19. Abstract

A hazardous waste analysis study was conducted for Naval Air Station (NAS) Memphis. The purpose of the study was to identify solid wastestreams and evaluate them to whether they are hazardous. If a determination could not be made, it was recommended that the wastestream be sampled and laboratory analyzed. The following summary and recommendations are based on the findings.

- Between January and April, 1995 site visits were conducted and reports reviewed. About 240 wastestreams were identified and documented.
- Each wastestream was reviewed using existing and historical data. Process knowledge and material usage was used in assessing if the wastestream could be adequately characterized.

In conclusion, about 66 wastestreams could not be adequately characterized and are recommended to be sampled and analyzed for various characteristics. The remaining wastestreams have been adequately characterized.

1.0 INTRODUCTION

1.1 Purpose

The purpose of this report is to list wastestreams requiring chemical analyses for hazardous waste characterization. This effort is being made to update Naval Air Station (NAS) Memphis' hazardous waste profile. Southern Division, Naval Facilities Engineering Command (SOUTHNAVFACENGCOM) tasked EnSafe/Allen and Hoshall (E/A&H) under Contract N62467-89-D-0318, task order 0092, to conduct the first phase of a hazardous waste analysis at NAS Memphis in Millington, Tennessee, to determine if the waste is hazardous, to identify and classify it, and to determine the management options. Waste analysis involves identifying or verifying the chemical and physical characteristics of a waste by analyzing a representative sample or by applying known information to the waste. A waste analysis plan documents the procedures used to obtain information about the waste. Because NAS Memphis operates a Resource Conservation and Recovery Act-permitted hazardous waste container storage facility and generates hazardous waste, the base is required to have a waste analysis plan and to properly identify all hazardous waste under Title 40 Code of Federal Regulations (CFR) Part 260 through 280, and Tennessee Department of Environment and Conservation (TDEC) Rule 1200-1.

The Navy's Statement of Work dated August 16, 1994, identified specific generators to be included in the study. The project work included preparing a proposal on what wastestreams required analyses based on observing wastestream generation, technical knowledge, and wastestream process knowledge obtained from the *NAS Memphis Pollution Prevention Manual*. Current wastestream reports from the activity were to be obtained to help identify the wastestream constituents. This report details which wastestreams require sampling.

Before any sampling or laboratory testing occurs, a health and safety plan is to be submitted to the Navy for approval.

The Navy divided the work into two phases and then awarded Phase I. E/A&H conducted the Phase I waste analysis which involved: (1) searching files and reviewing records at NAS Memphis, (2) conducting site-specific surveys of generating activities for waste process information, (3) obtaining waste identification documentation (e.g., material safety data sheets [MSDS] and hazardous substance information system data sheets), (4) screening wastestreams and noting which ones cannot be completely identified based on user knowledge, (5) preparing a sampling and analysis plan for wastestreams at which user knowledge cannot be applied or the concentration from a process varies, and (6) preparing a health and safety plan for the proposed sampling and associated contaminants. This report presents the results of Phase I findings, along with a sampling and analysis plan.

Phase II, which will be negotiated and awarded upon acceptance of the Phase I work, will consist of sampling and analysis, evaluating hazardous wastestreams with respect to land-ban restrictions, assessing the applicability of TDEC hazardous waste codes, and compiling a comprehensive list of all processes generating, recycling, and disposing of hazardous wastes, along with their waste analysis profiles.

The goal of both phases is to satisfy the U.S Environmental Protection Agency (USEPA) and TDEC requirements for a hazardous waste analysis plan. The result will be a complete profile of hazardous wastestreams, a sampling and analysis plan, and a quality assurance/quality control (QA/QC) plan which NAS Memphis can implement to keep its hazardous waste lists current.

In all, 240 identified wastestreams have been listed in this report. This list, compiled by E/A&H from information gathered during the field surveys in January 1995, deviates from the table in the Navy's Statement of Work because some tenant commands either have departed or downsized due to base realignment and closure. The Navy's original wastestream list is included in Appendix A.

2.0 CHARACTERIZATION EFFORTS

2.1 File Search and Record Review

Before the site visit, information about materials, processes, wastes, frequencies of generation, and disposal were obtained from the following plans and records.

- Pollution Prevention Plan
- Part B Permit
- Hazardous Waste Management Plan
- Wastestream reports
- Waste profile sheets

Using the material, each generator was profiled for the site-specific survey team's use.

The Pollution Prevention Plan outlined many waste processes schematically. However, the plan did not provide the information needed to properly characterize each wastestream. Instead, it described responsibilities and procedures for reducing the amount of waste NAS Memphis generates.

The Part B Permit listed hazardous wastes that can be stored in the container storage area and outlined waste analysis procedures for properly identifying these wastes. Based on observations during the site visit, most generated wastes are stored before offsite shipment for disposal. However, the federal prison manifests its own hazardous waste.

The hazardous waste management plan listed the generators and wastes present at NAS Memphis at the time it was written, but it did not contain the data necessary to properly identify each wastestream as a hazardous waste. Rather, it described responsibilities and procedures which NAS Memphis and its tenants must implement to properly identify their wastes.

Wastestream reports, such as those submitted to the state and USEPA, listed only wastes which had been stored in the permitted hazardous waste storage area and/or ultimately disposed of offsite.

