PROFESSIONAL CERTIFICATION

Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI)
Solid Waste Management Units (SWMUs) 47, 53, and 55 (Group IV)
U.S. Naval Station, Mayport, Florida

This document, Resource Conservation and Recovery Act (RCRA) Facility Investigation; Solid Waste Management Units (SWMUs) 47, 53, and 55; U.S. Naval Station, Mayport, Florida has been prepared under the direction of a Florida Registered Professional Geologist. The work and professional opinions rendered in the report were conducted or developed in accordance with commonly accepted procedures consistent with applicable standards of practice. If conditions are determined to exist that differ from those described, the undersigned geologist should be notified to evaluate the effects of additional information on the assessment and recommendations in this report. This document was prepared specifically for the referenced site and should not be construed to apply to any other site.

1.0 INTRODUCTION

This Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) Report documents the activities, findings, conclusions, and recommendations of the RFI conducted at Solid Waste Management Units (SWMUs) 47, 53, and 55 (Group IV) at Naval Station (NAVSTA) Mayport. NAVSTA Mayport is located in northeastern Duval County, Florida, at the confluence of the St. Johns River and the Atlantic Ocean, as shown on Figure 1-1.

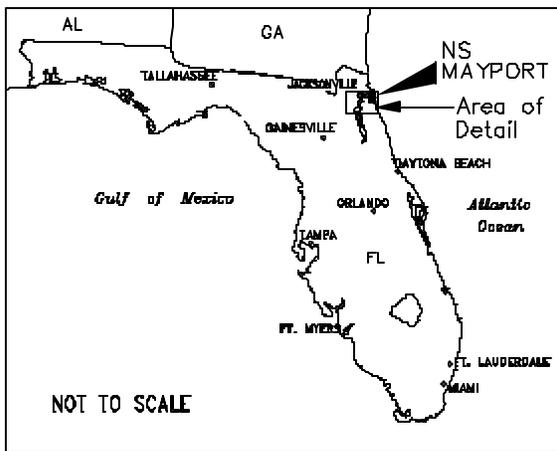

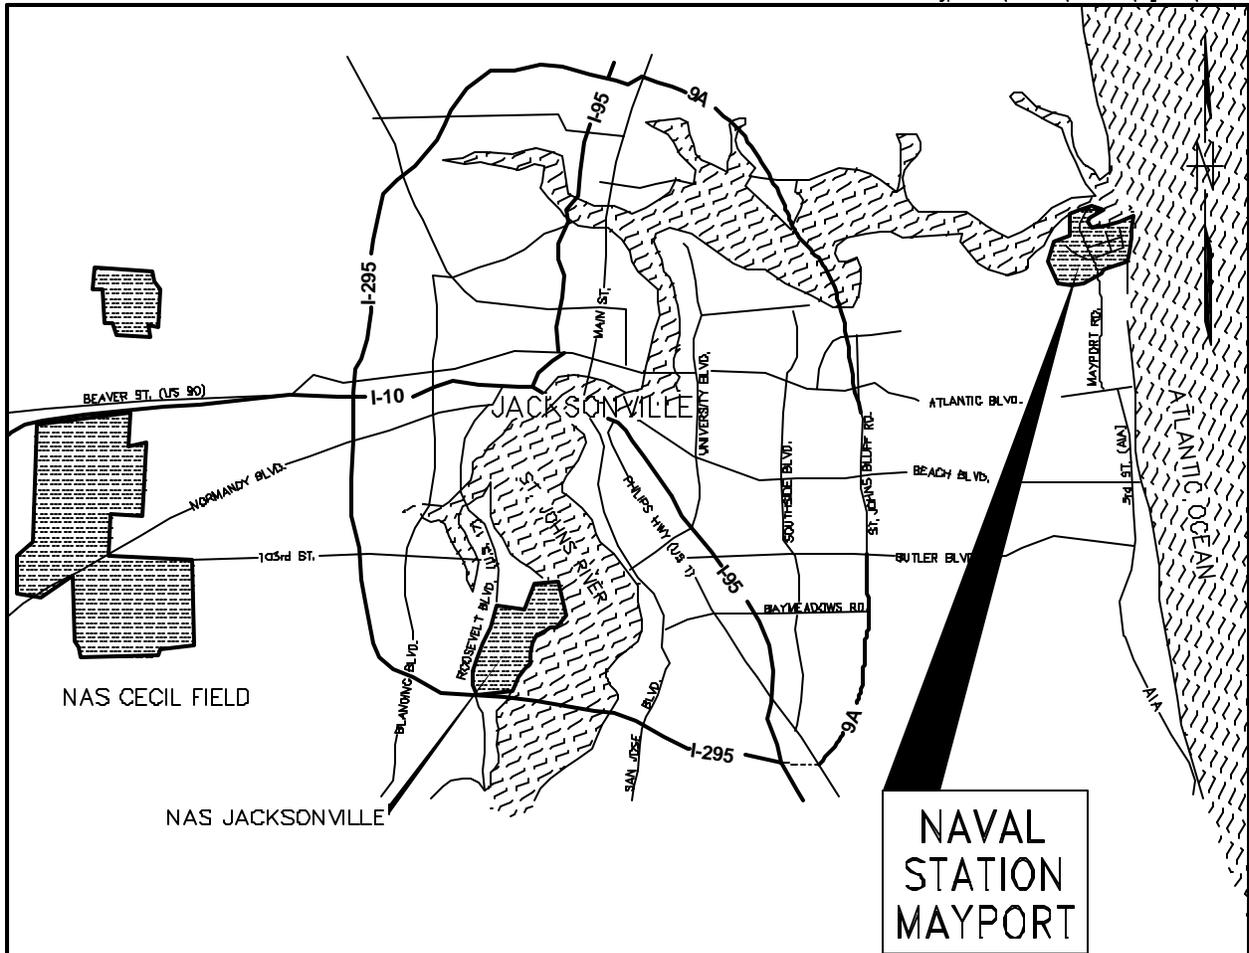

1.1 REGULATORY SETTING AND BACKGROUND

The United States Environmental Protection Agency (USEPA) issued RCRA Permit Number H016-118598 and Hazardous and Solid Waste Amendment (HSWA) Permit FL9 170 024 260 to NAVSTA Mayport on March 25, 1988. The HSWA permit was revised and reissued on June 15, 1993. The current HSWA permit is under review by the Florida Department of Environmental Protection (FDEP).

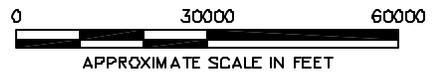

A. T. Kearney, Inc. conducted a RCRA facility assessment (RFA) visual site inspection for NAVSTA Mayport on behalf of the USEPA, Region 4. The RFA identified 56 SWMUs and 2 areas of concern (AOCs) at NAVSTA Mayport. Forty-one SWMUs warranted further investigation with 18 SWMUs designated for an RFI due to confirmed hazardous substance releases and 23 SWMUs designated for further investigation due to suspected hazardous substance releases. RFA sampling visits (SVs) were conducted at 7 of the 23 sites designated for further investigation. The remaining 15 SWMUs were determined not to require further action because no hazardous substance releases to the environment had occurred.

The USEPA recommended that a phased approach be used to implement RFA/SV, RFI, and other corrective action activities. This goal was to account for the number of SWMUs at NAVSTA Mayport, the diversity of their past and/or present operations, and the magnitude of permit requirements. A component of the RCRA program at NAVSTA Mayport is the Corrective Action Management Plan (CAMP), which is revisited every year to incorporate the latest descriptions of the phased approach, proposed schedule, and strategy to implement the RCRA Corrective Action Program at NAVSTA Mayport. The original CAMP is located in Appendix F of Volume I of the USEPA-approved RFI work plan [ABB Environmental Services, Inc. (ABB-ES), 1991]. The CAMP identifies the operational groups of SWMUs, ranks them by their perceived relative risks to human health and the environment, and contains the proposed schedule for the field investigations and report submittals.

The Group IV SWMUs investigated for this RFI include the Oily Waste Collection System (OWCS) (SWMU 47), the Sanitary Sewer System (SWMU 53), and the Storm Sewer System (SWMU 55). Other Group IV SWMUs include the Oil/Water Separators (SWMU 54), Fuel Distribution System (AOC A), and Underground Product Storage Tanks (AOC B) and are part of the petroleum program at NAVSTA Mayport. In the context of this report, the Group IV SWMUs refer only to those investigated under the RCRA program, unless otherwise specified.

Much of the background information provided in this report originates from the RCRA Facility Investigation General Information Report (GIR) for NAVSTA Mayport (ABB-ES, 1995) provides information relevant to the Group IV SWMUs, including background sampling information and analytical methodology, risk assessment approach, and the ecological characterization of NAVSTA Mayport. The NAVSTA Mayport GIR includes a summary of published information including the following: geography, physiography, demographics, climate, regional geology, and hydrogeology; methods and procedures used to conduct the field activities; methodology used to validate analytical data and conduct risk assessments; and characterization of station-wide background conditions, including surface soil, subsurface soil, and groundwater. The information contained in the GIR (ABB-ES, 1995) is common to all of the NAVSTA Mayport SWMUs and AOCs and will not be repeated in this report.

1.2 PURPOSE

The purpose of the RFI activities at NAVSTA Mayport is to provide data that will be used to determine the following:

- Nature and extent of contaminant release from SWMUs 47, 53, and 55.
- Potential pathways and receptors of contaminant migration in the groundwater.
- Potential risks to human health and the environment.

1.3 SCOPE

Group IV field activities occurred in a series of field events from July 2000 through June 2001. The first phase of the field effort consisted of subsurface soil sampling and groundwater screening using direct push technology for SWMUs 47 and 53. The second phase consisted of surface soil, surface water, and sediment sampling for SWMU 55. The third phase consisted of monitoring well installation and sampling. The final phase, of the field activities, consisted of surveying all sampling and groundwater monitoring well locations.

1.4 RFI REPORT LAYOUT

The Group IV RFI report is divided into the following eight chapters.

- Chapter 1.0 provides an introduction to the investigation with basic background information about NAVSTA Mayport and the RFI process.
- Chapter 2.0 presents the physical features, including site geologic and hydrogeologic characteristics of the Group IV SWMUs.
- Chapter 3.0 provides a summary of previous investigations applicable to the Group IV SWMUs.
- Chapter 4.0 presents a summary of the RFI investigation and process methodologies.
- Chapter 5.0 presents the analytical results of environmental samples collected during the RFI.
- Chapter 6.0 provides the human health risk assessment.
- Chapter 7.0 provides the ecological risk assessment.
- Chapter 8.0 presents conclusions and recommendations based on the data interpretation and human health and ecological risk assessments. The need for a Corrective Measures Study (CMS) is determined based on these conclusions.

Except as noted in this report, field activities were conducted in accordance with the approved RFI Work Plan [Tetra Tech NUS, Inc. (TtNUS), 1999] and the TtNUS Comprehensive Quality Assurance Plan (CompQAP) Number 980038.

1.5 FACILITY DESCRIPTION AND BACKGROUND

NAVSTA Mayport is located within the corporate limits of the city of Jacksonville, Duval County, Florida, approximately 12 miles to the northeast of downtown Jacksonville and adjacent to the town of Mayport. The station complex is located on the northern end of a peninsula bound by the Atlantic Ocean to the east and the St. Johns River to the north and west as shown on Figure 1-2. NAVSTA Mayport occupies the

entire northern part of the peninsula except for the town of Mayport located to the west between the station and the St. Johns River.

NAVSTA Mayport was commissioned in 1942 on approximately 700 acres of land. The station initially consisted of a harbor and an airfield located near the mouth of the St. Johns River. The harbor and airfield were constructed from the dredging and filling of Ribault Bay. The harbor was initially dredged to a depth of 29 feet (ft) below mean sea level, and is referred to as the Mayport Turning Basin. The Mayport Turning Basin is surrounded by six ship piers (Alpha, Bravo, Charlie, Delta, Echo, and Foxtrot).

The original mission of the station included use by patrol craft, target boats, and rescue boats. The station was placed in caretaker status from 1946 to 1948. In 1948, the station was reopened, and in 1952, an aircraft carrier was assigned to the station. The turning basin was dredged to a depth of 40 ft to allow aircraft carriers and other large ships to berth at NAVSTA Mayport. Using dredge material to fill areas south of the turning basin increased the amount of uplands at NAVSTA Mayport.

NAVSTA Mayport provides all necessary support services for the surface fleet and aircraft stationed at or visiting Mayport. This support includes a division of the Public Works Center, which is headquartered at Naval Air Station Jacksonville, and provides infrastructure support. Other services include personnel support, facilities support, and ship and aircraft repair and maintenance.

Industrial operations conducted at NAVSTA Mayport involve intermediate level maintenance for both ships and aircraft, and vehicle maintenance and repair. Any maintenance activities that can be conducted without putting a ship into dry-dock are considered intermediate. Squadron personnel perform aircraft maintenance in the hangar buildings.

Maintenance and repair operations for ships are carried out by three organizations on the station: Shore Intermediate Maintenance Activity (SIMA), Supervisor of Shipbuilding (SUPSHIP), and Naval Aviation Depot (NADEP). SIMA conducts repair and maintenance operations onboard ships at the piers and in the SIMA operations building. SUPSHIP is a contracting organization that contracts out maintenance and repair work. NADEP conducts maintenance operations on aircraft launching and arresting systems in its own building on the station.

1.6 GROUP IV DESCRIPTION AND BACKGROUND

1.6.1 SWMU 47

SWMU 47, the OWCS, is a system of gravity pipelines, lift stations, and force mains that convey oily bilge water collected from ships at the piers to the oily waste treatment plant (OWTP). An oily-waste line from the Firefighter Training Center (FFTC) was formerly connected to the network; however, the line was disconnected when the stormwater retention pond was constructed at the FFTC. A majority of the system was constructed during 1978 to 1980 from ductile iron pipe that is not cathodically protected. Piping at Alpha Pier was replaced in 1991, and the Foxtrot Pier was constructed in 1994. The collection system can be broken down into two subsystems: the gravity feed system used to convey the oily wastewater from the oily waste risers at the piers to the lift stations, and the lift stations with force main pipelines that convey oily waste to the OWTP.

The OWCS consists of lines that run parallel to the piers along the Mayport Turning Basin. These lines are the gravity flow subsystem of the OWCS. The risers that feed the gravity subsystem are located approximately every 50 ft along the length of the entire pier system. The gravity subsystem feeds four lift stations, which pump the oily waste via force mains to the OWTP.

According to an evaluation of the OWCS, there are approximately 47 risers around the Mayport Turning Basin that feed approximately 13,702 linear ft of 6- to 8-inch diameter gravity pipeline. The gravity lines feed the lift stations, which pump the oily waste through approximately 9,960 linear ft of 6-, 8-, and 12-inch diameter force mains. These lines are believed to be approximately 6 ft below land surface (bls) (Hendon, 1992).

1.6.2 SWMU 53

The sewer pipeline system (SWMU 53) collects and transports sanitary and industrial wastewater from all areas of the NAVSTA Mayport to the Wastewater Treatment Facility (WWTF) (A. T. Kearny, 1989). The WWTF is a National Pollutant Discharge Elimination System (NPDES) permitted facility located to the south of the entrance to the Mayport Turning Basin. Like the OWCS, the sewer lines are composed of gravity feed pipelines, lift stations, and force main sewer lines.

The RFA states that the sewer pipeline transports industrial wastewater to the WWTF in addition to domestic sewage (A .T. Kearny, 1989). The industrial operations that contribute wastewater flow to the WWTF include SIMA, Aircraft Intermediate Maintenance Depot (AIMD), helicopter maintenance hangars, commercial shipyards, and the ships berthed in the Mayport Turning Basin. The RFA also states that

each part of the system was likely constructed when the associated buildings were constructed, beginning in 1942. Therefore, much of the system was probably constructed in the 1950s when the NAVSTA Mayport was expanded to accommodate more and larger vessels.

1.6.3 SWMU 55

The storm sewer system (SWMU 55) at NAVSTA Mayport consists of underground storm sewer pipes and unlined drainage ditches (A. T. Kearny, 1989). The storm sewer system conveys runoff to the St. Johns River, Sherman Creek, Lake Wonderwood, the Mayport Turning Basin, and the Atlantic Ocean. Many of the storm sewer pipes that discharge to the surrounding surface water are supplied by unlined drainage ditches found over the entire facility.

2.0 PHYSICAL CHARACTERISTICS

A detailed description of the physical characteristics of NAVSTA Mayport is provided in the NAVSTA Mayport GIR (ABB-ES, 1995). Information including topography, demography, climate, soil types, and regional geology and hydrogeology has been presented and will not be repeated in this report.

Site-specific geologic and hydrologic information was not collected during the Group IV RFI due to the expanse of the Group IV SWMUs. Instead, TtNUS relied on applicable information culled from the documentation of prior investigations when applicable to the Group IV SWMUs. A summary of the geologic and hydrologic data is discussed in the following sections.

2.1 SITE GEOLOGY

Geology from the Groups I, II, and III RFIs was compiled and documented in Section 3.1 of the Mayport GIR. The compiled data is summarized below.

A surficial deposit of dredge material from the Mayport Turning Basin and St. Johns River makes up the interior areas of NAVSTA Mayport covering former marshes and sand flats. Beach and riverbank sands predominate in areas along the Atlantic Ocean and St. Johns River. The dredge material typically consists of fine-grained, well sorted sands and/or marine shell fragments (ABB-ES, 1995). Field observations during the Group IV RFI are consistent with this description.

Undifferentiated post-Hawthorne deposits are typically encountered beneath the surficial dredge depositional material. This unit consists of fairly uniform, well-sorted, poorly graded, very fine-grained sand, which typically contains minor quantities of fines consisting of silt and clay. It also typically has numerous shell fragments and subrounded pea-size gravel. Color ranges from tan to light gray with color change typically gradational over several ft (ABB-ES, 1995). A subsurface characterization was not performed at this interval for the Group IV RFI.

The Upper Hawthorne Group is encountered beneath the undifferentiated post-Hawthorne deposits. This formation consists of fine- to medium-grained, tan to greenish-gray sand with black phosphatic nodules and/or lithic limestone fragments. Sandy clay, typically gray or olive green in color may be found within this zone. In addition, clay seams may be encountered varying in thickness from inches to several ft along the zone between the Upper Hawthorne Group and the overlying post-Hawthorne deposits (ABB-ES, 1995). A subsurface characterization was not performed at this interval for the Group IV RFI.

2.2 SITE HYDROGEOLOGY

Significant portions of the Group IV SWMUs are located within or in proximity to previously assessed SWMUs; therefore, aquifer test data from other investigations was used to estimate the hydraulic characteristics for the Group IV SWMUs. Much of the hydrogeologic information available for NAVSTA Mayport originates from the Group I, II, and III RFIs, and was compiled and documented in Section 3.2 of the Mayport GIR. In addition to the Group I, II, and III RFIs, information was obtained from various petroleum investigations. Summary of site hydrogeology characteristics is presented in Table 2-1.

Table 2-1 Site Hydrogeology Group IV RCRA Facility Investigation Naval Station Mayport Mayport, Florida			
Site	Hydraulic Conductivity (ft/day)	Velocity (ft/day)	Transmissivity (ft ² /day)
Alpha and Delta Pier*	33.20/9.06	0.963/0.25	256.60/72.48
Bravo Pier	10.0	0.48	200.0
Site 1330	19.0	0.27	134.9
Building 1490	14.3	0.43	107.3
Notes: * = values are a range ft/day = feet (or foot) per day ft ² /day = feet squared per day			

2.2.1 Tidal Influence

Tidal influence surveys were performed for the Groups I, II, and III RFIs, as well as various petroleum sites. Although the surveys provide insight about the tidal influence along the St. Johns River, the extent may differ in areas surrounding the Mayport Turning Basin due to the presence of subsurface construction materials (i.e., sheet piling, concrete, etc.) to depths exceeding 40 ft bls. This seems to be substantiated by tidal influence studies performed at the Bravo and Echo Piers, which concluded that only minor tidal fluctuations are present in the pier areas. Many of the Group IV sampling points were placed along the piers. Charlie Pier may exhibit characteristics that differ from the other piers due to its geological feature as a narrow spit situated between the Mayport Turning Basin and the St. Johns River, although no tidal influence surveys have been performed to substantiate Charlie Piers hydrologic characteristics. In general, studies have concluded that tidal influence extends approximately 400 ft inland. However, this may be mitigated in the pier areas due to construction materials that potentially impede groundwater flow.

2.2.2 Potentiometric Surface

According to the GIR, groundwater flow in the surficial aquifer originates from four areas of groundwater mounding at NAVSTA Mayport. These areas include the two dredge spoil areas, an area located along the runway, and an area near the Aircraft Intermediate Maintenance Area. Another mound may exist near Massey Avenue and Bon Homme Richard Street; however, the extent of data for this area is limited. The following is a description of the potentiometric surface of each of three major areas of investigation: the piers, Moale Avenue, and AIMD.

According to Figure 3-19 of the GIR, groundwater at the Alpha, Bravo, Delta, Echo, and Foxtrot Piers flows toward the Mayport Turning Basin. Groundwater flow data for Charlie Pier is not available; however, it is plausible that groundwater at Charlie Pier may exhibit horizontal flow characteristics that differ from the other piers due to its location between the Mayport Turning Basin and the St. Johns River.

Groundwater at the AIMD appears to flow radially outward from a groundwater high on the northern side of Building 1552. Groundwater on the western half of the complex appears to be flowing west and southwest toward a tidally influenced ditch and estuarine marsh located opposite Patrol Road from the complex. Groundwater on the eastern half of the complex appears to be flowing east and southeast eventually flowing into the turning basin.

Limited groundwater data is available for the Moale Avenue corridor; however, it appears that groundwater flow is toward Lake Wonderwood or Sherman Creek basin.

A United States Geological Survey (USGS) Model (Halford, 2002) to estimate groundwater flow at NAVSTA Mayport is provided in Appendix A. The report includes simulated potentiometric surface maps for both the shallow (S) zone, the underlying intermediate (I) zone and the deep (D) zone of the surficial aquifer at Mayport. The USGS report also provided particle pathline (showing path of groundwater or contaminant particles transported by advective flow) maps for the surficial aquifer.

2.2.3 Hydraulic Conductivity

Hydraulic conductivity tests have been conducted for various sites at NAVSTA Mayport. The documentation has been reviewed and information applicable to the Group IV SWMUs is summarized below. No information was available for the area along Moale Avenue.

- Radial hydraulic conductivities ranged from 1.3 to 44.7 ft/day with an average of 23 ft/day for two monitoring wells and two piezometers at SWMU 13. No intermediate or deep surficial aquifer information is available for the AIMD. Based on published values from tests performed at other

Group I SWMUs, radial hydraulic conductivity is expected to decrease with depth due to the encountered lithological features (ABB-ES, 1996).

- An average horizontal hydraulic conductivity of 19.0 ft/day was calculated for the shallow zone of the surficial aquifer for two monitoring wells at Site 1330, north of Bravo Pier. Hydraulic Conductivity, Velocity, and Transmissivity values are provided on Table 2-1.
- An average horizontal hydraulic conductivity of 10 ft/day was calculated for the monitoring wells at Bravo Pier.
- A hydraulic conductivity ranging from 9.06 to 33.20 ft/day was obtained for the shallow zone of the surficial aquifer for four monitoring wells at the Alpha-Delta Pier.
- An average horizontal hydraulic conductivity of 14.3 ft/day was calculated for the two monitoring wells at Building 1490, also known as SIMA.

2.2.4 Groundwater Flow Velocity

Horizontal groundwater flow rates have been documented for prior investigations for the shallow surficial aquifer at NAVSTA Mayport. These rates are expressed as average linear groundwater velocities, calculated from a modified form of Darcy's equation (listed below), and represent the ratio of linear travel distance to travel time.

Darcy's equation: $Q = (K \cdot I) / n$

K = Hydrologic conductivity

I = Hydrologic gradient

n = estimated porosity

The horizontal flow rates are summarized in the following table.

Table 2-2 Groundwater Flow Velocity	
Group IV RCRA Facility Investigation Naval Station Mayport Mayport, Florida	
Area	Flow Velocity (ft/day)
AIMD area	0.15 ft/day
Bravo Pier	0.27 ft/day
Alpha/Delta Pier*	0.963 / 0.25 ft/day
Building 1490	0.43 ft/day
Notes: * = values are a range	

Flow velocities ranged from 0.15ft/day to 0.963 ft/day with the highest value at Alpha pier and the lowest at the AIMD area.

2.2.5 Groundwater Transmissivity

Horizontal and vertical permeability have been previously calculated in the shallow surficial aquifer at NAVSTA Mayport. Transmissivity for various sites across Mayport was calculated using the equation listed below.

$$T = K \cdot b$$

T = transmissivity in ft²/day

K = Hydrologic conductivity

b = aquifer test interval (thickness)

The transmissivities are summarized in the table below.

Table 2-3 Groundwater Transmissivity	
Group IV RCRA Facility Investigation Naval Station Mayport Mayport, Florida	
Area	Transmissivity ft ² /day
Site 1330	134.9 ft ² /day
Bravo Pier	200 ft ² /day
Alpha/Delta Pier*	256.60 / 72.48 ft ² /day
Building 1490	107.3 ft ² /day
Notes: * = values are a range	

Transmissivity values ranged from 107.3 ft²/day to 256.60 ft²/day with the highest value at Alpha pier and the lowest at Building 1490.

3.0 PREVIOUS INVESTIGATIONS

This chapter summarizes previous investigations applicable to the Group IV SWMUs at NAVSTA Mayport. Previous investigations include a RCRA groundwater assessment at Bravo Pier; various petroleum program investigations at the Alpha, Delta, and Echo Piers; and visual inspections of the OWCS and Sanitary Sewer System.

3.1 RCRA INVESTIGATIONS

The United States Navy (Navy) Comprehensive Long-term Environmental Action Navy (CLEAN) I contractor (Harding Lawson Associates) was contracted by the Navy Southern Division, Naval Facilities Engineering Command (NAVFAC EFD SOUTH) in November 1997 to conduct a limited Group IV sampling event at NAVSTA Mayport. Results of the sampling event are provided in Appendix B. The focus of the assessment was Group IV sites located within the northern and west-central parts of NAVSTA Mayport. The sampling event consisted of collecting surface water, sediment, and subsurface soil samples; installing direct push technology (DPT) monitoring wells; and collecting groundwater samples. The findings are as follows:

3.1.1 Surface Water

Three surface water samples were collected in various areas of the stormwater sewer system. Butyl benzene and zinc exceeded their respective Florida Surface Water Quality Criteria for Class III freshwater, and lead exceeded the Class III marine criteria.

3.1.2 Sediment

Five sediment samples exceeded their respective industrial FDEP soil cleanup target levels (SCTLs) for benzo(a)pyrene, chlordane, arsenic, barium, copper, lead, and vanadium. Antimony, cadmium, chromium, and lead exceeded FDEP SCTL leachability criteria.

3.1.3 Subsurface Soil

Subsurface soil and groundwater samples were collected to assess portions of the sanitary sewer system (SWMU 53) located in the vicinity of the Moale Avenue pump station and northeast of the Commander for Carrier Group Eight Headquarters. None of the subsurface soil samples exceeded the FDEP SCTL industrial criteria. Chromium exceeded its FDEP SCTL leachability criterion.

Seven subsurface soil samples were collected to assess the OWCS and/or sanitary sewer system at Bravo Pier. The subsurface soil analytical results indicated that benzo(a)pyrene exceeded its FDEP

SCTL industrial criterion, and methylene chloride, 2-methylnaphthalene, and benzo(a)pyrene exceeded their respective FDEP SCTL leachability criteria.

Three subsurface soil samples were collected at the Building 38 Public Works Shop. The subsurface soil analytical results indicated that arsenic exceeded its FDEP SCTL industrial criterion. Arsenic was not detected in an additional surface and subsurface soil sample subsequently collected at this location. Chromium exceeded its FDEP SCTL leachability criterion.

Two subsurface soil samples were collected at the Former SIMA (Buildings 37 and 46). There were no subsurface soil analytical results that exceeded FDEP criteria.

3.1.4 Groundwater

Groundwater samples were collected to assess portions of the sanitary sewer system (SWMU 53) located in the vicinity of the Moale Avenue pump station and northeast of the Commander for Carrier Group Eight Headquarters. One inorganic (nickel) was detected in the groundwater sample exceeding its FDEP Groundwater Guidance Concentration (GGC). Nickel was not detected in a subsequent sampling event.

Eleven groundwater samples were collected to assess the OWCS and/or sanitary sewer system at Bravo Pier. The groundwater samples were collected from newly installed monitoring wells (MPT-47-MW01S through MPT-47-MW11S), which used the Navy's Site Characterization Analysis and Penetrometer System technology. The groundwater analytical results indicated that acenaphthene and thallium exceeded their respective FDEP GGCs.

Three groundwater samples were collected at the Building 38 Public Works Shop. The groundwater samples were collected from newly installed monitoring wells (MPT-PW-MW01S through MPT-PW-MW03S). The groundwater analytical results indicated that bis(2-ethylhexyl)phthalate exceeded its FDEP GGC.

Three groundwater samples were collected at the Former SIMA (Buildings 37 and 46). There were no groundwater analytical results that exceeded FDEP criteria.

Analytical results of environmental samples were used to assess whether contaminants were present or potentially have been released from SWMUs 47, 53, and 55. The analytical data was also used to conduct a preliminary risk screening of SWMUs 47, 53, and 55. The preliminary risk screening included comparisons of the analytical data to relevant background samples and regulatory criteria. Based on the preliminary risk screening, recommendations were made for additional sampling to be conducted as part of a formal RFI process.

The Group IV RFA/SV is provided as Appendix B.

3.2 PETROLEUM INVESTIGATIONS

3.2.1 Alpha-Delta Piers

A Contamination Assessment Report was prepared by ABB-ES in November 1992 due to the release of more than 500 gallons of fuel from a diesel fuel marine pipeline failure. The pipeline defect, discovered in 1985, was repaired and the source of contamination abated. A Remedial Action Plan (RAP) was prepared and submitted in December 1993.

A groundwater monitoring program was conducted from June 1996 through October 1997 in accordance with the approved RAP. Two monitoring wells, MPT-1406-6 and MPT-1406-16, and two utility manholes were monitored for light non-aqueous phase liquid (LNAPL). In addition, two rounds of quarterly groundwater samples were collected in September and December 1996. A supplemental sampling of selected monitoring wells at the Alpha-Delta Piers was performed in October 2000 [United States Army Corps of Engineering (USACE), 2000].

LNAPL has been present in the utility manhole north of monitoring well MPT-1406-16 and in MPT-1406-16 since sampling activities began. The October 2000 sampling results indicated that acenaphthene, benzene, and naphthalene was present in monitoring well MPT-1406-4 above regulatory criteria. The Groundwater Monitoring Report for October 2000 is presented in Appendix C.

3.2.2 Other Investigations

In 1988, an evaluation using a remote video camera to view the sewer system was completed by Smith and Gillespie Engineers, and a large number of recommended repairs were identified. Many of the repairs recommended by the inspection were completed. This limited the area to be investigated to the sewers from helicopter maintenance, SIMA, and the sewers along Moale Avenue north of the golf course. The results of the inspection are documented in the ABB-ES RFA and are not included in this report. Based on these findings, the RFI sampling strategy was developed to screen areas identified as suspect locations.

4.0 RFI INVESTIGATION

The RFI investigation was conducted in three phases: soil and groundwater screening for the SWMUs 47 and 53, monitoring well installation and groundwater sampling for the SWMUs 47 and 53, and multimedia sampling for SWMU 55.

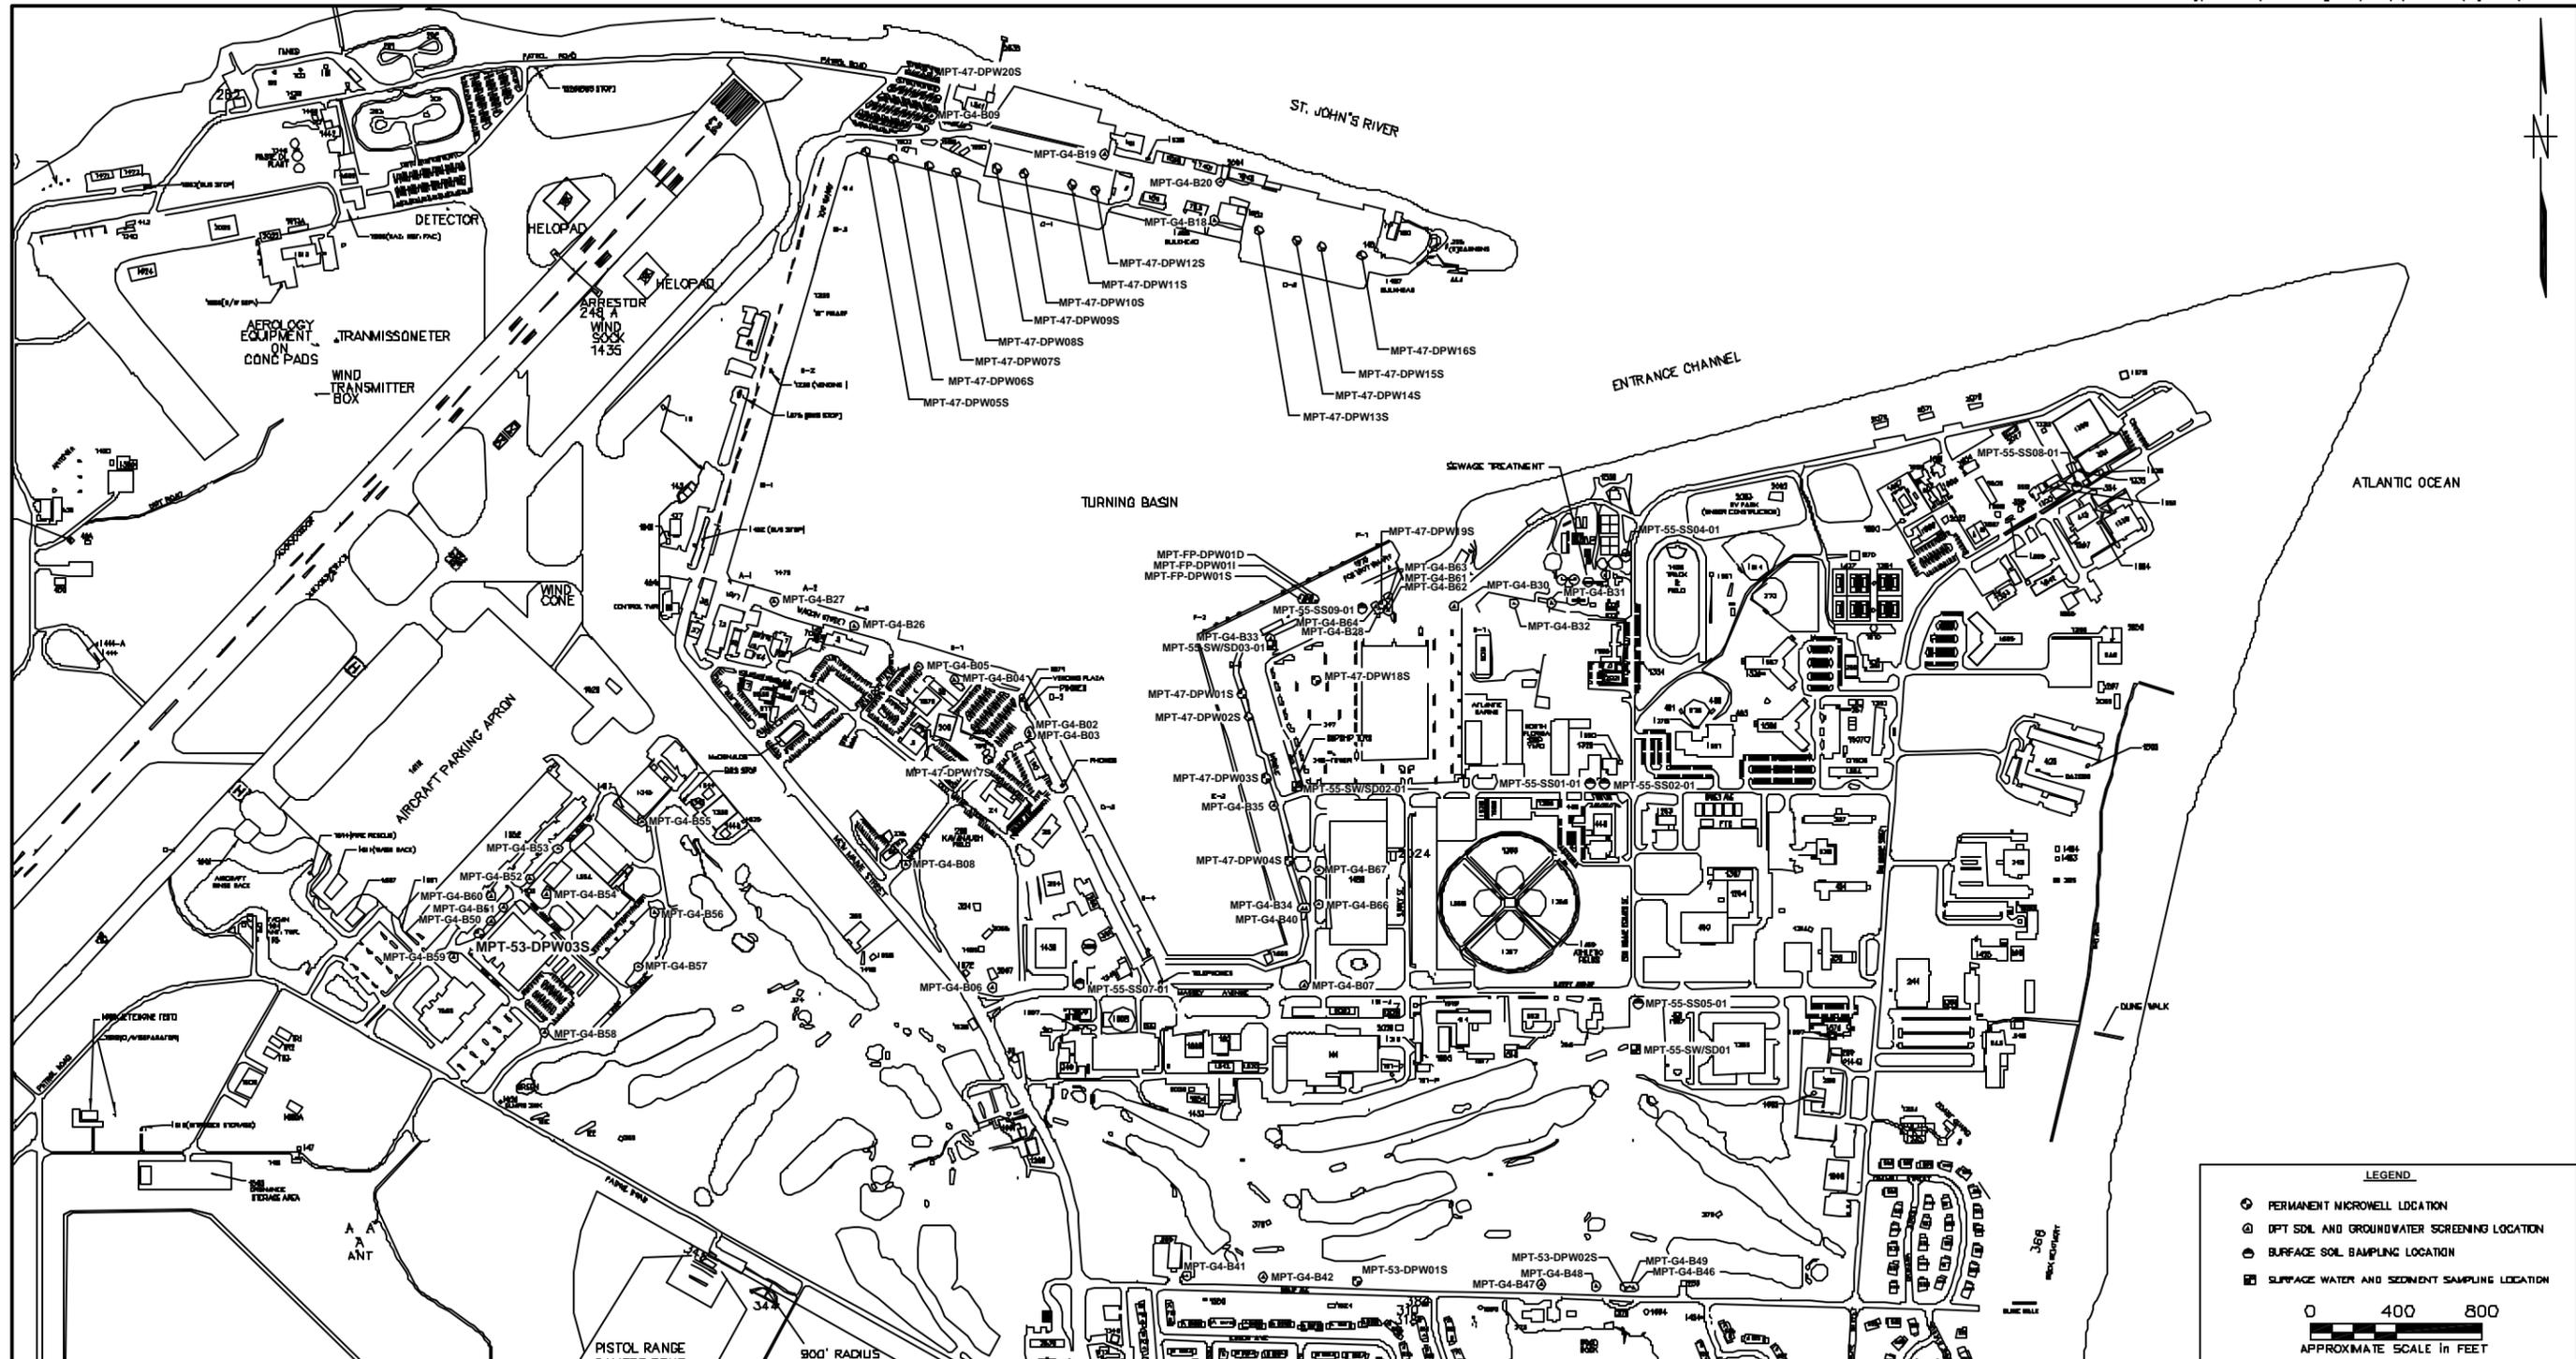

Environmental sample locations were chosen based on results of a 1997 ABB-ES sampling event (ABB-ES, 1999). The 1999 sampling event was conducted to address physical defects identified during pipeline video and visual inspections of the OWCS, storm sewer, and sanitary sewer systems at NAVSTA Mayport. Environmental soil and groundwater samples were collected by DPT to assess whether hazardous constituents were present in the surrounding soil and/or groundwater. The location of surface soil, surface water and sediment samples, collected during this RFI, are based on the sampling event conducted by ABB-ES. The monitoring well locations are based on data collected during this study and on historical data. Some locations at the OWCS (SWMU 47) and Sewer Pipeline System (SWMU 53) were sampled in conjunction with each other, as these two systems often coincide. Therefore, they will be discussed together in the following sections and throughout this report unless otherwise specified. The following sections describe the technical approach for each phase.

