample that was prepared in this batch exceeded the laboratory's acceptance limits. For this reason, Katahdin Sample Nos. WU0050-(1-16) were redigested for mercury analysis on 01/16/04 (QC Batch UA16HGS0). Redigestates are identified throughout the raw data by the suffixes "R" or "X" appended to the Katahdin sample number, e.g. "WU0050-001R". These redigestates were successfully analyzed for mercury.

Mercury analyses of the Katahdin SDG WU0050 sample digestate were performed using a Leeman Labs PS200 automated mercury analyzer. All samples were analyzed within holding times and all run QC criteria were met.

### Matrix QC Summary

One or both of the matrix-spiked aliquots of Katahdin Sample No. WU0050-1 exceeded the laboratory's acceptance criteria (75% - 125% recovery of the added element, if the native concentration is less than four times the amount added) for the following analytes: antimony, magnesium, mercury, silver, and zinc.

Low matrix spike recoveries for antimony in soil samples are common, and are attributed to loss of insoluble antimony compounds during filtration of the digestates. Matrix spike recovery failures for other elements are attributed to sample heterogeneity, and difficulty in obtaining representative replicate aliquots of the samples.

The matrix spike duplicate analysis of Katahdin Sample No. WU0050-1 exceeded the laboratory's acceptance limit (<20% relative difference between duplicate matrix spiked aliquots) for the following elements: calcium, copper, and mercury. These failures are attributed to sample heterogeneity, and difficulty in obtaining representative replicate aliquots of the sample.

The serial dilution analyses of Katahdin Sample No. WU0050-1 was within the laboratory's ICP serial dilution acceptance limit (<10% difference between the original sample result and the result for a 5-fold dilution of the sample, if the result for the dilution is at least ten times the instrument detection limit) for all analytes.

### Wet Chemistry Analysis

The samples of Work Order WU0050 were analyzed in accordance with the specific methods listed on the Report of Analysis.

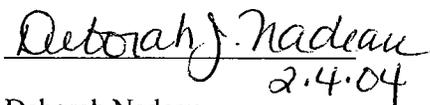

Analyses for cyanide were performed according to "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA.

Analyses of Work Order WT3024 samples for total solids were performed according to U.S. EPA Contract Laboratory Program Statement of Work for Inorganic Analysis, 7/88.

All Wet Chemistry results were evaluated to Katahdin Analytical Services' Method Detection Limits (MDL). Measured concentrations that fall between the MDL and Katahdin's Practical Quantitation Limit (PQL) are flagged "J". Measured concentrations that are below the MDL are flagged "U" and reported as "U PQL", where "PQL" is the numerical value of the Practical Quantitation Limit.

All analyses were performed within analytical hold time, and all quality control criteria were met. No deviations were noted by the Wet Chemistry group.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

Sample Calculation: Sample MPT-45-E4-2' Arsenic

NS mg part  
CTO 091  
SDG W00050

$$0.02999 \frac{\text{mg}}{\text{L}} \times \frac{1 \text{ L}}{1000 \text{ mL}} \times \frac{100 \text{ mL}}{1.13 \text{ g}} \times \frac{1000 \text{ g}}{\text{kg}} \times 0.874 = 3.0 \text{ mg/kg}$$