The waste profile sheets were the most useful records for properly characterizing each wastestream as hazardous. The waste profile sheet requires the tenant to either provide the MSDS or laboratory analysis to support the waste characterization. E/A&H found that not all wastes were registered, thus not all wastes were profiled. To register a wastestream, the generator must submit a completed DD form 1348-1 (disposal turn-in document) and the waste's MSDS to the Public Works Department, Environmental Division, Hazardous Waste Branch for processing. This department prepares a hazardous waste profile sheet (HWPS) and inspects the waste to ensure that it matches the HWPS, MSDS, and disposal turn-in document. Figure 1 is an example of a hazardous waste profile sheet.

2.2 Site-Specific Surveys

E/A&H conducted site-specific surveys during January 1995 with follow-up visits in February and March. During these surveys, information packets made from records were verified. Outdated data were either deleted or updated based on interviews and/or the process components and materials present. Some tenants appointed one individual to escort the survey team while others appointed different escorts at individual processes. Each generator was notified before the survey team's visit.

2.3 Identification Documentation

E/A&H developed forms to track data and wastestream characterization. The forms list the building number and describe the following:

- The work center activity which generates the waste
- The document reviewed

HAZARDOUS WASTE PROFILE SHEET

PART I - GENERAL INFORMATION

GENERATOR NAME		BLDG NO.	GEN. EPA ID
TECHNICAL CONTACT		TITLE	PHONE
NAME OF WASTE		HEM	EPA WASTE CODE
GENERATING WASTE PROCESS		PROJ. VOL/UNITS	COLLECTION MODE

SPECIAL HANDLING INFORMATION

- CHEMICAL ANALYSIS (Attach Lab Results)
- USER KNOWLEDGE (Attach Supporting Documents)

I hereby certify that all information submitted is an accurate representation of the waste listed.

GENERATOR'S PRINTED NAME	GENERATOR'S SIGNATURE	DATE
--------------------------	-----------------------	------

- The storage location and container type used to manage the waste
- Preliminary waste code determination

Figure 2 is an example of the form, which was completed with information obtained during the file/document review and field surveys. A completed form for each wastestream identified during the document review and field survey is included as Appendix B.

2.4 Screening and Identifying Wastestream Characteristics

E/A&H screened and identified each wastestream using the data collected as described above. First each wastestream was screened to see if it could be defined as a nonregulated solid waste, a possible hazardous waste, a special waste, or used oil in accordance with state and USEPA regulatory definitions. Second, the wastestreams were categorized into five groups — I, II, III, IV, or V — depending on the amount of process and material user knowledge available. Third, all documented data were assessed to determine whether there was enough proof to properly characterize the wastestream or whether further sampling and laboratory analysis were needed.

2.4.1 Regulatory Definitions

Each wastestream was preliminarily defined as solid waste, hazardous waste, possibly hazardous, a special waste, or used oil. This information was entered on each wastestream documentation form. Regulatory definitions, from several references, used during this study are listed below.

Solid waste refers to any garbage or refuse, including recyclable materials when they become discarded, or sludge from a waste treatment plant, water supply treatment plant, or air pollution control facility. It also refers to any other discarded materials, including solid, liquid, semisolid, or contained gaseous material resulting from industrial, commercial, and agricultural operations and community activities. It includes the following:

²Coding System: TBD — To be Determined by Analysis
NA — Not Applicable

- Solid or dissolved materials in domestic sewage

- Solid or dissolved materials in irrigation return flows or industrial discharges which are point sources subject to permits under Section 402 of the Federal Water Pollution Control Act (compiled at 33 U.S. Code [USC] 1342) as amended

- Source, special nuclear, or by-product material as defined by the Atomic Energy Act of 1954, as amended (compiled at 42 USC 2011 et seq). Hazardous waste means: (1) any material listed as a hazardous waste in Title 40 CFR Part 261 Subpart D, or (2) any material that possesses any of the hazard characteristics of corrosivity, ignitability, reactivity, or toxicity as defined in 40 CFR 261, Subpart C, or (3) a material that is contaminated by or mixed with any of the previously mentioned materials.

Hazardous waste means: (1) any material listed as a hazardous waste in 40 CFR 261, Subpart D, (2) any material that possesses any of the hazard characteristics of corrosivity, ignitability, reactivity, or toxicity as defined in 40 CFR 261, Subpart C, or (3) a material that is contaminated by or mixed with any of the materials noted above.

Special wastes include sludges, bulky wastes, pesticide wastes, medical wastes, industrial wastes, hazardous wastes not subject to regulations under TDEC rules 1200-1-11-.03 through 1200-1-11-.07, liquid wastes, friable asbestos wastes, combustion wastes, and other solid wastes that are either difficult or dangerous to manage and require extraordinary management. However, discarded automotive tires and dead animals are not categorized as a special waste.

Used oil means any oil that has been refined from crude oil or any synthetic oil that has been used and, as a result, has been contaminated by physical or chemical impurities (40 CFR 279).

Exempt includes discharges that are permitted or household solid waste.

2.4.2 Group Definitions

NAS Memphis has an established Pollution Prevention Plan which consists of process flow diagrams. Waste or by-products are listed on the diagrams. The Pollution Prevention Plan's purpose is to minimize the amount of hazardous waste generated.

Based on the reviewed processes for the work centers, each wastestream was grouped into one of five categories based on the data collected, the generator's knowledge, and E/A&H's knowledge of the process, materials used, and process by-products. Each grouping is defined below. Table 1 lists each generator, its wastestream, assigned group number, and process identification number.