4.1 RFI FIELD ACTIVITIES

4.1.1 Subsurface Soil Sampling

Sixty-seven subsurface soil samples were collected at SWMUs 47 and 53 from July 2000 to March 2001. The sampling locations were based on results of the 1997 Group IV sampling event conducted by ABB-ES (ABB-ES, 1999). The samples were collected using DPT technology from varying depths based on expected depth of the utility pipelines and/or the depth to groundwater. The samples above 5 ft bls were collected using a decontaminated stainless steel hand auger. The subsurface soil sampling locations are shown in Figure 4-1.

The subsurface soil samples were analyzed for the following parameters: Appendix IX volatile organic compounds (VOCs) (USEPA Method 8260B), Appendix IX semi-volatile organic compounds (SVOCs) (USEPA Method 8270), target analyte list (TAL) metals (USEPA Method 6010B), and cyanide (USEPA Method 9010B).

4.1.2 Groundwater Screening

A total of 67 groundwater samples were collected at SWMUs 47 and 53 from July 2000 to March 2001. The samples were collected using DPT from varying depths intervals depending on depth to groundwater. A peristaltic pump was used to extract groundwater through a temporary well point utilizing a 4-ft stainless steel screen. The groundwater screening locations are shown in Figure 4-1.

Groundwater samples were collected using low-flow purge techniques and analyzed for the following parameters: Appendix IX VOCs (USEPA Method 8260B), Appendix IX SVOCs (USEPA Method 8270), TAL metals (USEPA Method 6010B), and cyanide (USEPA Method 9010B).

4.1.2.1 Monitoring Well Installation

Twenty-six new monitoring wells were installed for SWMUs 47 and 53 from December 12, 2000, through March 20, 2001. Twenty-three of the monitoring wells were installed to determine whether contamination exists due to potential pipeline defects or failures. Five of the wells were installed to delineate identified contamination at Charlie Pier. A three-well cluster was installed on Foxtrot Pier to serve as a point of compliance.

The monitoring wells were installed using direct push technology. The shallow wells were completed to depths of up to 15 ft bls, the intermediate wells were installed to approximately 35 ft bls and the deep wells were installed to approximately 50 ft bls. The depths of the shallow wells were determined by the anticipated depth of the pipeline or the depth to groundwater with the well screened placed such that they bracketed the water table. The shallow wells were constructed using 1-inch inner diameter, Schedule 40 polyvinyl chloride (PVC), flush-threaded casing with 10 ft of 0.01-inch, factory-slotted, pre-packed, PVC screen. Once the well was in place, the annulus of the boring was backfilled with 20/30, silica sand from the bottom of the borehole to 2 ft above the top of the screen. A 2-ft seal of fine sand (30/65) was then installed on top of the filter pack. The remainder of the annulus was backfilled with cement/bentonite grout.

Each monitoring well surface completion was flush mount. The riser pipe was cut to approximately 3 inches bls using an inside pipe cutter. An 8-inch diameter protective steel casing with sealing gasket was then flush-mount installed around each monitoring well. The flush mounted casings were completed 1-inch above existing grade and the apron tapered to be flush with existing grade at the edges such that water would run off of the apron. A 2-ft by 2-ft (saw-cut or saw-scored and jack hammered hole) by 6-inch thick concrete apron was constructed around each flush mount monitoring well.

The monitoring well locations are shown in Figure 4-2. Monitoring well construction diagrams are presented as Figure 4-3 for the shallow wells and Figure 4-4 for the intermediate and deep wells.

4.1.2.2 Monitoring Well Development

Monitoring wells were developed using peristaltic pumps no sooner than 24 hours after installation until the following criteria were achieved:

- Stabilization of temperature, pH, and electrical conductivity.
- Turbidity remained within a 10 Nephelometric turbidity unit range for two consecutive readings.
- A minimum of three well volumes was removed from the monitoring well.
- Accumulated sediment was removed from the well.

4.1.2.3 Groundwater Sampling

The second phase of groundwater sampling was conducted from December 6, 2000, through June 7, 2001. Groundwater samples were collected using low-flow purge techniques and analyzed for the following parameters: Appendix IX VOCs (USEPA Method 8260B), Appendix IX SVOCs (USEPA Method 8270), TAL metals (USEPA Method 6010B), and cyanide (USEPA Method 9010B).

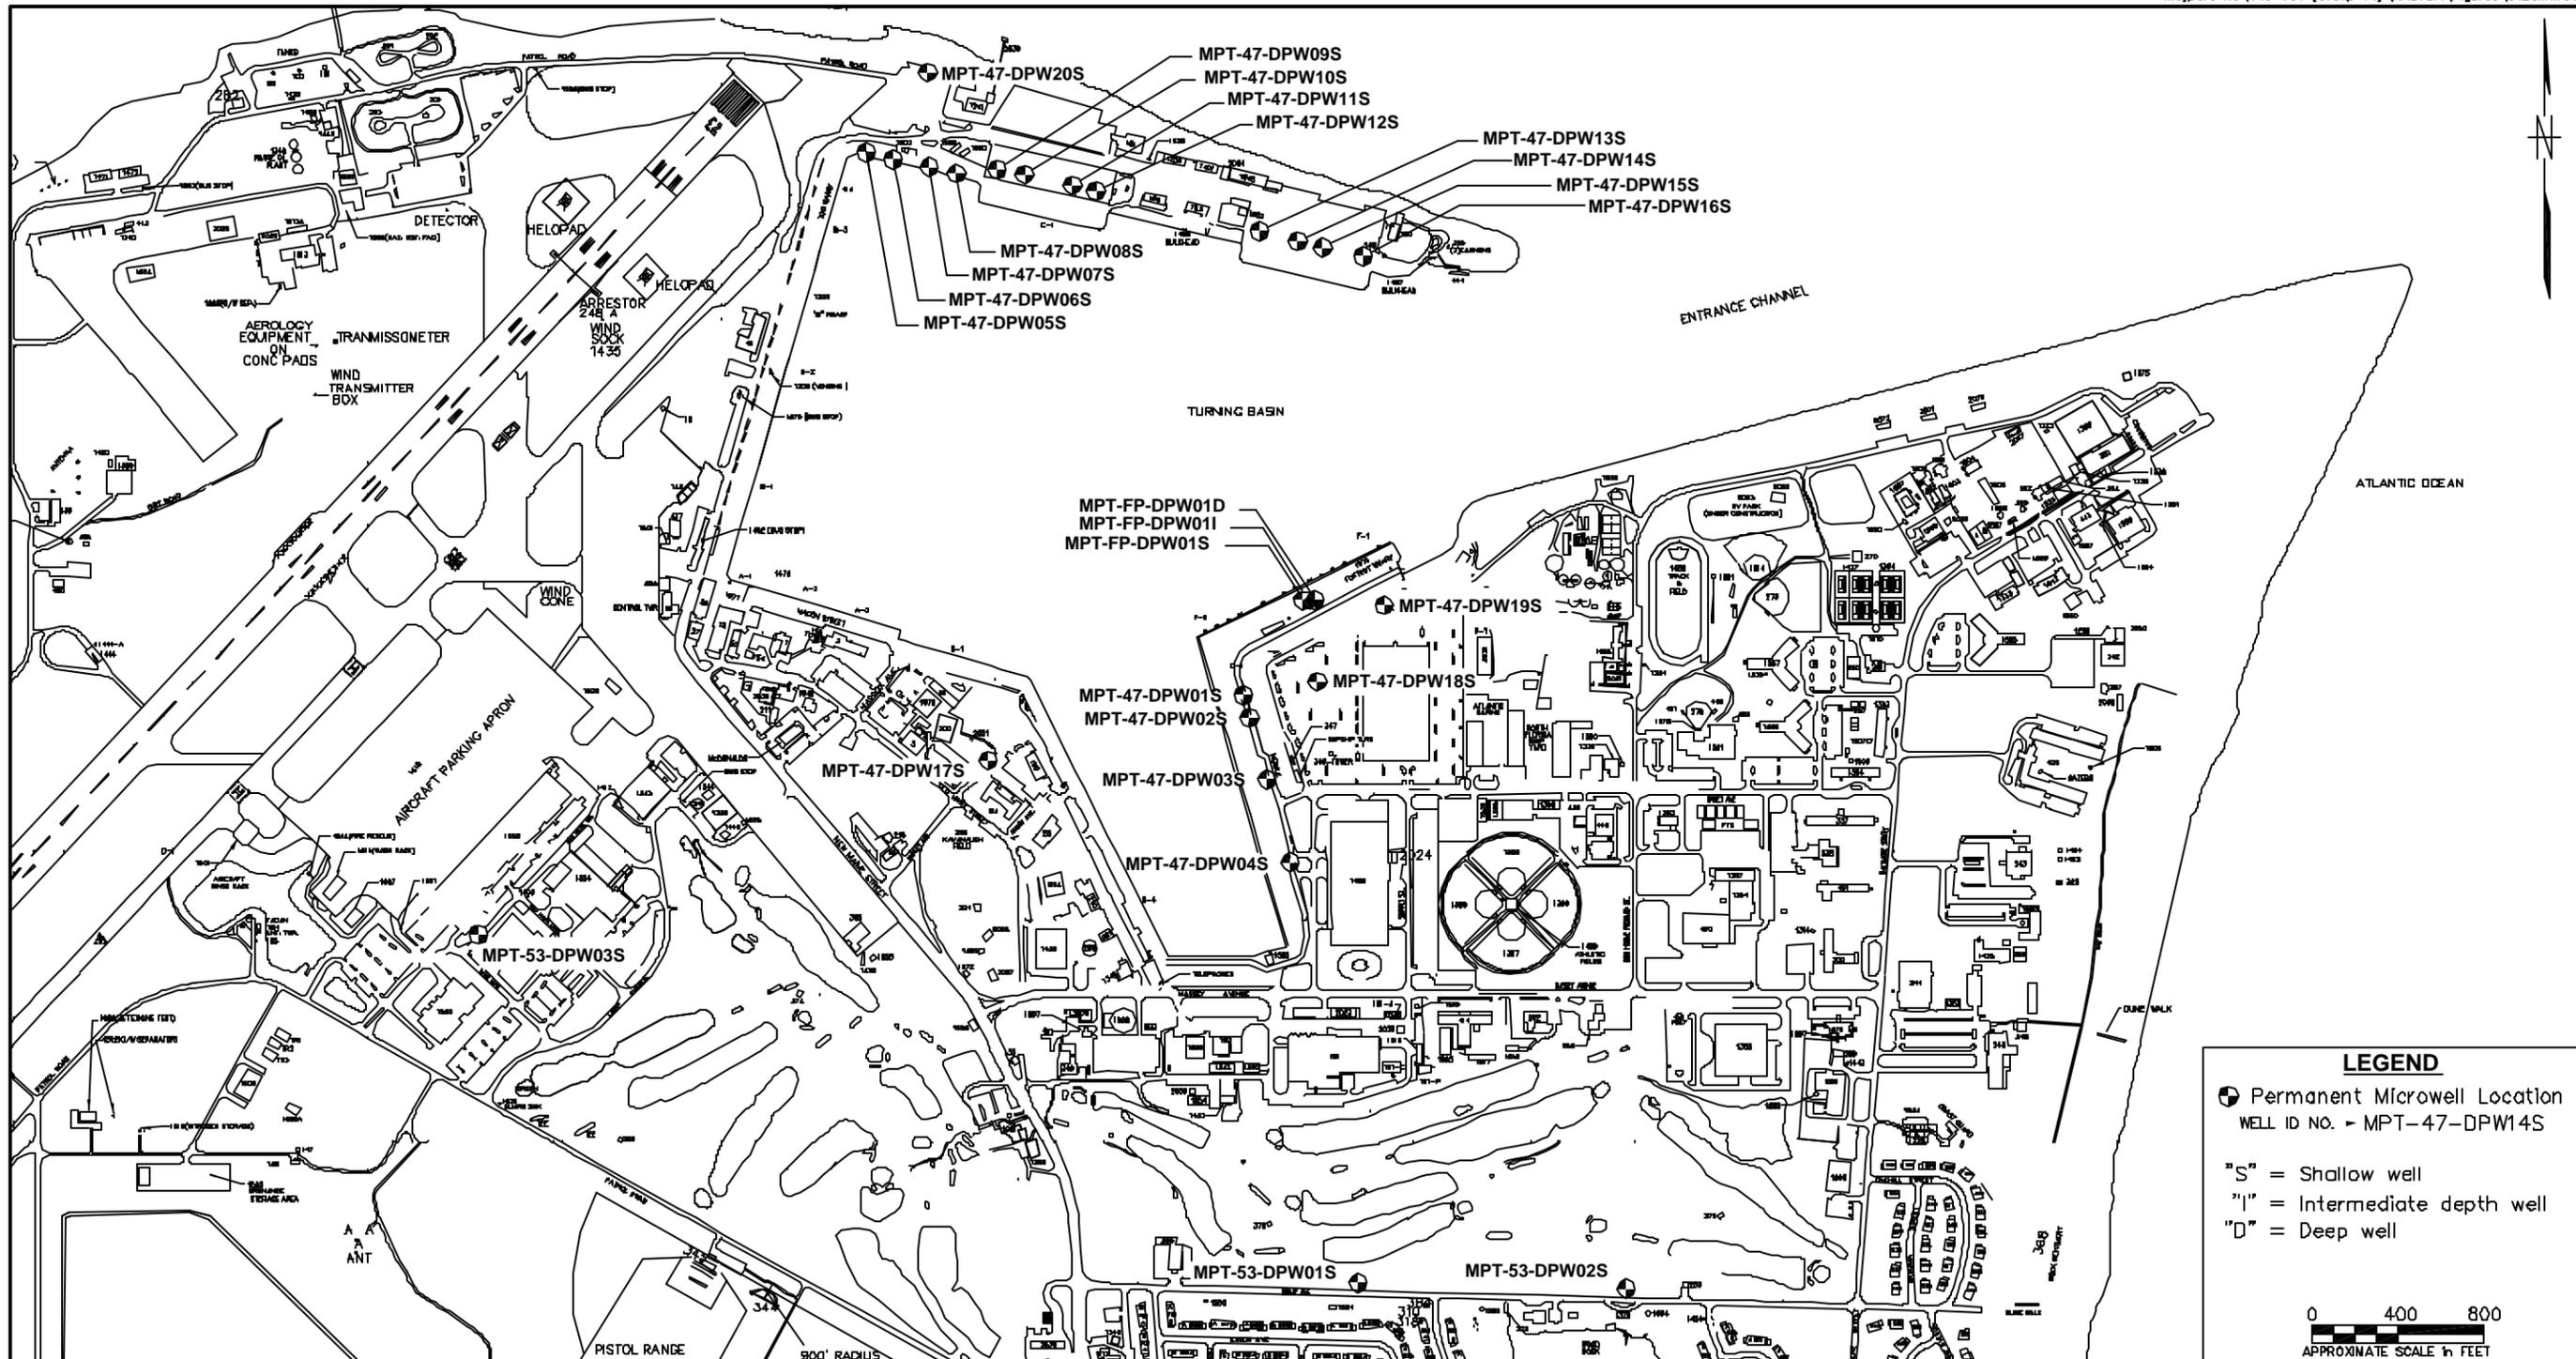

4.1.3 SWMU 55

SWMU 55, the storm sewer system, is a network of lined and unlined drainage ditches and retention areas located throughout NAVSTA Mayport. Sample locations for SWMU 55 are provided on Figure 4-1. The SWMU 55 field effort included surface soil, surface water, and sediment sampling at eleven locations throughout the industrialized areas of NAVSTA Mayport. A description of the SWMU 55 sampling activities is provided below.

4.1.3.1 Surface Soil Sampling

Nine surface soil samples were collected at SWMU 55 from July 31 to August 1, 2000. The samples were collected from 0 to 1 ft bls using disposable sampling equipment.

Surface soil samples were analyzed for the following parameters: Appendix IX VOCs (USEPA Method 8260B), Appendix IX SVOCs (USEPA Method 8270), organochlorine pesticides (USEPA Method 8081A), polychlorinated biphenyls (PCBs) (USEPA Method 8082), TAL metals (USEPA Method 6010B), and cyanide (USEPA Method 9010B).

4.1.3.2 Surface Water Sampling

Three surface water samples were collected at SWMU 55 (Figure 4-1) on August 1 and 3, 2000. The samples were collected just below the water's surface by submerging the sample container. For the pre-preserved sample containers, the samples were collected using an unpreserved glass container and transferring a sample aliquot from the unpreserved container into the pre-preserved container.

Surface water samples were analyzed for the following parameters: Appendix IX VOCs (USEPA Method 8260B), Appendix IX SVOCs (USEPA Method 8270), TAL metals (USEPA Method 6010B), and total cyanide (USEPA Method 9010B).

4.1.3.3 Sediment Sampling

Three sediment samples were collected at SWMU 55 on August 1 and 3, 2000. The samples were collected from the upper 1-ft of the sediment layer using a stainless steel hand auger. The hand auger was decontaminated in accordance with the TtNUS CompQAP prior to collecting each sample.

Sediment samples were analyzed for the following parameters: Appendix IX VOCs (USEPA Method 8260B), Appendix IX SVOCs (USEPA Method 8270), TAL metals (USEPA Method 6010B), and cyanide (USEPA Method 9010B).

4.2 QUALITY ASSURANCE/QUALITY CONTROL SAMPLES

All environmental sampling was performed in accordance with procedures outlined in the CompQAP and Quality Assurance Project Plan located in Appendix C of the Group IV Work Plan (TtNUS, 1999). Quality Assurance (QA)/Quality Control (QC) samples including equipment blanks, trip blanks, and field duplicates were collected.

4.2.1 Investigation Derived Waste Management

Investigation derived waste (IDW) generated during the corrective action and RFI field activities was managed in accordance with the practices and procedures previously taken by the CLEAN I contractor as described in the *Draft RFI Work Plan, Addendum 1, Investigation-Derived Waste Management Plan* (ABB-ES, 1992). All IDW generated during RFI field activities was stored on site until analysis of the media had been reviewed. The NAVSTA Mayport environmental coordinator then made an appropriate decision for disposal.

4.2.2 National Geodetic Vertical Datum Survey Locations

The locations of all newly installed monitoring wells and certain pre-existing monitoring wells were measured by a certified land surveyor. The elevations of all monitoring wells were surveyed at the water level measuring reference point on the top of the well casing and on the undisturbed ground surface adjacent to the well pad. Elevations and horizontal locations were recorded to the nearest hundredth of a foot. Each point was measured from a reference location tied to the Florida State Plane Coordinate System. An X-Y coordinate system was used to identify locations, with the X coordinate as the east-west axis and the Y coordinate as the north-south axis. Existing installation benchmarks and various newly installed control points served as the horizontal and vertical datum for the survey. A table providing monitoring well and soil boring survey data for the Group IV SWMUs and Foxtrot Pier is presented in Appendix D.

5.0 NATURE AND EXTENT

Results of the Group IV field sampling activities as described in Sections 3.0 and 4.0 are presented in this section. The nature and extent of the impact to surface and subsurface soil, groundwater, surface water, and sediment are also summarized and evaluated.

The quality of the chemical analytical data collected during the Group IV investigation has been documented. The analytical data validation process was completed for all laboratory data packages in accordance with the USEPA Functional Guidelines for Organic Data Validation (USEPA, 1994a), and the USEPA Functional Guidelines for Inorganic Data Validation (USEPA, 1994b). The data set compiled using these guidelines is considered acceptable for use in this RFI and to support a CMS. The validated laboratory data packages are presented in Appendix E.

Sources of contamination are discussed in Section 5.1. A summary of the background screening program for NAVSTA Mayport (ABB-ES, 1995) is presented in Section 5.2. In Section 5.3, the nature and distribution of contamination throughout Group IV are presented and evaluated against background screening values and appropriate regulatory benchmark values. Within the media discussion, analytical fractions are discussed in the following order: VOCs, SVOCs, inorganics, polychlorinated biphenyls (PCBs), pesticides, and herbicides. Following the evaluation of each analytical fraction for a particular medium, a summary of relevant results and findings is presented.

5.1 SOURCES OF CONTAMINATION

5.1.1 SWMU 47 (Oily Waste Collection System)

The OWCS is a network of pipelines which conveys bilge water from the ships berthed at NAVSTA Mayport to the OWTP (SWMU 8) via gravity lines and force mains. Potential sources of contamination to the areas around the pipelines include discharges from defects or failures in the product line.

Potential contaminants were identified in a 1987 study by the David W. Taylor Naval Ship Research Center. Testing was performed on the pre- and post-separated bilge water generated by Naval vessels at NAVSTA Mayport. Analytes detected in the separated bilge water included arsenic; cadmium; chromium; lead; 1,1-trichloroethane; tetrachloroethene; and toluene (A. T. Kearney, 1989).

5.1.2 SWMU 53 (Sanitary Sewer System)

The sanitary sewer system is a network of pipelines that spans NAVSTA Mayport. This network conveys domestic and industrial wastewater from buildings and ships located at NAVSTA Mayport to the WWTF (SWMU 25) via gravity lines and force mains. Potential sources of contamination to the areas around the pipelines may be a result of discharges due to defects or failures in the system.

Potential contaminants were identified in a 1987 USEPA study analyzing several of the influent wastewater streams that are discharged to the WWTF through the sewer pipelines. A number of hazardous constituents were detected in the waste stream including chromium; nickel; chloroform; toluene; naphthalene; methyl ethyl ketone; benzene; 1,4-dichlorobenzene; bromoform; and phenols (A. T. Kearney, 1989).

5.1.3 SWMU 55 (Stormwater Sewer System)

The storm sewer system at NAVSTA Mayport consists of underground pipes and unlined drainage ditches. The storm sewer system conveys runoff to the St. Johns River, Sherman Creek, Lake Wonderwood, the Mayport Turning Basin, and the Atlantic Ocean. Many of the storm sewer pipes that discharge to the surrounding surface water are supplied by unlined drainage ditches found over the entire facility. Potential sources of contamination to the storm sewers at NAVSTA Mayport include non-point sources such as run-off from nearby locations and migration of potential contaminants through the network from other areas.

5.2 BACKGROUND SCREENING CONCENTRATIONS

Analytes detected during this investigation were compared to background data obtained during previous background and site investigations. The background characterization consisted of surface and subsurface soil, surface water, sediment, and groundwater sampling from areas outside of SWMUs and industrialized areas within the NAVSTA Mayport boundary. The background data is presented in Section 2.0 of the NAVSTA Mayport GIR (ABB-ES, 1995).

5.3 CONTAMINATION ASSESSMENT

The Group IV field effort included surface and subsurface soil sampling, surface water and sediment sampling, groundwater screening, and monitoring well installation and sampling. The surface soil, surface water, and sediment samples were collected from the stormwater sewer system. The subsurface soil and groundwater screening samples were collected near the oily waste and sanitary sewer pipelines at depths corresponding to the anticipated pipeline depth. All of the monitoring wells were placed near the utility pipelines and were screened in the surficial aquifer.

5.3.1 SWMUs 47 and 53

Field activities for SWMUs 47 and 53 included collecting 67 subsurface soil, 67 groundwater screening samples, and 31 groundwater samples from newly installed monitoring wells. The sampling locations for SWMUs 47 and 53 are presented in Figure 4-1 and Figure 4-2.

5.3.1.1 Subsurface Soil Results

Target analytes detected in the subsurface soil samples consisted of VOCs, SVOCs, and inorganics. A discussion of each is presented below.

5.3.1.1.1 Volatile Organic Compounds

Four VOCs were detected in the subsurface samples collected from SWMUs 47 and 53. There were no detections exceeding comparison values. Table 5-1 presents a summary of VOCs detected in the subsurface soil samples collected at Group IV.

5.3.1.1.2 Semivolatile Organic Compounds

Eighteen SVOCs were detected in the subsurface soil samples collected from SWMUs 47 and 53. Two analytes (benzo(a)pyrene and hexachlorobenzene) were detected above comparison values. Table 5-2 presents a summary of SVOCs detected in the subsurface soil samples collected at Group IV. The analytical results are presented below.

Benzo(a)pyrene was detected in samples MPT-G4-SU-20-10 [790 micrograms per kilogram ($\mu\text{g}/\text{kg}$), 22-08 (130 $\mu\text{g}/\text{kg}$), 23-08 (170 $\mu\text{g}/\text{kg}$), and 27-07 (160 $\mu\text{g}/\text{kg}$), above the FDEP SCTL (100 $\mu\text{g}/\text{kg}$) and USEPA Region IX PRG (62 $\mu\text{g}/\text{kg}$) residential criteria. Benzo(a)pyrene was also detected in sample MPT-G4-SU-20-10 (790 $\mu\text{g}/\text{kg}$) above the FDEP SCTL (500 $\mu\text{g}/\text{kg}$) and USEPA Region IX PRG (290 $\mu\text{g}/\text{kg}$) industrial criteria. There were no detections above the FDEP SCTL leaching criterion (8,000 $\mu\text{g}/\text{kg}$).

Hexachlorobenzene was detected in sample MPT-G4-SU-06-07 (2,200 $\mu\text{g}/\text{kg}$) above the FDEP SCTL residential (500 $\mu\text{g}/\text{kg}$) and industrial (1,100 $\mu\text{g}/\text{kg}$) criteria. The result was equivalent to the FDEP SCTL leaching criterion.

5.3.1.1.3 Inorganics

Twenty-two inorganics were detected in the subsurface soil samples with seven above background screening values, three above FDEP SCTL residential criteria, one above the FDEP SCTL industrial criteria, and one above both the USEPA Region IX PRG residential and industrial criteria. Fourteen of the detected inorganic analytes did not have background screening values. Table 5-3 presents a summary of inorganics detected in the subsurface soil samples collected at Group IV. The analytical results are discussed below.

Arsenic was reported at concentrations equal to or exceeding the FDEP SCTL residential criterion in 35 samples, ranging from 0.8 milligrams per kilogram (mg/kg) to 6.9 mg/kg. Twenty-eight were detected above the background screening value (0.9 mg/kg) for arsenic, which also exceeds the FDEP SCTL residential criterion. Arsenic was also detected above the FDEP SCTL industrial criterion (3.7 mg/kg) in sample MPT-G4-SU-49-03 (6.3 mg/kg). There were no detections exceeding the FDEP SCTL leachability criterion (29 mg/kg).

Copper was detected in sample MPT-G4-SU-45-04 (203 mg/kg) above the FDEP SCTL residential criterion (100 mg/kg). There were no detections of copper above the FDEP industrial SCTL (76,000 mg/kg).

Vanadium was detected in sample MPT-G4-SU-49-03 (26.6 mg/kg) above the FDEP SCTL residential criterion (15 mg/kg). There were no detections of vanadium above the FDEP SCTL industrial criterion (7,600 mg/kg).

5.3.1.1.4 Interpretation of Subsurface Soil Data

Two SVOCs [benzo(a)pyrene and hexachlorobenzene] and three inorganics (arsenic, copper, and vanadium) were detected in the subsurface soil samples above FDEP SCTL residential criteria. Both SVOCs and one inorganic (arsenic) also exceeded the FDEP SCTL industrial criteria. A discussion of each is provided below. Subsurface soil analytical results exceeding residential SCTL values are provided on Figure 5-1.

Semivolatiles

Benzo(a)pyrene and hexachlorobenzene were the only two SVOCs detected in the subsurface soil samples at concentrations that exceed FDEP SCTLs. Benzo(a)pyrene was detected above the FDEP SCTL residential criterion in four samples and above the FDEP SCTL industrial criterion in one sample.

Hexachlorobenzene was detected above the FDEP SCTL industrial criterion and at a concentration equivalent to its FDEP SCTL leaching criterion in one sample. Neither constituent was detected in the groundwater samples collected from the sample locations where the subsurface soil detections occurred.

Inorganics

Arsenic, copper, and vanadium were reported at values exceeding FDEP SCTL residential criteria. Copper and vanadium were singular occurrences; however, arsenic was prevalent with 35 detections above FDEP SCTL residential criteria and one detection above FDEP SCTL industrial criteria. There were no detections above the leachability SCTL. Groundwater screening results for these locations suggest that arsenic has not leached into the groundwater at levels exceeding the FDEP GCTL.

5.3.1.2 Groundwater Screening Results

Target analytes detected in the groundwater screening samples consisted of VOCs, SVOCs, and inorganics. A discussion of each is presented below.

5.3.1.2.1 Volatile Organic Compounds

Seventeen VOCs were detected in the groundwater screening samples with one VOC above FDEP groundwater cleanup target levels (GCTLs) and eight VOCs above USEPA Region IX PRGs. There were no detections above USEPA maximum contaminant levels (MCLs). A summary of VOC detections in the groundwater screening samples collected for Group IV is presented in Table 5-4. VOC and SVOC concentrations exceeding GCTLs in DPT groundwater grab samples are provided on Figure 5-2. The analytical results are discussed below.

Benzene was detected in sample MPT-G4-GW26-05 [1.2 micrograms per liter ($\mu\text{g/L}$)] above the GCTL (1 $\mu\text{g/L}$) and USEPA Region IX PRG (0.41 $\mu\text{g/L}$). The USEPA MCL for benzene is 5 $\mu\text{g/L}$.

Seven constituents exceeded only MCL values as follows: 1,1,2,2-tetrachloroethane; 1,1-dichloroethene; 1,2-dichloroethane; cis-1,2-dichloroethene; trans-1,2-dichloroethene; trichloroethene; and vinyl chloride were reported at values exceeding USEPA Region IX PRGs, but were below FDEP GCTLs.

5.3.1.2.2 Semivolatile Organic Compounds

The groundwater screening samples consisted of 14 different SVOCs with two detected above FDEP GCTLs, three above USEPA Region IX PRGs, and one above USEPA MCLs. Table 5-5 presents a summary of SVOC detections in the Group IV groundwater screening samples, and concentrations exceeding GCTL values are provided on Figure 5-2. The analytical results are discussed below.

Bis(2-ethylhexyl)phthalate was detected in sample MPT-G4-GW-17-09 (26 µg/L) above the FDEP GCTL (6 µg/L), USEPA Region IX PRG (4.8 µg/L), and USEPA MCL (6 µg/L).

Carbazole was detected in sample MPT-G4-GW-27-08 (20 µg/L) above the GCTL (4 µg/L) and USEPA Region IX PRG (0.03 µg/L). There is not an MCL for carbazole.

1,4-Dichlorobenzene was reported at a value of 1.1 µg/L (estimated) in a duplicate sample of MPT-G4-GW-17-09, exceeding the USEPA Region IX PRG of 0.5 µg/L, but below the FDEP GCTL and USEPA MCL of 75 µg/L.

5.3.1.2.3 Inorganics

Eighteen inorganics were detected in the groundwater screening samples with six above background screening values, six above FDEP GCTLs, one above USEPA Region IX PRGs, and two above USEPA MCLs. There are no background screening values for six of the inorganic analytes detected in the groundwater screening samples. A summary of inorganic detections in the groundwater screening samples collected for Group IV is presented in Table 5-6. The analytical results are discussed below.

Aluminum was detected in samples MPT-G4-GW-42-04 (851 µg/L) and 44-04 (248 µg/L) above the FDEP GCTL (200 µg/L). There is not a background screening value or an USEPA MCL for aluminum.

Arsenic was detected in one sample MPT-G4-GW-25-07 (161 µg/L) above the FDEP GCTL (50 µg/L) and the USEPA MCL (5 µg/L). All arsenic detections reported (25 total) exceeded the USEPA Region IX PRG (0.045 µg/L). It is likely that additional samples had arsenic concentrations exceeding the USEPA Region IX PRG because the detection limit achieved by the laboratory (minimum 2.9 µg/L was higher than the PRG). There were four arsenic results above the background screening value (9.8 µg/L).

Notes:												
¹ BSC, Recalculation of Media Background Screening Values, NAVSTA Mayport, Florida, November 2001								< - result is less than the method detection limit				
² FDEP GCTLs, Chapter 62-777, FAC, August 1999								Bolded numbers exceed FDEP GCTLs.				
³ USEPA Region IX PRGs, November 2000								-- - no defined target value				
⁴ USEPA MCLs, National Primary Drinking Water Standards, December 1999								NA - not available				
J - indicates the presence of a chemical at a concentration less than the reporting limit and greater than the method detection limit												

Iron was detected above the FDEP GCTL (300 µg/L) in 53 samples, ranging from 313 to 8,020 µg/L. Seventeen samples had reported values exceeding the background screening concentration (1,728 µg/L). There were no results above the USEPA Region IX PRG (11,000 µg/L). There is not an USEPA MCL for iron.

Manganese was detected above its FDEP GCTL (50 µg/L) in 45 samples, ranging from 57.4 to 454 µg/L. Seven samples had reported values exceeding the background screening concentration (210 µg/L). There were no detections of manganese above the USEPA Region IX PRG (880 µg/L). There is not an USEPA MCL for manganese.

Sodium was detected above the FDEP GCTL (160,000 µg/L) in 13 samples, ranging from 179,000 to 848,000 µg/L. No reported values exceeded the background screening concentration (1,519,016 µg/L). There is not an USEPA Region IX PRG or an USEPA MCL for sodium.

Thallium was detected in samples MPT-G4-GW-18-09 (6.7 µg/L), 29-05 (9.9 µg/L), 59-05 (8.3 µg/L), and 60-05 (6.8 µg/L) above the FDEP GCTL (2 µg/L) and USEPA MCL (2 µg/L). There is not an USEPA Region IX PRG for thallium.

5.3.1.2.4 Interpretation of Results

One VOC, two SVOCs, and six inorganics were detected above FDEP GCTLs in the groundwater screening samples collected at Group IV. A discussion of each is provided below.

Volatiles

Benzene was the only VOC detected above FDEP GCTLs. The sample, located at Alpha Pier, was collected from the shallow zone of the surficial aquifer approximately 7 ft bls. Alpha Pier is currently being evaluated under the petroleum program due to the presence of free product, which may explain the presence of benzene at this location.

Semivolatiles

Bis(2-ethylhexyl)phthalate and carbazole were the only SVOCs detected above FDEP GCTLs. The sample, containing bis(2-ethylhexyl)phthalate, was located at Charlie Pier and collected from the shallow zone of the Surficial aquifer at approximately 11 ft bls. Bis(2-ethylhexyl)phthalate was not detected in a sample collected from a monitoring well subsequently placed in this location.

Inorganics

Aluminum, arsenic, iron, manganese, sodium, and thallium were detected above FDEP GCTLs. Aluminum was detected above FDEP GCTLs in two samples, arsenic in one sample, and thallium in four samples. A groundwater sample collected from a monitoring well subsequently placed at the location of the arsenic detection was below the FDEP GCTL for arsenic. Both aluminum exceedances were located along the sanitary sewer pipeline adjacent to Maole Avenue. The four occurrences of thallium are not concentrated in one geographic area.

5.3.1.3 Monitoring Well Groundwater Sampling Results

Monitoring wells were subsequently installed at previous screening locations to confirm the presence and/or absence of detected analytes. Target analytes detected in the groundwater samples consisted of VOCs, SVOCs, and inorganics. A discussion of each is provided below.

5.3.1.3.1 Volatiles

Five VOCs were detected in the groundwater samples, with one analyte (vinyl chloride) above FDEP GCTLs and USEPA Region IX PRGs. Vinyl chloride was detected above the FDEP GCTL (1 µg/L) in monitoring wells MPT-47-DPW14S (1.5 µg/L) and 15S (1.4 µg/L). It was reported at a value of 0.16 µg/L in MPT-47-DPW165, exceeding the USEPA Region IX PRG of 0.02 µg/L. There were no detections above the USEPA MCL (2 µg/L). A summary of VOCs detected in the groundwater samples collected from monitoring wells at Group IV is presented in Table 5-7. VOC and SVOC concentrations exceeding GCTL values in permanent monitoring well samples are provided on Figure 5-3.

5.3.1.3.2 Semivolatile Organic Compounds

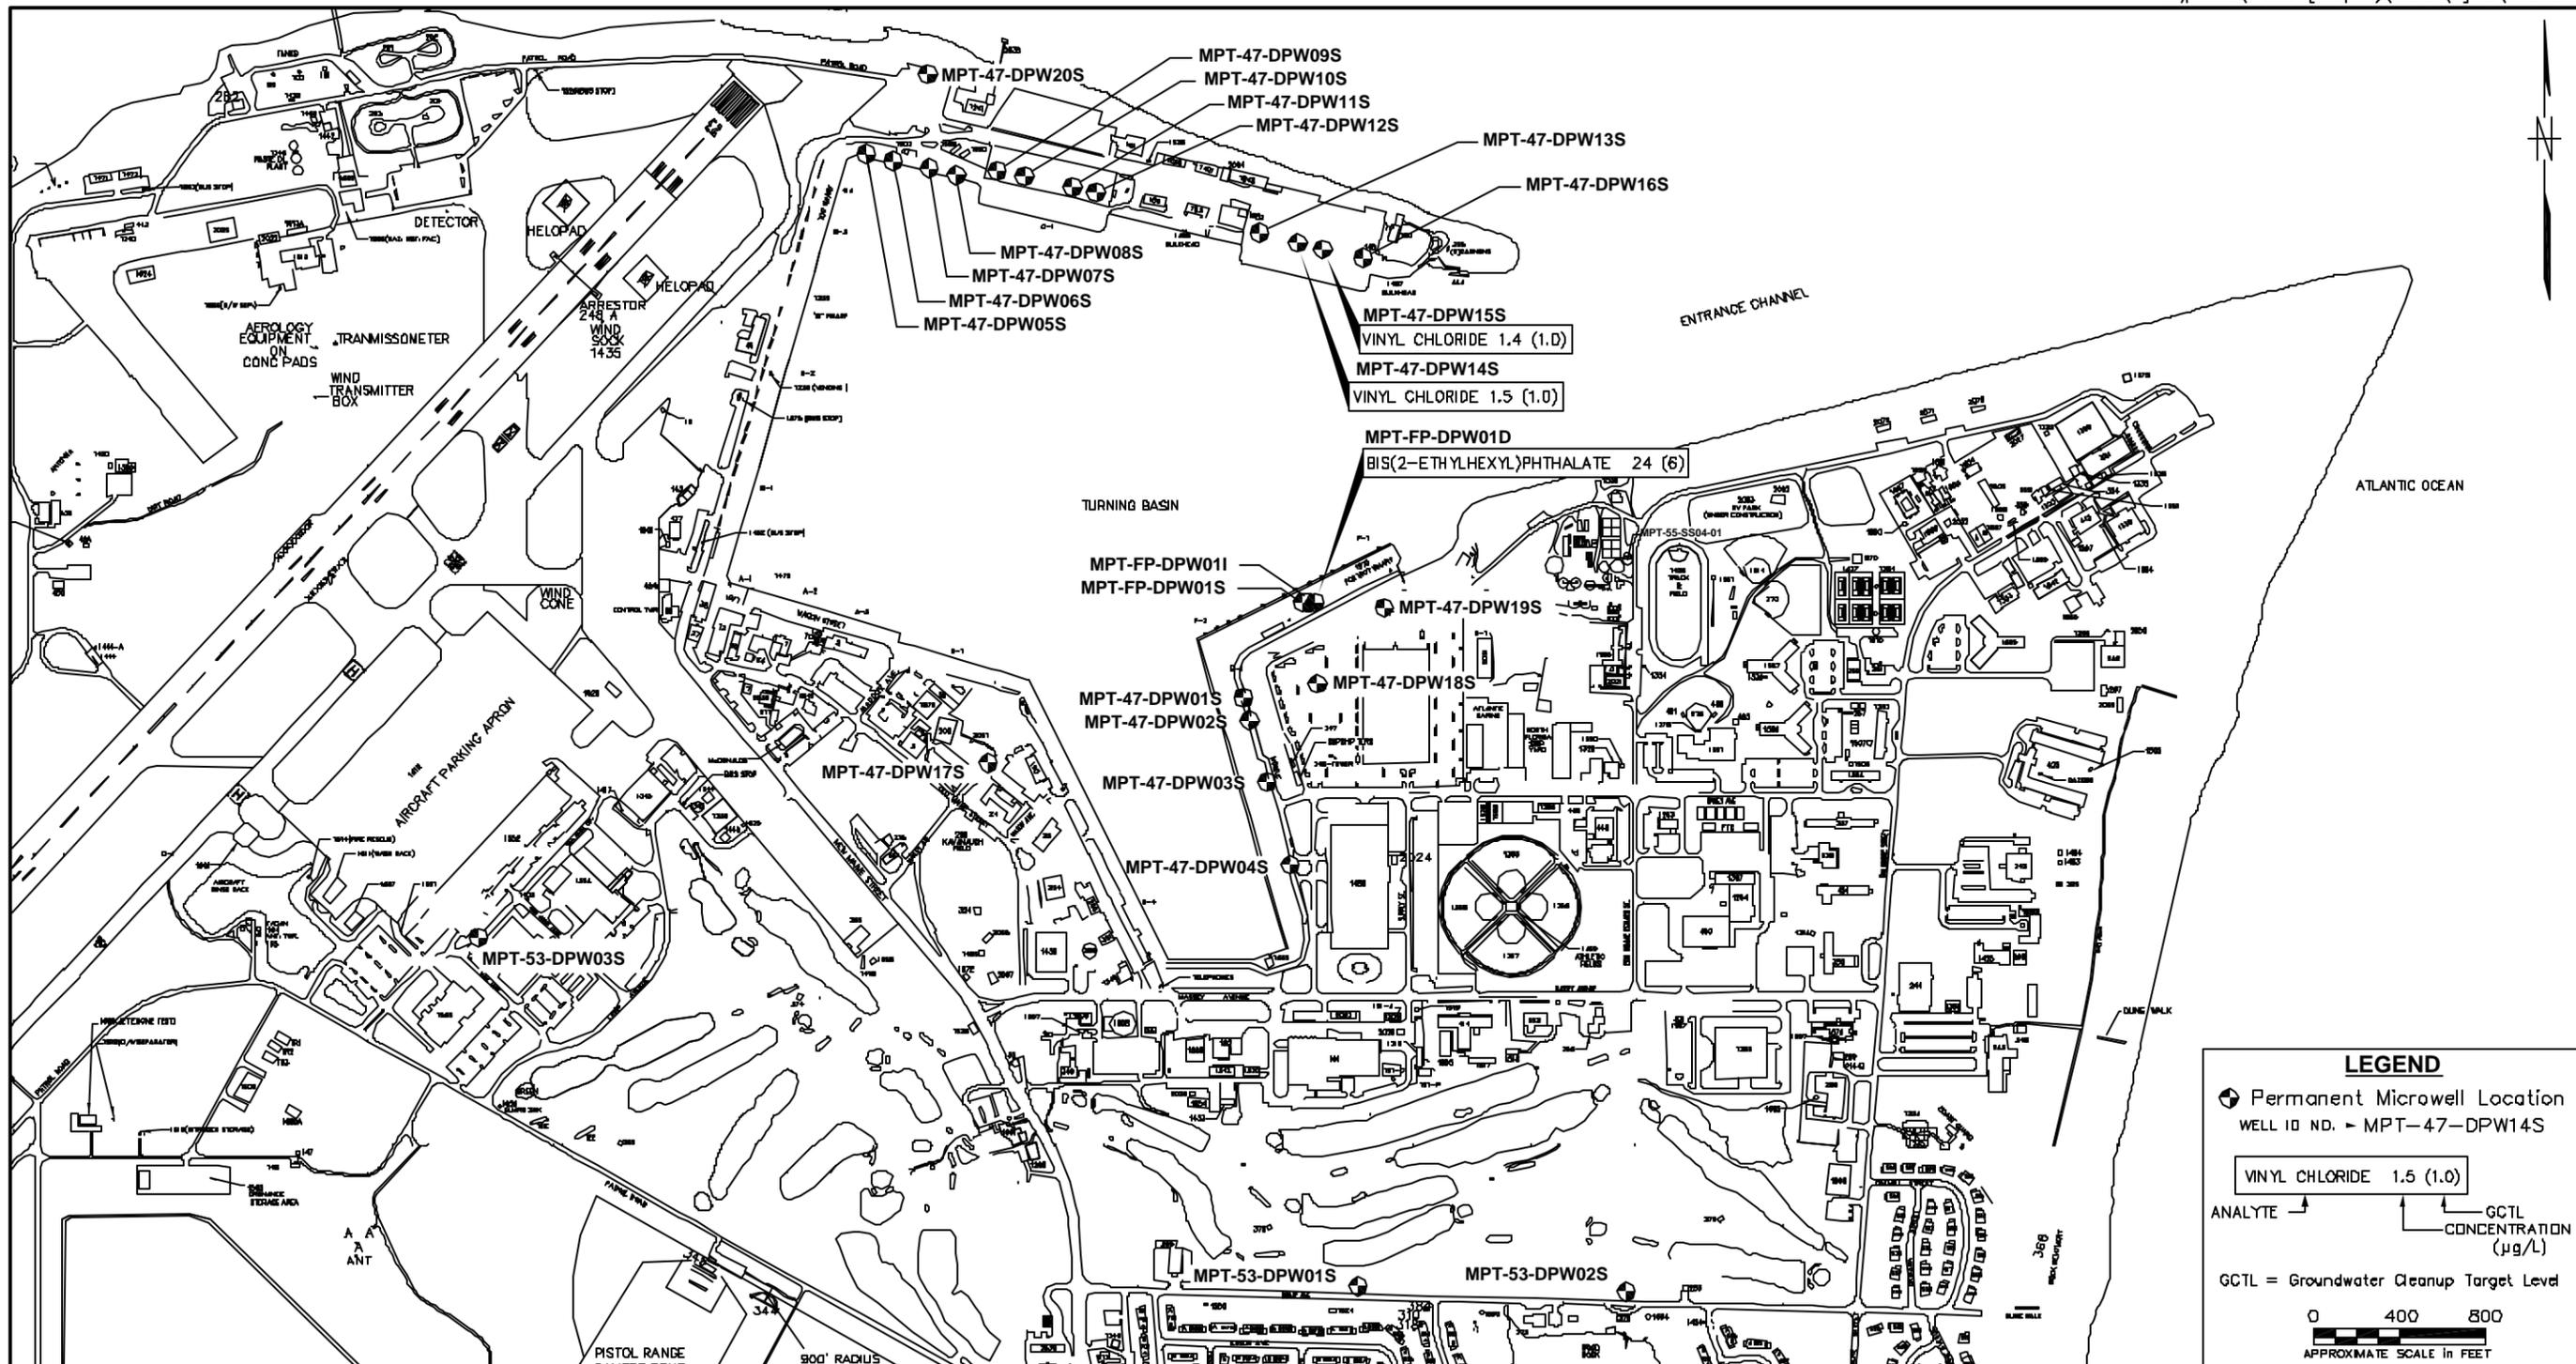

Seven SVOCs were detected in the groundwater samples with one reported at a value exceeding the FDEP GCTL and USEPA MCL of 6 µg/L. Bis(2-ethylhexyl)phthalate was reported at a concentration of 24 µg/L in monitoring well MPT-FP-DPW01D (24 µg/L). There is not an USEPA Region IX PRG for bis(2-ethylhexyl)phthalate. A summary of SVOCs detected in the groundwater samples collected from monitoring wells at Group IV is presented in Table 5-8.

5.3.1.3.3 Inorganics

Nineteen inorganics were detected in the groundwater samples with seven above background screening values, four above FDEP GCTLs, two above USEPA Region IX PRGs, and one above USEPA MCLs.

< - Analytical result is less than the method detection limit										
J - Estimated value										

Eight analytes did not have established background screening values. Background screening values listed for iron, manganese, and sodium at NAVSTA Mayport are higher than FDEP GCTLs. A summary of inorganics detected in the groundwater samples collected from monitoring wells at Group IV is presented in Table 5-9. The analytical results are discussed below.

Iron was detected above the FDEP GCTL (300 µg/L) in 28 samples ranging from 404 to 13,100 µg/L. Of these, 26 samples were detected above the background screening value (494 µg/L). Iron was also detected above the USEPA Region IX PRG (11,000 µg/L) in one sample (MPT-47-DPW04S). There is not an USEPA MCL for iron.

Manganese was detected above the FDEP GCTL (50 µg/L) in 23 samples, ranging from 55.1 to 315 µg/L. There were no detections above the USEPA Region IX PRG (880 µg/L). Eleven samples had detections above the background screening value (141 µg/L). There is not an USEPA MCL for manganese.

Sodium was detected above its FDEP GCTL (160,000 µg/L) in four samples, ranging from 174,000 to 1,140,000 µg/L. There were no detections exceeding the background screening value (1,524,588 µg/L). There is not an USEPA Region IX PRG or an USEPA MCL for sodium.

Thallium was detected above the FDEP GCTL and USEPA MCL of 2 µg/L in samples collected from monitoring wells MPT-47-DPW02S (7.4 µg/L), DPW23I (6.8 µg/L), and DPW23D (6.8 µg/L). There is not an USEPA Region IX PRG or background screening value listed for thallium.

5.3.1.3.4 Interpretation of Results

One VOC, one SVOC, and four inorganics were detected above FDEP standards in the groundwater samples collected at Group IV. A discussion of each is provided below.

Volatiles

Vinyl chloride was the only VOC detected above FDEP standards. The two samples from which exceedances were reported, located at Charlie Pier (Carrier Pier), were collected from monitoring wells screened in the shallow zone of the Surficial aquifer (approximately 5 to 15 ft bls). The two wells are adjacent to one another and approximately 100 ft apart. Additional wells placed in the area suggest that the aerial extent of vinyl chloride is not defined.

Semivolatile Organic Compounds

Bis(2-ethylhexyl)phthalate was the only SVOC detected above FDEP standards. The lone sample in which an exceedance of this compound was reported, was collected from a monitoring well (MPT-FP-DPW01D) located at Foxtrot Pier screened in the deep zone of the surficial aquifer (approximately 45 to 50 ft bls). Bis(2-ethylhexyl)phthalate was not detected in the shallow monitoring well (5 to 15 ft bls) or the intermediate monitoring well (25 to 30 ft bls) nested with the deep well.

Inorganics

Iron, manganese, sodium, and thallium were detected above FDEP standards in the groundwater samples collected at Group IV. The majority of the results for iron and manganese were above FDEP GCTLs. Both are naturally occurring and are prevalent in the groundwater at NAVSTA Mayport. The background screening levels for each are significantly higher than their respective FDEP standards. There were significantly fewer detections of iron and manganese above their respective background screening values than their respective FDEP standards.

Sodium is similar to iron and manganese in that it is prevalent in the groundwater at NAVSTA Mayport and has a background screening value far in exceedance of the FDEP standard. Unlike iron and manganese, there were only four samples with results exceeding the FDEP standard and none exceeded the background screening value.

Thallium was detected in three groundwater samples collected at Group IV. Although thallium was reported at elevated levels in only three samples, additional exceedances potentially exist because the method detection limit used by the laboratory exceeds the FDEP standard. Thallium was not detected in any subsurface soil samples collected in the locations where the monitoring wells were installed; therefore, leaching from the soil matrix does not appear as a likely source. Additional potential sources of thallium are unknown.

5.3.2 SMWU 55 (Stormwater Sewer System)

5.3.2.1 Surface Soil Results

Nine surface soil samples were collected within the storm sewer system based on results of a 1997 ABB-ES sampling event (ABB-ES, 1999). The 1999 sampling event was conducted to address physical defects identified during pipeline video and visual inspections storm sewer, and sanitary sewer systems at NAVSTA Mayport. One surface soil sample (MPT-55-SS06-01) is included in the AOC C RFI data set and is not discussed in this report; however, PCBs and SVOCs were detected above FDEP residential

criteria. Target analytes detected in the surface soil samples include VOCs, SVOCs, PCBs, and inorganics. The surface soil analytical results are presented in Table 5-10.

5.3.2.1.1 Volatiles

One VOC was detected in the surface soil samples collected from the stormwater sewer system. No VOC compounds were detected above benchmark values.

5.3.2.1.2 Semivolatile Organic Compounds

Ten SVOCs were detected in the surface soil samples collected from the stormwater sewer system. No values were reported above benchmark concentrations.

5.3.2.1.3 Pesticides

One pesticide was detected in the surface soil samples collected from the stormwater sewer system. There were no detections above benchmark values.

5.3.2.1.4 Polychlorinated Biphenyls

One PCB was detected in in the surface soil samples collected from the stormwater sewer system. There were no detections above benchmark values.

5.3.2.1.5 Inorganics

Eighteen inorganics were detected in the surface soil samples collected in the stormwater sewer system. There are established background screening values for six of the analytes, all of which were detected above background screening values. Arsenic was the only analyte reported at concentrations above the residential FDEP SCTL (0.8 µg/kg) in samples MPT-55-SS01-01 (0.92 µg/kg), MPT-55-SS04-01 (0.83 µg/kg), and MPT-55-SS08-01 (1.3 µg/kg). Arsenic was also detected above the USEPA Region IX PRG (0.39 mg/kg) in every surface soil sample collected at SWMU 55. There were no detections above the FDEP SCTL or USEPA Region IX PRG industrial value. There is not a background screening value for arsenic in the surface soil.

5.3.2.1.6 Interpretation of Results

One VOC, 10 SVOCs, one pesticide, one PCB, and 18 inorganics were detected in the stormwater conveyance soil samples collected at Group IV. There were no VOCs, SVOCs, pesticides, or PCBs detected in the surface soil samples above FDEP standards. The only inorganic analytical fraction exceeding FDEP standards is discussed below.

Inorganics

Arsenic was the only inorganic detected in surface soil samples above the FDEP residential SCTL of 0.8 mg/kg. Arsenic was detected in samples MPT-55-SS01-01 (0.92 mg/kg), MPT-55-SS04-01 (0.83 mg/kg), and MPT-55-SS08-01 (1.3 mg/kg). Arsenic appears to be pervasive in the surface soil at NAVSTA Mayport, which is common in Florida where arsenic is naturally occurring.

5.3.2.2 **Surface Water Sampling Results**

Three surface water samples were collected within the storm sewer system at locations shown on Figure 5-4. Target analytes detected in the surface soil samples included VOCs, SVOCs, and inorganics. The surface water analytical results are presented in Table 5-11.

5.3.2.2.1 Volatiles

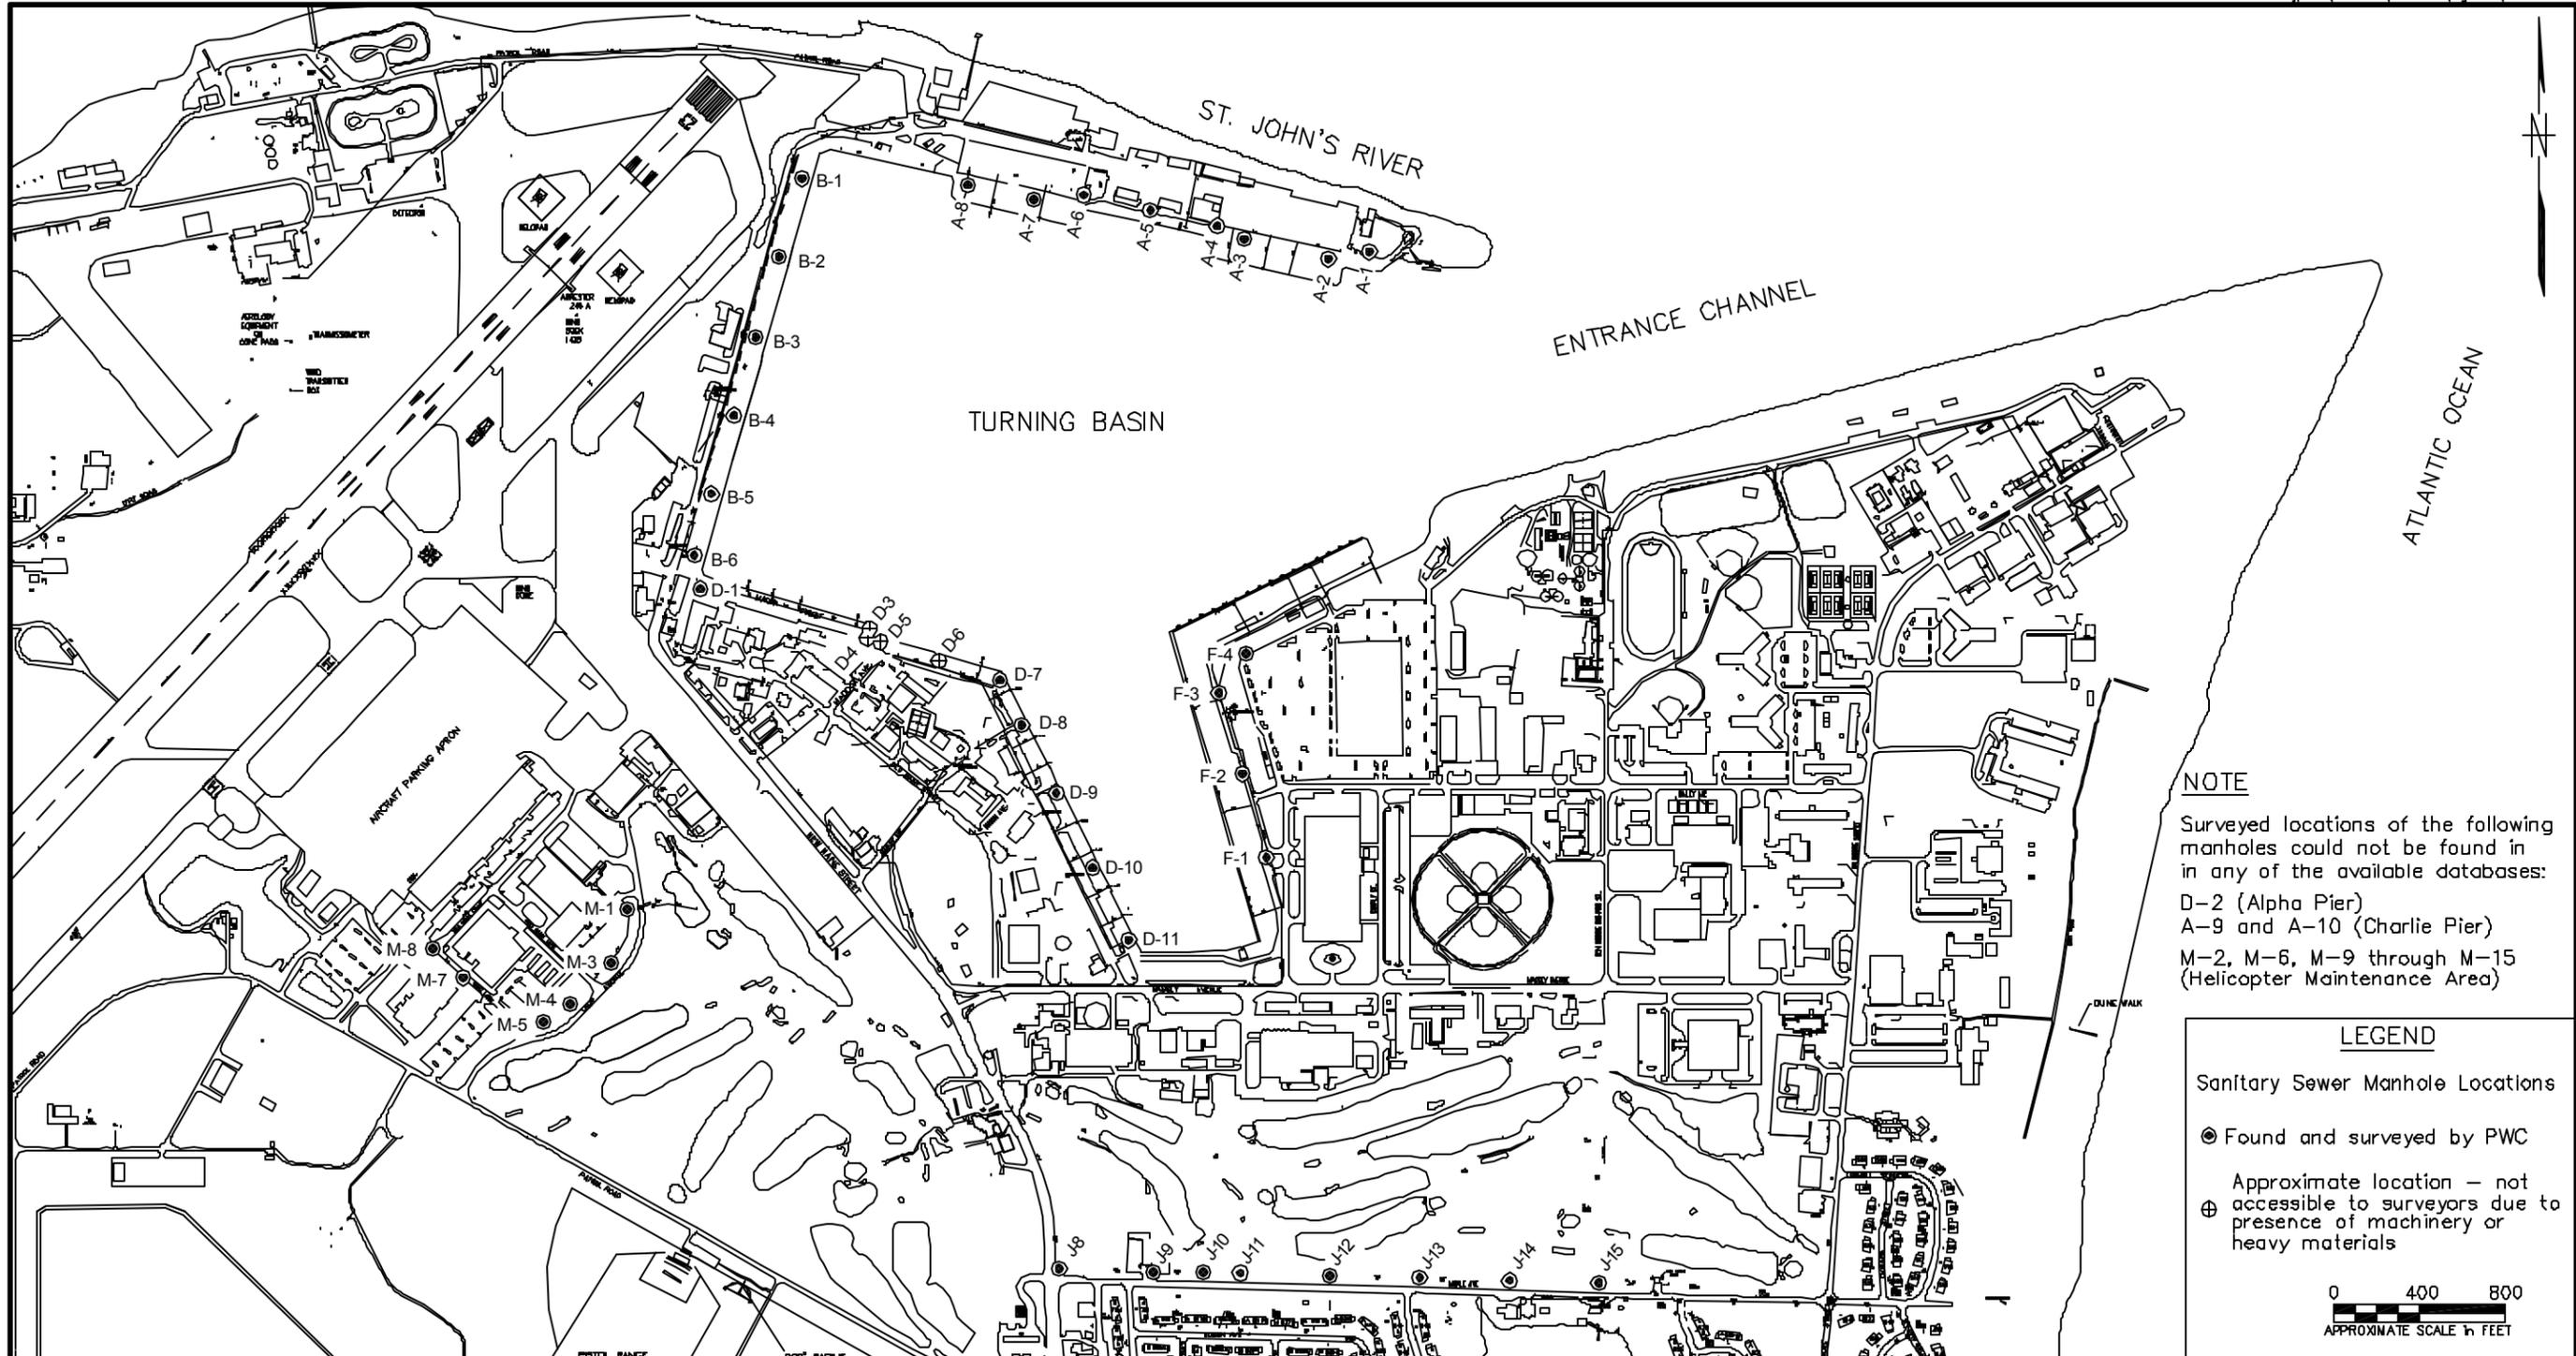

Three VOCs were detected in the surface water samples collected from the stormwater collection system. None of the reported values exceeded regulatory benchmark values.

5.3.2.2.2 Semivolatile Organic Compounds

Four SVOCs were detected in the surface water samples collected from the stormwater collection system. Aniline and phenol, detected in sample MPT-55-SW01-01 at 11 and 12 µg/L, respectively, were the only two SVOCs detected above FDEP Surface Water Cleanup Target Levels (SWCTLs) of 4 and 6.5 µg/L, respectively.

5.3.2.2.3 Inorganics

Eighteen inorganics were detected in the surface water samples collected from the stormwater collection system. Aluminum, detected in sample MPT-55-SW-02-01 (4,330 µg/L) and MPT-55-SW-03-01 (1,910 µg/L), was the only inorganic analyte detected above the FDEP SWCTL (13 µg/L).

NOTE
 Surveyed locations of the following manholes could not be found in any of the available databases:
 D-2 (Alpha Pier)
 A-9 and A-10 (Charlie Pier)
 M-2, M-6, M-9 through M-15 (Helicopter Maintenance Area)

 ** = shall not exceed 4,000, per Chapter 62-302, FAC
 -- = no defined target value

5.3.2.2.4 Interpretation of Results

Two SVOCs and one inorganic were reported at values exceeding FDEP standards in the surface water samples at SWMU 55. Each is discussed below.

Semivolatiles

Aniline and phenol were detected above FDEP standards in a surface water sample collected at SWMU 55. The sample was located south of the intersection of Massey Avenue and Bon Homme Richard Street near the old gas station and bordering the golf course. The sources of each are unknown; however, they most likely originated from the old gas station or golf course. Neither is persistent in surface water; therefore, concentrations above FDEP standards are not likely to be persistent.

Inorganics

Aluminum was detected above FDEP standards in two samples collected at SWMU 55. Both samples were collected in the Echo Pier retention basin network. Surface water in the retention basins originates from runoff of the surrounding areas and stormwater collection grates located along Echo Pier and the Echo/Foxtrot Pier parking area. The retention basins are dry for significant periods of the year. Aluminum in the sediment samples did not exceed the FDEP soil standards. The source of aluminum in the surface water is not known.

5.3.2.3 Sediment Sampling Results

Three sediment samples were collected within the storm sewer system at locations shown in Figure 5-4. All three samples were collected in the retention pond network at Echo Pier. The retention ponds are dry for a significant part of the time; therefore, the analytical results will be compared to surface soil and sediment benchmark values. Target analytes detected in the samples included VOCs, SVOCs, and inorganics. The analytical results are presented in Table 5-12.

5.3.2.3.1 Volatiles

Acetone was the only VOC detected in the sediment samples collected from the stormwater collection system. It was not detected above regulatory benchmark values.

5.3.2.3.2 Semivolatile Organic Compounds

Diethyl phthalate was the only SVOC detected in the sediment samples collected from the stormwater collection system. There were no exceedances of FDEP criteria.

5.3.2.3.3 Inorganics

Seventeen inorganics were detected in the sediment samples collected from the stormwater collection system. None of the inorganics were detected above USEPA Group IV Sediment Screening Values.

The samples were also compared to regulatory comparison values for surface soils because these locations are dry for extended periods throughout the year. There were five analytes (barium, chromium, copper, vanadium, and zinc) with detections above background screening values for surface soil. One analyte (arsenic) was detected above FDEP SCTLs. Arsenic was detected in sample MPT-55-SD02-01 (1.7 mg/kg) above the FDEP residential SCTL value of 0.8 mg/kg, but below the industrial value of 3.7 mg/kg.

5.3.2.3.4 Interpretation of Results

There were no detections in the sediment samples above benchmark values for sediment standards. However, the retention basin in which the sample was collected is dry for extended periods of the year. Consequently, the analytical results were compared to FDEP surface soil standards. There was one inorganic analyte detected in a sample that occurred above FDEP standards. The inorganic analytical fraction is discussed below.

Inorganics

Arsenic was detected in one sample above FDEP industrial values for surface soil. As discussed in Section 5.3.1.1.3, arsenic appears to be pervasive in the surface soil at NAVSTA Mayport and is naturally occurring in Florida soils.

6.0 HUMAN HEALTH RISK ASSESSMENT

The purpose of the human health risk assessment (HHRA) is to characterize the risks to humans associated with the potential exposures to chemicals in surface soil, subsurface soil, groundwater, surface water, and sediment. This HHRA is conducted in accordance with applicable USEPA and FDEP guidance documents.

The methodology for the HHRA consists of the following five steps:

- Data evaluation
- Selection of chemicals of potential concern (COPCs)
- Exposure assessment
- Toxicity assessment
- Risk characterization (including uncertainty analysis)

Collectively, these components are used to identify significant site-related contaminants, known as COPCs, and estimate the potential magnitude of exposure and risk associated with these contaminants.

Appendix F provides supporting HHRA information and calculations. Note that tables in Appendix F are numbered in accordance with the requirements of *Risk Assessment Guidance for Superfund: Volume I, Human Health Evaluation Manual (Part D, Standardized Planning, Reporting, and Review of Superfund Risk Assessments)* (USEPA, 1998a) and, therefore, are not necessarily referred to in sequential order in this chapter.

6.1 DATA EVALUATION

The data evaluation involves numerous activities, including sorting the data by medium, evaluating the quality of data with respect to qualifiers and codes, and developing a data set for use in risk assessment.

Data for this HHRA consisted of analytical results for surface soil, subsurface soil, surface water, sediment, and groundwater samples collected during the investigation for this report. Surface water and sediment samples were collocated. For groundwater, unfiltered samples were collected and analyzed. Risk estimates for groundwater were based on the analytical data collected during the most recent sampling effort in 2000 and 2001. Groundwater data from older investigation in 1997 were not used for the risk evaluation. The Data Quality Objectives (DQOs) for collecting environmental samples and conducting laboratory analyses are described in the RCRA Facility Assessment Sampling Visit Work Plan

SWMUs 47, 53, and 55 (TtNUS, 1999). Sample collection and analysis followed documented QA/QC procedures as described in the approved GIR (ABB-ES, 1995).

Chemical analyses were performed in accordance with SW-846 methodologies. The analytical results were evaluated, using the National Functional Guidelines (USEPA, 1994a and 1994b) to assess data usability and the laboratory's compliance with the analytical methodology. The analytical data were reviewed, validated, and evaluated using the criteria specified in the DQOs. All validated data (and qualifiers, as necessary) are presented in Appendix F. All unqualified positive detections and "J" qualified detections (estimated values) were considered as detected concentrations for this HHRA. All nondetects (indicated with a "U" qualifier) were retained in the HHRA data set. Any samples with a "UR" qualifier (indicating a rejected non-detect result) or "R" qualifier (indicating a rejected positive detection) were not included in the HHRA data set. Based upon the evaluation of the analytical data in conformance with the DQOs, the data presented in this report are acceptable for use in this HHRA.

For the 2000 groundwater sampling, DPT sampling locations and monitoring wells MPT-47-GW-DPW01 through MPT-47-GW-DPW23, MPT-53-GW-DPW01 through MPT-53-GW-DPW03, and MPT-G4-GW-01 through MPT-G4-GW-67 were included in Group IV. Additional monitoring wells were installed including MPT-47-DPW21S, MPT-47-DPW 22S, MPT-47-DPW 23S, MPT-47-DPW I, MPT-47-DPW D, MPT-FP-DPW01S, MPT-FP-DPW I, and MPT-FP-DPW D. Surface soil samples were collected from sampling locations MPT-55-SS-01-01 through MPT-55-SS-09-01. Subsurface soil samples were collected from sampling locations MPT-G4-SU-01 through MPT-G4-SU-67. Surface water samples were collected from sampling locations G4W001, G4W003, G4W004, and MPT-55-SW-01 through MPT-55-SW-03. Sediment samples were collected from sampling locations G4D001 through G4D005, and MPT-55-SD-01 through MPT-55-SD-03.

The data evaluation included the calculation of basic descriptive statistics for each data set evaluated in the HHRA. Basic statistics included frequency of detection, range of positive detections, arithmetic mean, normal 95 percent Upper Confidence Level (UCL-N) on the mean, and log-normal 95 percent Upper Confidence Level (UCL-L) on the mean. Appendix F-12 provides the equations used to determine the UCL-L and the UCL-N on the mean.

6.2 SELECTION OF CHEMICALS OF POTENTIAL CONCERN FOR HHRA

COPCs for baseline human health risk assessment are limited to those chemicals that exceed a selection criterion. For this risk assessment, state risk-based and health-based criteria were used to reduce the number of chemicals and exposure routes considered in a risk assessment. The premise of this screening step is that risk is typically dominated by a few chemicals and that, although dozens may actually be detected, many chemicals may contribute minimally to the total risk.

FDEP guidelines and criteria were used to select COPCs (FDEP, 2000). For soil, surface water, sediment, and groundwater, COPCs were selected for each medium (e.g., arsenic in surface soil). The COPCs were defined as chemicals that were positively detected in an environmental medium at a maximum concentration exceeding background and screening values.

For each medium, the following criteria were used to exclude detected analytes from the list of COPCs. Each criterion by itself was justification for excluding the analyte:

- Infrequent Detection. Frequency of detection is defined as the number of samples in which the analyte is detected divided by the number of samples analyzed for that analyte. A chemical was considered a candidate for exclusion if (1) it had a low frequency of detection (e.g., less than 5 percent), (2) it was not detected in other sampled media or at high concentrations (i.e., contaminated “hot spots” do not exist), and (3) there was no reason to believe that the chemical may be present (USEPA, 1989). No chemicals were eliminated from this HHRA based on the frequency of detection screening criteria.
- Less than Background Screening Concentrations. If the maximum detected concentration of an analyte in a medium was less than twice the arithmetic mean of the background concentration (inorganics only), the analyte was not selected as a COPC (USEPA, 1995). The background screening values were taken from the *Recalculation of Media Background Screening Values Memorandum* (TtNUS, 2000).
- Less than Risk-Based Screening Concentrations, Standards, and Guidelines. If the maximum detected concentration of the analyte in a medium was less than its corresponding adjusted Florida risk-based screening concentrations, the analyte was not selected as a COPC. Florida risk-based screening concentrations were based on residential use and were taken from *Technical Report: Development of Soil Cleanup Target Levels (SCTLs) for Chapter 62-777, FAC* (prepared for the FDEP by Saranko et al., 2000). In the FDEP tables, the target cancer risk is 1×10^{-6} and the target hazard quotient (HQ) is 1. All screening levels based on noncarcinogenic effects were adjusted to represent a target HQ of 0.1 in accordance with FDEP guidance (FDEP, 2000). To make this adjustment, all risk-based screening levels for noncarcinogenic effects were divided by 10. All risk-based screening levels for carcinogenic effects were adjusted to account for cumulative cancer effects by dividing the screening level by the number of detected carcinogenic chemicals in accordance with FDEP guidance (FDEP, 2000). GCTLs based on Primary or Secondary Standards were not adjusted.

- Less than Essential Nutrient Screening Values. If the maximum detected concentration of an essential nutrient (i.e., calcium, magnesium, potassium, and sodium) in a medium was below a toxic level or consistent with or only slightly above its background concentration, the essential nutrient was not selected as a COPC. The derivation of essential nutrient screening values for calcium, magnesium, potassium, and sodium is presented in Appendix C-1 of the *Remedial Investigation and Feasibility Study, General Information Report, Naval Air Station Whiting Field, Milton, Florida* (ABB-ES, 1998). A copy of this derivation is provided in Appendix F-13.

USEPA Region IX Preliminary Remediation Goals were presented as a point of comparison, but were not used in the determination of COPCs.

Tables 2.1 through 2.5 in Appendix F-2 provide the basic descriptive statistics for analytes detected in each medium, identify which analytes were selected as COPCs, and present the COPC selection rationale. Appendix F-3, Tables 3.1 through 3.5, provide the EPC determinations for the COPCs in each medium.

6.2.1 COPCs for GROUP IV

Sections 6.2.1.1 through 6.2.1.5 identify Group IV COPCs in surface soil, subsurface soil, surface water, sediment, and groundwater, respectively. Arsenic, determined to be a COPC in all media except surface water in Group IV, was a component of herbicides that were commonly used in the past. VOCs were only determined to be COPCs in groundwater. SVOCs were found to be COPCs in all media, with carcinogenic polynuclear aromatic hydrocarbons (PAHs) in sediments and soils. Metals were also determined to be COPCs in all media. Pesticides were found to be COPCs in sediment and surface soil.

6.2.1.1 Surface Soil – GROUP IV

Location identification numbers for Group IV surface soil samples considered for Group IV COPCs are listed in Section 6.1. There were seven detected carcinogenic chemicals; therefore, the carcinogenic screening levels were divided by seven. Table 6-1 lists analytes selected as COPCs for surface soil at Group IV. The COPC selection process Group IV is summarized in Appendix F-2, Table 2.1. The following chemicals were identified as COPCs: benzo(a)pyrene (equiv), aroclor-1260, antimony, arsenic, and iron.

6.2.1.2 Subsurface Soil – GROUP IV

Location identification numbers for subsurface soil samples considered for Group IV COPCs are listed in Section 6.1. There were six detected carcinogenic chemicals; therefore, the carcinogenic screening levels were divided by six. Table 6-1 lists analytes selected as COPCs at Group IV. The COPC selection process for subsurface soils in Group IV is summarized in Appendix F-2, Table 2.2. The following chemicals were identified as COPCs for Group IV subsurface soil: benzo(a)pyrene (equiv), hexachlorobenzene, aluminum, arsenic, chromium, copper, iron, manganese, and vanadium.