Group I wastes are unused hazardous materials that are usually in their original containers or spent hazardous wastes that are self-contained during use, such as batteries, or hazardous materials with no resale value. An example of a Group I waste is a hazardous material with an expired shelf life from the Memphis reuse store. The identification is obtained from the container label and, if applicable, the national stock number and hazardous material information system, or MSDS. Materials exhibiting a hazardous waste characteristic or containing a listed hazardous waste are managed as hazardous waste.

Group II wastes are routine hazardous wastestreams that require annual verification through laboratory analysis or MSDS. Group II wastestreams were identified during the E/A&H site visit or from registration records in the Public Works Department, Environmental Division, Hazardous Waste Branch. Process and material knowledge for these wastestreams was obtained during document review or site interviews.

Group III wastes are hazardous wastes generated in nonroutine wastestreams. Examples are spill residues. Group III wastestreams were identified during the site visits.

Group IV wastes are nonregulated wastes generated routinely. These wastes also include spent wastes which are returned to the manufacturer (i.e., titanium/zinc buttons and lead tabs from dental and toner packs). These wastestreams were identified during the E/A&H site visit or from registration records in the Public Works Department, Environmental Division, Hazardous Waste Branch. Process and material knowledge for these wastestreams was obtained during document review or recorded during site interviews.

Group V wastes are special wastes generated routinely. These wastestreams require analysis before being designated a special waste. Group V wastestreams were identified during site visits.

2.4.3 Wastestream Assessment

E/A&H personnel were not able to define all hazardous constituents for some of the wastestreams using the information collected or process knowledge. In assessing the data gathered, applying acceptable knowledge was considered first. A broad definition of acceptable knowledge was applied. This definition included "process knowledge," whereby detailed information on the wastes was obtained from published or documented waste analysis data or studies conducted on hazardous wastes from processes similar to those generating the wastes. Additionally, any wastestream which contained a USEPA-listed (F-, P-, and U-listed) hazardous waste was considered to always be a hazardous waste based on USEPA mixture rules. Even with this broad definition, a number of NAS Memphis wastestream toxic characteristics could not be assessed. Characteristics such as flash points and toxicity characteristic leachate procedure (TCLP) for metals and volatiles could not be quantified. The hazardous characteristics of wastestreams such as mixed paints and thinners, waste oils, fuels, and hydraulic fluids cannot be quantified without laboratory analysis. Wastestreams from nonroutine processes or process with changing materials could not be properly characterized either. For these wastestreams, sampling and laboratory analysis are recommended. Table 2 summarizes E/A&H's assessment of like wastestreams.

	Ballasts
	Fluorescent Lights

User knowledge is shown for wastestreams with enough data available to properly characterize them. Recommended testing parameters are provided for wastestreams that cannot be properly characterized without laboratory analysis.

3.0 SAMPLING AND ANALYSIS

This sampling and analysis plan applies to wastestreams with unknown characteristics. Laboratory analysis will not be performed on Groups I and IV wastes. Sampling and analysis for the parameters listed in Table 3 will be performed on the wastestreams according to USEPA Solid Waste Method 846 or appropriate methods. Discrete or composite samples will only be taken at the point of generation. Composite samples for different work centers will not be taken. Two E/A&H employees will spend approximately one week sampling the selected wastestreams. The E/A&H tasks to be completed under the sampling phase of this project include:

- Coordinating and obtaining sampling containers and ancillary documentation (i.e., sample labels, seal labels, and chain-of-custody forms) from the selected laboratory.
- Obtaining the appropriate sampling equipment (i.e., composite liquid waste sampler [Coliwasa], sludge-judge, dedicated plastic spoons, auger, resealable bags, etc).
- Coordinating sample shipment to the selected laboratory and ensuring samples are preserved according to SW-846.
- Providing data validation and deduction.
- Submitting a report which interprets the analytical results.

E/A&H will coordinate with the SOUTHNAVFACENGCOM Engineer in Charge and the NAS Memphis Environmental Protection Specialist before sampling activities begin.

Note:

* = Obtained from NAS Memphis Pollution Prevention Plan

The following procedures are recommended for sampling solid/hazardous waste liquids and solids in drums at NAS Memphis. Specific sampling methods and approaches will be incorporated in a Phase II field sampling memorandum.

3.1 Sampling Methods

The general sampling procedures that will be followed are described in Chapter 10 of SW-846. Table 4 lists the sampling methods for the various Group II, III, and V wastes to be analyzed. Many wastestreams are heterogeneous; therefore, care must be taken to obtain a representative sample. In sampling wastes, consideration should be given to the uniformity of the waste in a container and to daily variations in production which may cause the waste to vary. Liquids and sludges are the most common forms of hazardous waste at NAS Memphis. Recommended sampling access points for different waste containers and soil are listed in Table 5. Recommended numbers of samples to be taken for different types of wastes and soil are in Table 6.