6.2.1.3 Surface Water – GROUP IV

Location identification numbers for surface water samples considered for Group IV COPCs are listed in Section 6.1. There were four detected carcinogenic chemicals; therefore, the carcinogenic screening levels were divided by four. Table 6-1 lists analytes selected as COPCs at Group IV. The COPC selection process for surface water is summarized in Appendix F-2, Tables 2.3. The following chemicals were identified as COPCs for Group IV surface water: 4-methylphenol, aniline, bis(2-ethylhexyl)phthalate, butyl benzyl phthalate, phenol, aluminum, barium, chromium, iron, manganese, molybdenum, and vanadium.

6.2.1.4 Sediment – GROUP IV

Location identification numbers for sediment samples considered for Group IV COPCs are listed in Section 6.1. There were eight detected carcinogenic chemicals; therefore, the carcinogenic screening levels were divided by eight. Table 6-1 lists analytes selected as COPCs at Group IV. The COPC selection process for sediment is summarized in Appendix F-2, Tables 2.4. The following chemicals were identified as COPCs for Group IV sediment: benzo(a)pyrene (equiv), chlordane, arsenic, barium, chromium, copper, lead, mercury, and vanadium.

6.2.1.5 Groundwater – GROUP IV

Location identification numbers for groundwater samples considered for Group IV COPCs are listed in Section 6.1. There were 12 detected carcinogenic chemicals; therefore, the carcinogenic screening levels were divided by twelve. Table 6-1 lists analytes selected as COPCs for groundwater at Group IV. The COPC selection process for groundwater in Group IV is summarized in Appendix F-2, Tables 2.5. The following chemicals were identified as COPCs for Group IV in groundwater: 1,1-dichloroethane; 1,2-dichloroethene (total); 1,3-dichlorobenzene; acenaphthene; aluminum; arsenic; benzene; carbazole;

chloromethane; iron; manganese; molybdenum; naphthalene; phenol; pyridine; thallium; vanadium; and vinyl chloride.

6.3 EXPOSURE ASSESSMENT

The exposure assessment was conducted to identify the pathways by which humans are potentially exposed, the magnitude of potential human exposure, and the frequency and duration of exposure. This process involves several steps:

- Characterization of the exposure setting in terms of physical characteristics and the populations that may potentially be exposed to site-related chemicals.
- Identification of potential exposure pathways and receptors.
- Quantification of exposure for each receptor in terms of the amount of chemical, which is either ingested, inhaled, or absorbed through the skin from all potentially complete exposure pathways.

6.3.1 Exposure Setting Characterization

Chapter 2.0 describes the regional and site-specific environmental setting of Group IV. The Group IV SWMUs are located throughout the developed part of NAVSTA Mayport. Much of the utility networks are in close proximity to the Turning Basin. The SWMUs in this group are related by the fact that they transport wastewater and petroleum-related liquids.

6.3.2 Identification of Potential Receptors and Exposure Pathways

The receptors to be evaluated were selected based on the current and plausible future use of the sites and surrounding areas. The property is currently being used for non-residential naval activities and is expected to remain non-residential for the foreseeable future.

The following five potential receptors were evaluated for Group IV assuming current and future land use scenarios.

- Military residents - Individuals who live on base with their families during their tour of duty at NAVSTA Mayport. Typically, a tour of duty is three years. These residents use groundwater extracted from NAVSTA Mayport's deep on-base water supply wells. The groundwater is treated using activated carbon at the wellhead. The screened interval for the on-base water supply wells is approximately 400 ft bls and is, therefore, not from the potentially contaminated shallow aquifer.

- Hypothetical future on-site residents - Individuals who may reside on the area of Group IV in the future. These residents may come into direct contact with contaminants in surface soils, surface water, and sediments, and may rely on the shallow groundwater aquifer as a domestic water supply. This scenario is considered unlikely but is included for purposes of completeness and to provide information to the risk managers.
- Trespassers - Individuals who may from time to time enter a site without proper authorization and come into contact with surface soil, surface water, or sediment. Exposure to authorized visitors is also considered under this scenario.
- Construction Workers - Individuals who may come into contact with surface soils, subsurface soils, surface water, sediment, or groundwater while excavating or performing construction activities near contaminated sites.
- Base Workers - Individuals who, during their 8-hour work shifts, may come into contact with surface soils, surface water, or sediment. Use of the shallow aquifer for a potable water supply was not considered likely for the same reasons listed for the military residents. Exposure of base workers is very task-dependant. For example, the exposure of office workers to site-related media may be much lower than the exposure of landscapers.

Hypothetical future adult and child (ages 1-6) on-site residents were quantified for purposes of completeness only. NAVSTA Mayport is an active Naval Base and expected to remain so in the foreseeable future.

A summary of the potential exposure pathways for the aforementioned receptors at Group IV are presented in Table 6-2. Information in these tables includes the scenario time frame, exposure medium, potentially exposed receptor population, exposure route, and the rationale for pathway selection or exclusion. Sections 6.3.2.1 through 6.3.2.5 describe the receptors potentially exposed to surface soil, subsurface soil, surface water, sediment, and groundwater, respectively.

6.3.2.1 Surface Soil

The receptors potentially exposed to surface soil are:

- **Hypothetical future on-site residents** who may directly contact contaminants in surface soils. These receptors were evaluated for purposes of completeness only, because the site is expected to remain non-residential.
- **Current and future base workers** who may come in contact with surface soils while performing work.
- **Current and future construction workers** who may come in contact with surface soils while performing excavation or construction work.
- **Current and future trespassers** who may come in contact with contaminated surface soils while visiting the site.

Exposures of hypothetical potential future residents (adult and child), current and future base workers, current and future construction workers, and current and future trespassers (combined adolescent and adult) to surface soil contaminants were evaluated in this HHRA. Incidental ingestion, dermal contact, and inhalation exposure routes were considered.

6.3.2.2 Subsurface Soil

The receptors potentially exposed to subsurface soil are:

- **Current and future construction workers** who may come in contact with subsurface soils while performing excavation or construction work.

Exposures of current and future construction workers to subsurface soil contaminants were evaluated in this HHRA. Incidental ingestion, dermal contact, and inhalation exposure routes were considered.

6.3.2.3 Surface Water

Surface water sampling was limited to the storm water drainage ditches. Much of Group IV is located in close proximity to the Mayport Turning Basin; however, an evaluation of COPCs in surface water and sediments of the Turning Basin is beyond the scope of this HHRA. This is primarily because the basin is dredged every 2 to 3 years for safe berthing of Navy ships. Dredged sediments are transferred through a

slurry pipeline to SWMU 50, the Western Dredge Spoil area. Data from any surface water or sediment sampling that would be collected for this investigation, and subsequent evaluation of human risks, would be unusable the next time the basin is dredged. The receptors potentially exposed to surface water are:

- **Hypothetical future residents** who may wade in the surface water. These receptors were evaluated for purposes of completeness only, because it is expected that the land will continue to be used as a naval base.
- **Current and future base workers** who may come in contact with surface water while performing work.
- **Current and future construction workers** who may come in contact with surface water while performing excavation or construction work.
- **Current and future trespassers** who may come in contact with contaminated surface water while visiting the site.

Hypothetical future residents (adult and child) exposed to surface water contaminants were evaluated in this HHRA. Incidental ingestion and dermal contact exposure routes were considered.

6.3.2.4 Sediment

The sediments sampled are those limited to the storm water drainage ditches. The water level may vary with rainfall; sediments are periodically exposed. The hypothetical future resident, base worker, construction worker, and trespasser may be potentially exposed to sediment; however, the exposure is likely to be minimal and is not quantified in this HHRA. Therefore, although COPCs were developed for sediment, risk due to exposure to sediment was not evaluated further in this risk assessment.

The Mayport Turning Basin is located adjacent to Group IV; however, the evaluation of risks as a result of exposure to surface waters and sediments in the Turning Basin is beyond the scope of the HHRA. This is primarily because the basin is dredged every 2 to 3 years for safe berthing of Navy ships. Dredged sediments are transferred through a slurry pipeline to SWMU 50, the Western Dredge Spoil area. Data from any surface water or sediment sampling that would be collected for this investigation, and subsequent evaluation of human risks, would be unusable the next time the basin is dredged.

6.3.2.5 Groundwater

The receptors potentially exposed to groundwater are:

- **Hypothetical future on-site residents** who may use groundwater from wells in the contaminated shallow aquifer. These receptors were evaluated for purposes of completeness only, because it is expected that the land will continue to be used as a naval base. In addition, drinking water is provided to the area from the NAVSTA Mayport's deep on-base water supply wells, and it is unlikely that hypothetical future residents would install domestic water supply wells in the shallow aquifer.
- **Current and future construction workers** who may come in contact with groundwater while performing excavation.

On-base water supply wells exist on NAVSTA Mayport and are used for groundwater supply to on-base military residents. The groundwater is extracted from approximately 400 ft bls and is treated. Therefore, exposure to the contaminated shallow aquifer is not considered for the military resident receptor, the base worker, or the trespasser.

6.3.3 Exposure Point Concentration

The Exposure Point Concentration (EPC) is the concentration of a COPC used to best estimate the intake. Ideally, the EPC should be the true average concentration within the exposure unit. However, because of the uncertainty associated with estimating the true average concentration at a site, the 95% upper confidence level (UCL) of the arithmetic mean is used as the EPC. If there were less than 10 samples, the maximum concentration was chosen as the EPC as the UCL does not provide a good estimation of the upper bound of the mean concentration for these small data sets. If there were more than 10 samples, each data set was evaluated using the Shapiro-Wilk W test (Gilbert, 1987) to determine if the dataset more closely reflected a normal or lognormal distribution. A lognormal distribution was assumed if the results were inconclusive. The 95 UCL-L and 95 UCL-N were calculated for each analyte in each medium and data set using one-half the reporting limit for nondetect results and the average for samples with duplicates. The UCL-N was used as the EPC if the Shapiro-Wilk W test indicated a normal distribution, and the UCL-L was used as the EPC if the Shapiro-Wilk W test indicated a lognormal distribution. If the calculated 95 UCL exceeded the maximum detected concentration, the maximum detected concentration was selected as the EPC. EPCs were calculated for analytes in surface soil, subsurface soil, surface water, sediment, and groundwater samples located in Group IV.

USEPA Region 4 guidance (USEPA, 1995) was followed to determine an equivalent benzo(a)pyrene EPC concentration to represent the carcinogenic PAHs. The Region 4 guidance uses a Toxicity

Equivalency Factor (TEF) methodology to convert each of the reported carcinogenic PAHs to benzo(a)pyrene equivalents. The equivalent benzo(a)pyrene EPC is referred to as benzo(a)pyrene (equiv) EPC in this HHRA. The following TEFs were used to convert each PAH concentration to a benzo(a)pyrene (equiv) concentration: (1) benzo(a)pyrene, TEF = 1.0; (2) benzo(a)anthracene, TEF = 0.1; (3) benzo(b)fluoranthene, TEF = 0.1; (4) dibenzo(a,h)anthracene, TEF = 1.0; (5) benzo(k)fluoranthene, TEF = 0.01; (6) chrysene, TEF = 0.001; and (7) indeno(1,2,3-cd)pyrene, TEF = 0.1. If any of the carcinogenic PAHs were detected at a sample location, the benzo(a)pyrene (equiv) concentration was calculated for that location by multiplying the concentration of each carcinogenic PAH by the appropriate TEF and summing the resultant values. If any of the carcinogenic PAHs were below detection limits at that sample location, half the detection limit of that PAH was used as a surrogate concentration. If all of the carcinogenic PAHs were below detection limits at a sample location, the benzo(a)pyrene (equiv.) concentration was calculated by multiplying half the detection limit for each carcinogenic PAH by the appropriate TEF and summing the resultant values.

6.3.4 Exposure Quantification

6.3.4.1 Base Workers

Base workers are those individuals, other than construction workers, who work at Group IV and may come into contact with contaminated environmental media. Table 4.1 in Appendix F-4 provides exposure dose equations used to estimate chemical intake for base workers exposed to surface soil. Table 4.2 in Appendix F-4 provides exposure dose equations used to estimate chemical intake for base workers exposed to surface water. Where available, the exposure assumptions used in the equations were those suggested by standard USEPA guidance documents. Tables 4.1 and 4.2 provide a reference for each exposure assumption. Exposure assumptions that are not standard USEPA values include the following:

- An exposure time of 1.0 hour per event was assumed because no standard USEPA parameter was found for exposure time for ingestion of surface water during commercial activities. Similarly, an exposure frequency of 50 events per year was assumed. These two factors together assumed site maintenance workers were exposed to onsite surface water for 50 hours per year.

- No standard USEPA parameters were found for event frequency, exposure frequency, or duration of event for dermal exposure to surface water. An event frequency, exposure frequency, and duration of event of 1 event per day, 50 days per year, and 1.0 hour per event, respectively, were assumed so that the total number of hours per year for dermal exposure to surface water was consistent with the total hours per year for ingestion of surface water.

Intake values for base worker exposures to Group IV noncarcinogens are provided in Appendix F-7, Tables 7.1 and 7.2. Intake values for base worker exposures to Group IV carcinogens are provided in Appendix F-8, Tables 8.1 and 8.2.

6.3.4.2 Construction Workers

Construction workers are those individuals who work at Group IV and may come into contact with contaminated media during excavation or construction activities. Tables 4.3, 4.4, 4.5, and 4.6 in Appendix F-4 provide exposure dose equations used to estimate chemical intake for construction workers exposed to surface soil, subsurface soil, surface water, and groundwater, respectively. Where available, exposure assumptions used in the equations were those suggested by standard USEPA guidance documents. Tables 4.3, 4.4, 4.5, and 4.6 provide a reference for each exposure assumption. Exposure assumptions that are not standard USEPA values include the following:

- The exposure frequency was assumed to be equal to one worker month per year. A worker month is equal to 20 days. This value was taken from the RAIS Internet site listing exposure parameters for an excavation worker <http://risk.lsd.ornl.gov/homepage/tm>.
- An exposure time of 1.0 hour per event was assumed because no standard USEPA parameter was found for exposure time for ingestion of surface water during construction activities.
- No standard USEPA parameters were found for event frequency or duration of event for dermal exposure to surface water. An event frequency and duration of event of 1 event per day and 1.0 hour per event, respectively, were assumed so that the total number of hours per year for dermal exposure to surface water was consistent with the total hours per year for ingestion of surface water.

Intake values for construction worker exposures to Group IV noncarcinogens are provided in Appendix F-7, Tables 7.3, 7.4, 7.5, and 7.6. Intake values for construction worker exposures to Group IV carcinogens are provided in Appendix F-8, Tables 8.3, 8.4, 8.5, and 8.6.

6.3.4.3 Adult and Adolescent Trespassers

Trespassers, both adult and adolescent, were assumed to be individuals other than authorized personnel who may from time to time enter the site and contact contaminated environmental media. Risks estimated for this receptor also represent the exposure to authorized site visitors. Tables 4.7, 4.8, 4.9, and 4.10 in Appendix F-4 provide exposure dose equations used to estimate chemical intake for adult and adolescent trespassers, respectively, exposed to surface soil and surface water. Where available, exposure assumptions used in the equations were those suggested by standard USEPA guidance documents. Tables 4.7, 4.8, 4.9, and 4.10 (Appendix F-4) provide a reference for each exposure assumption. Exposure assumptions that are not standard USEPA values include the following:

- The soil ingestion rate was assumed to be 100 milligrams per day for both adults and adolescents. This is the same as the soil ingestion rate assumed for resident adults given in the USEPA Region 4 supplemental risk assessment guidance (USEPA, 1995).
- The exposure duration was assumed to be 20 years for adults and 10 years for adolescents. This is based on the 30 year exposure duration also assumed for a residential land use scenario. (The adolescent is assumed to range in age from 7 to 18 years (or 10 of the 30 years exposure duration), assuming 20 years exposure as an adult.
- An exposure frequency of 100 events per year or days per year was assumed for adolescent exposure to surface soil. This value was selected to be greater than the adult exposure frequency of 45 events per year (USEPA, 1995) based on the belief that adolescents are more likely to trespass than adults are. The value selected for adolescents is equivalent to approximately twice per week during the course of a year.
- An exposure time of 1.0 hour per event was assumed because no standard USEPA parameter was found for exposure time for ingestion of surface water during trespassing activities.

Intake values for adult trespasser exposures to Group IV noncarcinogens are provided in Appendix F-7, Tables 7.7 and 7.8. Intake values for adolescent trespasser exposures to Group IV noncarcinogens are provided in Appendix F-7, Tables 7.9 and 7.10. Intake values for adult trespasser exposures to Group IV carcinogens are provided in Appendix F-8, Tables 8.7 and 8.8. Intake values for adolescent trespasser exposures to Group IV carcinogens are provided in Appendix F-8, Tables 8.9 and 8.10.

6.3.4.4 Hypothetical Future Adult and Child Onsite Residents

Risks to the hypothetical future onsite resident adult and child were quantified for purposes of completeness only. NAVSTA Mayport is expected to remain a naval base; therefore, onsite residential land use is not expected in the foreseeable future. The adult and child intakes were quantified for exposure to surface soil, surface water, and groundwater COPCs.

Tables 4.11, 4.12, and 4.13 in Appendix F-4 provide exposure dose equations used to estimate chemical intake for the hypothetical future adult resident exposed to surface soil, surface water, and groundwater, respectively. Tables 4.14, 4.15, and 4.16 in Appendix F-4 provide exposure dose equations used to estimate chemical intake for the hypothetical future child resident exposed to surface soil, surface water, and groundwater, respectively. Inhalation intake of VOCs vaporizing from groundwater was not quantified for hypothetical future adult and child residents because the inhalation risk (for VOCs) was assumed to be equal to the ingestion risk (USEPA, 1995). Where available, exposure assumptions used in the equations were those suggested by standard USEPA guidance documents. Tables 4.11 through 4.16 (Appendix F-4) provide a reference for each exposure assumption. Exposure assumptions that are not standard USEPA values include the following:

- No standard USEPA exposure assumptions were found for event frequency for adult and child dermal exposure to surface water. An event frequency of 1 event per day was assumed.
- An exposure frequency of 100 events per year or days per year was assumed for child exposure to surface water. This value was selected to be greater than the adult exposure frequency of 45 events per year (USEPA, 1995) based on the belief that children are more likely to participate in wading activities than adults are. The value selected for the child is equivalent to approximately twice per week during the course of a year.

Surface soil, surface water, and groundwater intake values for hypothetical future adult resident exposures to GROUP IV noncarcinogens are provided in Appendix F-7, Tables 7.11, 7.12, and 7.13. Surface soil, surface water, and groundwater intake values for hypothetical future child resident exposures to Group IV noncarcinogens are provided in Appendix F-7, Tables 7.14, 7.15, and 7.16. Surface soil, surface water, and groundwater intake values for hypothetical future adult resident exposures to Group IV carcinogens are provided in Appendix F-8, Tables 8.11, 8.12, and 8.13. Surface soil, surface water, and groundwater intake values for hypothetical future child resident exposures to Group IV carcinogens are provided in Appendix F-8, Tables 8.14, 8.15, and 8.16.

6.4 TOXICITY ASSESSMENT

The toxicity assessment for the COPCs examines information concerning the potential human health effects of exposure to COPCs. For each COPC, the goal of the toxicity assessment is to provide a quantitative estimate of the relationship between the magnitude and type of exposure and the severity or probability of human health effects. The toxicity values presented in this section are integrated with the exposure assessment (Section 6.3) to characterize the potential for the occurrence of adverse health effects.

The toxicological evaluation involves a critical review and interpretation of toxicity data from epidemiological, clinical, animal, and in vitro studies. This review of the data ideally determines both the nature of the health effects associated with a particular chemical and the probability that a given quantity of a chemical could result in the referenced effect. This analysis defines the relationship between the dose received and the incidence of an adverse effect for the chemicals of potential concern.

The entire toxicological database is used to guide the derivation of CSFs for carcinogenic effects and Reference Doses (RfDs) for noncarcinogenic effects. These data may include epidemiological studies, long-term animal bioassays, short-term tests, and evaluations of molecular structure. Data from these sources are reviewed to determine if a chemical is likely to be toxic to humans. Because of the lack of available human studies, however, the majority of toxicity data used to derive CSFs and RfDs comes from animal studies.

For noncarcinogenic effects, the most appropriate animal model (the species most biologically similar to the human) is identified. Pharmacokinetic data often enter into this determination. In the absence of sufficient data to identify the most appropriate animal model, the most sensitive species is chosen. The RfD is generally derived from the most comprehensive toxicology study that characterizes the dose-response relationship for the critical effect of the chemical. Preference is given to studies using the exposure route of concern; in the absence of such data, however, an RfD for one route of exposure may be extrapolated from data from a study that evaluated a different route of exposure. Such extrapolation must take into account pharmacokinetic and toxicological differences between the routes of exposure. Uncertainty factors are applied to the highest no-observed-adverse-effect level (NOAEL) to adjust for inter- and intraspecies variation, deficiencies in the toxicological database, and use of subchronic rather than chronic animal studies. Additional uncertainty factors may be applied to estimate a NOAEL from a lowest-observed-adverse-effect level (LOAEL) if the key study failed to determine a NOAEL. When chemical-specific data are not sufficient, an RfD may be derived from data for a chemical with structural and toxicological similarity.

CSFs for weight-of-evidence Group A or B chemicals are generally derived from positive cancer studies that adequately identify the target organ in the test animal data and characterize the dose-response relationship. CSFs are derived for Group C compounds for which the data are sufficient, but they are not derived for Group D or E chemicals. (An explanation/definition of these weight-of-evidence classes is provided in Section 6.4.1). No consideration is given to similarity in the animal and human target organs because a chemical capable of inducing cancer in any animal tissue is considered potentially carcinogenic to humans. Preference is given to studies using the route of exposure of concern, in which normal physiologic function was not impaired, and in which exposure occurred during most of the animal's lifetime. Exposure and pharmacokinetic considerations are used to estimate equivalent human doses for computation of the CSF. When a number of studies of similar quality are available, the data may be combined in the derivation of the CSF.

Toxicological profiles for each of the COPCs are presented in Appendix F-11. These profiles present a summary of the available literature on carcinogenic and noncarcinogenic effects associated with human exposure to the chemical.

6.4.1 Carcinogenic Effects

The toxicity information considered in the assessment of potential carcinogenic risks includes a weight-of-evidence classification and a slope factor. The weight-of-evidence classification qualitatively describes the likelihood that a chemical is a human carcinogen and is based on an evaluation of the available data from human and animal studies. A chemical may be placed in one of three groups in USEPA's classification system to denote its potential for carcinogenic effects:

- Group A - known human carcinogen
- Group B1 or B2 - probable human carcinogen
- Group C - possible human carcinogen

Chemicals that cannot be classified as human carcinogens because of a lack of data are placed in Group D, and those for which there is evidence of noncarcinogenicity in humans are in Group E.

The CSF is the toxicity value used to quantitatively express the carcinogenic hazard of cancer-causing chemicals. It is defined as the upper bound estimate of the probability of cancer incidence per unit dose averaged over a lifetime. Slope factors are derived from studies of carcinogenicity in humans and/or laboratory animals and are typically calculated for compounds in Groups A, B1, and B2, although some Group C carcinogens also have slope factors and some B2 carcinogens such as lead have none. Slope factors are specific to a chemical and route of exposure and are expressed in units of $[\text{mg/kg-day}]^{-1}$ for both oral and inhalation routes. Inhalation cancer toxicity values are usually expressed as inhalation unit

risks in units of reciprocal micrograms per meters cubed ($\mu\text{g}/\text{m}^3$) [$1/(\mu\text{g}/\text{m}^3)$]. The inhalation unit risk must be converted to an inhalation slope factor. This is done by assuming that humans weigh 70 kilograms (kg) and inhale 20 meters cubed (m^3) of air per day [i.e., the inhalation unit risk ($1/\mu\text{g}/\text{m}^3$) is divided by 20 meters cubed per day (m^3/day), multiplied by 70 kg, and multiplied by 1,000 micrograms per milligram ($\mu\text{g}/\text{mg}$) to yield the mathematical equivalent of an inhalation slope factor ($\text{mg}/\text{kg}\text{-day}$)⁻¹] (USEPA, 1995). CSFs for COPCs at Group IV are presented in Appendix F-6 in Tables 6.1 and 6.2. The primary sources of information for these values are IRIS (USEPA, 2001) and the annual HEAST (USEPA, 1997a).

The IRIS database (USEPA, 2001) was consulted as the primary source for CSF values, as well as for RfDs. USEPA intends that IRIS supersede all other sources of toxicity information for risk assessment. If values are not available in IRIS, the HEAST values (USEPA, 1997a) were consulted. If no CSF is available from any of these sources, carcinogenic risks are not quantified and potential exposures are addressed in the general uncertainty section, Section 6.5.

CSFs exist for several (but not all) Class C compounds, which are identified as "possible" human carcinogens. Based on data for these compounds, there is inadequate evidence of carcinogenicity in humans and limited evidence of carcinogenicity in animals. In this HHRA, Class C compounds are evaluated quantitatively as class A/B1/B2 compounds, but the risks associated with exposure to Class C compounds are also discussed separately if these chemicals are major risk drivers, underscoring the uncertainty associated with these estimations.

Dermal CSFs are derived from the corresponding oral values. In the derivation of a dermal CSF, the oral CSF is divided by the gastrointestinal absorption efficiency to determine a CSF based on an absorbed dose rather than an administered dose. The oral CSF is divided by the absorption efficiency because CSFs are expressed as reciprocal doses. Dermal CSFs and the absorption efficiencies used in their determination are also included in Appendix F-6 in Table 6.1. When no absorption rate is available in the literature, no adjustment is made.

In the past, risk estimates for PAHs have assumed that all carcinogenic PAHs have a potency equal to that for benzo(a)pyrene. A benzo(a)pyrene equivalent concentration is calculated using TEFs for the other Class B2 PAHs as explained in Section 6.1. While benzo(a)pyrene was well studied, other Class B2 PAHs had insufficient data with which to calculate a CSF.

6.4.2 Noncarcinogenic Effects

For noncarcinogens, it is assumed that a dose exists below which no adverse health effects will be seen. Below this "threshold" dose, exposure to a chemical can be tolerated without adverse effects. Toxic effects are manifested only when physiologic protective mechanisms are overcome by exposures to a chemical above its threshold level. Maternal and developmental endpoints are considered systemic toxicity.

The potential for noncarcinogenic health effects resulting from exposure to chemicals is assessed by comparing an exposure estimate (intake or dose) to an RfD. The RfD is expressed in units of mg/kg-day and represents a daily intake of contaminant per kg of body weight that is not sufficient to cause the threshold effect of concern. An RfD is specific to the chemical, the route of exposure, and the duration over which the exposure occurs. Separate RfDs are presented for ingestion and inhalation pathways. In particular, Reference Concentrations (RfCs) in units of mg/m³ are typically presented for the inhalation pathway. Because characterization of noncarcinogenic effects requires an estimate of dose in units of mg/kg/day, the inhalation RfC must be converted to an inhalation RfD. The conversion is performed by assuming that humans weigh 70 kg and inhale 20 m³ of air per day [i.e., the inhalation RfC (mg/m³) is multiplied by 20 m³/day and divided by 70 kg to yield an inhalation RfD with units of mg/kg-day] (USEPA, 1995a).

To derive an RfD, USEPA reviews all relevant human and animal studies for each compound and selects the study (studies) pertinent to the derivation of the specific RfD. Each study is evaluated to determine the NOAEL or, if the data are inadequate for such a determination, the LOAEL. The NOAEL corresponds to the dose (in mg/kg-day) that can be administered over a lifetime without inducing observable adverse effects. The LOAEL corresponds to the lowest daily dose that induces an observable adverse effect. The toxic effect characterized by the LOAEL is referred to as the "critical effect." To derive an RfD, the NOAEL (or LOAEL) is divided by uncertainty factors to ensure that the RfD will be protective of human health. Uncertainty factors are applied to account for extrapolation of data from laboratory animals to humans (interspecies extrapolation), variation in human sensitivity to the toxic effects of a compound (intraspecies differences), derivation of a chronic RfD based on a subchronic rather than a chronic study, or derivation of an RfD from the LOAEL rather than the NOAEL. In addition to these uncertainty factors, modifying factors between 1 and 10 may be applied to reflect additional qualitative considerations in evaluating the data. For most compounds, the modifying factor is one.

A dermal RfD is developed by multiplying an oral RfD (based on an administered dose) by the gastrointestinal tract absorption factor. The resulting dermal RfD, based on an absorbed dose, is used to evaluate the dermal (absorbed) dose calculated by the dermal exposure algorithms.

RfDs for the COPCs at Group IV are presented in Appendix F-5 in Tables 5.1 and 5.2. The primary source of these values is the IRIS database, followed by other USEPA sources described for the carcinogens. This table also includes the primary target organs affected by a particular chemical. This information may be used in the risk characterization section to segregate risks by target organ effects, unless the total hazard index (HI) is below unity.

6.5 RISK CHARACTERIZATION, UNCERTAINTY ANALYSIS, AND CONCLUSIONS

6.5.1 Risk Characterization for Group IV

A summary of the risk characterization for Group IV is presented in this section. Total noncarcinogenic and carcinogenic risks for each exposure route, as well as the cumulative risks for each receptor are presented in Tables 9.1 through 9.6 in Appendix F-9. The following receptors were evaluated:

- The base worker.
- The construction worker.
- The trespasser (adult and adolescent).
- The hypothetical future resident (adult and child).

Example calculations and relevant risk calculation spreadsheets are presented in Appendix F.

6.5.1.1 Noncarcinogenic Risks for Group IV

HIs developed for the aforementioned receptors and presented in the referenced tables were as follows:

Receptor	HI	Table in Appendix F
Base Worker (Current/Future)	6.4E-02	9.1
Construction Worker (Current/Future)	4.5E-02	9.2
Adult Trespasser (Current/Future)	4.6E-02	9.3
Adolescent Trespasser (Current/Future)	1.6E-01	9.4
Hypothetical Adult Resident (Future)	1.3E+00	9.5
Hypothetical Child Resident (Future)	3.7E+00	9.6

HIs calculated for the base worker, the construction worker, and the adult/adolescent trespassers are equal to or less than one, indicating that adverse noncarcinogenic health effects are not anticipated under the conditions established in the exposure assessment.

HIs calculated for the hypothetical future resident exceed 1 when the hypothetical future adult or child is the receptor of concern. HIs calculated for the adult and small child resident routinely exposed to soils only were 1.9E-01 and 9.2E-01, respectively. HIs calculated for the adult and small child occasionally

exposed to local surface water only were 5.2E-02 and 3.4E-01, respectively. HIs calculated for the adult and small child resident routinely exposed to groundwater were 1.1E+00 and 2.2E+00, respectively. HIs calculated on a target organ-specific basis did not exceed one. The risk estimates presented for the environmental media are subject to several significant sources of uncertainty. This includes the fact that a very conservative RfD for iron was used to conduct the risk analysis. These significant sources of uncertainty are further discussed in Section 6.5.1.3.

6.5.1.2 Carcinogenic Risks for Group IV

Incremental lifetime cancer risk (ILCR) estimates calculated for the aforementioned receptors and presented in the referenced tables were as follows:

Receptor	Cancer Risk Estimate	Table in Appendix F
Base Worker (Current/Future)	8.6E-06	9.1
Construction Worker (Current/Future)	3.2E-07	9.2
Adult Trespasser (Current/Future)	3.5E-06	9.3
Adolescent Trespasser (Current/Future)	7.2E-06	9.4
Hypothetical Adult Resident (Future)	1.1E-04	9.5
Hypothetical Child Resident (Future)	1.0E-04	9.6

The ILCR estimate developed for the construction worker (3.2E-07) exposed to Group IV media does not exceed the USEPA target risk range of 1E-04 to 1E-06. IILCR estimates calculated for the base worker and the trespasser are within the USEPA target risk range but exceed the State of Florida risk benchmark of 1E-06. Cancer risk estimates for the hypothetical future resident (combined adult and child) do exceed the USEPA target risk range and the State of Florida risk benchmark of 1E-06. A review of the media and chemical-specific risk results indicate benzo(a)pyrene (equiv), Aroclor-1260, and arsenic in surface soil, and arsenic, vinyl chloride, and carbazole in groundwater are the predominant risk drivers for Group IV.

Receptor	Media	Cancer Risk Estimate	Table in Appendix F
Base Worker (Current/Future)	Surface Soil	8.5E-06	9.1
	Surface Water	8.9E-08	9.1
	TOTAL	8.6E-06	9.1
Construction Worker (Current/Future)	Surface Soil	2.4E-07	9.2
	Subsurface Soil	3.8E-08	9.2
	Surface Water	3.6E-08	9.2
	Groundwater	3.4E-09	9.2
	TOTAL	3.2E-07	9.2
Adult Trespasser (Current/Future)	Surface Soil	3.4E-06	9.3
	Surface Water	6.4E-08	9.3
	TOTAL	3.4E-06	9.3
Adolescent Trespasser (Current/Future)	Surface Soil	7.1E-06	9.4
	Surface Water	8.1E-08	9.4
	TOTAL	7.1E-06	9.4
TOTAL FOR TRESPASSER		1.1E-05	
Hypothetical Adult Resident (Future)	Surface Soil	3.2E-05	9.5
	Surface Water	1.3E-07	9.5
	Groundwater	8.0E-05	9.5
	TOTAL	1.1E-04	9.5
Hypothetical Child Resident (Future)	Surface Soil	5.4E-05	9.6
	Surface Water	1.6E-07	9.6
	Groundwater	4.6E-05	9.6
	TOTAL	1.0E-04	9.6
TOTAL FOR RESIDENT		2.1E-04	

As noted above, benzo(a)pyrene (equiv), Aroclor-1260, and arsenic were the carcinogenic COPCs selected for surface soils. The chemical-specific risk estimates for exposure to benzo(a)pyrene (equiv) are within the USEPA target risk range of 1E-04 to 1E-06 for all receptors evaluated except the construction worker, where the risk estimate is less than 1E-06. The risk estimates for exposure to Aroclor-1260 and arsenic are within the USEPA target risk range of 1E-04 to 1E-06 for the hypothetical resident and less than 1E-06 for all other receptors.

As noted above, the predominant risk drivers for groundwater are arsenic, vinyl chloride, and carbazole. Chemical-specific risk estimates for the three chemicals are within the target risk range of 1E-04 to 1E-06 for the hypothetical resident and less than 1E-06 for all other receptors.

There were no carcinogenic COPCs in surface water.

The cancer risk estimates presented for the environmental media are subject to several significant sources of uncertainty. This includes the fact that the carcinogenic PAH concentrations noted in the soils at Group IV are within the range of concentrations reported in the literature as representing anthropogenic background. The EPCs for arsenic and vinyl chloride in groundwater (4.395 µg/L and 0.5839 µg/L, respectively) are below their corresponding GCTLs of 50 µg/L and 1 µg/L. In addition, the carbazole was

detected in only 1 of 93 groundwater samples. These significant sources of uncertainty are further discussed in Section 6.5.1.3.

6.5.1.3 Uncertainty Analysis for Group IV

Uncertainty in the selection of COPCs is related to the current status of the predictive databases, the grouping of samples, and the procedures used to include or exclude constituents as COPCs. Uncertainty associated with the exposure assessment includes the values used as input variables for a given intake route/scenario, the assumptions made to determine exposure point concentrations, and the predictions regarding future land-use and population characteristics. Uncertainty in the toxicity assessment includes the quality of the existing toxicity data needed to support dose-response relationships and the weight-of-evidence used for determining the carcinogenicity of COPCs. Uncertainty in the risk characterization includes that associated with exposure to multiple chemicals and the cumulative uncertainty from combining conservative assumptions made in earlier steps of the risk assessment process.

Whereas there are various sources of uncertainty as described earlier, the direction of uncertainty can be influenced by the assumptions made throughout the risk assessment, including selection of COPCs and selection of values for dose-response relationships. In general, assumptions, which consider safety factors, are made so that the final calculated risks are overestimated.

Once the risk assessment is complete, the results must be reviewed and evaluated to identify the type and magnitude of uncertainty involved. Reliance on results from a risk assessment without consideration of uncertainties, limitations, and assumptions inherent in the process can be misleading.

6.5.1.4 Uncertainty in COPC Selection

The following uncertainties should be considered when evaluating the results of the risk characterization conducted for Group IV:

6.5.1.4.1 Existing Databases

All data used for this evaluation have been validated according to guidelines. Therefore, uncertainties associated with the quality of the data are considered to be minimal. For surface soil, surface water, and sediment, less than 10 samples were collected. The use of small datasets may result in additional uncertainty both in the COPC selection and in the calculated risks.

6.5.1.4.2 COPC Screening Levels

The use of risk-based screening values should ensure that the significant contributors to risk from a site area not incorrectly screened out but are retained for evaluation. Screening values were based on conservative land-use scenarios (i.e., residential land use for soil) and protective levels of risk corresponding to an ILCR of 10^{-6} (divided by the number of initial carcinogenic COPCs) and an HI of 0.1.

6.5.1.4.3 Absence of COPC Screening Levels

Essential human nutrients (magnesium, potassium, calcium, and sodium) are considered toxic only at very high doses and do not have screening levels listed in the GCTL/SCTL tables referenced in this report. These nutrients were eliminated from consideration as COPCs. Exclusion of these chemicals as COPCs is not expected to add significant uncertainty to the risk.

6.5.1.4.4 Frequency of Detection

1,3-Dichlorobenzene; carbazole; naphthalene; pyridine; and aluminum (COPCs in groundwater) were each detected in less than 5% of the samples. However, the chemicals were not screened from being a COPC because of infrequent detection because the wide area encompassed by Group IV; therefore, the detections were not less than 5% of the samples collected at one possible area of impact. No chemicals were eliminated from this HHRA based on the frequency screening criteria, leading to possible overestimation of risk for these chemicals. Carbazole, detected in 1 of 93 groundwater samples collected, was identified as a risk driver.

It should also be noted that the remaining two risk drivers in groundwater (arsenic and vinyl chloride), although detected in several samples, were detected above their respective GCTLs in only 1 and 2 of 94 samples, respectively.

6.5.1.4.5 USEPA Region 9 Preliminary Remediation Goals

USEPA Region 9 PRGs were presented in the COPC selection tables but not used in COPC selection. Because Florida SCTLs and GCTLs are primarily conservative, risk-based screening levels, it is unlikely that the fact that PRG values were not used for COPC screening would result in the underestimation of risk. However, for many chemicals, the Region 9 PRG value and the State of Florida screening value are different. There are some cases in which a chemical would have been selected as a COPC based on a comparison of the maximum concentration to the PRG but the chemical was eliminated as a COPC

based on a comparison of the maximum concentration and the Florida screening values. This is limited to a few chemicals.

In groundwater, the maximum concentrations of 1,1-dichloroethene; 1,4-dichlorobenzene; and cyanide exceeded their unadjusted PRG. 1,4-Dichlorobenzene was detected at a relatively low frequencies (1%). The maximum concentrations of all three chemicals were both less than their respective MCLs. Therefore, it is unlikely that significant underestimation of risk resulted from the omission of these chemicals as COPCs in groundwater.

In surface soil and subsurface soil, the maximum concentration of chromium exceeded its adjusted PRG (divided to account for carcinogenic additivity) but did not exceed the unadjusted PRG. Likewise, in sediment the maximum concentration of cadmium exceeded its adjusted PRG but did not exceed the unadjusted PRG. Arsenic in surface water exceeded its unadjusted PRG but was less than the MCL. Therefore, it is unlikely that significant underestimation of risk resulted from the omission of these chemicals of COPCs in these media.

6.5.1.5 Uncertainty in the Exposure Assessment

6.5.1.5.1 Land-Use

The current land use patterns of NAVSTA Mayport are well established, thereby reducing the uncertainty associated with land use assumptions. Current land use receptors are base workers, construction workers, and site trespassers; this list of receptors is not expected to change in the foreseeable future.

6.5.1.5.2 Mayport Turning Basin

Much of Group IV is located in close proximity to the Mayport Turning Basin; however, potential risks resulting from exposure to surface water and sediment in the Turning Basin were not evaluated in this HHRA. This is primarily because the basin is dredged every two to three years for safe berthing of Navy ships. Dredged sediments are transferred through a slurry pipeline to SWMU 50, the Western Dredge Spoil area. Data from any surface water or sediment sampling that would be collected for this investigation, and subsequent evaluation of human risks, would be unusable the next time the basin is dredged. It is possible that personnel could be exposed to surface water in the Turning Basin through swimming or ingestion of fish.

6.5.1.5.3 Exposure Point Concentration

The maximum concentrations of COPCs in surface soil, surface water, and sediment were selected as the exposure point concentrations for the HHRA. Consequently, risk estimates are likely to be overestimated because it is unlikely that potential receptors would be exposed to maximum concentration only for the entire assumed exposure period.

The method used to calculate the benzo(a)pyrene (equiv.) concentration for carcinogenic polycyclic aromatic hydrocarbons (cPAHs) might also overestimate the risk. USEPA Region 4 guidance (USEPA, 1995) was followed to determine a benzo(a)pyrene (equiv.) concentration representative of total cPAHs in each sample. The Region 4 guidance suggests the following TEFs for each cPAH to calculate the benzo(a)pyrene (equiv.) concentration.:

- benzo(a)pyrene, TEF = 1.0;
- benzo(a)anthracene, TEF = 0.1;
- benzo(b)fluoranthene, TEF = 0.1;
- dibenzo(a,h)anthracene, TEF = 1.0;
- benzo(k)fluoranthene, TEF = 0.01;
- chrysene, TEF = 0.001; and
- indeno(1,2,3-cd)pyrene, TEF = 0.1.

If cPAHs were detected at a sample location, the benzo(a)pyrene (equiv) concentration was calculated for that location by multiplying the concentration of each cPAH by the appropriate TEF and summing these values. If a non-detect result was reported for a cPAH, then half the detection limit of that PAH was used as a surrogate concentration. If cPAHs were not detected at a sample location, then the benzo(a)pyrene (equiv.) concentration was calculated by multiplying half the detection limit for each cPAH by the appropriate TEF and summing these values. As with other analytes in surface soil, the maximum benzo(a)pyrene (equiv.) concentration in an environmental media was used to estimate potential risks.

6.5.1.5.4 Exposure Parameters

The exposure factors, e.g., exposure frequency and duration, used to characterize the risk are based on reasonable maximum exposure (RME) assumptions. Generally, default and literature exposure factors are based on surveys of physiological and lifestyle profiles across the United States. The attributes and activities studied in these surveys generally have a broad distribution. Therefore, the risk is not likely to be underestimated for maximum exposed individuals and is more likely to be overestimated for the general populations exposed to the chemicals in the environmental media at the sites. Assumptions were

made for soil ingestion rate, exposure duration, exposure frequency for the trespasser, and the exposure frequency of a resident child hypothetically exposed to surface water. The assumptions were conservative and are not likely to underestimate the exposure to the receptor.

6.5.1.6 Uncertainty in Toxicity Assessment

6.5.1.6.1 Derivation of Toxicity Criteria

Uncertainty is associated with hazard assessment and dose-response evaluations. The hazard assessment deals with characterizing the nature and strength of the evidence of causation, or the likelihood that a chemical that induces adverse effects in animals will also induce adverse effects in humans. Hazard assessment of carcinogenicity is evaluated as a weight-of-evidence determination, using the USEPA methods. Positive animal cancer test data suggest that humans contain tissue(s), which may manifest a carcinogenic response; however, the animal data cannot necessarily be used to predict the target tissue in humans. In the hazard assessment of no cancer effects, however, the positive animal data often suggest the nature of the effects (i.e., the target tissues and type of effects) anticipated for humans.

Uncertainty in hazard assessment arises from the nature and quality of the animal and human data. Uncertainty is reduced when similar effects are observed across species, strain, sex, and exposure route; when the magnitude of the response is clearly dose-related; when pharmacokinetic data indicate a similar fate in humans and animals; when postulated mechanisms of toxicity are similar for humans and animals; and when the chemical of concern is structurally similar to other chemicals for which the toxicity is more completely characterized.

Uncertainty in the dose-response evaluation is associated with the determination of a CSF for the carcinogenic assessment and derivation of an RfD or RfC for the noncarcinogenic assessment. Uncertainty introduced from interspecies (animal to human) extrapolation, which, in the absence of quantitative pharmacokinetic or mechanistic data, is usually based on consideration of interspecies differences in basal metabolic rate. Uncertainty also results from intraspecies variation. Most toxicity experiments are performed with animals that are very similar in age and genotype, so that intragroup biological variation is minimal, but the human population of concern may reflect a great deal of heterogeneity including unusual sensitivity or tolerance to the COPC. Even toxicity data from human occupational exposure reflect a bias because only those individuals sufficiently healthy to attend work regularly (the healthy worker effect) and those not unusually sensitive to the chemical are likely to be occupationally exposed. Finally, uncertainty arises from the quality of the key study from which the quantitative estimate is derived and the database. For cancer effects, the uncertainty associated with

dose-response factors is mitigated by assuming the 95% upper bound for the slope factor. Another source of uncertainty in carcinogenic assessment is the method by which data from high doses in animal studies are extrapolated to the dose range expected for environmentally exposed humans. The linearized multistage model, which is used in nearly all quantitative estimations of human risk from animal data, is based on a non-threshold assumption of carcinogenesis. Evidence suggests, however, that epigenetic carcinogens, as well as many genotoxic carcinogens, have a threshold below which they are noncarcinogenic (Williams and Welsburger, 1991); therefore, the use of the linearized multistage model is conservative for chemicals that exhibit a threshold for carcinogenicity.

For noncancer effects, additional uncertainty factors may be applied in the derivation of the RfD or RfC to mitigate poor quality of the key study group or gaps in the database. Additional uncertainty for noncancer effects is associated with a prediction of a threshold dose rate less than which adverse effects are not expected. Therefore, an uncertainty factor is usually applied to the estimate of a no-effects level. Additional uncertainty arises in estimation of an RfD or RfC for chronic exposure from subchronic data. Unless empirical data indicate that effects do not worsen with increasing duration of exposure, an additional uncertainty factor is applied to the no-effect level in the subchronic study. Uncertainty in the derivation of RfDs is mitigated by the use of uncertainty and modifying factors that normally range between 3 and 10. The resulting combination of uncertainty and modifying factors are used to proportionally adjust the RfD downwards and thereby intentionally introduce a conservative bias in the RfD by a factor of 1000 or more.

The derivation of dermal RfDs and CSFs from oral values may cause uncertainty. This is particularly the case when no gastrointestinal absorption rates are available in the literature or when only qualitative statements regarding absorption are available.

6.5.1.6.2 Toxicity Criteria For Arsenic

The toxicity criteria for arsenic are a major source of uncertainty for this baseline risk assessment. While conventional risk assessment methodology suggests that there is no “zero risk concentration” for a carcinogen such as arsenic, the human body does have a limited capacity to methylate arsenic and this limit is not generally reached until the body’s intake of arsenic exceeds 500 micrograms per day ($\mu\text{g}/\text{day}$). Most environmental exposures result in intakes lower than 500 $\mu\text{g}/\text{day}$. Additionally, the USEPA suggests that an order of magnitude adjustment of risk (downward) may be appropriate for arsenic in some cases.

6.5.1.7 Uncertainty in the Risk Characterization

Uncertainty in risk characterization results primarily from assumptions made regarding additivity of effects from exposure to multiple COPCs from various exposure routes. High uncertainty exists when summing cancer risks for several substances across different exposure pathways. This assumes that each substance has a similar effect and/or mode of action. Often compounds affect different organs, have different mechanisms of action, and differ in the fate in the body, as additivity may not be an appropriate assumption. However, the assumption of additivity is made to provide a conservative estimate of risk.

Finally, the risk characterization does not consider antagonistic or synergistic effects. Little or no information is available to determine the potential for antagonistic or synergism for the COPCs. Therefore, this uncertainty cannot be discussed for its impact on the risk assessment, as it may either over- or underestimate potential human health risk.

Arsenic and Vinyl Chloride

The groundwater EPCs calculated for arsenic (4.395 µg/L) and vinyl chloride (0.5839 µg/L) do not exceed their respective GCTLs (50 µg/L and 1 µg/L), yet the estimated risk associated with exposure to both of these chemicals was calculated to be greater than 1.0E-06, i.e., they are risk drivers. The chemicals were selected as COPCs in groundwater because 1 and 2 samples, respectively, out of 93 had a detectable concentration greater than the GCTL. The GCTL for these two chemicals is a primary drinking water standard, not a risk-based concentration.

6.5.1.8 Summary and Conclusions for Group IV

A summary of the risk characterization for Group IV is presented in Table 6-3. The following items summarize the results of the risk characterization for Group IV:

- Noncancer risk estimates [Hazard Indices (HIs)] developed for the base worker, the construction worker, the adult trespasser, and the adolescent trespasser are equal to or less than 1, indicating that adverse noncarcinogenic effects are not anticipated under the conditions considered in the risk assessment. HIs developed for the hypothetical future resident adult and child exceed 1.0. HIs developed for individual COPCs and target organs do not exceed 1.0.
- The ILCR estimate for the construction worker (3.2E-07) does not exceed the USEPA target risk range (1E-04 to 1E-06) or the State of Florida cancer risk benchmark (1E-06).

- The ILCR estimates for the base worker ($8.6E-06$) and trespasser ($1.1E-05$) exceed the conservative end of the USEPA target risk range ($1E-06$). Risk from exposure to benzo(a)pyrene (equiv) in surface soil exceeds $1E-06$ for both receptors.
- The ILCR estimate for the hypothetical future resident ($2.1E-04$) exceeds the USEPA target risk range ($1E-04$ to $1E-06$). Risk from exposure to benzo(a)pyrene (equiv), Aroclor-1260, and arsenic in surface soil, and arsenic, vinyl chloride, and carbazole in groundwater exceeds $1E-06$. The EPCs for both arsenic and vinyl chloride in groundwater are below their respective GCTLs.

7.0 ECOLOGICAL RISK ASSESSMENT

7.1 OVERVIEW OF SCREENING-LEVEL ERA METHODOLOGY

This section provides an outline of the general approach that was taken to assess the impacts of site contamination on ecological receptors in the Group IV area and the habitats that support these organisms. This ecological risk assessment (ERA) generally followed a two-step process:

Step 1: Preliminary Problem Formulation (Section 7.2) and Preliminary Ecological Effects Evaluation (Section 7.3)

- Preliminary Problem Formulation - This is the first phase of an ERA, which discusses the goals, breadth, and focus of the assessment. It includes general descriptions of the site to be investigated with emphasis on the habitats and ecological receptors present. This phase also involves characterization of chemical sources and migration pathways, evaluation of routes of chemical exposure, and selection of analytes to be assessed. Preliminary assessment and measurement endpoints are also selected in this phase. Finally, a preliminary conceptual model is developed that describes how chemicals associated with the site may come into contact with ecological receptors.
- Preliminary Ecological Effects Evaluation - In this phase, medium-specific ecological screening guidelines for each analyte (i.e., concentrations of each chemical above which adverse effects to ecological receptors may occur) are identified. This step is undertaken concurrently with the exposure assessment described below.

Step 2: Preliminary Exposure Estimate (Section 7.4) and Risk Calculation (Section 7.5)

- Preliminary Exposure Estimate - This portion of the ERA includes the identification of data sources containing concentrations of chemicals to which ecological receptors may be exposed in various media. It also includes the selection of exposure point chemical concentrations from those data.
- Preliminary Risk Calculation - In this step, exposure point concentrations are compared to guidelines in order to characterize potential risk to ecological receptors. Analytes found to pose potential risk after these comparisons are selected as ecological COPCs.

The above process, described in further detail below, represents the general ERA approach recommended in the most recent USEPA guidance for performing ERAs (USEPA, 1998c and 1997b). Region 4 has developed region-specific guidance (USEPA, 2000) and has requested that this guidance

be followed for all ERAs performed in Region 4. Region 4 guidance is consistent with national USEPA guidance (USEPA, 1998c and 1997b). Hence, this ERA follows Region 4 guidance while containing relevant elements of national USEPA guidance. Additional guidance consulted for this ERA includes Department of the Navy (DON) ERA policy (DON, 1999), which refers to this "screening-level assessment" as a "Tier 1" study in the Navy's three-tiered ERA approach.

Because of the potential complexity of ERAs, they are often conducted using a tiered approach and punctuated with Scientific/Management Decision Points (SMDPs). SMDPs are meetings involving the risk assessors, risk managers, and client to control costs, prevent unnecessary analyses, and ensure that the ERA is proceeding in an efficient, timely manner. Information analyzed in one tier is evaluated to determine whether the objectives of the study have been met, and then it may be used to identify the data required for the next tier, if necessary. Again, this ERA can be considered a "screening-level" assessment because it is based only on comparing chemical concentrations against conservative screening values.

A baseline ERA (BERA) may be conducted if the results of the screening-level ERA indicate that additional study is warranted. The BERA includes more focused studies that incorporate the initial screening, but it may also encompass detailed laboratory and field studies or extensive modeling (USEPA, 1997b). The BERA represents steps 3 through 7 of the 8-step ERA process. The beginning of the BERA presents a more balanced evaluation of the conservativeness inherent in the first two steps in the process (DON, 1999); it is described in detail in Section 7.6. Step 8 is risk management.

7.2 PRELIMINARY PROBLEM FORMULATION

7.2.1 Habitat Types and Ecological Receptors

Group IV is a collection of SWMUs for this RFI located on NAVSTA Mayport. These include the OWCS (SWMU 47), the Sanitary Sewer System (SWMU 53), and the Storm Sewer System (SWMU 55) (Figure 1-2). Other Group IV SWMUs include the Oil/Water Separators (SWMU 54), Fuel Distribution System (AOC A), and Underground Product Storage Tanks (AOC B), which are part of the petroleum program at NAVSTA Mayport (Figure 1-2).

The OWCS is a system of gravity pipelines, lift stations, and force mains that convey oily bilge water collection from ships at the piers and oily water from operations at the FFTC to the OWTP (SWMU 9). A majority of the system was constructed during 1978 to 1980 from ductile iron pipe that is not cathodically protected. Piping at Alpha Pier was replaced in 1991, and the Foxtrot Pier was constructed in 1994. The collection system can be broken down into two subsystems: the gravity feed system used to convey the

oily wastewater from the oily waste risers at the piers to the lift stations, and the lift stations with force main pipelines that convey oily waste to the OWTP.

The sewer pipeline system (SWMU 53) collects and transports wastewater from all areas of the NAVSTA Mayport to the WWTF (A. T. Kearny, 1989). The WWTF is a NPDES-permitted facility located to the south of the entrance to the Mayport Turning Basin. Like the OWCS, the sewer lines are composed of gravity feed pipelines, lift stations, and force main sewer lines.

The storm sewer system (SWMU 55) at NAVSTA Mayport consists of underground storm sewer pipes and unlined drainage ditches (A. T. Kearny, 1989). The storm sewer system conveys runoff to the St. Johns River, Sherman Creek, Lake Wonderwood, the Mayport Turning Basin, and the Atlantic Ocean. Many of the storm sewer pipes that discharge to the surrounding surface water are supplied by unlined drainage ditches found over the entire facility.

NAVSTA Mayport is highly developed, consisting mainly of buildings, roadways, piers, parking lots, and other paved areas. Due to the highly developed nature of the Group IV sites and surrounding areas, terrestrial habitat is poor and of limited quantity and, thus, use by ecological receptors is expected to be minimal. Some mowed turf grass is present along the roadways and between some buildings, with some scattered ornamental trees present. The base golf course is located near some of the sites (Figure 1-2). Some limited aquatic habitat is present in the of the stormwater runoff ditches, with some small runoff retention ponds present. Limited open water is present in the retention ponds, and some cattails (*Typha* spp.) are present along their margins. Open water is located in the Turning Basin, but the aquatic media associated with this area are not considered to be part of Group IV.

7.2.2 Major Chemical Sources and Migration Pathways

The major sources of chemicals at Group IV are the Group IV SWMUs themselves, in particular, the OWCS (SWMU 47), the Sanitary Sewer System (SWMU 53), and the Storm Sewer System (SWMU 55). Chemicals associated with past waste disposal practices associated with these SWMUs are of concern. For this ERA, the ditches associated with the Storm Water Sewer System are most relevant, as the other SWMUs and AOCs are subsurface, and no known groundwater-to-surface water discharge of chemicals to the ditches is known to occur. The major contaminant migration pathways for the Group IV sites are runoff to the ditches from adjacent areas, or back-up of subsurface systems leading to surface contamination.

7.2.3 Exposure Routes

The chemical exposure routes for Group IV are aquatic, semi-aquatic, and terrestrial. Because the surface water and sediment samples were collected from drainage ditch areas that are frequently dry, the majority of exposure would be for terrestrial receptors. Aquatic and semi-aquatic organisms associated with the drainage areas could be exposed to chemicals via direct contact with surface water and sediments, incidental ingestion of surface water and sediments, drinking surface water, and consumption of contaminated food items. Exposure can occur also via discharge of chemicals in groundwater to surface water and sediment. However, groundwater is not known to discharge to surface water in the potentially impacted areas containing surface water and sediment.

Terrestrial animals at the site may be exposed to soil contaminants through ingestion of contaminated food items. Animals can incidentally ingest soil while grooming fur, preening feathers, digging, grazing close to the soil, or feeding on items to which soil has adhered (such as roots and tubers). Terrestrial vegetation may be exposed to contaminants via direct aerial deposition and root translocation. Aerial deposition was not investigated, primarily because the contaminant sources at the sites under investigation are largely covered by vegetation, reducing the amount of bare soil and fugitive dust. Exposure to contaminants in the soil via dermal contact may occur, but is unlikely to represent a major exposure pathway because fur, feathers, and chitinous exoskeletons probably minimize transfer of contaminants across dermal tissue. Soil trapped in the fur or feathers could be ingested during grooming or preening activities, which are evaluated as part of the indirect ingestion exposure route. In addition, little information is available (e.g., absorption factors) to evaluate dermal exposures to wildlife. Direct exposure to soil chemicals is also possible for terrestrial invertebrates.

Volatile constituents are present in some site soils and soil-bound contaminant resuspension may occur. However, inhalation does not represent a significant exposure pathway because air contaminant concentrations are assumed to be quite low, even for burrowing wildlife. The inhalation exposure route is generally only relevant after a spill of a volatile chemical. In addition, inhalation ecotoxicity data for chronic exposure are lacking. Hence, the air pathway was not considered for ecological receptors.

7.2.4 Selection of Analytes to be Investigated

Analytes included in the ERA for quantitative analysis were all chemicals detected in surface water, sediment, and surface soil samples collected in 2001. Calcium, magnesium, potassium, and sodium were excluded as analytes to be investigated because they are essential nutrients that are toxic only in extremely high concentrations. Due to the scarcity of data for these essential nutrients, it would not be possible to develop ranges of toxicity for them, even at high concentrations. The limited toxicity data available indicate that high dietary intake of these nutrients is well tolerated.

7.2.5 Assessment and Measurement Endpoints

As discussed in USEPA (1997b) one of the major tasks in preliminary problem formulation is the selection of preliminary assessment and measurement endpoints. An assessment endpoint is defined as "an explicit expression of actual environmental values that are to be protected" (USEPA, 1997b). Measurement endpoints are "measurable ecological characteristics that are related to the valued characteristic chosen as the assessment endpoint" (USEPA, 1997b). Region 4 has specified that assessment endpoints for the screening-level assessment should be broad and generic and considered preliminary. For this ERA, the preliminary assessment endpoints were protection of the following groups of receptors from adverse effects of chemicals on their growth, survival, and reproduction:

- Aquatic and Semi-Aquatic Biota
- Terrestrial Biota

As indicated above, measurement endpoints (also referred to as "measures of effects") are related to assessment endpoints, but these endpoints are more easily quantified or observed. In essence, measurement endpoints serve as surrogates for assessment endpoints. While declines in populations and shifts in community structure can be quantified, studies of this nature are generally time-consuming and difficult to interpret. However, measurement endpoints indicative of observed adverse effects on individuals are relatively easy to measure in toxicity studies and can be related to the assessment endpoint.

For surface water and sediment in the drainage areas, the preliminary measurement endpoints were chemical concentrations in surface water and sediment associated with adverse effects on growth, survival, and reproduction of surface water and benthic organisms, respectively (screening levels). For surface soil, the preliminary measurement endpoints were chemical concentrations in surface soil associated with adverse effects on growth, survival, and reproduction of soil invertebrates/plants (surface soil screening levels). The measurement endpoints listed above incorporate, to the fullest extent possible, the assessment endpoints.

7.2.6 Preliminary Conceptual Site Model

The conceptual model is designed to diagrammatically identify potentially exposed receptor populations and applicable exposure pathways, based on the physical nature of the site and the potential chemical source areas. Actual or potential exposure to chemicals for ecological receptors associated with Group IV was determined by identifying the most likely pathways of chemical release and transport. A complete exposure pathway has three components: a source of chemicals that can be released to the environment; a route of

chemical transport through an environmental medium; and an exposure route or contact point for an ecological receptor. A preliminary conceptual model for Group IV is presented in Figure 7-1.

7.3 PRELIMINARY ECOLOGICAL EFFECTS EVALUATION

For this ERA, exposure point concentrations of detected analytes in surface water, sediment, and surface soil were compared to ecologically-based guidelines to determine if they should be selected as COPCs. Screening levels for this assessment were Region 4 ecological screening levels (USEPA, 2000). Freshwater values were used because water in the drainage system is freshwater runoff from portions of the Group IV sites area. When screening levels were available for different species of the same metal, the screening level for the most toxic form was used, such as those for hexavalent chromium, trivalent arsenic, and methyl mercury.

7.4 PRELIMINARY EXPOSURE ESTIMATE

Data used to obtain exposure point chemical concentrations in this ERA were obtained from analyses of the surface water, sediment, and surface soil samples collected as part of this investigation. For this screening assessment, the maximum concentrations of chemicals in these media were used as the exposure point concentrations. Three surface water and sediment samples were collected at potentially impacted areas throughout Group IV. Eight surface soil samples were collected at potentially impacted areas throughout Group IV. Groundwater data were not analyzed in this ERA because groundwater is not known to discharge to surface water in the potentially impacted areas containing surface water and sediment.

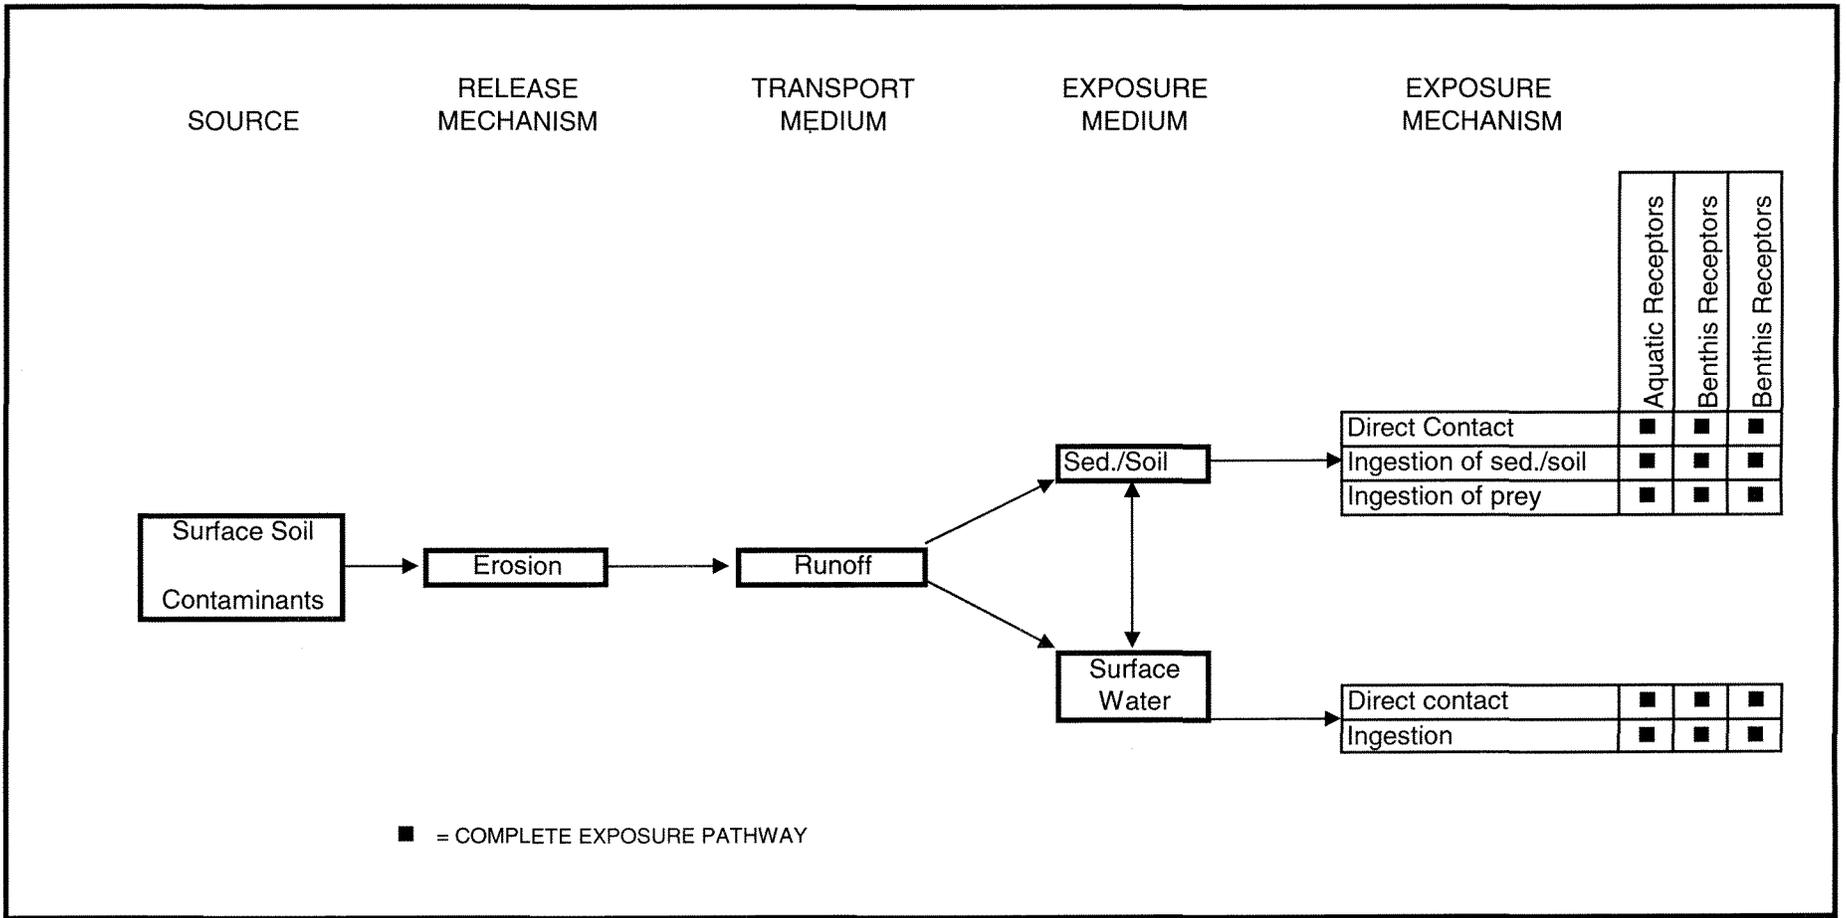

FIGURE 7-1

ECOLOGICAL CONCEPTUAL SITE MODEL
GROUP IV SITES
NAS MAYPORT, FLORIDA

7.5 PRELIMINARY RISK CALCULATION

As identified by USEPA (1997b), the preliminary risk calculation step in the ERA process compares the maximum concentrations of chemicals in surface water and sediment to Region 4 screening levels. The ratio of the exposure point chemical concentration to the screening level is called the Hazard Quotient (HQ) and is defined as follows:

$$HQ_i = EPC_i / ESG_i$$

where: HQ_i = Hazard Quotient for analyte "i" (unitless)
 EPC_i = Exposure Point Concentration ($\mu\text{g}/\text{kg}$ or mg/kg)
 ESG_i = Ecological Screening Guideline for analyte "i" ($\mu\text{g}/\text{kg}$ or mg/kg)

When the ratio of the exposure point concentration to its respective guideline exceeded 1.0, adverse impacts were considered possible, and the chemical was selected as a COPC. The HQ value should not be construed as being probabilistic; rather, it is a numerical indicator of the extent to which an exposure point concentration exceeds, or is less than a guideline. When HQ values exceeded 1.0, it was an indication that ecological receptors are potentially at risk. Additional evaluation or data may be necessary to confirm with greater certainty whether ecological receptors are actually at risk, especially since most screening-level guidelines are conservatively derived.

The use of HQs is probably the most common method used for risk characterization in ERAs. Advantages of this method, according to Barnhouse et al. (Barnhouse et. al., 1987), include the following:

- The HQ method is relatively easy to use, is generally accepted, and can be applied to any data.
- The method is useful when a large number of chemicals must be screened.

This method of risk characterization has some inherent limitations. One primary limitation is that it is a "no/maybe" method for relating toxicity to exposure. That is, it uses single values for exposure concentrations and guidelines. The HQ method does not account for the variability in both these parameters, nor for incremental or cumulative toxicity.

The comparisons described above are presented in surface water, sediment, and surface soil screening tables to select COPCs from comparison to screening levels. Screening tables include the exposure point concentrations, the chemical-specific screening levels, and HQs.

7.5.1 Screening Results – Surface Water

Aluminum, copper, iron, lead, selenium, and thallium had HQs greater than 1.0 in Group IV surface water (see Table 7-1). Acetone, carbon disulfide, 2-butanone, aniline, 3-methylphenol, 4-methylphenol, barium, manganese, molybdenum, and vanadium were selected as surface water COPCs because no Region 4 screening levels were available see (Table 7-1).

7.5.2 Screening Results – Sediment

No chemical detected in Group IV sediment had an HQ greater than 1.0 (see Table 7-2). Acetone, diethyl phthalate, aluminum, barium, cobalt, iron, manganese, molybdenum, selenium, and vanadium were selected as COPCs because no Region 4 screening levels were available (see Table 7-2).

7.5.3 Screening Results – Surface Soil

Five PAHs [4,4'-Dichlorodiphenyldichloroethylene (DDE); aluminum; chromium; copper; iron; lead; mercury; vanadium; and zinc] had HQs greater than 1.0 in Group IV surface soil (see Table 7-3).

7.6 STEP 3A: REFINEMENT OF CONTAMINANTS OF POTENTIAL CONCERN

7.6.1 Step 3A Methodology

The use of conservative guidelines and maximum detected concentrations as a starting point for assessing risks in the screening-level assessment is necessary to ensure that potential risks are not underestimated. However, the use of only a comparison of conservative guidelines to maximum detected concentrations has severe limitations as a tool for determining the need for, and the nature and magnitude of, additional ecological work, and/or a complex baseline ERA.

The undertaking of costly additional ecological analyses must be weighed against benefits, especially in such cases where remedial alternatives are limited or do not exist. Moreover, the environment may suffer as sites of lesser ecological significance are given the same priority as sites of clearly greater ecological concern. For these reasons, the consideration of other relevant factors was employed as part of this assessment. USEPA and the Navy (DON, 1999) consider the evaluation of these factors as part of Step 3 in the 8-step process, or "Step 3A, Refinement of Contaminants of Potential Concern." DON has specified that Step 3A be conducted following all screening-level ERAs at its bases. Region 4 USEPA (USEPA, 2000) has indicated that Step 3A assessments can be submitted with the screening-level

assessment. The factors that were used as part of Step 3A in this ERA include the following and are described in detail below:

7.6.1.1 Frequency of Detection and Spatial Analysis of Detections/Magnitude of HQ Values

The frequency of detection and spatial analysis of exceedances was also evaluated as part of Step 3A. Evaluation of these items allows for determination of whether potential risks are widespread or limited to a small area. This is especially important in a large area such as the Group IV area. The magnitude of the HQs was also evaluated. As described earlier, the relationship between the magnitude of an HQ and toxicity is not necessarily linear. However, the magnitude of an HQ can be used as a rough approximation of the extent of potential risks, especially if there is sufficient confidence in the guideline used.

7.6.1.2 Less Conservative Screening Levels

USEPA Region 4 sediment guidelines are designed to be conservative. Therefore, less conservative sediment guidelines are discussed in this Step 3A for sediment and surface soil COPCs. These guidelines include FDEP sediment screening levels as presented in Jones et. al. (Jones et. al., 1997). In particular, permissible exposure limits (PELs) from FDEP are presented. PELs represent the lower limit of the range of chemical concentrations that are usually or always associated with adverse biological effects, and are derived from both fresh and saltwater data. Several of the USEPA Region4 sediment screening levels are based on FDEP Threshold Effect Levels (TELs), which represent the upper limit of the range of sediment concentrations dominated by no effects data. TELs, thus, are conservative and PELs are less conservative. The presentation of PELs for sediment COPCs provides balance to the assessment.

Other “less conservative” sediment guidelines are also discussed in this Step 3A and include sediment severe effects levels (SELs), National Oceanic and Atmospheric Administration (NOAA) effects range-medians (ER-Ms), and Assessment and Remediation of Contaminated Sediments Program (ARCS) Probable Effects Concentrations (PECs) as summarized in Jones et. al. (Jones, et. al., 1997). SELs were from the Ontario Ministry of the Environment (MOE). MOE guidelines were based exclusively on observed effects in the field (absence of certain species). The SEL represents the chemical level that could potentially eliminate most of the benthic organisms. Unlike NOAA and FDEP guidelines, MOE guidelines were based exclusively on freshwater sediments. NOAA ER-Ms are defined as the concentration above which adverse effects would “frequently” be observed (Jones et. al., 1997). ARCS PECs were generated as part of USEPA’s Great Lakes National Program.

Friday (Friday, 1998) recommended surface soil screening levels that are the USEPA Region 4 recommended screening levels used in the screening. However, Friday (Friday, 1998) generally used the most conservative values from these sources as the recommended value. Thus, all of the guidelines presented in Step 3A for surface soils are the less conservative values from the sources considered by Friday (Friday, 1998). The surface soils Step 3A tables present United States Fish and Wildlife Service (USFWS) "B" values, various Oak Ridge National Laboratory (ORNL) values, and Dutch "Intervention" values, as summarized in Friday (Friday, 1998). USFWS "B" values are defined as the concentrations representative of "moderate" contamination. ORNL presents three sets of values representing risks to earthworms, soil microbes, and plants, respectively. The Dutch Intervention values represent concentrations that appear to be of sufficient magnitude to require clean-up.

In general, alternate or "less conservative" guidelines for surface water are not as plentiful as those for sediments are. Hence, a broad range of alternative guidelines for surface water could not be developed.

7.6.1.3 Toxicological Information

Furthermore, toxicity data and information from various sources in the literature were discussed as they relate to the interpretation of potential risks from each COPC. These sources include the USFWS Chemical Hazard Reviews, commonly referred to as the "Eisler" publications, and ecotoxicological journals. Discussion of this toxicity data and information is presented in the COPC-specific Step 3A discussion below.

Food chain modeling was not relevant to the assessment because the samples were collected in disparate locations in a highly developed area. Use of the site by semi-aquatic wildlife, such as wading birds and mammals, would be negligible, and the potentially impacted drainage ditches would constitute only a small fraction of the home range or feeding territory of these receptors.

7.6.2 Inorganics

7.6.2.1 Aluminum

Aluminum was a COPC in all media at Group IV. No suitable alternate guidelines were available for aluminum in any medium. The one exception was the ARCS sediment PEC (58,030 mg/kg), which was higher than the maximum concentration in sediment (1,980 mg/kg).

As summarized in Venugopal and Luckey (Venugopal and Luckey, 1978), aluminum is not readily absorbed through the skin mammals and gastrointestinal absorption of ingested aluminum is poor due to the transformation of aluminum salts into insoluble aluminum phosphate. Another factor in the lack of

accumulation of aluminum in animals with age or the absence of any increase in tissue levels of aluminum following fairly high dietary intake may be that certain organisms possess a homeostatic mechanism for this element. For most terrestrial organisms (e.g., semi-aquatic mammals and birds), aluminum compounds are generally not harmful and are considered to be toxicologically inert, except in cases of high experimental doses or prolonged inhalation (Venugopal and Luckey, 1978). Data on the toxicity of aluminum to aquatic organisms is somewhat limited. USEPA (USEPA, 1988) suggests that freshwater organisms should not be adversely affected when pH is between 6.5 and 9.0. For these reasons, aluminum should be dropped from further consideration as a Group IV COPC.

7.6.2.2 Barium

Barium was a COPC in surface water and sediments because no USEPA Region 4 screening levels were available. No alternate guidelines for barium in sediments were available. Barium is a common element in sediments and it is not generally associated with significant toxicity [Agency for Toxic Substances and Disease Registry (ATSDR), 1997]. For these reasons, barium should be dropped from further consideration as a Group IV COPC.

7.6.2.3 Chromium

Chromium was a COPC in surface soils. The elevated HQ for chromium in surface soil appears to be a function of the overly-conservative screening level for chromium. This screening level is the ORNL earthworm value of 0.4 mg/kg. Qualitatively, this concentration is an order of magnitude less than typical soil background concentrations (Shacklette and Boerngen, 1984). The maximum detected concentration of chromium in surface soils of 10.6 mg/kg is less than the conservative USFWS "A" value of 100 mg/kg and the Dutch Target Value of 100 mg/kg (Friday, 1998). Moreover, chromium is not known to bioaccumulate or biomagnify (Eisler, 1986). For these reasons, chromium should be dropped from further consideration as a Group IV COPC.

7.6.2.4 Cobalt

Cobalt was a COPC in sediments because no USEPA Region 4 screening level was available. It was detected in one of three sediment samples. Toxicity data for cobalt are scarce. Cobalt is present in all natural media and is found in tissues of most higher organisms (ATSDR, 1997). The mobility of cobalt is controlled by its characteristic of adsorbing to the clay minerals and hydrous oxides of iron, manganese, and aluminum available in sediments. Therefore, cobalt may be present in Group IV sediments in forms that are not bioavailable. Moreover, cobalt is a component of certain B vitamins, which are essential for birds and mammals. Thus, cobalt should be dropped from further consideration as a COPC at Group IV.

7.6.2.5 Copper

Copper was a COPC in surface water and surface soil. The HQs for surface water and sediment were relatively low (1.5 and 1.27, respectively). The maximum detected concentration in surface soils of 50.7 mg/kg is approximately equal to the conservative USFWS "A" value of 50 mg/kg and only slightly higher than the conservative Dutch Target value of 36 mg/kg (Friday, 1998). Therefore, copper should be dropped from further consideration as a COPC at Group IV.

7.6.2.6 Iron

Iron was a COPC in surface water, sediments, and surface soil. Iron is an essential nutrient and is one of the most common elements in the earth's crust (fourth most abundant). It is rarely toxic in aquatic media at normal pH; all of the surface water samples collected in Hancock Creek contained typical pH values. Stained surface water, such as that in the retention areas, may contain iron concentrations of several milligrams per liter in the presence or absence of dissolved oxygen, but has little effect on aquatic life (USEPA, 1990). For these reasons, iron should be dropped from further consideration as a Step 3A COPC.

7.6.2.7 Lead

Lead was a surface water and surface soil COPC. The three detection of lead in surface water all somewhat exceeded the Region 4 screening level. Lead was not elevated in sediments. The HQ for lead in surface soils was relatively low (HQ = 1.79) and the maximum concentration of 80.9 mg/kg was only slightly higher than the conservative USFWS "A" value of 50 mg/kg and approximately equal to the conservative Dutch Target Value of 85 mg/kg (Friday, 1998). For these reasons, some potential risks from lead in surface water may be present but, overall, the potential risks from lead in Group IV media do not appear to be of sufficient magnitude to warrant its retention as a COPC.

7.6.2.8 Manganese

Manganese was a COPC in surface water and sediment because no USEPA Region 4 screening levels were available. Toxicity data for manganese is scarce. Manganese is a common element in the earth's crust and an essential nutrient. In the sediment, the concentrations and chemical forms in which manganese can occur are affected by pH, cation exchange capacity, and other factors. Lower pH and reducing conditions tend to favor solubility and, hence, the toxicity of manganese in surface waters. For these reasons, manganese should be dropped from further consideration as a Group IV COPC.

7.6.2.9 Mercury

Mercury was a surface soil COPC. It was detected in 1 of 8 samples with a relatively low HQ of 2.9. It was not detected in surface water or sediment. The maximum detection of mercury in surface soils of 0.29 mg/kg was less than the conservative USFWS "A" value of 0.5 mg/kg and the conservative Dutch Target Value of 0.3 mg/kg (Friday, 1998). For these reasons, mercury should be dropped from further consideration as a Group IV COPC.