Table 4 Sampling Methods	
Type of Waste	Guide Reference*
Extremely viscous liquid	ASTM Standard D140-70, Auger (depending on thickness)
Crushed or powdered material	ASTM Standard D346-75, Thief or trier
Soil-like material	ASTM Standard D1452-65, Augers or trier
Fly Ash-like material	ASTM Standard D2234-76, Thief
Containerized liquid waste	Coliwasa
Liquid waste in pits and tanks	Dipper, weighted bottle sampler, or Coliwasa (depending on depth)

Notes:

- * = *Test Methods for Evaluation of Solid Waste, Physical/Chemical Methods*
- ASTM = *American Society for Testing and Materials*

Table 5 Sampling Points Recommended for Most Waste Containers	
Container Type	Sampling Point
Drum (bung on one end)	Withdraw sample through the bung opening.
Drum (bung on side)	Lay drum on side with bung up. Withdraw sample through the bung opening.
Barrel, fiber drum, buckets, sacks, bags	Withdraw samples through the top of barrels, fiber drums, buckets, and similar containers. Withdraw samples through fill openings of bags and sacks. Withdraw samples through the center of the containers and to different points diagonally opposite the point of entry.
Tank and similar containers	Withdraw sample through open hatch. Sample all other hatches.
Soil and sludge	Divide the surface area into an imaginary grid. (The number of grids is determined by the desired number of samples to be collected which, when combined, should give representative sample of the wastes.) Sample each grid.

Table 6 Number of Samples to Be Collected				
Case No.	Information Desired	Waste Type	Container Type	Number of Samples to Be Collected
1	Average Concentration	Liquid	Drum, vacuum truck, and similar	1 collected with Coliwasa.
2	Average Concentration	Solid (powder or granular)	Bag, drum, bin, sack	1 composite sample of several samples collected at the same sampling area.
3	Average Concentration	Soil or sludge		1 composite sample of several samples collected at the same sampling area.

For all liquid hazardous wastes in containers ranging from 5 gallons to 85 gallons, use a Coliwasa sampler. This device collects material throughout the depth of the liquid in a drum, assuring a representative sample. Instructions for drum sampling are presented in Table 7. For

all wastes except mixed paint wastes, a single sample (top to bottom) will be taken from a container, unless the waste is heterogeneous and/or contains one or more layers. In these cases, multiple samples should be taken. Samples to be analyzed for volatile organics should be uncomposited grab samples. Mixed paint waste will be sampled by using a glass tube or Coliwasa, collecting a full-depth sample. Wipe the outside of the sampling device with a clean rag before placing the sample in a sampling container.

Table 7 Procedure for Sampling Waste in Drums	
1.	Choose the plastic or glass Coliwasa for the liquid waste to be sampled.
2.	Make sure that the sampler is clean.
3.	Make sure the sampler is functioning properly.
4.	Wear necessary protective clothing and gear and observe required sampling precautions.
5.	Slowly lower the sampler into the liquid waste. (Lower the sampler at a rate that permits the levels of the liquid inside and outside the sampler tube to remain about the same. If the level of the liquid in the sampler tube is lower than that outside the sampler, the sampling rate is too fast and will result in a nonrepresentative sample).
6.	When the end of the Coliwasa reaches the bottom of the waste container, push the inner tube of the Coliwasa downward against the stopper, which will close the container and leave a sample of the waste inside the Coliwasa.
7.	Slowly withdraw the sampler from the waste container with one hand while wiping the sampler tube with a disposable cloth or rag with the other hand.
8.	Carefully discharge the sample into a suitable sample container by slowly opening the sampler. This is done by retracting the inner tube and allowing the sample to flow into the designated sample container.
9.	Repeat this process until the container is full of sample material.
10.	Cap the sample container; attach label and seal; record in field logbook; and complete sample analysis request sheet.
11.	Clean sampler onsite or store the contaminated parts in a plastic storage tube for subsequent cleaning. Store used rags in plastic bags for subsequent disposal.
12.	Samples are preserved and refrigerated as required by USEPA SW-846 until delivered to the laboratory for analysis.

Solid and powdered waste (i.e., ash in a container or drum) will be sampled using a thief or trier. To assure a uniform sample, drums will be agitated before sampling, if possible.

3.1.1 Sample Preparation, Containers, Preservation, and Labeling

Each wastestream will be designated by a unique numeric code. The sample label will indicate the drum from which the sample was collected, the project name and location (unit name and building number), the date and time of collection, and the required analysis.

From each drum, sufficient sample will be collected to completely fill the container. The laboratory will provide the containers, along with the appropriate container labels and chain-of-custody records. No preservatives will be used other than cooling the samples.

Air bubbles (headspace) will not be trapped in the sample containers. To achieve this, sample material will be introduced slowly until a convex meniscus extends just above the bottle lip for liquid samples, while complete filling of the container will be ensured for solid samples. Once the sample container is filled, a label will be quickly affixed to the container lid while the bottle is inverted to check for the presence of air bubbles.

Once samples are transferred to the appropriate container and the labels are affixed, containers will be immediately placed in a field cooler with blue ice or bagged ice so that the samples are maintained at a temperature of 4°C.

3.1.2 Transfer of Custody and Shipment

Partially completed chain-of-custody forms will be provided with each cooler shipment of empty sample containers from the laboratory. After samples have been collected, sampling personnel must complete the chain-of-custody forms (sample collection time, date, and names of sampling personnel) and maintain the samples under strict chain-of-custody procedures. The original chain-of-custody form must accompany the sample shipment. A copy of the chain-of-custody form will be retained by the sampling personnel and returned to the project manager.

Sample containers will be packed in the coolers in a manner minimizing the risk of glassware breakage during shipment. Each cooler also will be packed with blue ice to maintain the samples at approximately 4°C during shipment. As mentioned previously, each cooler will contain the chain-of-custody form which corresponds to the samples placed in the respective cooler. Once all coolers are determined to contain the correct information, they will be secured using duct tape or similar adhesive.