7.6.2.10 Molybdenum

Molybdenum was a surface water and sediment COPC because no Region 4 screening levels were available. No alternate sediment guidelines were available. Little data exist to help interpret abiotic media concentrations of molybdenum. However, trace quantities of molybdenum are beneficial and may be essential for normal growth of plants and animals (Eisler, 2000). Aquatic plants are relatively resistant to molybdenum, as are freshwater fishes (Eisler, 2000). It can also protect against poisoning by copper or mercury and may be useful in controlling cancer (Eisler, 2000). For these reasons, molybdenum should not be retained as a COPC in Group IV media.

7.6.2.11 Selenium

Selenium was a COPC in surface water. It was a COPC in sediment because no USEPA Region 4 screening level was available. The HQ in surface water was relatively low (HQ = 1.16). No alternate guidelines are available for selenium in sediment, but the one detection in this medium appears to be qualitatively low (0.87 mg/kg). Selenium can be harmful at elevated concentrations, but is an essential nutrient. For these reasons, selenium should not be retained as a Group IV COPC in Step 3A.

7.6.2.12 Thallium

Thallium was a surface water COPC, though the HQ was relatively low (1.65). It was not detected in sediments or in surface soils. For these reasons, thallium should be eliminated from consideration as a Step 3A COPC.

7.6.2.13 Vanadium

Vanadium was a surface water and sediment COPC because no screening level was available. It was a COPC in surface soils with an HQ greater than 1.0.

No suitable alternate guidelines were available for vanadium in sediment. One was available in surface soil; the maximum concentration of vanadium in surface soils (7.0 mg/kg) was less than this value, the ORNL soil microorganism guideline (20 mg/kg). The guidelines appear to be conservative because they are comparable to concentrations of vanadium commonly found in unimpacted areas of military bases. Vanadium is a common element found in all types of substrates (ATSDR, 1997). It can also be found in all types of organisms due to its ubiquitous nature (Klaassen et. al., 1986). Toxicity data for this element are scarce, but it is not generally considered to be toxic in the environment (Mailman, 1980), and it is not known to bioaccumulate or biomagnify. For these reasons, vanadium should be dropped from further consideration as a Group IV COPC.

7.6.2.14 Zinc

Zinc was a surface soil COPC. The maximum concentration of zinc in surface soils was somewhat elevated. However, the average concentration of 66.8 mg/kg was less than the conservative USFWS "A" value of 200 mg/kg and the conservative Dutch Target Value of 140 mg/kg (Friday, 1998). For these reasons, zinc should be dropped from further consideration as a Group IV COPC.

7.6.3 Organics

7.6.3.1 Volatile Organic Compounds

VOCs were detected in surface water and sediment and only a few ecological screening levels were available. Alternate guidelines for these compounds are scarce, but are generally quite high when available. Overall, frequencies of detection were low and concentrations appear to be qualitatively low in sediments and surface soils. VOCs do not bioaccumulate or biomagnify and are generally of low ecotoxicological significance due to their mode of action, carcinogenicity, which is generally irrelevant for ecological receptors. For these reasons, VOCs should not be retained as COPCs in Step 3A.

7.6.3.2 Polycyclic Aromatic Hydrocarbons

Several polycyclic aromatic hydrocarbons were COPCs in surface soils. HQs were relatively low (HQs = 1.8 or less) for individual polycyclic aromatic hydrocarbons, suggesting low potential risks. All of the maximum concentrations of polycyclic aromatic hydrocarbons were in Sample SS-04 (Table 7-3). All

of the other detections in Group IV surface soils were much less. This suggests localized potential risks at sample location SS-04. The maximum concentration for total polycyclic aromatic hydrocarbons of 0.99 mg/kg was less than the Dutch Intervention value for polycyclic aromatic hydrocarbons of 40 mg/kg and USFWS "C" value of 200 mg/kg.

Furthermore, food chain uptake is generally not considered to be a major exposure route for polycyclic aromatic hydrocarbons for aquatic organisms (ATSDR, 1990). Polycyclic aromatic hydrocarbons have strong affinities for organic carbon in sediments, which generally reduces their bioavailability. Although polycyclic aromatic hydrocarbons can accumulate in terrestrial and aquatic organisms, most organisms are able to metabolize and eliminate these compounds. Vertebrates can readily metabolize most polycyclic aromatic hydrocarbons (ATSDR, 1990).

For these reasons, although some localized potential risks may be present in surface soils, these potential risks do not appear to be of sufficient magnitude to warrant retention of polycyclic aromatic hydrocarbons as COPCs at Group IV.

7.6.3.3 Additional SVOCs

Aniline, 3-methylphenol, and 4-methylphenol were detected in one surface water sample (SW-01). No Region 4 screening levels were available for these SVOCs. They were not detected in any other medium. Diethyl phthalate was detected in one sediment sample, and no Region 4 screening level was available. It was not detected in any other medium. No alternate guidelines were available.

Aniline, 3-methylphenol, 4-methylphenol, and diethyl phthalate are generally not considered to be ecotoxic and their spotty detections do not appear to pose widespread potential risks. However, without site-specific data for these organics, their potential risks cannot be fully assessed.

7.6.3.4 Pesticides/PCBs

Two pesticides were COPCs in surface water and several pesticides were COPCs in sediments and surface soils.

4,4'-DDE was a COPC in Group IV surface soils. It was detected in 1 of 8 samples at a relatively low HQ (HQ = 1.08). The maximum detection of this compound of 0.0027 mg/kg was less than the Dutch Intervention value of 4.0 mg/kg for total dichlorodiphenyltrichloroethane (DDT) and less than the USFWS value of 0.1 mg/kg for individual organochlorine pesticides. Overall, the concentration of 4,4'-DDE in

Group IV surface soils appears to be indicative of historical, legal use of these pesticides. Thus, the Group IV area does not appear to be a source of pesticide contamination.

7.7 SCREENING-LEVEL AND STEP 3A UNCERTAINTY ANALYSIS

Uncertainty is associated with all aspects of the ERA process. This section provides a summary of the uncertainties involved in each step of the ERA process, with a discussion of how they may affect the final risk values and conclusions.

7.7.1 Uncertainty in the Preliminary Problem Formulation

Measures of effects (i.e., measurement endpoints) are used to evaluate the assessment endpoints that are selected for the ERA. For the most part, the measures of effects are not the same as the assessment endpoints. By selecting surrogate species for evaluation, the measures are used to predict effects to the assessment endpoints. This use of surrogate species adds uncertainty to the assessment due to the differences in toxicity and modes of toxicity to different species or groups of receptors.

7.7.2 Uncertainty in the Ecological Effects Characterization

Some chemicals were present in Group IV media for which no toxicity data were available. These chemicals were selected as COPCs, including some VOCs and inorganics. They were eliminated in nearly all instances for qualitative reasons, but without adequate toxicity data, their ecotoxicity cannot be fully assessed.

Little data exist for investigating risks to reptiles and amphibians in the Group IV area. As a result, direct conclusions about the potential risks to reptiles and amphibians cannot be made, and only qualitative inferences can be drawn. Given the relatively low overall ecological risks associated with Group IV, unacceptable risks to reptiles and amphibians are unlikely.

7.7.3 Uncertainty in the Exposure Assessment

Uncertainty in the exposure assessment arises from the low sample size for surface water and sediments. However, the drainage areas represent the only aquatic habitat that is of ecological concern at Group IV, which is located in a highly developed portion of the base.

The detection limits for site media can also carry uncertainties. That is, it is possible that high detection limits could result in "false negatives," where concentrations are actually present that could result in potential risks. In these cases, the detection limits are normally higher than the screening levels. For the most part, however, the detection limits were those commonly achieved for these analyses, and could

only be lowered by employing seldom-used and complicated laboratory methodologies. Nonetheless, the detection limits for some chemicals introduce uncertainty in the ERA.

7.7.4 Uncertainty in the Risk Calculation

Uncertainty in risk calculation stems, in part, from combining different components of the ERA in this step. Each of those components already contains uncertainty. Thus, uncertainties may be propagated when these components are combined. Uncertainty is associated with the potential for additive, antagonistic, synergistic, or ameliorative effects of chemicals detected in Group IV media. In most cases, little or no data or methodologies exist for quantifying these types of effects and, thus, they cannot be fully assessed.

To try to reduce the overall uncertainty in the risk assessment, the weight of evidence approach is used to make risk decisions. This approach takes the results of all aspects of the assessment into account, including the uncertainties, to make determinations of acceptable risk/unacceptable risk.

7.8 STEP 3A SUMMARY AND CONCLUSIONS

A screening-level ecological risk assessment was performed for the Group IV sites at NAVSTA Mayport. Some inorganics, polycyclic aromatic hydrocarbons, and pesticides were selected as COPCs because their maximum concentrations in surface water, sediment, and/or surface soil exceeded Region 4 screening levels. A Step 3A analysis was conducted for the COPCs that remained after the screening-level analysis. The Step 3A analysis indicated that some low potential risks were present from some chemicals, including lead in surface water, and zinc and polycyclic aromatic hydrocarbons in surface soils. However, the elevated detections of these chemicals were spotty and in most cases, confined to a single sample. Most importantly, the Group IV area is located in a highly developed and industrialized area, with a significant amount of human use and human disturbance. As a result, further ecological risk assessment or ecological risk management appears to be unwarranted for the Group IV area.

8.0 CONCLUSIONS AND RECOMMENDATIONS

8.1 CONCLUSIONS

The RFI identified the following items for Group IV:

SWMUs 47 and 53

Subsurface Soil

- Four VOCs were detected in the subsurface samples collected from SWMUs 47 and 53. There were no detections exceeding regulatory criteria.
- Two SVOCs [benzo(a)pyrene and hexachlorobenzene] and three inorganics (arsenic, copper, and vanadium) were detected in the subsurface soil samples above FDEP SCTL residential criteria. Both SVOCs and one inorganic (arsenic) also exceeded the FDEP SCTL industrial criteria. Hexachlorobenzene was detected above the FDEP SCTL industrial criterion and at a concentration equivalent to its FDEP SCTL leaching criterion in one sample.

Groundwater

- One VOC (benzene), two SVOCs [bis(2-ethylhexyl)phthalate and carbazole], and six inorganics (aluminum, arsenic, iron, manganese, sodium, and thallium) were detected above FDEP GCTLs in the groundwater screening samples collected at Group IV.
- One VOC (vinyl chloride), one SVOC [bis(2-ethylhexyl)phthalate], and four inorganics (iron, manganese, sodium, and thallium) were detected above FDEP standards in the groundwater monitoring well samples collected. There were significantly fewer detections of iron and manganese above their respective background screening values than their respective FDEP standards.

SWMU 55

Subsurface Soil

- One VOC, 10 SVOCs, one pesticide, one PCB, and 18 inorganics were detected in the stormwater conveyance soil samples collected. There were no VOCs, SVOCs, pesticides, or

PCBs detected in the surface soil samples above FDEP standards. Arsenic was the only inorganic analyte reported at concentrations above the residential FDEP SCTL (0.8 µg/kg) in samples MPT-55-SS01-01 (0.92 µg/kg), MPT-55-SS04-01 (0.83 µg/kg), and MPT-55-SS08-01 (1.3 µg/kg). Arsenic was also detected above the USEPA Region IX PRG (0.39 mg/kg) in every surface soil sample collected at SWMU 55. There were no detections above the FDEP SCTL or USEPA Region IX PRG industrial value.

- An IM for the ditch in front of Building 191 is scheduled to be performed in 2004. The completion report providing the IM activities and data will be provided in the CMS.

Surface Water

- Two SVOCs and one inorganic were reported at values exceeding FDEP standards in the surface water samples collected at SWMU 55.

Sediments

- There were no detections in the sediment samples above benchmark values for sediment standards. However, the retention basin in which the sample was collected is dry for extended periods of the year. Consequently, the analytical results were compared to FDEP surface soil standards. There was one inorganic analyte (arsenic) detected in a sample that occurred above FDEP standards.

The HHRA identified the following items for Group IV:

- Noncancer risk estimates [Hazard Indices (HIs)] developed for the base worker, the construction worker, the adult trespasser, and the adolescent trespasser are equal to or less than 1, indicating that adverse noncarcinogenic effects are not anticipated under the conditions considered in the risk assessment. HIs developed for the hypothetical future resident adult and child exceed 1.0. HIs developed for individual COPCs and target organs do not exceed 1.0.
- The ILCR estimate for the construction worker (3.2E-07) does not exceed the USEPA target risk range (1E-04 to 1E-06) or the State of Florida cancer risk benchmark (1E-06).
- The ILCR estimates for the base worker (8.6E-06) and trespasser (1.1E-05) exceed the conservative end of the USEPA target risk range (1E-06). Risk from exposure to benzo(a)pyrene (equiv) in surface soil exceeds 1E-06 for both receptors.

- The ILCR estimate for the hypothetical future resident (2.1E-04) exceeds the USEPA target risk range (1E-04 to 1E-06). Risk from exposure to benzo(a)pyrene (equiv), Aroclor-1260, and arsenic in surface soil, and arsenic, vinyl chloride, and carbazole in groundwater exceeds 1E-06. The EPCs for both arsenic and vinyl chloride in groundwater are below their respective GCTLs.

The ERA identified the following items for Group IV:

- The screening-level ERA concluded that some inorganics, polycyclic aromatic hydrocarbons, and pesticides were selected as COPCs because their maximum concentrations in surface water, sediment, and/or surface soil exceeded Region 4 screening levels.
- The Step 3A analysis indicated that some low potential risks were present from some chemicals, including lead in surface water, and zinc and polycyclic aromatic hydrocarbons in surface soils. However, the elevated detections of these chemicals were spotty and in most cases, confined to a single sample.
- The Group IV area is located in a highly developed and industrialized area, with a significant amount of human use and human disturbance. As a result, further ecological risk assessment or ecological risk management appears to be unwarranted for the Group IV area.

8.2 RECOMMENDATIONS

It is recommended that additional delineation be performed to identify the extent of contamination present in the surface and subsurface soil at three areas along the Group IV SWMUs. Due to the linear nature of the Group IV SWMUs and limited extent of the contamination present, specific investigation “areas” within the SWMUs will be created. This will allow for a focused investigation and limit the areal extent potentially requiring a remedial action. Area 1 will include sample MPT-G4-B20, with an industrial exceedance of benzo(a)pyrene. Area 2 will include sample MPT-G4-B06, with an industrial exceedance of hexachlorobenzene. Area 3 will include sample MPT-G4-B49, with an industrial exceedance of arsenic. A letter report presenting the results and recommendations for the three specific areas will be issued as an RFI addendum.

After completion of the additional activities, a CMS to evaluate and recommend a remedial action to mitigate soil and groundwater contamination at the Group IV SWMUs will be completed. At a minimum, the CMS should evaluate the implementation of natural attenuation of COPCs in groundwater and land use controls.

SUBJECT: Group IV Sampling Event
U.S. Naval Station (NAVSTA), Mayport, Florida
Navy CLEAN District I CTO #0028
Contract No. N62467-89-D-0317

Dear Adrienne:

This report provides the results of a limited sampling event at Group IV. The Group IV sites are located in the northern and westcentral parts of NAVSTA Mayport (Figures 1 and 2, Attachment A). The sampling event consisted of collecting surface water, sediment, and subsurface soil samples, installing microwells, and collecting groundwater samples. The sampling locations were selected to be where potential releases to the environment may have occurred. It is our understanding that the analytical results from this limited sampling event will be used by the Navy to characterize the potential for risk to human health and the environment, and prioritize funding for the Group IV sites.

Sampling and well installation procedures were in general accordance with those described in the Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) Workplan for NAVSTA Mayport, Florida (ABB Environmental Services, Inc. [ABB-ES], 1991); the RCRA, the Corrective Action Program General Information Report, NAVSTA, Mayport (ABB-ES, 1995), Florida, and the U.S. Environmental Protection Agency (USEPA) Standard Operating Procedures (USEPA, 1996).

Surface water samples were collected by dipping a decontaminated glass beaker below the water surface. The beaker was then used to transfer the sample to the appropriate sample containers.

Sediment and subsurface soil samples were collected using a decontaminated 4-inch diameter stainless-steel hand auger. A sediment sample was collected below the

water/sediment interface to a depth of 1 foot when surface water was present or from the land surface to a depth of 1 foot when surface water was not present. Subsurface soil samples were collected after using the hand auger to drill to the desired sampling interval (a one foot interval along side a utility pipe or the one foot interval above the water table that was measured at the time of drilling).

The majority of the collected sediment or soil was removed from the hand auger with a stainless-steel spoon and transferred to a stainless-steel mixing bowl. The sample was thoroughly mixed and aliquots for analysis of semivolatile organics, pesticides, polychlorinated biphenyls, and inorganics were transferred to the appropriate sample container. The aliquot for analysis of volatile organics was transferred directly from the hand auger to the sample container.

Direct push monitoring wells were installed using the Navy's Site Characterization Analysis and Penetrometer System rig. The well installation materials were made of materials manufactured by Geoprobe®. The well materials consist of ½-inch inner diameter schedule 40 polyvinylchloride (PVC) riser pipe attached (screw threaded) to a PVC screen with 0.01 inch slots. The screen is covered with a pre-packed silica seal that is held in place by a stainless steel screen mesh. Each screen was made of two 3 feet long screen sections. Records of the well installations are provided in Attachment B.

Groundwater samples were collected from monitoring wells using the low flow purging and sampling protocol. The low-flow protocol results in samples that are considered representative of dissolved and colloidal elements and/or complexes present in the aquifer zone that is adjacent to the well screen (Puls and Powell, 1992; Kearn, et al., 1994; Barcelona, et al., 1994). The purging and sampling procedures followed established standard protocols (ABB-ES, 1995 and U.S. Environmental Protection Agency [USEPA], 1996).

Temperature, pH, specific conductivity, salinity and turbidity were measured during the purging of the wells. Purging was judged to be sufficient when the temperature, pH, and specific conductance measurements stabilized.

The groundwater samples were placed in a cooler refrigerated with ice and submitted overnight under chain of custody protocol to the analytical laboratory. The groundwater sample was analyzed for volatile organics, semivolatile organics, pesticides, polychlorinated biphenyls and metals. Analytical results are provided in Attachment C.

Sample holding times were met, and the laboratory did not report any significant deviations from the analytical protocol. This suggests that the analytical results are of sufficient quality to characterize chemicals present in the surface water, sediment, subsurface soil, and groundwater samples.

Below are the results of the Group IV sampling event.

Group IV Surface Water and Sediment Samples Three surface water and five sediment samples were collected in various areas in Group IV (Attachment D, Table 1, and Figure 2). Sampling locations include, two near the NEX gas station, one near Building 191, one near Commander Carrier Group 8 headquarters building, and one at the golf course across from the Aircraft Intermediate Maintenance Depot Area (Figure 2).

Surface Water Samples: Surface water was encountered at only three of the sampling locations, MPT-55-SW01, MPT-55-SW03, and MPT-55-SW04 (Figure 2, and Table 1). The surface water samples contained one volatile organic compound (VOC) (acetone), three semivolatile organic compounds (SVOCs) (butylbenzylphthalate, di-n-butylphthalate, and bis(2-ethylhexyl)phthalate), and 4 inorganics (barium, lead, tin, and zinc).

lead Butylbenzylphthalate and zinc were detected at concentrations that exceed their respective Florida Surface Water Quality Criteria for Class III freshwater, and zinc exceeded the Class III marine criteria (Table 1).

Pesticides and PCBs, if present, were not detected at concentrations exceeding their respective detection limits.

Sediment Samples: The sediment samples contained five VOCs (2-butanone, acetone, carbon disulfide, methylene chloride, and tetrachloroethene), twelve SVOCs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, di-n-butylphthalate, fluoranthene, indeno(1,2,3-cd)pyrene, phenanthrene, pyrene, and bis(2-ethylhexyl)phthalate), two pesticides (chlordane, and heptachlor), and 14 inorganics (antimony, arsenic, barium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, silver, tin, vanadium, and zinc) (Tables 2 and 3).

Concentrations of benzo(a)pyrene, chlordane, arsenic, barium, copper, lead, and vanadium exceed Florida Department of Environmental protection (FDEP) soil cleanup target levels (SCTLs) for an industrial exposure under Chapter 62-777 Florida Administrative Code (FAC) (Tonner-Navarro, and Roberts, 1998) (Table 4). Concentrations of antimony, cadmium, chromium, and lead exceed leachability screening criteria under Chapter 62-777 FAC.

Concentrations of barium, cadmium, chromium, copper, vanadium and zinc exceeded their respective background screening concentrations (Table 4).

Sanitary Sewer System (SWMU 53): Subsurface soil and groundwater samples were collected in the vicinity of pump stations and pressure mains for the Stations sanitary sewer system. The soil and groundwater samples were collected in the vicinity of a pump station for the sanitary sewer system located north of Lake Wonderwood on the north side of at Moale Avenue, and northeast of the Commander for Carrier Group Eight Headquarters. Because of the proximity of the sewer line to the oily waste line, sample location MPT-53-MW05S, (the possible location of a release from the oily waste line), was included in this group.

Subsurface Soil Samples: One VOC (acetone) and six SVOCs (benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, di-n-butylphthalate, and bis(2-ethylhexyl)phthalate) were detected in the subsurface soil samples (Tables 5 and 6). Twelve inorganic analytes (antimony, arsenic, barium, beryllium, chromium, cobalt, copper, lead, nickel, selenium, vanadium, and zinc) detected in the subsurface soil samples.

The only SVOC detected at sample location MPT-53-MW05S was a phthalate compound. Polynuclear aromatic hydrocarbons (PAHs), which are indicators of the release of petroleum were at concentrations, if present, less than the detection limit in the subsurface soil sample from MPT-53-MW05S.

The aforementioned PAHs (benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene) were detected at sample location MPT-53-MW04S, which was located along Moale Avenue adjacent to a sanitary sewer pump station.

None of the organic or inorganic analytes were detected in the SWMU 53 subsurface soil samples at concentrations that exceed the FDEP industrial SCTLs under Chapter 62-777 FAC (Table 7). Chromium was detected at a level that exceeded the leachability screening criteria under Chapter 62-777 FAC.

Concentrations of arsenic, barium, beryllium, chromium, cobalt, copper, lead, vanadium, and zinc exceeded their respective background screening concentrations (Table 7).

Groundwater Samples: The groundwater samples contained two VOCs (2-butanone and acetone), and two SVOCs (di-n-butylphthalate and bis(2-ethylhexyl)phthalate) and four inorganic analytes (barium, lead, nickel, and tin) (Tables 8 and 9).

One groundwater sample collected near the Lake Wonderwood pump station contained nickel (139 micrograms per liter, [$\mu\text{g}/\text{l}$]) at a concentration that exceeded the FDEP groundwater guidance concentration (100 $\mu\text{g}/\text{l}$) (Table 10). The well was resampled on January 15, 1998. Nickel, if present, was not detected in this sample at a concentration that exceeded the 20 $\mu\text{g}/\text{l}$ detection limit.

Concentrations of barium and lead exceeded their respective background screening concentrations (Table 10).

Pesticides and PCBs, if present, were not detected in either the subsurface soil, or groundwater samples at concentrations that exceeded the detection limit.

Bravo Pier Seven subsurface soil and groundwater samples (locations MPT-47-MW01S through MPT-47-MW07S) were collected along Bravo Pier. Locations MPT-47-MW01S through MPT-47-MW07S were located near pier risers or pipe joints where the pipe line changed direction. Locations MPT-47-MW06S and MPT-47-MW07S were near a break in the sanitary sewer and oily waste pipe lines. Location MPT-47-MW08S was at the location of a valve box, where a leak occurred in the past. Locations MPT-47-MW09S and MPT-47-MW10S were at the influent and effluent sides of a collection sump/pump station for the oily waste pipe line. The SWMU 47 samples also include a subsurface and groundwater sample (MPT-47-MW11S), collected along Charlie pier near a septic tanks that was utilized at the Boatswains Locker area for wastewater disposal. The septic tank was utilized prior to the construction of the Station's sanitary sewer system. The subsurface soil and groundwater samples collected from location MPT-47-MW11S were included with SWMU 47 because of the detection of PAHs.

Subsurface Soil Samples: The subsurface soil samples contained two VOCs (acetone and methylene chloride), 19 SVOCs (2-methylnaphthalene, acenaphthene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, butylbenzylphthalate, chrysene, dibenz(a,h)anthracene, dibenzofuran, di-n-butylphthalate, fluoranthene, fluorene, indeno(1,2-cd)pyrene, phenanthrene, pyrene and bis(2-ethylhexyl)pht*pl697X and 10 inorganics (antimony, arsenic, barium, chromium, cobalt, copper, lead, nickel, vanadium, and zinc) (Tables 11 and 12).

16 vs 20 ?
Benzo(a)pyrene was detected at a concentration that exceeded its FDEP SCTL for an industrial exposure under Chapter 62-777 FAC (Table 13). Concentrations of methylene chloride, 2-methylnaphthalene, and benzo(a)pyrene exceed their respective leachability screening criteria under Chapter 62-777 FAC.

Arsenic, barium, chromium, cobalt, copper, lead, vanadium, and zinc were detected at concentrations that exceed their respective background screening concentration (Table 13).

Groundwater Samples: The groundwater samples contained five VOCs (1,2-dichloroethene, acetone, ethylbenzene, methylene chloride, and xylenes), 13 SVOCs (2-methylnaphthalene, acenaphthene, acetophenone, anthracene, dibenzofuran, di-n-butylphthalate, fluoranthene, fluorene, naphthalene, phenanthrene, phenol, pyrene, and bis(2-ethylhexyl)phthalate), and seven inorganics (arsenic, barium, chromium, copper, lead, tin, and zinc) (Tables 14 and 15).

Acenaphthene
|
when
|
Acetophenone, and thallium were detected at concentrations that exceed their respective FDEP groundwater guidance concentrations (Table 16). Barium, chromium, copper, lead, selenium, silver, and zinc were detected at concentrations that exceed their respective background screening concentrations.

Pesticides and PCBs, if present, were not detected at concentrations exceeding their respective detection limits in either the subsurface soil, or groundwater samples.

Building 38 Public Works Shop Three subsurface soil samples and groundwater samples were collected at this site.

Subsurface Soil Samples: The subsurface soil samples contained one VOC (acetone), three SVOCs (di-n-butylphthalate, pyrene, and bis(2-ethylhexyl)phthalate), two pesticides (4,4'-dichlorodiphenyltrichloroethane [DDT], and 4,4'-dichlorodiphenyldichloroethylene [DDE]), and 12 inorganics (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, nickel, vanadium, and zinc) (Tables 17 and 18).

Arsenic was detected at a concentration that exceeded its FDEP industrial soil cleanup criteria at location MPT-PW-MW01S (Tables 17 and 19). An additional surface and subsurface soil sample pair were collected at this location on January 16, 1998. Arsenic, if present, was not detected at concentrations exceeding the 0.54 mg/kg detection limit in either of the samples.

Chromium was detected at a concentration that exceeded its leachability screening criteria under Chapter 62-777 FAC.

Arsenic, barium, beryllium, chromium, cobalt, copper, lead, vanadium, and zinc were detected at concentrations that exceed their respective background screening concentration (Table 19).

PCBs, if present, were not detected at concentrations exceeding their respective detection limits in the subsurface soil samples.

Groundwater Samples: The groundwater samples contained two VOCs (acetone and methylene chloride), three SVOCs (acenaphthene, di-n-butylphthalate, and bis(2-ethylhexyl)phthalate), and one inorganic (tin) (Tables 20 and 21).

Bis(2-ethylhexyl)phthalate was detected at a concentration that exceeded its groundwater guidance concentration (Table 22).

Pesticides and PCBs, if present, were not detected at concentrations exceeding their respective detection limits in groundwater samples.

Former Shore Intermediate Maintenance Area (Buildings 37 and 46) Septic tanks were utilized at this maintenance area for wastewater disposal prior to the construction of the Station's sanitary sewer system. Two subsurface soil samples and three groundwater samples were collected at this site.

Subsurface Soil Samples: The soil samples contained one VOC (methylene chloride), two SVOCs (di-n-butylphthalate and bis(2-ethylhexyl)phthalate, and eightics (arsenic, barium, chromium, copper, lead, nickel, vanadium, and zinc) (Tables 23 and 24).

None of the analytes were detected in the subsurface soil samples at concentrations that exceed their respective industrial SCTLs or leachability criteriar Chapter 62-777 FAC (Table 25).

Chromium, lead, vanadium and zinc were detected at concentrations that exceed their respective background screening criteria.

Groundwater Samples: The groundwater samples contained two VOCs (acetone and methylene chloride), one SVOC (di-n-butylphthalate), and 4 inorganics (chromium, lead, tin, and zinc) (Tables 26 and 27).

None of the analytes were detected at a concentration that exceed their respective FDEP groundwater guidance concentrations (Table 28). Chromium was detected at a concentration that exceeded its background screening concentration.

Pesticides and PCBs, if present, were not detected at concentrations exceeding their respective detection limits in either the subsurface soil, or groundwater samples.

The information for the Group IV sampling event was prepared under the direction of a Florida Registered Professional Geologist. The work rendered herein was conducted or developed in accordance with commonly accepted protocols and procedures. If conditions are discovered or determined to exist that differ from those described, the undersigned geologist should be notified to evaluate the effects of any additional information in this document. This document was prepared to provide information for the Navy to characterize the potential for risk to human health and the environment, and prioritize funding for the NAVSTA Mayport, Florida Group IV sites. The information contained herein should not be construed to apply for any other purpose or site.

If you have any questions concerning the above information please contact me.

Sincerely,

Harding Lawson Associates, Inc.

Francis K. Lesesne, P.G.

- Encl: (1) Completion and final report of findings for the site screening of sites 1-6 and 8-14 at NAVSTA Mayport, (LIF data sheets included)**
(2) Attachment (1) soils classification sheet
(3) Location map

1. The enclosed report contains the well inventory for all monitoring wells installed, and interpretations of Laser Induced Fluorescence (LIF) data collected at the subject sites. A total of (28) monitoring wells were installed with soil samples taken at each location. A 1/2" I.D. "Geoprobe" monitoring well was installed in the same hole soil samples were collected. Soil samples which were collected by the SCAPS crew were turned over to the ABB field engineer. The ABB field engineer originated the chain of custody sheets for each sample taken.

2. If there are any questions regarding this report please contact me at (904) 772-4548, ext. 8323.

George Steffen

Soil Samples/Monitoring Wells:

A total of (28) monitoring wells were placed and soil samples taken for ABB Environmental Services Inc. as part of the field screening of sites 1-6 and 8-14 at NAVSTA Mayport. Installation of the monitoring wells was concluded on August 13, 1997. Well mpt-s8-mw01s became damaged prior to construction of its manhole. This well and manhole were re-installed on 5 Sept. 97. Each well and soil sample was completed using direct push technology by the Navy Public Works Center, Jacksonville, Site Characterization Analysis and Penetrometer (SCAPS) vehicle, a (20) ton cone penetrometer truck.

Installation of direct push monitoring wells was accomplished in a two step process. After each location was identified by ABB and the NAVSTA Mayport Environmental Dept. utilities were cleared by station and SCAPS personnel, the SCAPS vehicle then positioned over the identified locations. The SCAPS vehicle using a dummy probe to break through surface pavement would next push the soil sample probe down hole. Keeping the SCAPS vehicle over the position, the monitoring well was then advanced down the same hole from which the soil samples was taken. All locations which were over asphalt and concrete were pre-drilled using a 4" dia., diamond bit core drill to remove the first 8-10" of surface material, prior to pushing the soil sampler and wells.

Soil samples were taken using a conventional split spoon sampler measuring approx. 1-1/2" in dia. X 18" in length. The sample probe as well as the split spoons are constructed of stainless steel material. Proper decontamination procedures of all components of the split spoon sampler were adhered to prior to each sample being taken. Each soil sample was taken from just above the existing water table. Water table elevations were determined by taking elevation measurements from existing wells located nearest to the SCAPS sample locations.

Each monitoring well was placed down the same vertical hole from which the soil samples were taken. The monitoring wells are manufactured by "Geoprobe". The well screen and riser sections are made from 1/2" I.D. PVC. The screen sections are standard .001" slot, covered by a pre-packed silica sand held in place by a stainless steel mesh. Each screen section measures approx. 3' in length. Screen intervals are set by assembling individual screen sections together. Each well is placed by advancing large diameter push rods with an expendable tip to the maximum well depth. The screen and riser sections are assembled and passed down the center of the push rods. The expendable tip makes connection to the assembled well sections; as the push rods are retrieved from down hole, the well remains in place.

Each monitoring well is finished with An 8" water tight manhole, encased in a 2' X 2' concrete well pad. Well lids are bolted to the manhole casing. Each well riser is capped, with no wells having locks on the risers.

An inventory of the monitoring wells is listed in table (1). The site map identifies each manhole location and is cross referenced on table (1).

(refer to locator map)

* Well, mpt-s8-mw01s became damaged after installation. The well was re-installed to the to final depth and with the screened interval listed above. Actual lat/long and depth to water table were not available prior to printing this report.

** Latitude and Longitude are reported in degrees, minutes and seconds.

Laser Induced Fluorescence (LIF):

In addition to taking soil samples and the placing of monitoring wells in the various sites on the naval station, SCAPS also performed real time site screening along the Bravo Pier using LIF systems. A total of (5) LIF push locations were identified by ABB and the station environmental department along the entire length of Bravo Pier. These LIF data locations also had a soil sample taken and monitoring well placed.

The LIF locations are identified on table (1) as mpt-BP-mw01s through mpt-BP-mw05s, running North to South along the pier. To cross reference the data sheets corresponding to each LIF push, refer to table (2). Sample locations along Bravo Pier were pushed by pushing the soil sample and well locations as described above. The LIF pushes for these locations were pushed at approx. 6-8" offset from the well locations.

Table (2)
LIF cross reference sheet

#	Monitoring Well ID	LIF Data Sheet ID
24	mpt-BP-mw01s	9706LIF1.PSH
25	mpt-BP-mw02s	9706LIF2.PSH
26	mpt-BP-mw03s	9706LIF3.PSH
27	mpt-BP-mw04s	9706LIF4.PSH
28	mpt-BP-mw05s	9706LIF5.PSH

The LIF systems are designed to detect PAH's contamination which may exist in the soil. The systems give qualitative and semi-quantitative results. Each LIF data sheet Figure (1), contains the following information:

Column 1: "Cone Pressure" Tip pressure, recorded in tons/sqft. Strain gauges are attached to the drive point at the bottom of the LIF probe. Data is recorded every 2 cm from ground "zero" to the bottom of the push.

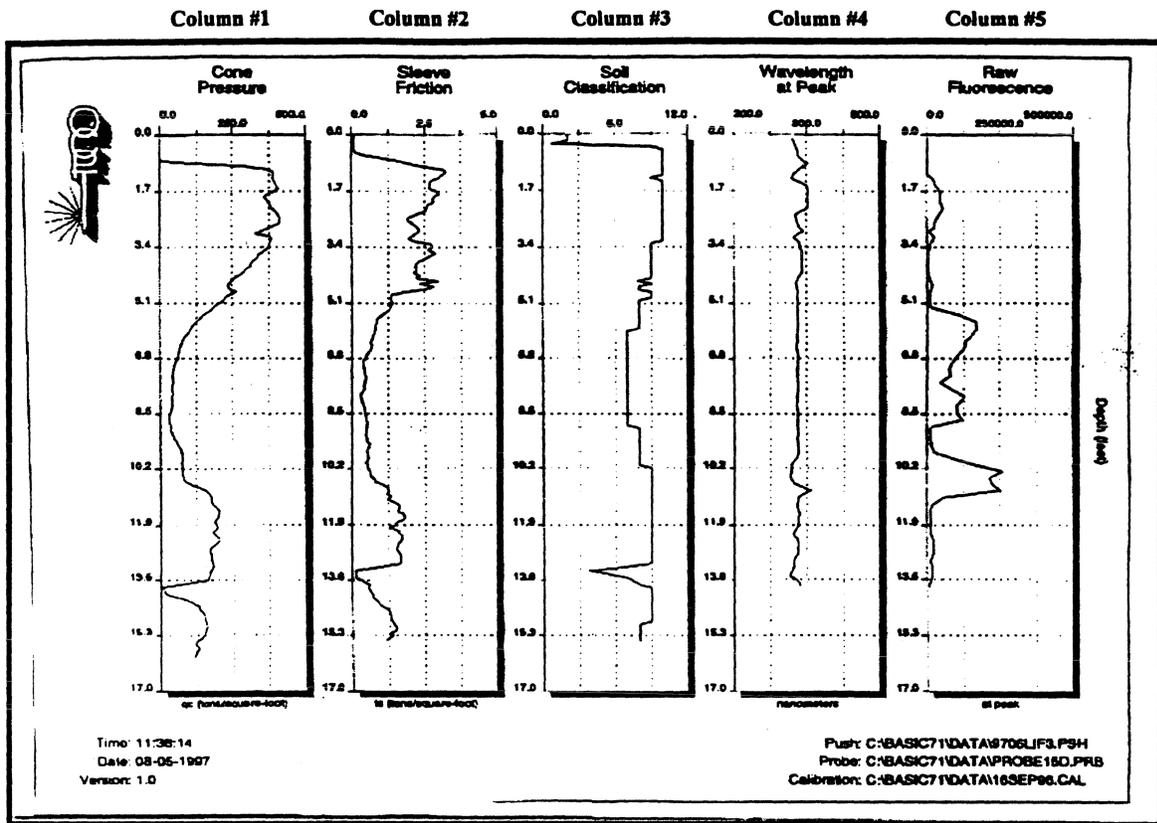

Column 2: "Sleeve Friction", Sleeve data is recorded in ton/sqft. Strain gauges are connected to a sleeve cylinder which rides just above the drive point tip and gauge assembly. Data is collected each 2 cm.

Column 3: "Soil Classification" is computed from empirical formulas derived by Robertson and Campanella, Attachment (1).

Column 4: "Wavelength at Peak". The wavelength at peak is a measure of the fluorescence light returned from the down hole probe. A nitrogen laser fires 308nm laser energy down a fiber optic cable which terminates in the probe. This power of energy causes 3-ring and greater PAH's exposed to the probe window to fluoresce. Fluoresced light is returned up from the probe through another fiber optic cable to a photo diode array and spectrograph which interprets the signal recording peak fluorescence. Sheet (2), the spectrograph for each push is produced by the laser operator during post processing of data. Any specific point the operator wants to highlight along the vertical push is marked and the spectral reading is recorded on this sheet.

Column 5: "Raw Fluorescence" is a measure of the fluorescent light intensity. This is a unit less measure of photons. No calibration information was collected or used for this project to equate raw fluorescence with contaminant concentrations.

Figure (1)
LIF data sheet

Interpretation of the LIF data is as follows:

Push - 9706LIF1.PSH: Minimum signal response was obtained over the vertical push. There are indications of contamination detected, however the detections occur in narrow bands, approx. 2.7', and 4.8' BGS are examples. Spectral print outs indicate the 4.8' BGS detection to have a peak wavelength which would indicate PAH's. The raw fluorescence count is sufficient to indicate a presence of contamination over a very narrow vertical band. The existence of micro lens of contamination could account for this, or this could be the extreme edge of a contamination plume

Push - 9706LIF2.PSH: Signal response between 0.8' and 1.5' BGS would indicate positive detection of contamination. The shift in wavelength which occurs at approx. 0.8' BGS, indicates the presence of material which is fluorescing above background. The increase in light intensity over the region of the wavelength shift further signifies the presence of a contaminant, rather than a false positive material causing the fluorescence.

Push - 9706LIF3.PSH: The region between 5.1' and approx. 11.0' BGS appears to have significant soils contamination. The wavelength shift occurring at approx. 4.5' BGS maintained a stable reading below background over the 5' region. There was significant intensity response corresponding to this same region. The presence of contamination appears to be greatest between 5.1' and 11' BGS however, positive signal response between approx. 1.5' and 3.4' BGS also indicates lower level contamination.

Push - 9706LIF4.PSH: Interpretation of the data collected for this push possibly indicates false positive detection of contamination from approx. 0.5' to approx. 2.25' BGS. Significant raw fluorescence readings were obtained for this region, however, no shift in wavelength occurs.