All sample shipping coolers will be sent to the laboratory via overnight courier on the day sampled.

3.1.3 Sampler Decontamination

The sampling devices will be decontaminated between drums using an isopropanol rinse and deionized water rinse (three times). This should help prevent cross-contamination between samples.

3.1.4 Sampler Safety Precautions

Sampler safety procedures are outlined in the health and safety plan. This plan has been submitted to the Navy for its approval.

3.2 Test Methods

Physical state and color will be checked visually and recorded at the time of sampling. All analyses will be conducted by a contracted laboratory (approved by the State of Tennessee or USEPA). Table 3 lists specific analytes for which the waste will be tested. Either SW-846 or American Society for Testing and Materials (ASTM)-approved methods will be used. The laboratory performing the hazardous waste analyses will adhere to QA/QC procedures.

If halogens are indicated in waste oil, subsequent analysis will be negotiated and awarded for additional sampling.

4.0 QUALITY CONTROL

All Group II, III, and V wastestreams will be analyzed using these USEPA-approved methods: *Test Methods for Evaluating Solid Waste Physical/Chemical Methods*, USEPA SW-846; *Methods for Chemical Analysis of Water and Wastes*, EPA 600/4/79/020; or ASTM methods.

QA objectives are to assess and document the precision, accuracy, representativeness, completeness, and comparability of sampling and analysis performed. These objectives for laboratory analytical methods (matrices) are based on the premise that the laboratory uses USEPA SW-846, USEPA 600, or ASTM analysis.

All laboratory QA/QC procedures will be conducted in accordance with SW-846. Sample bottle labels and sample security seals will be used. Sample containers to be provided by the laboratory will be prepared as described in Chapter 2 of SW-846. Containers will be shipped to E/A&H from the supplier by common carrier and will remain in E/A&H's custody. No preservatives will be used, other than cooling the sample.

Because the purpose of the Phase II sampling will be to characterize wastestreams, QA samples will not be included (i.e., trip blanks for volatiles, equipment rinsates, or field blanks as outlined under Naval Facilities Engineering Service Center [formerly NEESA] Level C will not be obtained).

Samples will be maintained in the custody of the sampling personnel. Upon transfer of custody, the chain-of-custody form will be signed, with the date and time noted. Because common carriers will not sign chain-of-custody forms, these records will be sealed in plastic inside each cooler. A signed, dated custody seal will be placed over the lid opening of the sample cooler (or each sample container) to indicate if it has been opened during shipment prior to receipt by the laboratory. Chain-of-custody forms received by the laboratory will be signed and dated by the laboratory sample custodian and returned to E/A&H following receipt or as part of the data

reporting package. Calibration procedures and frequency for the laboratory will be followed. Data reduction, validation, and reporting by the laboratory will meet the criteria needed by E/A&H for internal data validation.

The use of the laboratory will be accomplished by a services agreement. The contract will specify the scope of services to be performed by the laboratory, the specific analytical QA requirements to be met, and the information to be developed and reported.

Accuracy

Accuracy is the difference between an average value and the true value when the latter is known or assumed. The term accuracy is normally used interchangeably with percent recovery, and describes either recovery of a known amount of analyte (spike) added to a sample of known value, or recovery of a synthetic standard of known value.

Where: SSR = Spike sample results;
SR = Sample result; and
SA = Spike added.

Note: Units for the concentrations of spikes, samples, and observed and true values vary based on the analysis. However, they are typically noted in micrograms per liter ($\mu\text{g/L}$) or milligrams per liter (mg/L) for water samples and micrograms per kilogram ($\mu\text{g/kg}$) or milligrams per kilogram (mg/kg) for soil samples.

Average

The average (or arithmetic mean) of a set of N values is the sum of the values divided by N:

$$X = \frac{\sum_{i=1}^n X_i}{n}$$

Precision

Relative to the data from a single test procedure, precision is the degree of mutual agreement among individual measurements made under prescribed conditions. An estimate of standard deviation is normally used to describe a particular method's precision.

Standard Deviation Estimate

Standard deviation estimate is the most widely used measure to describe the dispersion of a set of data. Normally, + SD will include 68%, and + 2SD will include about 95% of the data from a study.

Relative Standard Deviation

The estimate of precision of a series of replicate measurements will usually be expressed as the relative standard deviation.

Relative Percent Difference

The relative percent difference is a measure of the difference between two samples assumed to be identical through dividing (splitting) an original sample, analyzing each portion, assessing the values of the first replicate (X1) and that of the second replicate (X2), then dividing the difference by the mean (X) of X1 and X2.

Completeness

Completeness is a measure of the amount of valid data obtained from a measurement system compared to the total amount expected to be obtained under normal conditions. A 95% completeness figure is usually required for a particular analysis and overall project objective.

5.0 WASTE ANALYSIS REPORT

The final Phase II waste analysis submittal will include the HWPS, MSDS, and analytical results for each wastestream sampled. It will also include a tabulation of the land ban requirements. The analytical results will be used to determine the appropriate method of disposal.

WASTESTREAM DOCUMENTATION FORM**

Work Center: AIMD Support Equipment (900)

Work Center Contact: AS-3 Brake

Building Number: N-112

Work Center Phone: 873-5496

Work Center Activity Description:

This work center provides scheduled and unscheduled maintenance, performs servicing of fluid systems, cleaning, corrosion removal, touch-up painting, and preservation of support equipment.

Wastestream as Identified in the Scope of Work and Use:

waste absorbent (speedy dry) which is contaminated with hydraulic fluid, JP-5, used oil, or turbo shaft oil from equipment repair

TDEC Code: None

Documents Reviewed¹: NM PPP/HW Minimization Plan A HMIS (JP-5, etc.)

NM Part B Permit NM HW Management Plan A MSDS (JP-5, etc.)

NM 1991, NM 1992, NM 1993 Wastestream Report NM 1991, NM 1992, NM 1993 Waste Profile Sheet

Process ID Number: AIMD900-01

Storage Location Description:

Outdoor quansit hut

Container Type (i.e., drum, kit, bag), Construction, Condition, and Size:

15-gallon metal container, good condition

Preliminary Waste Code Determination² (40 CFR 261):

X Solid Waste NA Exempt NA Listed TBD Characteristic

S Physical Characteristic (Solid or Liquid) NA Special Waste

Recommended Analysis or Handling Practices:

Minimize spillage of materials that would warrant absorbents. Analyze for TCLP metals and TCLP volatiles.

General Comments:

Waste speedy dry is stored in the container, taken to N-12, then picked up for disposal by HW Branch.

¹Coding System: NM — Not Mentioned in this Document
M — Mentioned in this Document, but no detail
A — Adequate detail to make comments on and gather information for this stream

Work Center Contact: AS-3 Brake

Building Number: N-112

Work Center Phone: 873-5496

Work Center Activity Description:

This work center provides scheduled and unscheduled maintenance, performs servicing of fluid systems, cleaning, corrosion removal, touch-up painting, and preservation of support equipment.

Wastestream as Identified in the Scope of Work and Use:

Empty Metal/Plastic Containers from equipment repair (previously contained hydraulic fluid, antifreeze, oil, brake fluid, etc.)

TDEC Code: None

Documents Reviewed¹: M PPP/HW Minimization Plan

A HMIS (fluid, etc.)

NM Part B Permit

NM HW Management Plan

A MSDS (fluid, etc.)

NM 1991, NM 1992, NM 1993 Wastestream Report

NM 1991, NM 1992, NM 1993 Waste Profile Sheet

Process ID Number: AIMD900-01

Storage Location Description:

Outdoor quansit hut

Container Type (i.e., drum, kit, bag), Construction, Condition, and Size:

5-gallon metal container, good condition

Preliminary Waste Code Determination² (40 CFR 261):

X Solid Waste

NA Exempt

NA Listed

NA Characteristic

S Physical Characteristic (Solid or Liquid)

NA Special Waste

Recommended Analysis or Handling Practices:

The containers should be collected, drained, crushed, and recycled. User knowledge, no analysis recommended.

General Comments:

The empty oil containers are allowed to drain into the UST, wiped clean, then stored until disposal through N-12.

 NM Part B Permit NM HW Management Plan A MSDS
NM 1991, NM 1992, NM 1993 Wastestream Report NM 1991, NM 1992, NM 1993 Waste Profile Sheet

Process ID Number: Not discussed in PPP.

Storage Location Description:

Lab

Container Type (i.e., drum, kit, bag), Construction, Condition, and Size:
The ticonium/rexillium buttons are accumulated in a 1-gallon plastic jug.

Preliminary Waste Code Determination² (40 CFR 261):

X Solid Waste NA Exempt NA Listed NA Characteristic
S Physical Characteristic (Solid or Liquid) NA Special Waste

Recommended Analysis or Handling Practices:

Recycle the buttons.

General Comments:

Returned to the manufacturer for recycle. Manufacturer then sends clean metals.

Work Center: Naval Hospital Pharmacy

Work Center Contact: Dent Williams

Building Number: H-100

Work Center Phone: 873-7512

Work Center Activity Description:

This work center supplies medication for the hospital. The drugs are ordered only as needed.

Wastestream as Identified in the Scope of Work and Use:

Outdated/deteriorated drugs; unused product (including empty containers which contained liquid)

TDEC Code: None

Documents Reviewed¹: NM PPP/HW Minimization Plan NA HMIS
 NM Part B Permit NM HW Management Plan NA MSDS
NM 1991, NM 1992, NM 1993 Wastestream Report NA 1991, NA 1992, NA 1993 Waste Profile Sheet

Process ID Number: Not discussed in PPP.

Storage Location Description:

Inside pharmacy. Outdated controlled substances are kept in vault.

Container Type (i.e., drum, kit, bag), Construction, Condition, and Size:
cardboard box lined with red plastic bag, good condition

Preliminary Waste Code Determination² (40 CFR 261):

X Solid Waste NA Exempt NA Listed NA Characteristic
S & L Physical Characteristic (Solid or Liquid) NA Special Waste

Recommended Analysis or Handling Practices:

User knowledge, no analysis recommended.

General Comments:

Outdated controlled substances are removed from the vault and rendered unusable by soaking them in hot water in a plastic container, placed in red bags, then put in a cardboard box with absorbent material to be picked up by BFI for incineration.

Substances which are not controlled go directly into the lined cardboard box. If the drug is in capsule form, it is taken out of the vial. Nothing goes down the pharmacy drain.

The drugs are picked up by BFI twice a week and are signed and sealed. BFI has manifest system documenting destruction.