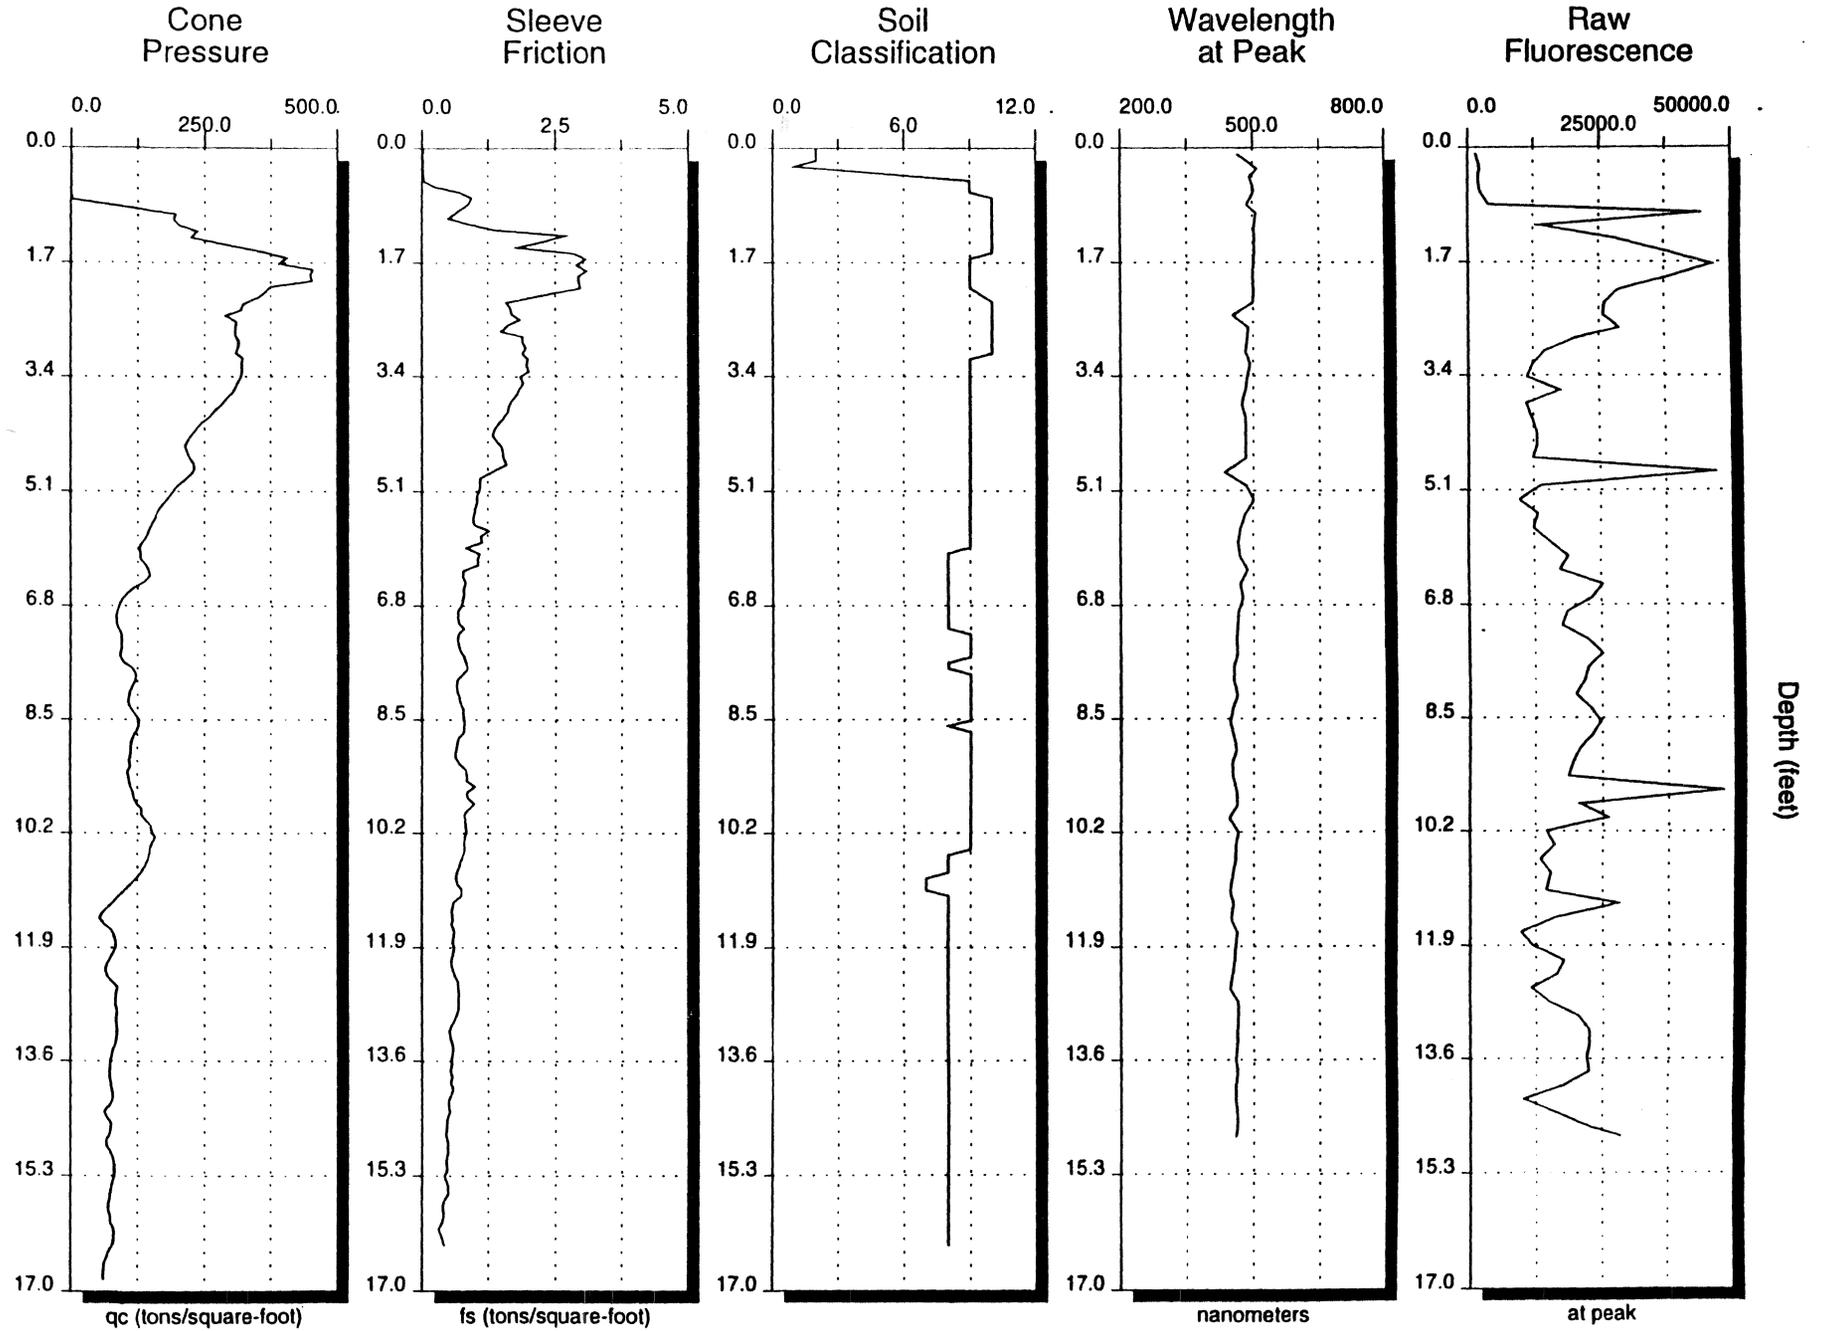

Positive detection of contamination appears to occur between 3.4' and 5.1' BGS. Signal response and wavelength shifts are commensurate with PAH's contamination readings. The most significant detection occurs between 10.2' and 11.9' BGS. These readings are well below the water table. Insignificant data is available to determine if this is a false positive detection or not. Soils classification information reveals a change in soil type at the beginning of the wavelength and intensity shifts.

Push - 9706LIF5.PSH: The only significant reading occurs at approx. 12.5' BGS. The same indication of potential false positive readings exist in this push just as with 9706LIF4.PSH. The change in soil type corresponds with wavelength and intensity readings.

Findings:

Normal protocol requires that 10% of the LIF data collected would be supported with analytical results to identify/confirm potential false positives and concentration values needed when marking contaminant plumes. Due to time constraints and changes in project scope, the LIF data collected was not supported by independent analytical sampling. Soil samples were collected at each location, however the depth intervals may not have been optimal for LIF confirmation purposes. The soil sample collected which corresponds with push hole 9706LIF3.PSH should provide sufficient data to support LIF results obtained in the shallow region of this push.

Recommendations: LIF data collected indicates positive detection of contaminants along Bravo Pier. The most significant signal responses and soils contamination appears around location 9706LIF3.PSH, approx. the middle of Bravo Pier. Further LIF pushes to determine the source and extent of contamination around this location is required. Soil samples from locations 9706LIF5.PSH and 9706LIF6.PSH at the deeper depths is needed to determine if there is any existence of contamination in the water table.

Analytes (Not Validated) Detected in Group IV Surface Water Samples (SWMU 55)

Group IV Sampling Event
 U. S. Naval Station
 Mayport, Florida

Dup(?)
 ↓ or 05

Sample Location ¹ :	MPT-55-SW01	MPT-55-SW03	MPT-55-SW04	MPT-55-SW04	Florida Surface Water Criteria
Sample Number:	G4D00101	G4D00301	G4D00401	G4D00401	Chapter 62 - 302.50 F.A.C.
Date Sampled:	26-SEP-97	25-SEP-97	25-SEP-97	25-SEP-97	Class III Criteria (Fresh/Marine)
Volatile Organics (µg/l)					
Acetone	5 JB	6 JB	4 JB	3 JB	NA / NA
Semivolatile Organics (µg/l)					
Butylbenzylphthalate	-	4 J B	-	-	< 3 / NA
Di-n-butylphthalate	2 J	2 J	-	1 J	< 3 / NA
bis(2-Ethylhexyl)phthalate	2 J	2 J	-	1 J	< 3 / NA
Inorganics (µg/l)					
Barium	-	-	-	-	NA / NA
Lead	7 M	-	10.3 M	4.6	² 14 / 5.6
Tin	43.3	52.7	81.6	81.7	NA / NA
Zinc	-	67.9 F	-	-	² 35 / 86

¹ = Surface water not present at locations MPT-55-SW02 and MPT-55-SW05, therefore no sample was collected.

² = A value of 100 was assumed for calculating the acute hardness criteria for lead and zinc.

Notes: SWMU = solid waste management unit.
 F.A.C. = Florida Administrative Code.
 µg/l = micrograms per liter.
 - = Analyte, if present, was at a concentration that was less than the detection limit.
 J = estimated value.
 B = analyte detected in laboratory quality control blank.
 NA = no screening criteria available.

Table 2 (Continued)
Analytes (Not Validated) Detected in Group IV Sediment Samples (SWMU 55)

Group IV Sampling Event
U. S. Naval Station
Mayport, Florida

¹ = Semivolatile organic samples G4D00101, G4D00201, G4D00301, and G4D00401 were collected on November 4, 1997.

² = Analytical result is from a reanalysis.

Notes: SWMU = solid waste management unit.

ft bls = feet below land surface.

$\mu\text{g}/\text{kg}$ = micrograms per kilogram.

mg/kg = milligrams per kilogram.

- = Analyte, if present, was at a concentration that was less than the detection limit.

J = estimated value.

B = analyte detected in laboratory quality control blank.

Silver	1/5	4.6	4.6	4.6	1.1 - 2.7	G4D00501
Tin	3/5	8.1	43.7	23.4	2.7 - 3.4	G4D00501
Vanadium	4/5	2.3	40.35*	15.9	1.3	G4D00401
Zinc	5/5	5.9	628	170.6	N/A	G4D00501

¹ Frequency of detection is the number of samples in which the analyte was detected divided by the total number of samples analyzed. A sample and duplicate are considered one sample.

² A value indicated by an asterisk (*) is the average of the detected concentrations in a sample and its duplicate. For nondetected values, 1/2 the Method Detection Limit is used as a surrogate.

³ The mean of detected concentrations is the arithmetic mean of all samples in which the analyte was detected. It does not include those samples in which the analyte was not detected.

Notes: SWMU = solid waste management unit.
 µg/kg = micrograms per kilogram.
 mg/kg = milligram per kilogram.
 N/A = analyte detected in each sample

Table 11 (Continued)
Analytes (Not Validated) Detected in Subsurface Soil Samples
Collected at Solid Waste Management Unit 47

Group IV Sampling Event
U. S. Naval Station
Mayport, Florida

Notes: DL = dilution sample.
R = re-extracted sample.
ft bls = feet below land surface.
 $\mu\text{g}/\text{kg}$ = micrograms per kilogram.
 mg/kg = milligrams per kilogram.
- = Analyte, if present, was at a concentration less than the detection limit.
NA = not analyzed.
J = estimated value.
B = analyte detected in field blank.
E = estimated value, out of range.
D = dilution qualifier.

Table 12 (Continued)
Summary of Analytes (Not Validated) Detected in Subsurface Soil Samples
Collected at Solid Waste Management Unit 47

Group IV Sampling Event
U.S. Naval Station
Mayport, Florida

¹ Frequency of detection is the number of samples in which the analyte was detected divided by the total number of samples analyzed. A sample and duplicate are considered one sample.

² A value indicated by an asterisk (*) is the average of the detected concentrations in a sample and its duplicate. For nondetected values, 1/2 the Method Detection Limit is used as a surrogate.

³ The mean of detected concentrations is the arithmetic mean of all samples in which the analyte was detected. It does not include those samples in which the analyte was not detected.

Notes: $\mu\text{g}/\text{kg}$ = micrograms per kilogram.
 mg/kg = milligram per kilogram.
N/A = analyte detected in each sample.

Table 13

Group IV Sampling Event
U. S. Naval Station
Mayport, Florida

¹ A value indicated by an asterisk (*) is the average of the detected concentrations in a sample and its duplicate. For nondetected values, 1/2 the Method detection Limit is used as a surrogate.

² The background screening concentration is twice the mean of detected concentrations for inorganic analytes.

³ FDEP SCTLs, Contaminant Cleanup Target Levels, Chapter 62-777 Florida Administrative Code (FAC).

⁴ FDEP Soil Leachability Criteria, Contaminant Cleanup Target Levels, Chapter 62-777 FAC.

Notes: SWMU = solid waste management unit.
 $\mu\text{g}/\text{kg}$ = micrograms per kilogram.
 mg/kg = milligram per kilogram.
NSC - no background screening concentration.
N/A - no screening criteria under Chapter 62-777 FAC.

Table 15
Summary of Analytes (Not Validated) Detected in Groundwater Samples Collected at
Solid Waste Management Unit 47

Group IV Sampling Event
 U. S. Naval Station
 Mayport, Florida

Analyte	Frequency of Detection ¹	Minimum Detected Concentration ²	Maximum Detected Concentration ²	Mean of Detected Concentrations ³	Range of Reporting Limits for Nondetects	Sample with Maximum Detected Concentration
---------	-------------------------------------	---	---	--	--	--

¹ Frequency of detection is the number of samples in which the analyte was detected divided by the total number of samples analyzed.

² A value indicated by an asterisk (*) is the average of the detected concentrations in a sample and its duplicate. For nondetected values, 1/2 the method detection limit is used as a surrogate.

³ The mean of detected concentrations is the arithmetic mean of all samples in which the analyte was detected. It does not include those samples in which the analyte was not detected.

Notes: SWMU = solid waste management unit.
 µg/l = micrograms per liter.
 N/A = analyte detected in each sample

OCTOBER 2000

INTRODUCTION

This ground-water monitoring report of selected monitoring wells on Alpha-Delta Piers at Mayport Naval Station, Mayport, Florida is a result of a request by the Florida Department of Environmental Protection (FDEP) that the Southern Division, Naval Facilities Engineering Command (NAVFACENGCOM) Charleston, South Carolina perform supplemental sampling at the site. This sampling is being performed as part of the Remedial Action Plan (RAP) phase at the site.

BACKGROUND

In 1985, it was discovered that a diesel fuel marine (DFM) pipeline that passes through the Alpha-Delta Piers area was broken and that more than 500 gallons of fuel had been lost. The pipeline was repaired and the source of contamination abated. Free product and water were recovered at the time of the pipeline repair; however, the amount of free product recovered is unknown. In 1989, free product and water were removed from a manhole located near the pipeline break. In the spring of 1992, petroleum contaminated soils were removed during the installation of a new water line at the site.

A Contamination Assessment Report (CAR) for the site was prepared and submitted by ABB Environmental Services Inc. in November 1992. After submittal of a CAR Addendum, ABB submitted a Remedial Action Plan (RAP) in December 1993. A revised RAP was submitted and approved by FDEP in August 1994.

In accordance with the approved RAP, a monitoring program was conducted from June 1996 through October 1997. Two monitoring wells, MPT-1406-6 and MPT-1406-16, and two utility manholes were monitored for LNAPL. Also, two rounds of quarterly ground-water samples were collected in September and December of 1996.

LNAPL has been present in the utility manhole north of monitoring well MPT-1406-16 and in MPT-1406-16 since the startup of site assessment activities at Alpha-Delta Piers. In two quarterly sampling events in 1996 (September and December), well MPT-1406-3 indicated naphthalene, and MPT-1406-4 indicated benzene, acenaphthene, and naphthalene.

SUMMARY OF GROUND-WATER MONITORING AND ANALYSIS

This report covers a sampling event at Alpha-Delta Piers, which occurred on 12 October 2000. All wells sampled were checked for free product petroleum using an oil/water interface probe. Monitoring wells MPT-1406-4, MPT-1406-5, MPT-1406-6, MPT-1406-9, MPT-1406-15, and MPT-1406-23D were sampled. All wells sampled were purged of a minimum of three volumes using a Teflon bailer. Well purging continued until field parameters (pH, specific conductance, and temperature) stabilized. Field water quality parameters for all wells sampled are contained in table 2 (attachment 4). Ground-water samples were collected using a Teflon bailer and placed in appropriate containers. The samples were properly preserved, stored on ice, and delivered to the laboratory for analysis.

All monitor well samples were analyzed for EPA Methods 8260B, 8270C, and Florida petroleum residual organics (FL PRO). Chain of custody was maintained on the samples throughout the sampling period. Sampling procedures were conducted according to U.S. Army Corps of Engineers, Savannah District's FDEP-approved Comprehensive Quality Assurance Plan No. 910026G. Laboratory analyses were performed according to the laboratory's FDEP-approved Generic Quality Assurance Plan.

In an attempt to obtain lower detection limits, EPA methods 8260B and 8270C were substituted for EPA methods 624 and 625 on this sampling event.

A summary of Laboratory analytical results of the samples from wells is shown in table 1 (attachment 1) and on the data summary map (attachment 2). Well MPT-1406-16 was not sampled since it contained 1.24 feet of free product.

Two wells, MPT-1406-4 and MPT-1406-6, indicated FL PRO above reporting limits at 2.0 ug/l, and 0.9 ug/l respectively.

Two wells indicated PAH compounds above reporting limits. MPT-1406-4 indicated acenaphthene at 58.7 ug/l, fluoranthene at 10.9 ug/l, fluorene at 45.1 ug/l, naphthalene at 258 ug/l, phenanthrene at 25.2 ug/l and pyrene at 5.47 ug/l. MPT-1406-15 indicated acenaphthene at 13.2 ug/l. Acenaphthene and naphthalene in MPT-1406-4 exceed the regulatory limit of 20 ug/l for these chemicals.

MPT-1406-4 was the only well to exhibit VOCs above reporting limits with benzene at 3.25 ug/l, ethylbenzene at 5.5 ug/l, toluene at 3.28 ug/l, and xylenes at 8.3 ug/l. The benzene in this well is above the regulatory limit of 1 ug/l.

As noted on table 1, the reporting limit for 1,2-dibromoethane (EDB) of 1.0 ug/l for all samples is above the regulatory limit of 0.02 ug/l.

Field water quality parameters are listed in table 2 (attachment 4), and laboratory analytical data are contained in attachment 5.

FREE PRODUCT MONITORING AND REMOVAL

Naval Station (NAVSTA) Mayport is conducting free product monitoring and removal on monitoring wells MPT-1406-6 and MPT-1406-16 on a monthly basis and on the utility manholes on a quarterly basis (see NAVSTA letters in attachment 3). Since product monitoring began in May 1998, a total of 11 gallons have been recovered.

SUMMARY AND CONCLUSIONS

These latest analytical results are remarkably similar to previous samplings, with the exception of benzene. Where earlier samplings have not indicated benzene, this latest event indicates an occurrence in well MPT-1406-4 of 3.25 ug/l. Other than the apparent show of benzene, the changes do not appear to be significant for the volatile organic, PAH, or TRPH analyses performed. The results do not appear to indicate that the area of ground-water contamination has expanded.

The measurement of free product petroleum in monitoring well MPT-1406-16 during sampling events and the monthly product recovery from MPT-1406-16 and the utility manholes/sumps indicates, as in the past, that the accumulation of product in wells is variable and is probably influenced by rainfall events as well as by pumping and removal.

NAVSTA MAYPORT FREE PRODUCT MONITORING REPORTS

DEPARTMENT OF THE NAVY

NAVAL STATION
MAYPORT, FLORIDA 32228-0112

IN REPLY REFER TO:

5090.16

Ser N4E446 2,000

OCT 16 2000

Mr. Jim Cason
Technical Review Section
Florida Department of Environmental Protection
2600 Blair Stone Road
Tallahassee, FL 32399-2400

Dear Mr. Cason:

SUBJECT: QUARTERLY FREE PRODUCT MONITORING OF ALPHA-DELTA PIERS,
NAVAL STATION MAYPORT

Naval Station (NAVSTA) Mayport submits the quarterly Free Product Recovery Alpha-Delta Piers monitoring and recovery results as an enclosure. During the fourth quarter of fiscal year 2000 monitoring, 0.003 gallons of product were recovered from well MPT-1406-16. The utility manholes were not checked during this quarter. Since monitoring began in May 1998, a total of 11.027 gallons of product has been recovered.

NAVSTA Mayport requests authorization to stop monitoring well MPT-1406-6. This well has shown no product since monitoring began in 1998.

If you have any questions, my point of contact is Mr. Randy Bishop, N4E4, at 904-270-6730 x203.

Sincerely,

CHERYL L. MITCHELL
Director, Environmental Division
By direction of the
Commanding Officer

NOTES

COORDINATE VALUES ARE FLORIDA STATE PLANE, EAST ZONE, NORTH AMERICAN DATUM OF 1983, 1990 ADJUSTMENT (NAD 83/90)

ELEVATIONS ARE MEAN SEA LEVEL, AND ARE GIVEN IN BOTH NORTH AMERICAN VERTICAL DATUM OF 1988(NAVD 88), AND NATIONAL GEODETIC VERTICAL DATUM OF 1929 (NGVD 29)

REVISED 4/4/01

APPENDIX E
VALIDATED LABORATORY DATA

TO: T. HANSEN – PAGE 2
DATE: FEBRUARY 21, 2001

* - All quality control criteria were met for this parameter.

Laboratory Blank Analyses

The following contaminants were detected in the laboratory method / preparation blanks at the following maximum concentrations:

<u>Analyte</u>	<u>Maximum Concentration</u>	<u>Action Level</u>
Aluminum	33.7 µg/L	168.5 µg/L
Barium	0.5 µg/L	2.5 µg/L
Beryllium	0.4 µg/L	2.0 µg/L
Calcium ⁽¹⁾	72.5 µg/L	362.5 µg/L
Cadmium	0.3 µg/L	1.5 µg/L
Cobalt	1.1 µg/L	5.5 µg/L
Copper ⁽¹⁾	1.8 µg/L	9.0 µg/L
Iron	20.3 µg/L	101.5 µg/L
Magnesium	43.7 µg/L	218.5 µg/L
Manganese ⁽¹⁾	0.72 µg/L	3.6 µg/L
Potassium	239 µg/L	1195 µg/L
Silver	1.2 µg/L	6.0 µg/L
Zinc ⁽¹⁾	2.9 µg/L	14.5 µg/L

⁽¹⁾ Maximum concentration present in a laboratory preparation blank.

An action level of 5X the maximum concentration were used to evaluate the sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluation for blank contamination. Positive results less than the blank action levels for aluminum, beryllium, cadmium, cobalt, copper and zinc were qualified, "U", as a result of blank contamination and should not be considered present. No qualification action was required for the remaining analytes since all results were either nondetected or greater than the action level.

Matrix Spike and Matrix Spike Duplicate Results

The Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Percent Recoveries (%Rs) were < 75% quality control limit for cyanide. All nondetected and positive results reported for cyanide were qualified as estimated, "UJ" and "J", respectively.

Field Duplicate Results

Field duplicate imprecision was noted for potassium and cyanide. All positive results reported for potassium and cyanide were qualified as estimated, "J".

ICP Serial Dilution Results

The ICP Serial Dilution Percent Difference (%D) exceeded the 10% quality control limit for potassium. All results for potassium were qualified as estimated, "J". A direction of bias could not be determined.

TO: T. HANSEN – PAGE 3
DATE: FEBRUARY 21, 2001

Notes

One continuing calibration verification (CCV) percent recovery for mercury was > 120% quality control limit. This CCV did not bracket any samples from this SDG; therefore, validation action was not required.

Executive Summary

Laboratory Performance: Several analytes were present in the laboratory method / preparation blanks.

Other Factors Affecting Data Quality: Cyanide was qualified due to matrix spike and matrix spike duplicate noncompliance. Potassium was qualified due to ICP serial dilution noncompliance. Cyanide and potassium were qualified due to field duplicate imprecision.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", February 1994 and the NFESC document entitled "Navy IRCDQM" (September 1999).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC Guidelines and the Quality Assurance Project Plan (QAPP)."

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A
QUALIFIED ANALYTICAL RESULTS

Qualifier Codes:

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration (i.e., % RSDs, %Ds, ICVs, CCVs, RPDs, RRFs, etc.) Noncompliance
- D = MS/MSD Noncompliance
- E = LCS/LCSD Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's $r < 0.995$
- K = ICP Interference - include ICSAB % R's
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation
- N = Internal Standard Noncompliance
- O = Poor Instrument Performance (i.e., base-time drifting)
- P = Uncertainty near detection limit ($< 2 \times$ IDL for inorganics and $<$ CRQL for organics)
- Q = Other problems (can encompass a number of issues)
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin
- U = Pest/PCD% between columns for positive results
- V = Non-linear calibrations, tuning $r < 0.995$ (correlation coefficient)
- W = EMPC result
- X = Signal to noise response drop
- Y = Percent solids $< 30\%$

ANALYTICAL METHODS SUMMARY

AOL150102

<u>PARAMETER</u>	<u>ANALYTICAL METHOD</u>
Cyanide, Total	SW846 9012A
Inductively Coupled Plasma (ICP) Metals	SW846 6010B
Mercury in Liquid Waste (Manual Cold-Vapor)	SW846 7470A
Semivolatile Organic Compounds by GC/MS	SW846 8270C
Trace Inductively Coupled Plasma (ICP) Metals	SW846 6010B
Volatile Organics by GC/MS	SW846 8260B

References:

SW846 "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", Third Edition, November 1986 and its updates.

SAMPLE SUMMARY

NOTE (S) :

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

72XCRDL

difference > 2XCRDL

OK - results are <5X CRDL and the difference between the results are <2X CRDL

dichloro-2-butene. No qualifiers were assigned on this basis since this compound was not detected in the reported results and the exceedances were less than 50%.

Initial and/or continuing calibration relative response factors (RRFs) fell below the 0.05 quality control limit for acrolein, acetonitrile, propionitrile, and isobutanol. Nondetected results for all aforementioned compounds were rejected, UR, in all samples.

A continuing calibration percent difference (%D) exceeded the 25% quality control limit on 12/19/00 for 1,4-dichloro-2-butene. Nondetected results were qualified as estimated, UJ, in the associated samples.

The following compounds were detected in the laboratory method blanks:

<u>Compound</u>	<u>Maximum Concentration</u>	<u>Blank Action Level</u>
Acetone	1.6 µg/L	16 µg/L
Methylene Chloride	0.6 µg/L	6.0 µg/L

Sample aliquot and dilution factors were taken into consideration when applying the blank action levels. Positive results for acetone and methylene chloride below the blank action level were qualified as nondetected, U.

Semivolatiles

Initial calibration percent relative standard deviations (%RSDs) exceeded the 30% quality control limit on A4HP7 for 1,3,5-trinitrobenzene, 4-nitroquinoline-1-oxide and Dinoseb on 12/13/00. No qualifiers were assigned on this basis since these compounds were not detected in the samples and the exceedances were less than 50%.

A continuing calibration %D exceeded the 25% quality control limit on 12/21/00 on A4HP7 for 1,3,5-trinitrobenzene. Nondetected results were qualified as estimated, UJ, in samples MPT-47-GW-DPW01, MPT-47-GW-DPW10, MPT-47-GW-DPW11, MPT-47-GW-DPW12, and MPT-47-GW-DPW16.

Continuing calibration %Ds exceeded the 25% quality control limit on 12/22/00 on A4HP7 for Dinoseb, 1,3,5-trinitrobenzene, p-phenylenediamine, and 4-aminobiphenyl. Nondetected results were qualified as estimated, UJ, in samples MPT-47-GW-DPW02, MPT-47-GW-DPW03, MPT-47-GW-DPW04, MPT-47-GW-DPW07, MPT-47-GW-DPW08, and MPT-47-GW-DPW15.

A continuing calibration RRF fell below the 0.05 quality control limit on 12/29/00 on A4HP7 for 4-Nitroquinoline-1-oxide. The nondetected result was rejected, UR in samples MPT-47-GW-DPW18 and MPT-53-GW-DPW01.

Continuing calibration %Ds exceeded the 25% quality control limit on 12/29/00 on A4HP7 for 2,4-dinitrophenol, 4-nitroquinone-1-oxide, 1,3,5-trinitrobenzene, p-phenylenediamine, 4-aminobiphenyl, aramite, chlorobenzilate, and 1,4-dioxane. Nondetected results were qualified as estimated, UJ, in samples MPT-47-GW-DPW18 and MPT-53-GW-DPW01. No further qualifiers were applied to 4-nitroquinone-1-oxide since the nondetected result was previously rejected.

Initial calibration %RSDs exceeded the 30% quality control limits on 01/02/01 for 2,4-dinitrophenol, 4-nitroquinone-1-oxide, Dinoseb, and 1,3,5-trinitrobenzene. No qualifiers were assigned on this basis since the compounds were not detected in the samples and the exceedance was less than 50%.

Continuing calibration %Ds exceeded the 25% quality control limit on 01/02/01 on A4HP7 for 1,3,5-trinitrobenzene, N-Nitrosomethylethylamine, N-Nitrosopyrrolidine, a,a-dimethyl-phenethylamine, p-phenylenediamine, and pentachloronitrobenzene. Nondetected results were qualified as estimated, UJ, in samples MPT-47-GW-DPW17, MPT-47-GW-DPW19, MPT-47-GW-DU01, MPT-53-GW-DPW03.

The following compounds were detected in the laboratory method blanks:

<u>Compound</u>	<u>Maximum Concentration</u>	<u>Blank Action Level</u>
Bis(2-ethylhexyl)phthalate	3.0 µg/L	30 µg/L

Sample aliquot and dilution factors were taken into consideration when applying the blank action levels. Positive results for bis(2-ethylhexyl)phthalate below the blank action level were qualified as nondetected, U.

Blank spike recoveries fell below 10% for hexachlorocyclopentadiene. Nondetected results were rejected, UR, in all samples.

Blank spike recoveries were below the quality control limits for diethyl phthalate and dimethyl phthalate. No qualifications were assigned on this basis.

Blank spike recoveries were outside the quality control limits for 1,2-dichlorobenzene and dimethyl phthalate. No qualifications were assigned on this basis.

The Matrix Spike (MS) / Matrix Spike Duplicate (MSD) has a % recovery below 10% for hexachlorocyclopentadiene and dimethyl phthalate. Nondetected results for hexachlorocyclopentadiene were rejected, UR in sample, MPT-47-GW-DPW01. No qualifications were made for dimethyl phthalate since it was compliant in the MS and both blank spikes.

RPDs were outside quality control limits in the MPT-47-GW-DPW01 matrix spike duplicate for butyl benzyl phthalate, di-n-butyl phthalate, diethyl phthalate, and dimethyl phthalate. No qualifiers were assigned on this basis since recoveries were compliant in the matrix spike.

Additional Comments:

Positive results below the reporting limit (RL) were qualified as estimated, J, due to uncertainty near the detection limit.

The semivolatile fraction of sample MPT-47-GW-DPW02 was analyzed and reported at a 2.5X dilution factor due to matrix interference. This accounts for the elevated reporting limits for this sample.

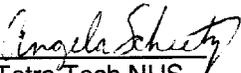

EXECUTIVE SUMMARY

Laboratory Performance Issues: Several compounds exceeded the initial and/or continuing calibration %D and RRF criteria. Several target compounds were detected in the laboratory and field quality control blanks.

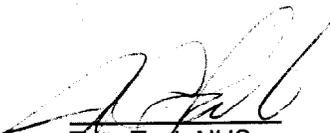

Other Factors Affecting Data Quality: Blank spike and/or matrix spike recoveries of hexachlorocyclopentadiene fell below 10%.

The data for these analyses were reviewed with reference to the EPA Functional Guidelines for Organic Data Validation (10/99), and the NFESC guidelines IRCDQM (Sept., 1999). The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC guidelines and the Quality Assurance Project Plan (QAPP)."

2-Methylnaphthalene

$$C = \frac{(\text{Area 2-methylnaphthalene})(I_s)(V_e)(Df)}{(\text{Area Is})(RRF)(V_o)(V_i)}$$

$$C = \frac{(120195)(8.75)(500 \mu\text{L})(1)}{(622307)(0.74052)(1000 \text{ mL})(2 \mu\text{L})} = 5.216 \frac{\text{ng}}{\text{mL}} = 5.2 \frac{\mu\text{g}}{\text{L}}$$

TO: T. HANSEN – PAGE 2
DATE: FEBRUARY 21, 2001

Laboratory Blank Analyses

The following contaminants were detected in the laboratory method / preparation blanks at the following maximum concentrations:

<u>Analyte</u>	<u>Maximum Concentration</u>	<u>Action Level</u>
Aluminum	42.6 µg/L	213 µg/L
Barium	1.0 µg/L	5.0 µg/L
Beryllium	0.7 µg/L	3.5 µg/L
Calcium	59.2 µg/L	296 µg/L
Iron	35.7 µg/L	178.5 µg/L
Magnesium	66.4 µg/L	332 µg/L
Manganese	1.4 µg/L	7.0 µg/L
Mercury	0.1 µg/L	0.5 µg/L
Thallium ⁽¹⁾	8.7 µg/L	43.5 µg/L
Zinc ⁽¹⁾	2.9 µg/L	14.5 µg/L

⁽¹⁾ Maximum concentration present in a laboratory preparation blank.

An action level of 5X the maximum concentration were used to evaluate the sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluation for blank contamination. Positive results less than the blank action levels for barium, beryllium, iron, mercury, thallium and zinc were qualified, "U", as a result of blank contamination and should not be considered present. No qualification action was required for the remaining analytes since all results were either nondetected or greater than the action level.

Notes

The equipment blank was not used to establish blank action levels and was not qualified due to laboratory blank contamination.

The Matrix Spike Duplicate (MSD) Percent Recovery (%R) was < 75% quality control limit and the MS/MSD RPD was >20% for cyanide. The matrix spike and matrix spike for cyanide were performed on a sample that was not from this SDG, therefore, no validation action was taken.

Laboratory duplicate imprecision (RPD>20%) from the percent difference between the matrix spike (MS) and matrix spike duplicate (MSD) was noted for calcium. Validation action was not taken based on the MS/MSD comparison.

Executive Summary

Laboratory Performance: Several analytes were present in the laboratory method / preparation blanks.

Other Factors Affecting Data Quality: None.

TO: T. HANSEN – PAGE 3
DATE: FEBRUARY 21, 2001

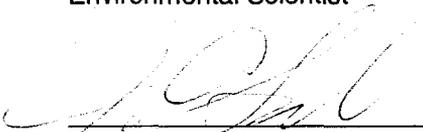

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", February 1994 and the NFESC document entitled "Navy IRCDQM" (September 1999).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC Guidelines and the Quality Assurance Project Plan (QAPP)."

NOTE (S) :

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

OK - results are <5X CRDL and the difference between the results are <2X CRDL

Volatile

Initial calibration and calibration verification Relative Response Factors (RRFs) fell below the 0.05 quality control limit for acrolein, acetonitrile, propionitrile, and isobutyl alcohol on instrument A3UX11, on 11/09/00. Only nondetected results were reported for the aforementioned compounds and these were rejected (UR) in all samples.

Initial calibration percent Relative Standard Deviations (%RSDs) exceeded the 30% quality control limit for 1,4-dichloro-2-butene on instrument A3UX11, on 12/13/00. Only nondetected results were reported for 1,4-dichloro-2-butene, therefore, no action was taken based on this noncompliance.

A calibration verification percent Difference (%D) exceeded the 25% quality control limit for 1,4-dichloro-2-butene on instrument A3UX11, on 12/19/00, at 09:09. Only nondetected results were reported for 1,4-dichloro-2-butene and these were qualified as estimated (UJ) in the affected samples.

A calibration verification percent Difference (%D) exceeded the 25% quality control limit for 1,4-dichloro-2-butene and vinyl acetate on instrument A3UX11, on 12/20/00, at 09:13. Only nondetected results were reported for the aforementioned compounds and these were qualified as estimated (UJ) in the affected samples.

The following compound was detected in the laboratory method blanks and field quality control blanks* at the maximum concentration indicated below:

<u>Compound</u>	<u>Concentration (ug/L)</u>	<u>Action Level (ug/L)</u>
Acetone*	2	20

Blank Actions

- Value < Reporting Limit (RL); report RL followed by a U.
- Value > RL and < Action Level; report value followed by a U.
- Value > RL and > Action Level; report value unqualified.

An action level of 10X the maximum contaminant concentration was established to evaluate laboratory contamination for acetone. Dilution factors and sample aliquots were taken into consideration during the application of all action levels. The affected positive results were qualified as (U) as a result of blank contamination for acetone.

Positive results for methylene chloride below the RL were qualified as nondetected (U) since methylene chloride is considered a common laboratory contaminant.

Semivolatile

Initial calibration %RSDs exceeded the 30% quality control limit for 1,3,5-trinitrobenzene and 4-nitroquinoline-1-oxide on instrument A4HP7, on 11/16/00. Only nondetected results were reported for the aforementioned compounds, therefore, no action was taken.

Calibration verification %Ds exceeded the 25% quality control limit for 3,3'-dimethylbenzidine and 1,4-dioxane on instrument A4HP8, on 12/22/00, at 10:23. Only nondetected results were reported for 3,3'-dimethylbenzidine and 1,4-dioxane and these were qualified as estimated (UJ) in the affected samples.

Calibration verification %Ds exceeded the 25% quality control limit for 4-nitrophenol, 3,3'-dimethylbenzidine and 1,4-dioxane on instrument A4HP8, on 12/26/00, at 10:20 and 13:30. Only nondetected results were reported for the aforementioned compounds and these were qualified as estimated (UJ) in the affected samples.

Calibration verification %Ds exceeded the 25% quality control limit for N-nitrosomethylethylamine, N-nitrosopyrrolidine, a,a-dimethyl-phenethylamine, p-phenylamine diamine, pentachloronitrobenzene and 1,3,5-trinitrobenzene on instrument A4HP7, on 01/02/01, at 14:48. Only nondetected results were reported for the aforementioned compounds and these were qualified as estimated (UJ) in the affected samples.

Laboratory Control Sample (LCS) % recovery of hexachlorocyclopentadiene was 0% and dimethyl phthalate was < 10% for extraction batch 0351095. Only nondetected results were reported for the aforementioned compounds and these were rejected (UR) in the samples associated with this quality control batch.

LCS % recovery of diethyl phthalate was < the lower quality control limit and > 10% for extraction batch 0351095. Only nondetected results were reported for diethyl phthalate, therefore, no action was taken.

Matrix Spike / Matrix Spike Duplicate (MS / MSD) % recovery of hexachlorocyclopentadiene was 0%; MS %recovery of dimethyl phthalate was 11% and MSD % recovery of dimethyl phthalate was < 10%. The nondetected results reported for the aforementioned compounds were rejected in the unspiked sample MPT-47-GW-DPW05 only.

MS / MSD % recovery of diethyl phthalate fell below lower quality control limits but was > 10%. No action was taken based on this noncompliance.

MS % recovery of 4-chloroaniline, 3,3'-dichlorobenzidine and 3-nitroaniline fell below 10%. However, MSD % recovery of the aforementioned compounds were compliant, therefore, no action was taken.

MS / MSD Relative Percent Differences (RPDs) exceeded quality control limits for 4-chloroaniline, 3,3'-dichlorobenzidine, 3-nitroaniline, 4-nitroaniline and N-nitrosodiphenylamine. No action was taken based on this noncompliance.