 L Physical Characteristic (Solid or Liquid) NA Special Waste

Recommended Analysis or Handling Practices:

Soil samples should be taken under the tanks due to apparent leaks/spills. Recycle hydraulic fluid in accordance with 40 CFR 279. Analyze for metals, flash point, and halogens.

General Comments:

Dumped in waste oil storage tanks. A log book is kept. Removed/recycled by Safety-Kleen. (Patrons provide materials)

Storage Location Description:

Inside maintenance shop

Container Type (i.e., drum, kit, bag), Construction, Condition, and Size:

5-gallon plastic bucket, good condition

Preliminary Waste Code Determination² (40 CFR 261):

X Solid Waste X Exempt NA Listed TBD Characteristic

L Physical Characteristic (Solid or Liquid) NA Special Waste

Recommended Analysis or Handling Practices:

Collect and recycle used antifreeze. Analyze for TCLP metals if not recycled.

General Comments:

When full, bucket is taken to car wash and put down the sewer drain. NAS Memphis has permission to dispose 1,400 gallons down the sewer per year.

Container Type (i.e., drum, kit, bag), Construction, Condition, and Size:

10-gal drum

Preliminary Waste Code Determination² (40 CFR 261):

X Solid Waste NA Exempt NA Listed NA Characteristic

S Physical Characteristic (Solid or Liquid) NA Special Waste

Recommended Analysis or Handling Practices:

If ballasts are not marked "PCB Free", ballasts are sent off via NAS Memphis' PCB disposal contractor since there is usually not enough material in the ballast to provide an analysis. Also, the expense of sampling each ballast would be cost prohibitive.

General Comments:

Stored at S-77 Electric Shop.

Preliminary Waste Code Determination² (40 CFR 261):

X Solid Waste NA Exempt NA Listed TBD Characteristic

L Physical Characteristic (Solid or Liquid) NA Special Waste

Recommended Analysis or Handling Practices:

Handle in accordance with 40 CFR 279. Analyze for metal, flash point, and total halogens.

General Comments:

Used oil is poured into one of three access ports in the transportation buildings which drain into the 550-gallon UST which is pumped out by Maytag.

**NAS MEMPHIS
WASTESTREAM DOCUMENTATION FORM**

Work Center: Dyncorp Transportation

Work Center Contact: George Burns

Building Number: S-9

Work Center Phone: 873-7235

Work Center Activity Description:

This work center performs fluid services, cleaning, painting, and other miscellaneous repairs to Navy vehicles.

Wastestream as Identified in the Scope of Work and Use:

used oil filters

TDEC Code: None

Documents Reviewed¹: NM PPP/HW Minimization Plan NA HMIS
NM Part B Permit NM HW Management Plan NA MSDS (oil)
NM 1991, NM 1992, NM 1993 Wastestream Report NM 1991, NM 1992, NM 1993 Waste Profile Sheet

Process ID Number: DYNTRANS-01

Storage Location Description:

Inside wing B of the transportation building (near filter crushing machine)

Container Type (i.e., drum, kit, bag), Construction, Condition, and Size:

55-gallon metal drum, good condition

Preliminary Waste Code Determination² (40 CFR 261):

X Solid Waste NA Exempt NA Listed TBD Characteristic
S Physical Characteristic (Solid or Liquid) NA Special Waste

Recommended Analysis or Handling Practices:

Collect used oil filters, drain, crush and recycle the oil and metal. Analyze for TCLP metals and TCLP volatiles.

General Comments:

The filters are drained for 12 hours in a 5-gallon bucket which is dumped into the UST port. After the filters have dried, they are crushed in the machine, then stored in a 55-gallon drum which is taken to the Dyncorp satellite accumulation building (S-1238) for disposal (when full).

Work Center: NATTC Facility Support Branch

Work Center Contact: P.O. Conger

Building Number: S-54 Wing 2

Work Center Phone: 873-5033

Work Center Activity Description:

The Print Shop photocopies work curriculum for the training schools.

Wastestream as Identified in the Scope of Work and Use:

Rags contaminated with Multigraphics Multilith electrostatic solution (#6830-00-813-6702) and Multigraphics deglazing solvent (#6850-00-821-8882) which contains 1,1,1-trichloroethane.

TDEC Code: None

Documents Reviewed¹: NM PPP/HW Minimization Plan A HMIS

NM Part B Permit NM HW Management Plan A MSDS

NM 1991, NM 1992, NM 1993 Wastestream Report NM 1991, NM 1992, NM 1993 Waste Profile Sheet

Process ID Number: Not discussed in PPP.

Storage Location Description:

Inside building.

Container Type (i.e., drum, kit, bag), Construction, Condition, and Size:

red model #921 metal can and gray metal trash can, good condition

Preliminary Waste Code Determination² (40 CFR 261):

X Solid Waste NA Exempt X Listed TBD Characteristic

S Physical Characteristic (Solid or Liquid) NA Special Waste

Recommended Analysis or Handling Practices:

Make sure the rags have no free flowing liquids. Collect, clean, and reuse contaminated rags. Analyze for TCLP (metals and volatiles).

General Comments:

The rags are turned in to the less than 90 day accumulation area south of Building S-232 and disposed of as hazardous waste.

Work Center Phone: 873-5032

Work Center Activity Description:

This work center is responsible for corrosion removal, cleaning, treating, priming, and applying finished coats.

Wastestream as Identified in the Scope of Work and Use:

Cleaning chemicals (i.e., thinner and aliphatic naphtha used in cleaning and removing paint)

TDEC Code: 11

Documents Reviewed¹: A PPP/HW Minimization Plan A HMIS

 A Part B Permit A HW Management Plan A MSDS

 M 1991, M 1992, M 1993 Wastestream Report NM 1991, NM 1992, M 1993 Waste Profile Sheet

Process ID Number: NTGPME-01 and 02

Storage Location Description:

In the outdoor 360 Cage that is constructed of aluminum/fence with a roof.

Container Type (i.e., drum, kit, bag), Construction, Condition, and Size:

30-gallon metal drum, good condition

Preliminary Waste Code Determination² (40 CFR 261):

 X Solid Waste NA Exempt NA Listed X Characteristic

 L Physical Characteristic (Solid or Liquid) NA Special Waste

Recommended Analysis or Handling Practices:

Handle as a hazardous waste D001. Analyze for TCLP (metals and volatiles).

General Comments:

Picked up by HW Branch for disposal.

Work Center Contact: Lee York

Building Number: S-360

Work Center Phone: 873-5032

Work Center Activity Description:

This work center is responsible for corrosion removal, cleaning, treating, priming, and applying finished coats.

Wastestream as Identified in the Scope of Work and Use:

Empty paint cans

TDEC Code: None

Documents Reviewed¹: A PPP/HW Minimization Plan A HMIS
 NM Part B Permit NM HW Management Plan A MSDS
 NM 1991, NM 1992, NM 1993 Wastestream Report NM 1991, NM 1992, NM 1993 Waste Profile Sheet

Process ID Number: NTGPME-01 and 02

Storage Location Description:

Accumulated on table in Paint Shop.

Container Type (i.e., drum, kit, bag), Construction, Condition, and Size:

Plastic Bag

Preliminary Waste Code Determination² (40 CFR 261):

 X Solid Waste NA Exempt NA Listed NA Characteristic
 S Physical Characteristic (Solid or Liquid) NA Special Waste

Recommended Analysis or Handling Practices:

Collect, drain, crush, and recycle metal cans. User knowledge, no analysis recommended.

General Comments:

The empty cans are rinsed with thinner and wiped with rags. The bagged cans go to the HW Branch. The rinsate is drummed. The rags are placed in a 55-gallon drum and disposed of by the HW Branch as non-regulated waste.

WASTESTREAM DOCUMENTATION FORM**

Work Center: VR-60 Line

Work Center Contact: P. O. Bagby

Building Number: N-126

Work Center Phone: 873-7449

Work Center Activity Description: All operations have ceased.

This work center formerly provided scheduled cleaning, fuel testing, and pre-flight maintenance for squadron C-9 aircraft.

Wastestream as Identified in the Scope of Work and Use:

Deicing fluid (overstocked, never used)

TDEC Code: None

Documents Reviewed¹: NM PPP/HW Minimization Plan A HMIS
 NM Part B Permit NM HW Management Plan A MSDS
NM 1991, NM 1992, NM 1993 Wastestream Report NM 1991, NM 1992, NM 1993 Waste Profile Sheet

Process ID Number: Not discussed in PPP.

Storage Location Description:

Outdoor HW storage compound near Building N-126; enclosed within a fence, no roof

Container Type (i.e., drum, kit, bag), Construction, Condition, and Size:

Eight 55-gallon metal drums with dented and rusted areas

Preliminary Waste Code Determination² (40 CFR 261):

X Solid Waste NA Exempt NA Listed NA Characteristic
L Physical Characteristic (Solid or Liquid) NA Special Waste

Recommended Analysis or Handling Practices:

No recommended analysis. The drums are scheduled for disposal.

General Comments:

The drums were overstocked and appeared to have been stored at this location for several years. The deicing fluid has never been used. The drums are scheduled to be overpacked and turned in to the HW Branch instead of DRMO due to the condition of the drums.

When the deicing operation was in use, the aircrafts were washed/deiced and the rinsate went into the oil/water separator which then flowed into the sewer.

Analyze for flash point, TCLP metals, and volatiles.

General Comments:

When the coffee can is full, it is taken to AIMD (N-12) and the contents poured into a paint disposal drum.

Work Center: Beech Aircraft

Work Center Contact: John Landsittel

Building Number: N-798

Work Center Phone: 873-7306

Work Center Activity Description:

This contractor performs maintenance on the C-12 aircraft.

Wastestream as Identified in the Scope of Work and Use:

Rags w/turbo oil and fuel

(This work center was not identified in the scope of work.)

TDEC Code: None

Documents Reviewed¹: M PPP/HW Minimization Plan

A HMIS

NM Part B Permit

NM HW Management Plan

A MSDS

NM 1991, NM 1992, NM 1993 Wastestream Report NM 1991, NM 1992, NM 1993 Waste Profile Sheet

Process ID Number: Not discussed in PPP

Storage Location Description:

Inside hangar

Container Type (i.e., drum, kit, bag), Construction, Condition, and Size:

5-gallon metal can, good condition

Preliminary Waste Code Determination² (40 CFR 261):

X Solid Waste

NA Exempt

NA Listed

NA Characteristic

S Physical Characteristic (Solid or Liquid)

NA Special Waste

Recommended Analysis or Handling Practices:

Collect, clean, and reuse contaminated rags. Avoid cross contamination with other waste streams. User knowledge, no analysis recommended.

General Comments:

Rags are placed in a metal can until full. The rags are then double bagged (plastic) and taken to the AIMD (N-12) outdoor storage area.