Additional Comments

Positive results below the Reporting Limit (RL) were qualified as estimated (J) due to uncertainty near the detection limit.

Acetone, 4-methyl-2-pentanone, 2-butanone and toluene were detected in the equipment rinsate blank MPT-47-EB01. These results were not used as a basis for qualification during the data validation process.

EXECUTIVE SUMMARY

Laboratory Performance Issues: Poor instrument response was observed for several volatile and semivolatile compounds, resulting in the rejection of analytical data. The initial calibration of 1,4-dichloro-2-butene, 1,3,5-trinitrobenzene, and 4-nitroquinoline-1-oxide failed to meet linearity criteria. Several volatile and semivolatile compounds failed to meet calibration verification criteria. Semivolatile LCS recovery of several compounds fell below 10%, resulting in the rejection of analytical data.

Other Factors Affecting Data Quality: Several semivolatile MS and / or MSD compounds failed to meet recovery and RPD criteria.

The data for these analyses were reviewed with reference to the EPA Functional Guidelines for Organic Data Validation (10/99) and the NFESC guidelines "Navy IRCDQM" (Sept 1999). The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC guidelines and the Quality Assurance Project Plan (QAPP)."

SDG NARRATIVE
MP033

The following report contains the analytical results for ten water samples submitted to STL North Canton by Tetra Tech NUS, Inc. from the NS Mayport Group IV site, project number N0123. The samples were received December 15 and 16, 2000, according to documented sample acceptance procedures.

This SDG consists of two (2) laboratory IDs: A0L150200 and A0L1601269.

STL North Canton utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameters listed on the method reference page in accordance with the methods indicated.

Please refer to individual analytical sections for laboratory specific narratives.

SAMPLE RECEIVING

The temperature of the coolers upon sample receipt was 2.7, 3.1 and 1.5° C. The samples were received in wet ice.

See STL's Cooler Receipt Form for additional information.

STL Cooler Receipt Form/Narrative

North Canton Facility

Client: Tetra Tech
Cooler Received on: 12/15/00

Project: _____
Opened on: 12/15/00 by: _____

Quote#: _____
(Signature) [Signature]

Fedx Client Drop Off UPS Airborne
Other: _____

Cooler Safe Foam Box Client Cooler Other: _____
STL Shipper No#: A98 JZ14

1. Were custody seals on the outside of the cooler and intact? Yes No
If YES, Quantity 1 PCL Location ACROSS OPENING
Were the custody seals signed and dated? Yes No NA
 2. Shipper's packing slip attached to this form? Yes No
 3. Were custody papers included inside the cooler and relinquished? Yes No
 4. Did you sign the custody papers in the appropriate place? Yes No
 5. Packing material used:
Peanuts Bubble Wrap Vermiculite Foam None Other: _____
 6. Cooler temperature upon receipt _____ °C (see back of form for multiple coolers/temp)
METHOD: Temperature Vial Coolant Against Bottles
COOLANT: Wet Ice Blue Ice Dry Ice Water None
 7. Were all the bottles sealed in separate plastic bags? Yes No
 8. Did all bottles arrive in good condition (Unbroken)? Yes No
 9. Did all bottle labels and tags agree with the custody papers? Yes No
 10. Were samples at the correct pH? Yes No NA
 11. Were correct bottles used for the tests indicated? Yes No
 12. Were air bubbles >6 mm in any VOA vials? Yes No NA
 13. Was a sufficient amount of sample sent in each bottle? Yes No
- Contacted PM DSP Date: 12/15/00 by: SE via Voice Mail Verbal Other
Concerning: Bubble in Vials Average 30.

MACRO MACRO

1. CHAIN OF CUSTODY

SR1A	Samples were received under proper custody procedures and without discrepancies.
SR1B	The chain of custody and sample bottles did not agree. The following discrepancies occurred _____

2. SAMPLE CONDITION

SR2A	Sample(s) _____ were received or requested after the recommended holding time had expired.
SR2B	Sample(s) _____ were received with insufficient volume
SR2C	Sample(s) _____ were received in a broken container.

3. SAMPLE PRESERVATION

SR3A	Sample(s) _____ were further preserved in sample receiving to meet recommended pH level(s).
<input checked="" type="checkbox"/> SR3B	Sample(s) <u>1 x 40ml VOA</u> were received with bubble > 6 mm in diameter (cc: PM)

4. NCM

SR4A	NCM has been generated. Refer to Clouseau for details <u>112-117-MSMSD1</u>
------	---

5. Other Anomalies (see below or back)

SDG NARRATIVE
MP033

GC/MS VOLATILES

The results included in this report have been reviewed for compliance with the laboratory QA/QC plan. All data have been found to be compliant with laboratory protocol.

Sample(s) that contain results between the MDL and the RL were flagged with "J". There is the possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The reporting limit is lower than our standard reporting limit (SRL) but is supported by the laboratory's MDL and/or IDLs; however, there are no standards in the calibration curve low enough to support this value. The continuing calibration blanks and method blanks may not support the lower RL.

2-Chloroethyl vinyl ether cannot be reliably recovered in an acid preserved sample.

Holding Time Violations

All samples were prepared and analyzed within the method-specified holding time requirements.

Method Blank Contamination

Sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

MS/MSD/LCS/DCS and Surrogates Outside of QC Criteria

All spike recovery and RPD data met method-specific quality control criteria.

Calibrations

All calibrations and calibration verifications met method-specific quality control criteria.

**SDG NARRATIVE
MP033**

GC/MS SEMIVOLATILES

The results included in this report have been reviewed for compliance with the laboratory QA/QC plan. All data have been found to be compliant with laboratory protocol.

Holding Time Violations

All samples were prepared and analyzed within the method-specified holding time requirements.

Method Blank Contamination

All analytes in the method blank were less than the associated reporting limits.

MS/MSD/LCS/DCS and Surrogates Outside of QC Criteria

All spike recovery and RPD data met method-specific quality control criteria.

Calibrations

All calibrations and calibration verifications met method-specific quality control criteria.

SEMIVOLATILE ORGANIC GC/MS TUNING AND MASS
CALIBRATION - DECAFLUOROTRIPHENYLPHOSPHINE (DFTPP)

Lab Name: STL - NORTH CANTON Contract:
 Lab Code: QESOH Case No.: SAS No.: SDG No.: MP033
 Lab File ID: 8DF1218 DFTPP Injection Date: 12/18/00
 Instrument ID: A4HP8 DFTPP Injection Time: 1511

m/e	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE
51	30.0 - 60.0% of mass 198	45.9
68	Less than 2.0% of mass 69	0.0 (0.0)1
69	Mass 69 relative abundance	60.8
70	Less than 2.0% of mass 69	0.2 (0.4)1
127	40.0 - 60.0% of mass 198	51.9
197	Less than 1.0% of mass 198	0.0
198	Base Peak, 100% relative abundance	100.0
199	5.0 - 9.0% of mass 198	7.0
275	10.0 - 30.0% of mass 198	22.9
365	Greater than 1.0% of mass 198	3.1
441	Present, but less than mass 443	7.9
442	Greater than 40.0% of mass 198	51.1
443	17.0 - 23.0% of mass 442	9.2 (18.1)2

1-Value is % of mass 69 2-Value is % of mass 442

198	Base Peak, 100% relative abundance	100.0
199	5.0 - 9.0% of mass 198	6.7
275	10.0 - 30.0% of mass 198	24.9
365	Greater than 1.0% of mass 198	3.3
441	Present, but less than mass 443	7.6
442	Greater than 40.0% of mass 198	49.3
443	17.0 - 23.0% of mass 442	9.5 (19.3)2

1-Value is % of mass 69

2-Value is % of mass 442

SEMIVOLATILE ORGANIC GC/MS TUNING AND MASS
CALIBRATION - DECAFLUOROTRIPHENYLPHOSPHINE (DFTPP)

Lab Name: STL - NORTH CANTON

Contract:

Lab Code: QESOH

Case No.:

SAS No.:

SDG No.: MP033

Lab File ID: 7DF1116

DFTPP Injection Date: 11/16/00

Instrument ID: A4HP7

DFTPP Injection Time: 0810

m/e	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE
51	30.0 - 60.0% of mass 198	33.7
68	Less than 2.0% of mass 69	0.0 (0.0)1
69	Mass 69 relative abundance	82.6
70	Less than 2.0% of mass 69	0.4 (0.5)1
127	40.0 - 60.0% of mass 198	47.9
197	Less than 1.0% of mass 198	0.0
198	Base Peak, 100% relative abundance	100.0
199	5.0 - 9.0% of mass 198	7.0
275	10.0 - 30.0% of mass 198	22.9
365	Greater than 1.0% of mass 198	2.2
441	Present, but less than mass 443	6.9
442	40.0 - 100.0% of mass 198	47.4
443	17.0 - 23.0% of mass 442	9.0 (19.0)2

1-Value is % of mass 69

2-Value is % of mass 442

THIS TUNE APPLIES TO THE FOLLOWING SAMPLES, MS, MSD, BLANKS, AND STANDARDS:

Laboratory Blank Analyses

The following contaminants were detected in the laboratory method / preparation blanks at the following maximum concentrations:

<u>Analyte</u>	<u>Maximum Concentration</u>	<u>Action Level (aqueous)</u>
Aluminum	28.2 µg/L	141 µg/L
Barium	0.3 µg/L	1.5 µg/L
Beryllium	0.3 µg/L	1.5 µg/L
Calcium ⁽¹⁾	40.7 µg/L	203.5 µg/L
Magnesium	24.5 µg/L	122.5 µg/L
Manganese ⁽¹⁾	2.2 µg/L	11.0 µg/L
Mercury	0.10 µg/L	0.50 µg/L
Potassium	160 µg/L	800 µg/L
Zinc ⁽¹⁾	3.1 µg/L	15.5 µg/L

⁽¹⁾ Maximum concentration present in an aqueous preparation blank.

An action level of 5X the maximum concentration was used to evaluate the sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action levels for aluminum, beryllium, manganese and zinc were qualified, "U", as a result of blank contamination.

Laboratory Control Sample Results

The Laboratory Control Sample (LCS) percent recovery for cyanide was < 80% quality control limit. All nondetected results reported for cyanide were qualified as estimated, "UJ".

ICP Serial Dilution Results

The ICP serial dilution percent difference for zinc was >10% quality control limit. The positive result reported for zinc was qualified as estimated, "J".

Executive Summary

Laboratory Performance: Several analytes were present in the laboratory method / preparation blanks. Cyanide was qualified due to LCS noncompliance.

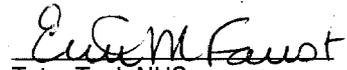

Other Factors Affecting Data Quality: Zinc was qualified due to ICP serial dilution noncompliance.

TO: T. HANSEN – PAGE 3
DATE: APRIL 19, 2001

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", February 1994 and the NFESC document entitled "Navy IRCDQM" (September 1999).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC Guidelines and the Quality Assurance Project Plan (QAPP)."

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A
QUALIFIED ANALYTICAL RESULTS

Qualifier Codes:

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration (i.e., % RSDs, %Ds, ICVs, CCVs, RPDs, RRFs, etc.) Noncompliance
- D = MS/MSD Noncompliance
- E = LCS/LCSD Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's $r < 0.995$
- K = ICP Interference - include ICSAB % R's
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation
- N = Internal Standard Noncompliance
- O = Poor Instrument Performance (i.e., base-time drifting)
- P = Uncertainty near detection limit ($< 2 \times$ IDL for inorganics and $<$ CRQL for organics)
- Q = Other problems (can encompass a number of issues)
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin
- U = Pest/PCD% between columns for positive results
- V = Non-linear calibrations, tuning $r < 0.995$ (correlation coefficient)
- W = EMPC result
- X = Signal to noise response drop
- Y = Percent solids $< 30\%$
- Z = Uncertainty at 2 sigma deviation is less than sample activity

NOTE (S) :

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

SDG NARRATIVE
MP039

METALS

The results included in this report have been reviewed for compliance with the laboratory QA/QC plan. All data have been found to be compliant with laboratory protocol.

Sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are \pm the standard reporting limit (SRL).

Serial dilution of a sample in this lot indicates that physical and chemical interferences were present. Refer to the sample report pages for the affected analytes.

Holding Time Violation

All samples were prepared and analyzed within the method-specified holding time requirements.

Method Blank Contamination

All analytes in the method blank were less than the associated reporting limits.

MS/MSD/LCS/DCS Outside of OC Criteria

All spike recovery and RPD data met method-specific quality control criteria.

Calibrations

All calibrations and calibration verifications met method-specific quality control criteria.

SDG NARRATIVE

Subject: RE: CTO 091 Field Duplicate

I am sorry, I misread the original email. Sample ID MPT-FP-DPW01S-01 was duplicated. Sorry about that.

Tom

Subject: RE: CTO 091 Field Duplicate

Tom,

I think the duplicate: MPT-FP-DUP-01 might be the duplicate of MPT-FP-DPW01S-01 instead of MPT-FP-DPW01D-01. It is very hard to tell from the organic data because all of the results are nondetects. However, I was talking with a co-worker who is doing the inorganic validation, and the duplicate results match up with the results from sample: MPT-FP-DPW01S-01. Would you help us clear up our confusion.

Thanks

Seth

Subject: CTO 091 Field Duplicate

Terry,

I am validating CTO 091 NS Mayport data (SDG MP039) and I wanted to double check to make sure that the field duplicate: MPT-FP-DUP-01 is associated with sample: MPT-FP-DPW01D-01. According to the Chain of Custody, it looks as one is the duplicate of the other but I want to be certain. Thanks for your time.

Thanks,

Seth

Seth,

You are correct. The duplicate IDs are one in the same.

Thanks

Thomas Thompson

MEMO TO: MR. T. HANSEN
DATE: 05/22/01- PAGE 2

VOLATILE FRACTION

The initial calibration contained relative response factors (RRFs) that were below the 0.05 quality control limit for acrolein, acetonitrile, propionitrile, and isobutanol. Only nondetected results were reported for the aforementioned compounds; therefore, the compounds were rejected, UR, in all samples.

The continuing calibration on 03/20/01 at 0742 contained RRFs that were below the 0.05 quality control limit for acrolein, acetonitrile, and isobutanol. Only nondetected results were reported for the aforementioned compounds and rejected, UR, in the associated samples.

The continuing calibration on 03/20/01 at 0742 contained percent differences (%Ds) that exceeded the 25% quality control limit for acrolein and acetone. The positive results were qualified as estimated, J, and the nondetected results were qualified as estimated, UJ, in the associated samples for acetone. Acrolein was already rejected for another technical noncompliance.

The continuing calibration on 03/20/01 at 0805 contained RRFs that were below the 0.05 quality control limit for propionitrile and isobutanol. Only nondetected results were reported for the aforementioned compounds and rejected, UR, in the associated samples.

The laboratory control sample and laboratory control sample duplicate (LCS/LCSD) contained percent recoveries (%Rs) that were less than the quality control limits for carbon disulfide and 1,1,1-Trichloroethane. No action was taken based on minor LCS/LCSD noncompliances.

The Matrix spike %R was less than the lower quality control limit for 1,1,1-Trichloroethane. No action was taken based on MS/MSD noncompliance.

SEMIVOLATILE FRACTION

The initial calibration contained RRFs that were less than the 0.05 quality control limit for 4-nitroquinoline-1-oxide. The nondetected results were rejected, UR, in all samples.

The continuing calibration on 03/26/01 at 1012 contained percent differences (%Ds) that exceeded the 25% quality control limits for a,a-dimethyl-phenethylamine, p-phenylene diamine, and methapyrilene. Nondetected results were reported for these compounds and qualified as estimated, UJ.

The continuing calibration on 03/26/01 at 1041 contained percent differences (%Ds) that exceeded the 25% quality control limit for 4-aminobiphenyl and Aramite. Nondetected results were reported for these compounds and qualified as estimated, UJ.

The LCS/LCSD %Rs were less than the lower quality control limit for diethyl phthalate and dimethyl phthalate. No action was taken based on minor LCS/LCSD noncompliance.

The LCS/LCSD %Rs were less than 10% for hexachlorocyclopentadiene. Only nondetected results were reported; therefore, rejected, UR, in all samples.

The MS and/or MSD %Rs were less than the lower quality control limit for diethyl phthalate, dimethyl phthalate, and hexachlorocyclopentadiene. No qualifiers were assigned to Diethyl phthalate and dimethyl phthalate since the %Rs were greater than 10%. Hexachlorocyclopentadiene was rejected since the %R was less than 10%.

MEMO TO: MR. T. HANSEN
DATE: 05/22/01- PAGE 3

ADDITIONAL COMMENTS

Positive results < Reporting Limit (RL) were qualified as estimated, J.

EXECUTIVE SUMMARY

Laboratory Performance: Several compounds exceeded the initial and/or continuing calibration criteria in the volatile and semivolatiles fractions.

Other Factors Affecting Data Quality: Several MS/MSD %Rs were outside of the quality control limits. The LCS/LCSD and MS/MSD contained %Rs that were lower than the control limit for diethyl phthalate, dimethyl phthalate, and hexachlorocyclopentadiene in the semivolatiles fraction.

The data for these analyses were reviewed with reference to the EPA Functional Guidelines for Organic Data Validation (October 1999) and the NFESC guidelines "Navy IRCDQM" (September 1999). The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC guidelines and the Quality Assurance Project Plan (QAPP)."

SDG NARRATIVE

MP039

GC/MS VOLATILES

The results included in this report have been reviewed for compliance with the laboratory QA/QC plan. All data have been found to be compliant with laboratory protocol.

Sample(s) that contain results between the MDL and the RL were flagged with "J". There is the possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

2-Chloroethyl vinyl ether cannot be reliably recovered in an acid preserved sample.

Holding Time Violation

All samples were prepared and analyzed within the method-specified holding time requirements.

Method Blank Contamination

All analytes in the method blank were less than the associated reporting limits.

MS/MSD/LCS/DCS Outside of QC Criteria

All spike recovery and RPD data met method-specific quality control criteria.

Calibrations

All calibrations and calibration verifications met method-specific quality control criteria.

cis-1,2-Dichloroethene	20	19	96	4.2	50	50 - 150	
trans-1,2-Dichloroethene	20	19	95	4.0	50	70 - 130	

NOTES (S) :

a Spiked analyte recovery is outside stated control limits.

Column to be used to flag recovery and RPD values with an asterisk

* Values outside of QC limits

RPD: 0 out of 35 outside limits

Spike Recovery: 1 out of 35 outside limits

VOLATILE ORGANIC GC/MS TUNING AND MASS
CALIBRATION - BROMOFLUOROBENZENE (BFB)

Lab Name: STL - NORTH CANTON Contract:
 Lab Code: QESOH Case No.: SAS No.: SDG No.: MP039
 Lab File ID: BFB088 BFB Injection Date: 03/20/01
 Instrument ID: A3UX11 BFB Injection Time: 0721
 Matrix: (soil/water) WATER Level: (low/med) LOW Column: (pack/cap) CAP

m/e	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE
50	15.0 - 40.0% of mass 95	19.5
75	30.0 - 60.0% of mass 95	52.3
95	Base Peak, 100% relative abundance	100.0
96	5.0 - 9.0% of mass 95	7.2
173	Less than 2.0% of mass 174	0.6 (0.8)1
174	50.0 - 120.0% of mass 95	73.7
175	5.0 - 9.0% of mass 174	5.4 (7.4)1
176	Greater than 95.0%, but less than 101.0% of mass 174	71.8 (97.5)1
177	5.0 - 9.0% of mass 176	5.8 (8.1)2

1-Value is % of mass 174

2-Value is % of mass 176

Laboratory Blank Analyses

The following contaminants were detected in the laboratory method / preparation blanks at the following maximum concentrations:

Affected samples : All

<u>Analyte</u>	<u>Maximum Concentration</u>	<u>Action Level (aqueous)</u>
Aluminum ⁽¹⁾	139 ug/L	695 ug/L
Barium	0.70 ug/L	3.5 ug/L
Beryllium	0.80 ug/L	4.0 ug/L
Calcium ⁽¹⁾	334 ug/L	1670 ug/L
Chromium	1.1 ug/L	5.5 ug/L
Cobalt	1.3 ug/L	6.5 ug/L
Copper	2.8 ug/L	14.0 ug/L
Cyanide ⁽¹⁾	5.0 ug/L	25.0 ug/L
Iron ⁽¹⁾	81.5 ug/L	407.5 ug/L
Magnesium	36.5 ug/L	182.5 ug/L
Manganese ⁽¹⁾	11.9 ug/L	59.5 ug/L
Potassium	30.7 ug/L	153.5 ug/L
Silver	1.4 ug/L	7.0 ug/L
Sodium	591 ug/L	2955 ug/L
Tin	3.8 ug/L	19.0 ug/L
Vanadium	0.80 ug/L	4.0 ug/L
Zinc ⁽¹⁾	9.5 ug/L	47.5 ug/L

⁽¹⁾ - Maximum concentration present in an aqueous preparation blank

An action level of 5X the maximum concentration was used to evaluate the sample data for blank contamination. Sample aliquot and dilution factors were taken into consideration in evaluation for blank contamination. Positive results less than the blank action level for aluminum, beryllium, chromium, cobalt, copper, cyanide, iron, manganese, vanadium and zinc were qualified, "U", as a result of blank contamination. No validation action was required for the remaining analytes as the results reported were either greater than the blank action level or were nondetected.

ICP Serial Dilution

The ICP Serial Dilution Percent Difference (%D) reported for manganese was greater than the 10% quality control limits. The positive results reported for manganese were qualified as estimated, "J".

Notes

A field duplicate summary table is included in Appendix C.

A continuing calibration verification for cyanide affecting sample MPT-G4-GW-DU01 was greater than 120%. However, the result reported was nondetected and a positive bias did not affect the reported result. The total cyanide analysis was reanalyzed at a later date and confirmed the original nondetected result. The original results are being reported.

TO: T. HANSEN
DATE: DECEMBER 7, 2000

- PAGE 3

Executive Summary

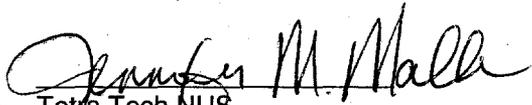

Laboratory Performance: Several analytes were present in the laboratory/preparation blanks.

Other Factors Affecting Data Quality: ICP serial dilution noncompliance was noted for manganese.

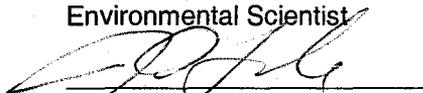

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", February 1994 and the NFESC document entitled "Navy Installation Restoration Chemical Data Quality Manual" (September 1999).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC Guidelines and the Quality Assurance Project Plan (QAPP)."

- E = LCS/LCSD Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's $r < 0.995$
- K = ICP Interference - include ICSAB % R's
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation
- N = Internal Standard Noncompliance
- O = Poor Instrument Performance (i.e., base-time drifting)
- P = Uncertainty near detection limit ($< 2 \times$ IDL for inorganics and $< CRQL$ for organics)
- Q = Other problems (can encompass a number of issues)
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin
- U = Pest/PCB D% between columns for positive results
- V = Non-linear calibrations, tuning $r < 0.995$. (correlation coefficient)
- W = EMPC result
- X = Signal to noise response drop
- Y = % Solid content is less than 30%

FORM NO. TINUS-001

SDG NARRATIVE
MP013

The following report contains the analytical results for twenty one water samples and one quality control sample submitted to STL North Canton by Tetra Tech NUS, Inc. from the NS Mayport Group IV site, project number N0123. The samples were received June 28, 29 and 30, 2000, according to documented sample acceptance procedures.

This SDG consists of three (3) laboratory ID's: A0F280235, A0G010106 and A0G010107.

STL North Canton utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameters listed on the method reference page in accordance with the methods indicated. Preliminary results were provided by facsimile transmission to Tom Thompson on July 21, 2000.

Please refer to individual analytical sections for laboratory specific narratives.

SAMPLE RECEIVING

The temperature of the coolers upon sample receipt was 0.4, 2.6, 1.9, 2.2 and 3.0° C.

(See STL's Cooler Receipt Form for additional information.)

ANALYTICAL METHODS SUMMARY

<u>PARAMETER</u>	<u>ANALYTICAL METHOD</u>
Cyanide, Total	SW846 9012A
Inductively Coupled Plasma (ICP) Metals	SW846 6010B
Mercury in Liquid Waste (Manual Cold-Vapor)	SW846 7470A
Semivolatile Organic Compounds by GC/MS	SW846 8270C
Trace Inductively Coupled Plasma (ICP) Metals	SW846 6010B
Volatile Organics by GC/MS	SW846 8260B

SDG NARRATIVE

MP013

METALS

The results included in this report have been reviewed for compliance with the laboratory QA/QC plan. All data have been found to be compliant with laboratory protocol.

Sample(s) that contain results between the IDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are \pm the standard reporting limit (SRL).

Some reporting limits are lower than our standard reporting limit (SRL) but are supported by the laboratory's MDL and/or IDLs; however, there are no standards in the calibration curve low enough to support these value. The continuing calibration blanks and method blanks may not support the lower RL.

Serial dilution of a sample in this lot indicates that physical and chemical interferences were present. Refer to the sample report pages for the affected analytes.

Holding Time Violations

All samples were prepared and analyzed within the method-specified holding time requirements.

Method Blank Contamination

All analytes in the method blank were less than the associated reporting limits.

MS/MSD/LCS/DCS and Surrogates Outside of QC Criteria

All spike recovery and RPD data met method-specific quality control criteria.

Calibrations

All calibrations and calibration verifications met method-specific quality control criteria.

**SDG NARRATIVE
MP013**

GENERAL CHEMISTRY

The results included in this report have been reviewed for compliance with the laboratory QA/QC plan. All data have been found to be compliant with laboratory protocol.

Samples MPT-G4-GW-13-06, MPT-G4-GW-14-10, MPT-G4-GW-15-09, MPT-G4-GW-16-08, MPT-G4-GW-17-09 and MPT-G4-GW-DU01 for batch 0196107 were not prepped with the Magnesium Chloride reagent as stated in the SOP.

Holding Time Violations

All samples were prepared and analyzed within the method-specified holding time requirements.

Method Blank Contamination

All analytes in the method blank were less than the associated reporting limits.

MS/MSD/LCS/DCS and Surrogates Outside of QC Criteria

All spike recovery and RPD data met method-specific quality control criteria.

Calibrations

The analyst used the secondary stock solution, which was a 1 ppm solution, for the Initial Calibration Verification (ICV) for the Total Cyanide analysis on batch 0196107. This should have been diluted within range. The digested LCS passed QC criteria. Due to the use of the 1 ppm standard, the subsequent Initial Calibration Blank (ICB) was out of control. The associated sample results were ND, and the data was reported.

The closing Continuing Calibration Verification (CCV) and Continuing Calibration Blank (CCB) failed. Sample MPT-G4-GW-DU01 associated with batch 0196107 for the Total Cyanide analysis was reanalyzed on July 26, 2000 to verify the original ND results. The reanalysis was performed after the recommended holding time had been exceeded. Only the original results are being reported.

VOA

The following compounds were detected in field quality control blanks* and laboratory method blanks:

<u>Compound</u>	<u>Maximum concentration (ug/L)</u>	<u>Action Level (ug/L)</u>
Benzene	0.11	0.55
*Methylene chloride	3.3	33.0
*Toluene	0.52	2.6
*1,1-dichloroethene	7.6	38.0
*Ethylbenzene	0.16	0.8
*Acetone	1.6	16.0
*4-methyl-2-pentanone	0.5	2.5

Sample aliquot and dilution factors were taken into consideration when applying the blank action level. Positive results less than blank action levels were qualified as undetected (U) in the affected samples. Field quality control blanks were not qualified on the basis of laboratory method blank contamination.

Initial calibration Relative Response Factors (RRFs) fell below the 0.05 quality control limit for acrolein, acetonitrile, propionitrile and isobutyl alcohol on 7/7/00, on instrument A3UX7. Only nondetected results were reported for the aforementioned compounds and these were rejected (UR) in the affected samples.

An initial calibration % Relative Standard Deviation (%RSD) exceeded the 30% (but <50%) quality control limit for acetone on 7/7/00, on instrument A3UX7. The positive results reported for acetone were *previously qualified for blank contamination and did not require further qualification. The positive results for acetone in the trip blanks were qualified as estimated (J).

Continuing calibration verification RRFs fell below the 0.05 quality control limit for acrolein and acetonitrile on 7/8/00, 09:28, on instrument A3UX7. Only nondetected results were reported for acrolein and acetonitrile and these were rejected (UR) in the affected samples.

Continuing calibration verification %Differences (%Ds) exceeded the 25% quality control limit for acrolein, vinyl acetate and trans-1,4-dichloro-2-butene on 7/8/00, 09:28, on instrument A3UX7. Only nondetected results were reported for vinyl acetate and trans-1,4-dichloro-2-butene and these were qualified as estimated (UJ) in the affected samples. The nondetected result reported for acrolein was previously qualified for the above RRF noncompliance and did not require further qualification.

Continuing calibration verification RRFs fell below the 0.05 quality control limit for propionitrile and isobutyl alcohol on 7/8/00, 09:55, on instrument A3UX7. Only nondetected results were reported for propionitrile and isobutyl alcohol and these were rejected (UR) in the affected samples.

Continuing calibration verification RRFs fell below the 0.05 quality control limit for acrolein and acetonitrile on 7/11/00, 08:46, on instrument A3UX7. Only nondetected results were reported for acrolein and acetonitrile and these were rejected (UR) in the affected samples.

Continuing calibration verification %Ds exceeded the 25% quality control limit for trichlorofluoromethane, carbon tetrachloride, dibromochloromethane and bromoform on 7/11/00, 08:46, on instrument A3UX7. Only nondetected results were reported for the aforementioned compounds and these were qualified as estimated (UJ) in the affected samples.

Date: 11/16/00

A continuing calibration verification %D exceeded the 25% quality control limit for 1,3,5-trinitrobenzene on 7/7/00, 09:22, on instrument A4HP7. Only nondetected results were reported for 1,3,5-trinitrobenzene, which were previously qualified for initial calibration noncompliance and did not require further qualification.

Continuing calibration verification %Ds exceeded the 25% quality control limit for 2,4-dinitrophenol and 4-nitrophenol on 7/12/00, 11:44, on instrument A4HP7. Only nondetected results were reported for 2,4-dinitrophenol and 4-nitrophenol and these were qualified as estimated (UJ) in the affected samples.

Initial calibration % RSDs exceeded the 30% (but <50%) quality control limit for 4-nitroquinoline-1-oxide and p-phenylamine diamine on 7/8/00, on instrument A4HP6. Only nondetected results were reported for 4-nitroquinoline-1-oxide and p-phenylamine diamine, which do not require qualification based on this calibration noncompliance.

Continuing calibration verification %Ds exceeded the 25% quality control limit for a,a-dimethyl phenethylamine, 7,12-dimethylbenz(A)anthracene and 3-methylcholanthrene on 7/11/00, 07:52, on instrument A4HP6. Only nondetected results were reported for the aforementioned compounds and these were qualified as estimated (UJ) in the affected samples.

Additional Comments

Positive results below the reporting limit were qualified as estimated, J, due to uncertainty near the detection limit.

The laboratory received a trip blank that was not on the chain of custody documentation. The sample named "Trip Blank" by the laboratory is reflected on the form 1 results. The sample named Trip Blank on the form 1 corresponds to TB062801 of the electronic deliverable.

Sample MPT-G4-GW-06-07 was not on the chain of custody documentation for semivolatile analysis, but was recorded on the vial label.

The volatile Matrix Spike and Matrix Spike Duplicate (MS/MSD) for sample MPT-G4-GW-08-05 had % recoveries that exceeded the upper quality control limit for carbon tetrachloride, bromodichloromethane, dibromochloromethane and bromoform. No qualifiers were required on this basis.

The volatile Matrix Spike and Matrix Spike Duplicate (MS/MSD) for sample MPT-G4-GW-01-11 had % recoveries that exceeded the upper quality control limit for dibromochloromethane and bromoform, and an MSD % recovery that exceeded the upper quality control limit for carbon tetrachloride. No qualifiers were required on this basis.

The semivolatile MS / MSD for sample MPT-G4-GW-01-11 had % recoveries that exceeded upper quality control limits for 4-chloroaniline and lower quality control limits for dimethyl phthalate and hexachlorocyclopentadiene. In sample MPT-G4-GW-01-11, the non-detected result for hexachlorocyclopentadiene was rejected (UR).

The laboratory reported Dinoseb as 2-sec-butyl-4,6-dinitrophenol.

Date: 11/16/00

It should be noted that according to the laboratory statement of work (SOW) both the volatile and semivolatile fraction both were to contain 1,2-dichlorobenzene, 1,3-dichlorobenzene, and 1,4-dichlorobenzene. Since this would create data management problems, the laboratory reported these compounds in the semivolatile fraction only. It was not necessary to qualify any data based on this issue.

The analytical SOW listed pentachloroethane to be analyzed and reported as a volatile compound but the laboratory analyzed and reported this compound as a semivolatile compound. It was not necessary to qualify any data based on this issue.

The laboratory reported allyl chloride, which according to the analytical SOW was not a required volatile target compound. Because allyl chloride is an Appendix IX compound it was determined that this compound should remain in the database.

The laboratory reported Dinoseb, Diallylate, a,a-dimethylphenethylamine, chlorobenzilate, diallate, and N-nitrosopiperidine, which according to the analytical SOW were not required semivolatile target compounds. Because the aforementioned are Appendix IX compounds it was determined that these compounds should remain in the database.

The laboratory did not report hexachlorophene as requested in the analytical SOW. This compound is unstable and could not be analyzed.

The laboratory did not report results for Sulfotepp and Zinophos as required by the analytical SOW. A resubmission was solicited and results for these compounds were provided and included in the database.

EXECUTIVE SUMMARY

Laboratory Performance Issues: The volatile Laboratory Control Sample (LCS) on 7/8/00 had % recoveries that exceeded the upper quality control limit for dibromochloromethane and bromoform. No qualifiers were required on this basis.

The volatile LCS on 7/11/00 had % recoveries that exceeded the upper quality control limit for 1,1,1-trichloroethane, carbon tetrachloride, bromodichloromethane, dibromochloromethane and bromoform. No qualifiers were required on this basis.

The volatile LCS on 7/12/00 had % recoveries that exceeded the upper quality control limit for carbon tetrachloride, bromodichloromethane, dibromochloromethane and bromoform, and % recoveries that exceeded the lower quality control limit for tetrachloroethene, ethylbenzene and total xylenes. No qualifiers were required on this basis.

The semivolatile LCSs on 7/7, 11 and 12/00 on instruments A4HP6 and A4HP7 had % recoveries that fell below lower quality control limits for hexachlorocyclopentadiene and dimethyl phthalate. In all samples non-detected results for hexachlorocyclopentadiene and dimethyl phthalate were rejected (UR).

The semivolatile LCS on 7/7/00 had % recoveries that exceeded quality control limits for diethyl phthalate and naphthalene. No qualifiers were required on this basis.

The semivolatile LCS on 7/11/00 had % recoveries that exceeded quality control limits for diethyl phthalate. No qualifiers were required on this basis.

Memo to: T. Hansen – Page 6

Date: 11/16/00

The semivolatile LCS on 7/12/00 had % recoveries that exceeded quality control limits for 1,2-dichlorobenzene, 1,3-dichlorobenzene, 2,4-dichlorophenol, 2-chloronaphthalene, 2-methylnaphthalene, 2-nitrophenol, 4-chloroaniline, fluorene, naphthalene and diethyl phthalate. No qualifiers were required on this basis.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the EPA Functional Guidelines for Organic Data Validation (10/99) and the NFESC guidelines "Navy IRCQM" (Sept 1999). The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC guidelines and the Quality Assurance Project Plan (QAPP)."

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Qualifier Codes:

- A = Lab Blank Contamination
- B = Field Blank Contamination
- C = Calibration (i.e., % RSDs, %Ds, ICVs, CCVs, RPDs, RRFs, etc.) Noncompliance
- D = MS/MSD Noncompliance
- E = LCS/LCSD Noncompliance
- F = Lab Duplicate Imprecision
- G = Field Duplicate Imprecision
- H = Holding Time Exceedance
- I = ICP Serial Dilution Noncompliance
- J = GFAA PDS - GFAA MSA's $r < 0.995$
- K = ICP Interference - include ICSAB % R's
- L = Instrument Calibration Range Exceedance
- M = Sample Preservation
- N = Internal Standard Noncompliance
- O = Poor Instrument Performance (i.e., base-time drifting)
- P = Uncertainty near detection limit ($< 2 \times$ IDL for inorganics and $<$ CRQL for organics)
- Q = Other problems (can encompass a number of issues)
- R = Surrogates Recovery Noncompliance
- S = Pesticide/PCB Resolution
- T = % Breakdown Noncompliance for DDT and Endrin
- U = Pest/PCD% between columns for positive results
- V = Non-linear calibrations, tuning $r < 0.995$ (correlation coefficient)
- W = EMPC result
- X = Signal to noise response drop

Date: 11/16/00

Continuing calibration verification RRFs fell below the 0.05 quality control limit for propionitrile and isobutyl alcohol on 7/11/00, 09:12, on instrument A3UX7. Only nondetected results were reported for propionitrile and isobutyl alcohol and these were rejected (UR) in the affected samples.

Continuing calibration verification RRFs fell below the 0.05 quality control limit for acrolein and acetonitrile on 7/12/00, 22:59, on instrument A3UX7. Only nondetected results were reported for acrolein and acetonitrile and these were rejected (UR) in the affected samples.

Continuing calibration verification %Ds exceeded the 25% quality control limit for dichlorodifluoromethane, trichlorofluoromethane, carbon tetrachloride, bromodichloromethane, 2-hexanone, dibromochloromethane, 1,1,1,2-tetrachloroethane and bromoform on 7/12/00, 22:59, on instrument A3UX7. Only nondetected results were reported for the aforementioned compounds and these were qualified as estimated (UJ) in the affected samples.

A continuing calibration verification RRF fell below the 0.05 quality control limit for isobutyl alcohol on 7/12/00, 23:25, on instrument A3UX7. Only nondetected results were reported for isobutyl alcohol and these were rejected (UR) in the affected samples.

A continuing calibration verification %D exceeded the 25% quality control limit for isobutyl alcohol on 7/12/00, 23:25, on instrument A3UX7. The nondetected results reported for isobutyl alcohol were previously qualified for the above RRF noncompliance and did not require further qualification.

SVOA

The common laboratory contaminant bis(2-ethylhexyl)phthalate was detected in the laboratory method blanks at a maximum concentration of 3.0 ug/L. An action level of 30.0 ug/L was established. Positive results less than blank action levels were qualified as undetected (U) in the affected environmental samples. Sample aliquot and dilution factors were taken into consideration when applying the blank action level.

Initial calibration RRFs fell below the 0.05 quality control limit for 1,3,5-trinitrobenzene on 6/6/00, on instrument A4HP7. Only nondetected results were reported for 1,3,5-trinitrobenzene and these were rejected (UR) in the affected samples.

Initial calibration % RSDs exceeded the 30% (but <50%) quality control limit for 1,3,5-trinitrobenzene, Dinoseb and 4-nitroquinoline-1-oxide on 6/6/00, on instrument A4HP7. Only nondetected results were reported for Dinoseb and 4-nitroquinoline-1-oxide, which do not require qualification based on this calibration noncompliance. The nondetected result reported for 1,3,5-trinitrobenzene was previously qualified for the above RRF noncompliance and did not require further qualification.

An initial calibration %RSD exceeded the 30% (but <50%) quality control limit for 4-nitroquinoline-1-oxide on 7/12/00, on instrument A4HP7. Only nondetected results were reported for 4-nitroquinoline-1-oxide, which do not require qualification based on this calibration noncompliance.

A continuing calibration verification RRF fell below the 0.05 quality control limit for 4-nitroquinoline-1-oxide on 7/7/00, 09:22, on instrument A4HP7. Only nondetected results were reported for 4-nitroquinoline-1-oxide and these were rejected (UR) in the affected samples.

TETRA TECH NUS, INC.

Lab Name: Severn Trent Laboratories, Inc.

SDG Number: MP013

Matrix: (soil/water) WZ

Lab Sample ID: A0F280235 008

Method: SW846 8260B

Volatile Organics, GC/MS (8260B)

Sample WT/Vol: 5 / mL

Date Received: 06/28/00

Work Order: DFF9H101

Date Extracted: 07/08/00

Dilution factor: 1

Date Analyzed: 07/08/00

Moisture %:
