EXECUTIVE SUMMARY

This plan updates all previous revisions of the Groundwater Monitoring Well Management Plan originally prepared by EnSafe/Allen & Hoshall in 1995 and outlines inspection criteria and maintenance procedures for wells at the Naval Support Activity (NSA) Mid-South, Millington, Tennessee. Maintenance procedures are designed to ensure well integrity and compliance with local, state, and federal regulations. There are presently 284 groundwater monitoring wells and piezometers, two leak detection wells, five potable water supply wells, and four non-potable water wells in use at and around NSA Mid-South. As part of the Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI), four private wells located offsite of the base property have also been monitored (i.e., water level measurements and/or groundwater sampling). The potable, non-potable and private wells are not covered under this management plan and are listed as reference only.

Most of the monitoring wells were installed at NSA Mid-South sites designated as Solid Waste Management Units (SWMUs) during the RFI. Some of these SWMUs have been or are nearing official closure. In accordance with a September 23, 1997, technical memorandum, several wells were closed in 1998. Many of the leak detection wells at NSA Mid-South were also closed in 1998 as the tank systems associated with them were removed. As a result, the well database (Appendix A) has been periodically updated by the Activity (or a designee). The table on the following page provides a summary of the wells currently in the database. Of the 455 wells listed in the summary table, four original closed potable water wells screened in the Memphis Sand aquifer (see Section 3.3.5.3) are not listed in the database.

1.0 INTRODUCTION

This revision updates the original Groundwater Monitoring Well Management Plan prepared by EnSafe/Allen & Hoshall (E/A&H) in 1995 and subsequent revisions, with the most recent being Revision 6 prepared by EnSafe Inc. in November 2001. It outlines inspection criteria and maintenance procedures for all monitoring wells installed at the Naval Support Activity (NSA) Mid-South, Millington, Tennessee. Maintenance procedures are designed to ensure well integrity and continued compliance with local, state, and federal regulations. This revised document will be referred to as the Groundwater Well Management Plan (GWMP) for NSA Mid-South, Millington, Tennessee.

During preparation of this plan, EnSafe reviewed reports related to groundwater investigations, Resource Conservation and Recovery Act (RCRA) Facility Investigations (RFIs), underground storage tank (UST) related investigations and monitoring programs, and Activity records to determine how many permanent or temporary groundwater monitoring wells have been installed at NSA Mid-South. Based on this research, EnSafe determined that 455 wells and piezometers have been installed over the years. Of these, 157 wells have since been closed and 298 monitoring wells remain open.

According to the original E/A&H plan, 119 wells had been installed at NSA Mid-South and 113 of them were field-located. Seventeen of these wells were closed in accordance with the original plan or as part of tank system closures. The six not field-located were leak detection wells that are believed to have been removed with their associated tank systems. Four former production wells identified in the original plan were not included in the 119 well count; they were closed during a well upgrade in 1985. Four wells installed in 1994 following a petroleum spill at the Building S-362 Training Mock-Up Facility were not identified when the original well management plan was completed. These wells were incorporated into the SWMU 65 RFI and have since been closed.

In addition to the 119 wells identified in the original plan, E/A&H installed RFI and UST related monitoring wells in 1995 and 1996. EnSafe installed additional RFI and UST monitoring wells from

1997 to 1999, and seven more wells for the Area of Concern A Corrective Measures Study (CMS) in 2000 and 2001. In August 1999, the U.S. Geological Survey (USGS) installed one monitoring well (002G17UA) offsite at SWMU 2. As part of a pilot scale remediation system, Parsons Engineering Science, installed 24 wells on the airfield apron near the former N-6 hangar in 2000. In 2002, EnSafe installed three, eight, and four additional wells at SWMUs 14, 15, and 39, respectively, to support CMS's. Overview site maps (Northern and Southern Sections) located in Appendix C show the location and status (open or closed) of each well. Section 3 of this plan provides a brief description of well site locations.

This plan includes a database with information on well configuration, date of installation, state plane coordinates, wellhead elevation, etc. This database is included as Appendix A and is provided electronically on a 3.25-inch diskette in database (*.DBF), Access (*.MDB) and Excel (*.XLS) formats.

2.0 WELL INSPECTION CRITERIA AND MAINTENANCE PROCEDURES

Each NSA Mid-South well must comply with the following applicable or relevant and appropriate requirements:

- Southern Division, Naval Facilities Engineering Command, *Guidelines for Groundwater Monitoring Well Installations*, Naval Energy and Environmental Support Activity *Groundwater Monitoring Guide*, NEESA 20.2-031A, February 1985.
- Rules of the Tennessee Department of Environment and Conservation (TDEC), Division of Water Supply, Chapter 1200-4-10 *Well Construction and Abandonment Standards*,
- Memphis-Shelby County Health Department (MSCHD) *Shelby County Well Construction Code*.

Relevant sections of these documents are included as Appendix B.

2.1 Inspection

Under the original plan, each monitoring and leak detection well was inspected using standard criteria. The general condition, the wellhead condition, the well annulus condition, and well construction specifications were assessed. Target inspection items are listed in Table 2-1. Wellhead conditions were ranked as:

- 1) Good
- 2) Minor damage
- 4) Moderate damage
- 5) Severe damage

A rating of good indicates that there is no damage associated with the well. Minor damage rating would include such things as cracked or broken well caps, rusted locks, and peeling paint. Moderate damage includes broken hinges on pro cover, broken manhole cover or stripped bolts

on flush mount wells, cracked or broken concrete pads or protective posts out of ground. Severe damage includes well head and concrete pad pulled from or shifted on ground (heavy equipment running into it), broken well pipe riser, or clogged/ collapsed well. The routine inspection of each well shall utilize the Groundwater Monitoring Well Inspection Form shown in Figure 2-1.

**Table 2-1
 Monitoring Well Specifications
 (Target Inspection Items)**

Above-Grade Mounts:	Flush-Grade Mounts:
Well pad: Condition Size (4' x 4' x 0.5')	Well pad: Condition Size (2' x 2' x 0.5')
Wellhead/Security Casing: Condition Brass, keyed-alike locks Leak-resistant well cap (Hex-key type) Paint — condition and color (high-visibility yellow epoxy AASHTO ^a — M220)	Wellhead/Manhole cover: Condition Leak-resistant well cap (Hex-key type) 22-gauge steel, load-bearing Bolt down Gasket condition Labeled — "Monitoring Well — Do Not Fill"
Guard post: Condition Number (4 required) ^b Cement-filled	Guard post: Not applicable
Well Annulus:	Well Data:
Riser pipe: Condition (at surface and above grade)	Water level
Total depth: Well open to reported construction depth	Headspace-organic vapor concentration Odor Significant sediment accumulation

Notes:

- ^a — American Association of State Highway and Transportation Officials, SOUTHDIV specifications.
- ^b — Well cluster may have less than 4 guard posts per well for protection if the wells are closely placed.

2.2 Maintenance

Well inspections shall be conducted twice a year to ensure that well caps, locks, and manhole gaskets are functioning properly. The rubber bushing on the well caps may become damaged or break down with time, thus reducing the wellhead security. Additionally, locks may seize-up or become clogged. Locks may be cleaned or *lightly* lubricated with common products, such as WD-40, as long as contaminants do not enter the well.

Figure 2-1 Example of Monitoring Well Inspection Form

This page intentionally left blank.

Gaskets on manhole cover rims may become dirty, dried, cracked, or otherwise damaged, allowing rainwater runoff or other contaminants to enter the manhole and potentially the well. Bolts may become stripped over time, thus preventing a snug fit between the cover and gasket and allowing rainwater runoff or other contaminants to enter the manhole. These items must be replaced if they show signs of damage.

2.3 Contingencies

The Environmental Division of the NSA Public Works must be notified immediately if a damaged well is discovered by NSA personnel. Under the original plan, a tag placed on each well lists the telephone number to call (874-5462). If a well becomes damaged or does not adequately protect the wellhead, it should be repaired as soon as practical. Immediate action may be required to prevent further damage or to prevent surface water, rainwater, or contaminants from entering the well casing. Failure to protect the wellhead and the associated water-unit may result in fines from the MSCHD and/or TDEC.

2.4 Well Repairs/Closures

Under current *Shelby County Well Construction Codes* (August 2001), major well repair, closure, or significant modification requires a permit. The codes do not have a "grandfather" provision for unpermitted wells installed before 1988, when the well codes were established. A permit application may be acquired from the MSCHD, Pollution Control Division, Groundwater Division, 814 Jefferson Avenue, Memphis, Tennessee 38105, or by calling (901) 576-7775.

This page intentionally left blank.

3.0 WELL BACKGROUND INFORMATION

This section describes the different well classes (types) and their associated geological formations, summarizes NSA Mid-South geology, and briefly discusses the origin of NSA Mid-South wells.

3.1 Well Classification

Wells are classified in one of four categories:

- Monitoring Wells — installed for site investigations to assess groundwater quality
- Leak Detection Wells — installed in UST tank pits to monitor for product release
- Potable Wells — drinking water supply wells
- Other Wells — non-potable water supply wells

Wells are sub-classified based on the geologic formation in which they are screened:

- Loess — LS
- Alluvium — lower (LA) and upper (UA)
- Fluvial Deposits — lower (LF), middle (MF), or upper (UF)
- Cockfield Formation — upper (UC)
- Memphis Sand — (production wells)
- Fort Pillow Sand, Wilcox Group — (production wells)
- Tank Pit — Fill dirt (leak detection wells only)

This plan currently includes 290 monitoring wells, two leak detection wells, five potable water supply wells, and four non-potable water wells. Most wells at NSA Mid-South are monitoring wells installed as part of RFIs or UST Environmental Assessments (EAs). Leak detection wells were installed under a UST upgrade program completed in 1989 and 1990. The remaining wells were installed for various reasons including potable and irrigation water supplies. Boring and well construction logs are in Appendix D.

3.2 NSA Mid-South Geology

A conceptual model of NSA Mid-South hydrogeology is presented in the *Hydrogeology of Post-Wilcox Group Stratigraphic Units in the Area of the Naval Air Station Memphis*,

Near Millington, Tennessee (Kingsbury and Carmichael, 1995). The hydrogeology of NSA Mid-South is summarized below.

The two principal stratigraphic units investigated during RFIs and UST EAs at NSA Mid-South are the loess/alluvium and fluvial deposits. The loess — eolian deposits consisting of silt, silty clay, clay, and minor amounts of sand — is the principal unit occurring at land surface throughout NSA Mid-South. Alluvium, which is restricted to stream valleys, includes alleviated or reworked loess. The loess is typically 0 to 65 feet thick in the Memphis area; at NSA Mid-South it ranges from 15 to 45 feet thick. Water-bearing zones are present primarily in the upper part of the loess (between 5 and 15 feet); however, yields are low and water quality does not meet several primary and secondary drinking water standards including turbidity, iron, and manganese. The fluvial deposits, which underlie the loess in upland areas, consist of sand, gravel, and some clay, with thin layers of ferruginous sandstone and conglomerate at the base. This unit ranges from 0 to 100 feet thick in the Memphis area. At NSA Mid-South, it ranges from 10 to 35 feet thick and represents the most significant component of the surficial aquifer. Many shallow domestic wells in rural areas surrounding Memphis have been completed in the fluvial deposits.

Below the fluvial deposits are the Cockfield Formation and the Cook Mountain Formation of the Jackson-Upper Claiborne confining unit. The Cockfield is a heterogeneous formation of very fine silty sand interbedded with clay and silt lenses or clay with interbedded fine sand lenses. Water-bearing sands are present in the upper Cockfield Formation. Below the Cockfield is the Cook Mountain Formation, which is predominantly clay and silty clay. It is considered a principal regional confining unit between the surficial water-bearing zones and the underlying aquifers. The lower portion of the Claiborne Group is the Memphis Sand which is made up of sand, clay, and minor amounts of lignite. The Memphis Sand aquifer is one of the primary drinking water aquifers in the Memphis area. Two NSA Mid-South potable water supply wells (PW-1 and PW-2) have drawn from the Memphis Sand aquifer since the 1940s.

The Wilcox Group underlies the Claiborne Group and consists of the Flour Island Formation and the Fort Pillow Formation. The Flour Island is a confining unit separating the Memphis Sand and Fort Pillow aquifers. The Fort Pillow aquifer is a regional drinking water source. Three production wells at NSA Mid-South pump potable water from the Fort Pillow aquifer: PW3, PW4, and PW5.

3.3 Well Sites and Origins

Site descriptions are based on well origin: RFIs, UST EAs, leak detection wells, and miscellaneous wells. At some sites, particularly RFI Sites 5 and 7, several well types are present within larger RFI site boundaries. For this reason, they are listed under each site category. This practice produces redundant RFI and UST site information, but is necessary for future plan users to be able to properly identify similar wells or well types in the field.

Monitoring wells were installed during RFIs or UST EAs to assess groundwater impacts related to known or suspected releases of regulated materials or wastes. Leak detection wells were installed to monitor UST systems for product leaks. Potable wells were installed to supply drinking water to the base. Two non-potable supply wells were installed for irrigation or other non-potable needs.

3.3.1 RFI-Related Monitoring Wells

Under RCRA, 52 of 67 solid waste management units (SWMUs) and one area of concern (AOC) were identified for investigation at NSA Mid-South. Under a Verification Study (VS) by Geraghty & Miller (G&M) in 1984 and 1985, 12 monitoring wells were installed at four of the RCRA sites. E/A&H initiated a series of RFIs in 1995 and 1996 during which the 52 SWMUs were divided into eight assemblies (A through H). The Northside fluvial deposits groundwater was designated AOC A when it became apparent there were multiple, co-mingled plumes of various origins on the NSA Mid-South Northside. Monitoring wells associated with a number of different SWMUs were used to evaluate AOC A; therefore, there are no monitoring wells with an AOC A ID. The majority of the AOC A wells resulted from an expansion of the SWMU 7 RFI, and consequently have a SWMU 7 ID.

The USGS installed four wells adjacent to Building 1698 (near SWMU 40) for long-term monitoring of water levels. Three were installed in April 1995 and screened in the loess, lower fluvial deposits, and the Cockfield Formation. In August 1995, one additional well was installed and screened in the upper fluvial deposits. While these wells were not installed as part of the SWMU 40 investigation, they were sampled to support that investigation. Water level data from these wells were used to assist USGS in developing a conceptual model of base-wide hydrogeology in support of the overall RFI.

Table 3-1 shows the number of wells currently present at each site by assembly.

Table 3-1

Total		58	22	164	12	256

Notes:

- a — Does not include one UST loess well at SWMU 5 and four UST loess wells at N-12 (see Table 3-3).
- b — Includes AOC A pilot study injection and extraction wells at SWMU 7 and Parsons sites.
- c — Includes two lower fluvial deposits wells at N-12 (N12G01LF and N12G02LF).

3.3.1.1 Assembly A

Assembly A consists of eight SWMUs: 1, 3, 5, 7, 8, 60, 66, and 67. Monitoring wells were installed at all of these SWMUs, except SWMUs 1 and 67.

SWMU 3 (*N-121 Plating Shop Dry Well*) Building N-121 was a metal plating shop which operated from the early 1950s to the early or mid-1970s. Wastes from this plating shop were disposed of in a dry well (10' x 10' x 6' pit filled with gravel) on the south side of the building, adjacent to Casablanca Street. This dry well was removed in September 1996.

Three monitoring wells were installed by G&M during the 1985 VS. During an RFI at SWMU 3 in early 1995, E/A&H installed eight additional RFI monitoring wells, which were screened in either the loess or fluvial deposits. Two monitoring wells are currently active at SWMU 3. Locations of monitoring wells at SWMU 3 are shown on Figure 3-1.

SWMU 5 (*Aircraft Fire Fighting Training Area [AFFTA]*) operated from 1949 until its closure in October 1996. RFI and UST EA monitoring wells, and leak detection wells, have been installed at SWMU 5 over the years. During a UST EA completed by E/A&H in 1992, 11 monitoring wells were installed in the loess. E/A&H installed 14 additional monitoring wells onsite in a 1995 RFI, and incorporated the existing UST EA wells into the investigation. Seven RFI wells were screened in the loess and seven were screened in the upper fluvial deposits. Two of the fluvial wells (005G4AUF and 005G4BUF) were installed alongside 004G04UF as part of a rotasonic drilling demonstration and were closed shortly thereafter. A lower fluvial well was added in 1998. Sixteen (15 loess and one fluvial) of 26 monitoring wells have been closed, including Well 005FF08LS, which was abandoned in December 1997 to facilitate a Voluntary Corrective Action conducted by the Navy. Following the VCA, the USGS installed a 4-inch diameter replacement well to determine the effectiveness of the soil removal and to serve as a recovery well. Locations of monitoring wells at SWMU 5 are shown on Figure 3-2 .

SWMU 7 (*N-126 Plating Shop Dry Well*), a dry well associated with a plating shop in hangar N-126, operated from 1955 to 1978. Plating wastes are reported to have been piped to

the dry well outside, near the southeast corner of the hangar. G&M installed a middle fluvial deposits monitoring well through the dry well during the VS in 1985. The monitoring well was abandoned in June 1996 and the dry well was removed in September 1996. E/A&H installed 43 RFI wells at SWMU 7 and the airfield apron area from February 1995 to March 1996. From 1997 to mid-1999, EnSafe installed an additional 47 RFI wells and piezometers as part of the AOC A investigation, which extended the original SWMU 7/airfield apron investigation area beyond the main runway and past the northwestern base boundary. Wells at the first nine locations were installed in clusters of four and screened in the loess, upper fluvial deposits, lower fluvial deposits, and the upper Cockfield Formation. An existing loess monitoring well (N9407LS) associated with a 1995 UST EA was renamed 007G08LS to serve as the loess well for cluster number 8. With the exception of three loess wells (007G37F1, 007G37L1 and 007G37L2) installed for an aquifer test, subsequent well installations focused on the upper and/or lower fluvial deposits based on sampling results. In the latter stages of the investigation, some wells were screened in the middle fluvial deposits, and others were screened throughout the entire thickness of the fluvial deposits. Thirteen SWMU 7 RFI wells have been closed.

In 1996, two lower fluvial deposits monitoring wells (N12G01LF and N12G02LF) were installed adjacent to Building N-12 and PW-1, respectively, to assess the possible impact on PW-1 of suspected chlorinated solvent releases from activities associated with Building N-12, a former print shop.

Two monitoring wells (007G58LF and 007G59LF), two injection wells (007G60LF and 007G61LF) and one extraction well (007G57LF) were installed in December 1999 for an enhanced bio-remediation pilot study conducted by EnSafe. In August of 2000, two additional wells monitoring wells (007G62LF and 007G63LF) were installed as part of the system.

A second pilot study was conducted by Parsons Engineering Science to evaluate the feasibility of using vegetable oil injection to remediate a portion of the AOC A groundwater plume, specifically the area of higher chlorinated solvent contamination in the vicinity of monitoring wells 007G15UF and 007G15LF near the former N-6 hanger. Eight injection (four upper and lower fluvial pairs) and

16 monitoring (eight pairs) wells were installed in the former N-6 area in August 2000. The 10 foot-long injection well screens were staggered so that the vegetable oil zone of influence would extend vertically from 45 to 85 feet below land surface and approximately 60 feet laterally. Additional well installation details are provided in the *Final Work Plan for Field Application to Enhance In Situ Bioremediation of Chlorinated Solvents via Vegetable Oil Injection at Site N-6, Former Naval Support Activity Mid-South, Millington, Tennessee* (Parsons, 2000).

Figures 3-3a, 3-3b, and 3-3c show the locations of active and closed wells associated with SWMU 7 and AOC A.

SWMU 8 (*Cemetery Disposal Area*) was a hazardous materials disposal area reported to have operated from 1965 to 1980. It is adjacent to the northern end of the main runway (Runway 4-22), and north of Chamberlayne Cemetery. In 1985, G&M installed three fluvial deposits wells during the VS. In early 1995, E/A&H installed four RFI fluvial deposits wells. Two of the G&M wells (008GMW10 and 008GMW12) were closed in November 1995 by E/A&H. Three loess wells were installed during the RFI, but closed within a few weeks because they produced no groundwater. After transfer of the property to the Millington Municipal Airport Authority, two additional wells (008G01FL and 008GMW11) were abandoned in January 1998 during a grading project. In November 1999, the three remaining monitoring wells were grouted in place by EnSafe in accordance with MSCHD guidance. Locations of the former monitoring wells at SWMU 8 are shown on the overview map (Northern Section) in Appendix C.

SWMU 60 (*Northside Landfill — Western Portion*) is reported to have been used primarily for disposal of demolition debris. The landfill was apparently active between 1951 and 1986. SWMU 60, which is in the southwest portion of the NSA Mid-South Northside, is bounded on the south by Dakar Street, on the west by Outlet Road, to the east by an unpaved perimeter road, and on the north by abandoned Illinois Central Railroad spurs. E/A&H installed 10 monitoring wells during an RFI in early 1995; however, three wells (060G01LS, 060G01LF, and 060G05LS) were

closed to facilitate a Voluntary Corrective Action conducted by the Navy in December 1997. Five more monitoring wells (060G02LS, 060G03LF, 060G03LS, 060G04LS, and 060G06LS) were closed in November 1998. SWMU 60 monitoring wells were screened in the loess and lower fluvial deposits. Monitoring wells 060G02LF and 060G04LF are currently active at this site and provide long-term monitoring of groundwater from SWMU 10 (Northside Landfill — Eastern Portion) which is approximately 500 feet upgradient of SWMU 60. Monitoring well locations associated with SWMU 60 are shown in Figure 3-4.

SWMU 66 (*Radar Disposal Area*) was used by the MWR as a debris disposal area for an unknown period of time. SWMU 66, which is in the northeast portion of the NSA Mid-South Northside, is bounded on the west by an abandoned runway, to the north by an abandoned radar facility, and to the east by pasture. As part of the investigation at SWMU 66, one monitoring well (066G01LF) was installed by EnSafe in May 1998 and has since then been abandoned. This monitoring well location is shown on the overview map (Northern Section) in Appendix C.

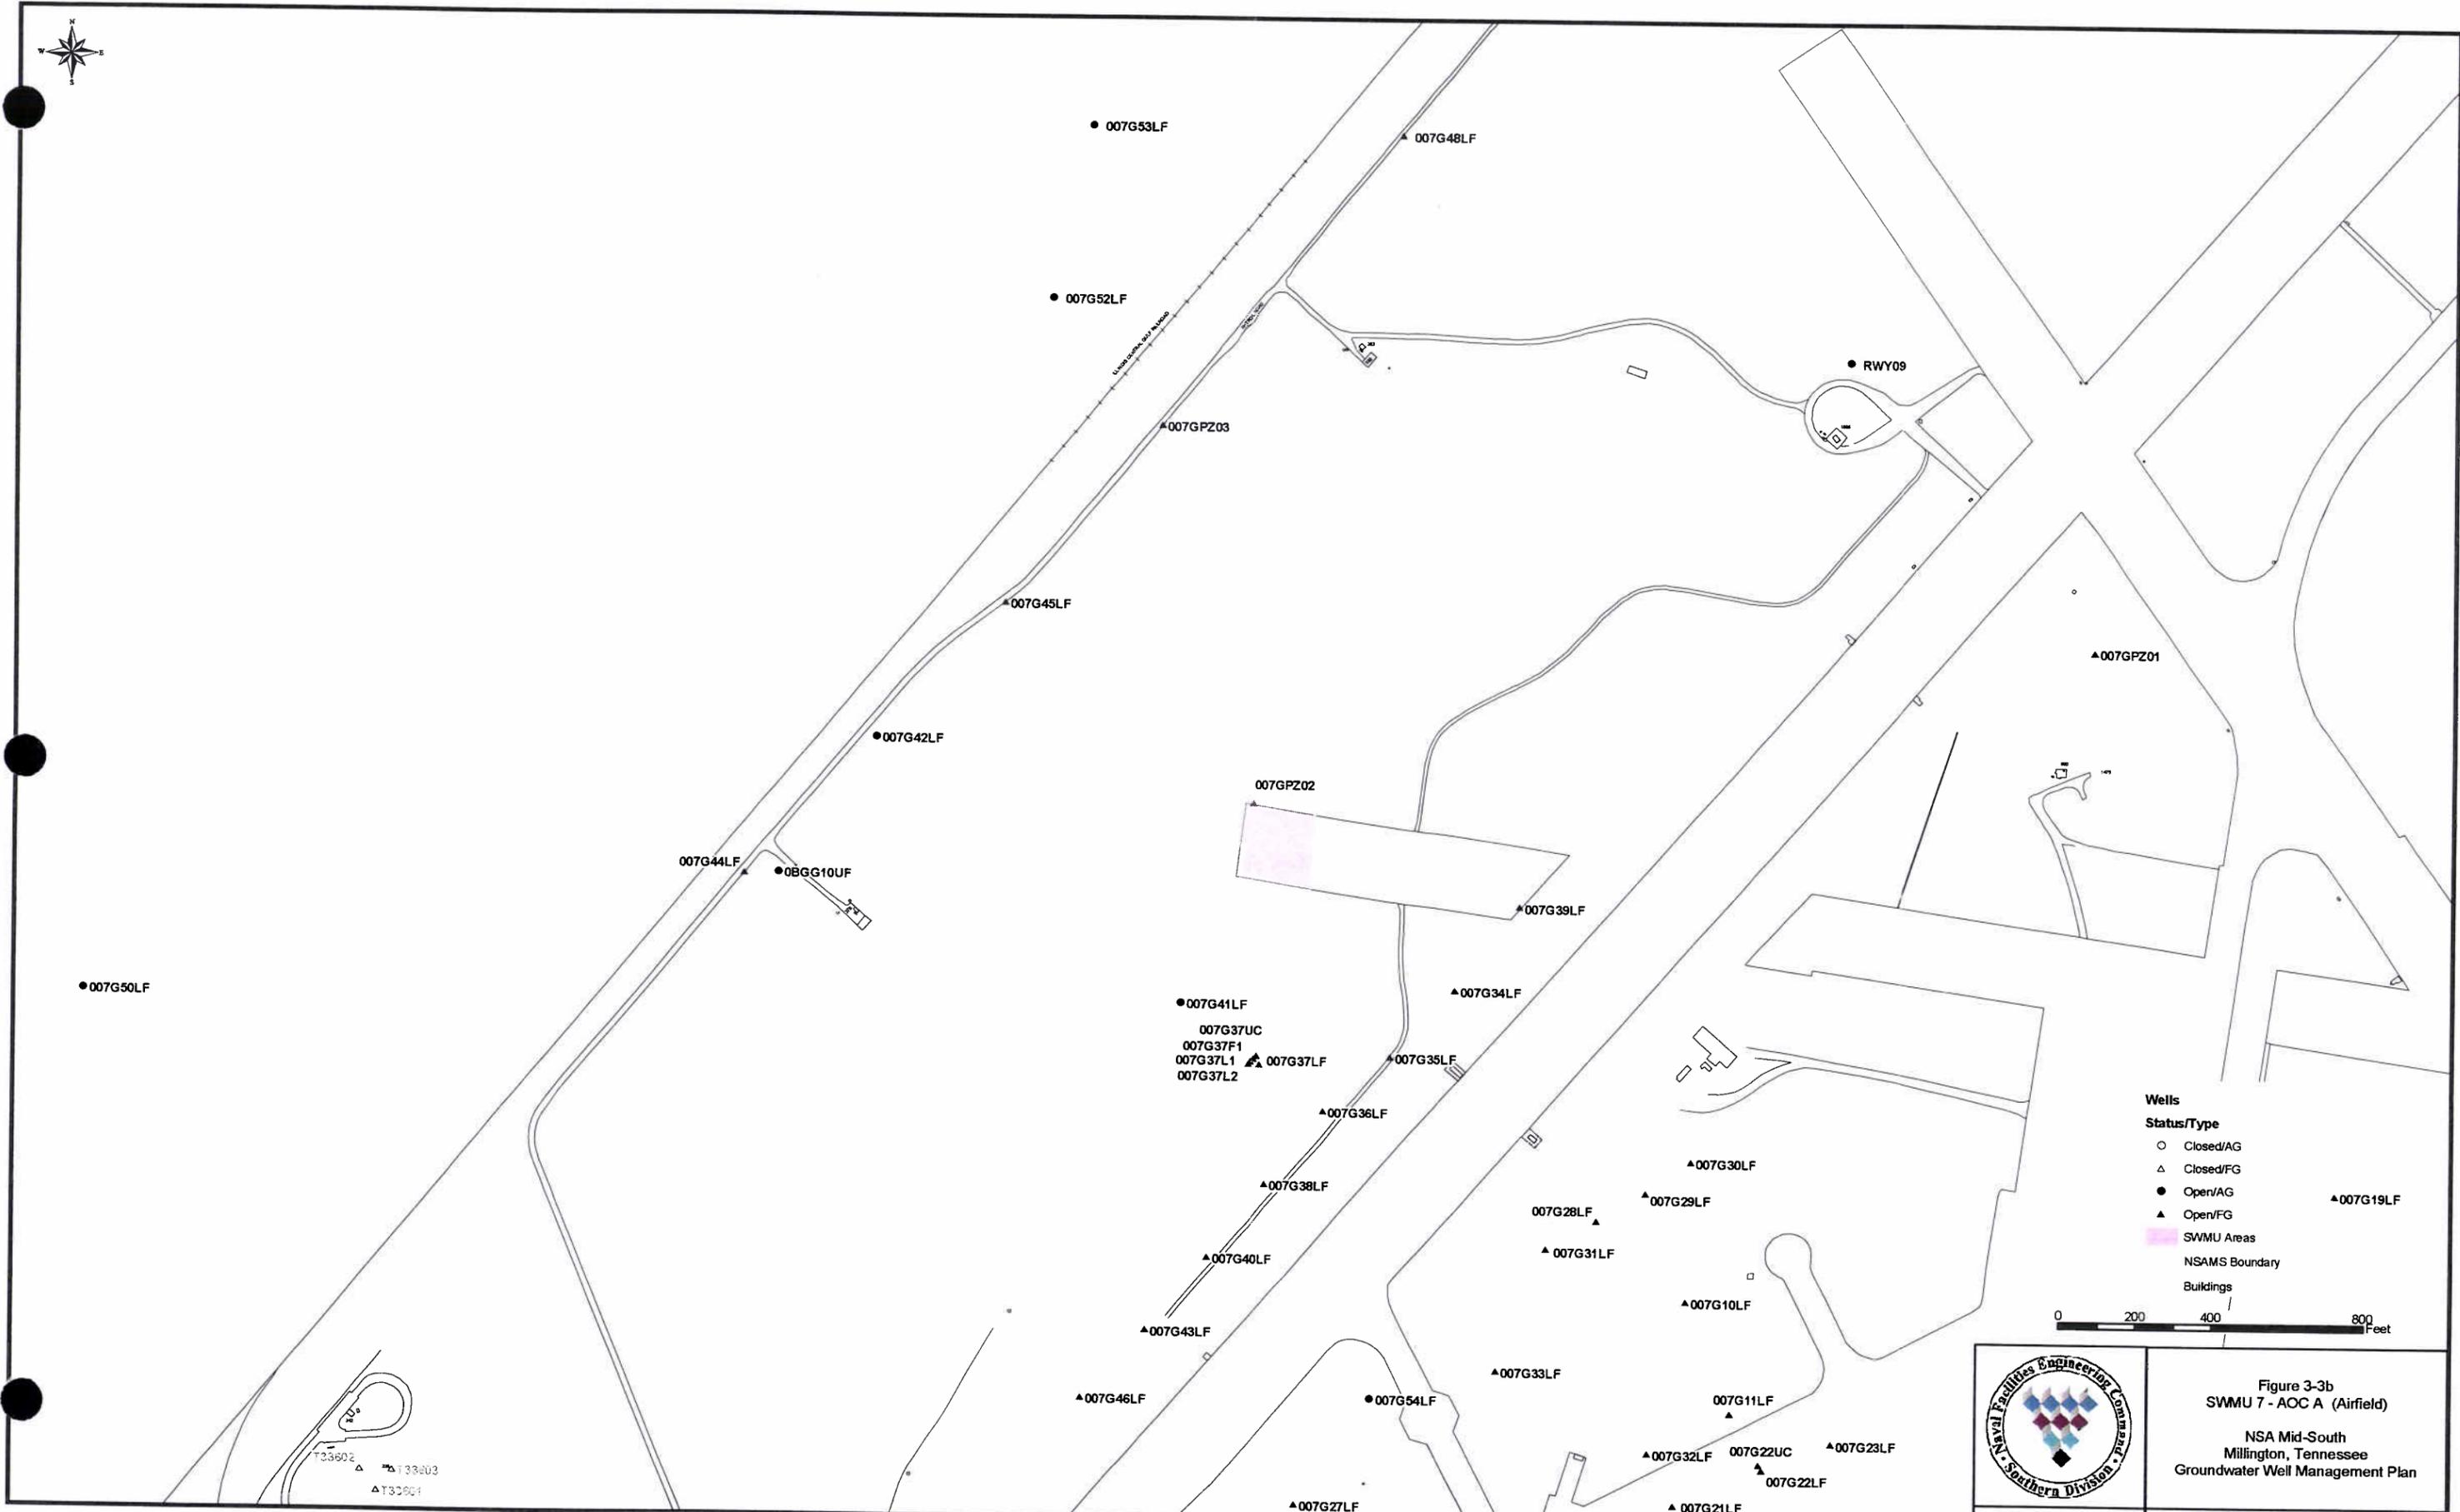

3.3.1.2 Assembly B

Assembly B includes SWMU 40 Salvage Yard No. 1, where four monitoring wells are currently installed: USGS01LS, USGS02LF, USGS03UC, and USGS04LF. These wells were installed by the U. S. Geological Survey (USGS) to gather hydrological data, but were sampled during the SWMU 40 RFI. Figure 3-5 shows the location of the USGS monitoring wells at SWMU 40.

3.3.1.3 Assembly C

Assembly C includes SWMUs 15, 18, 21, 26, 27, and 62. These SWMUs required Confirmatory Sampling Investigations (CSIs) to verify whether releases had occurred and, if so, whether RFI characterization was necessary. No monitoring wells were installed at SWMUs 26, 27, or 62.

SWMU 15 (*N-94 Underground Tank Farm*), which was southwest of Building N-94, consisted of ten 10,000- to 25,000-gallon USTs that stored aviation gasoline and lubricating oil. The USTs were

in service from 1943 until they were abandoned in 1986. They were removed in early 1992 under the Navy's UST program. Eight fluvial deposits monitoring wells (015G01LF, 01UF, 02LF, 02UF, 03LF, 03UF, 04LF and 04UF) were installed by E/A&H in 1996 during a follow-up RFI. Seven loess and one upper alluvial wells (015G01LS, 02LS, 03LS, 04LS, 05LS, 06UF, 07LS, and 08LS) were installed in April 2002 for the CMS. The upper alluvial well (015G06UF) was abandoned later in 2001 and two wells (015G04LS, 015G07LS) were closed in August 2003. Figure 3-5 shows monitoring well locations for SWMU 15.

SWMU 18 (*N-112 Underground Waste Tank*) was an underground waste storage tank for the Building N-112 (Ground Support Equipment Shop) area. The tank and contaminated soil were removed on September 6, 1996, during a Voluntary Corrective Action (VCA) conducted by the Navy. The VCA provided evidence of a past release from this tank and an RFI was performed. As part of the RFI, one well (018G01LF) was installed on April 13, 1999, and screened in the fluvial deposits. Groundwater contamination at SWMU 18 has been incorporated into the AOC A Corrective Measures Study. Figure 3-6 shows well location at SWMU 18.

SWMU 21 (*N-10 Underground Waste Tank*), a 3,000-gallon UST near Building N-9 collected waste oil and hydraulic fluid from an automobile repair and aircraft maintenance shop. It was installed in 1943 and removed in November 1991. Four fluvial deposits monitoring wells (021G01LF, 02LF, 03LF, and 04UF) were installed by E/A&H in 1996 as part of the RFI. Groundwater contamination at SWMU 21 has been incorporated into the AOC A Corrective Measures Study. Figure 3-7 shows the monitoring well locations.

3.3.1.4 Assembly E

Assembly E includes SWMUs 2, 9, 14, 38, 59, and 65, which required full RFI characterization. Monitoring wells were installed at each Assembly E SWMU, except SWMU 38 (drainage ditches). No monitoring wells were installed at SWMU 38.

SWMU 2 (*Southside Landfill*) operated from 1942 to 1970 at the southeast corner of NSA Mid-South, adjacent to Big Creek Drainage Canal. G&M installed five monitoring wells

(002GGM01DA, 02DA, 03DA, 04UA, and 05DA) during the VS. E/A&H installed 27 additional monitoring wells (002G01DA, 01UA, 02DA, 02UA, 03DA, 03UA, 04UA, 05DA, 05UA, 06DA, 06UA, 07UA, 08DA, 08UA, 09DA, 09UA, 10DA, 10UA, 11DA, 11UA, 12DA, 12UA, 13DA, 13MA, 13UA, 14DA, and 14UA) which were screened in the alluvium during the RFI in 1996. EnSafe installed nine more wells (002G15DA, 16DA, 17DA, 17UA, 18DA, 19DA, 20DA, 22DA, and 23DA) south of the Big Creek Drainage Canal in June 1998. In October 1998, monitoring well 002GM01DA (GM-1) was abandoned due to a U.S. Army Corps of Engineers' levee construction project. In August 1999 USGS installed one additional offsite monitoring well (002G17UA). In June 2001, five additional monitoring wells (002G24DA, 25DA, 26DA, 27DA, and 28DA) were installed along Big Creek, to further evaluate whether contaminants are migrating offsite. Figure 3-8 shows the well locations.

SWMU 9 (*Sewage Lagoons*) consists of two sewage lagoons on the southern boundary of the NSA Mid-South Southside, approximately 175 feet south of the Big Creek Drainage Canal and 200 feet west of the South Gate. The lagoons were once part of the base wastewater treatment system. The system primarily treated domestic wastewater, but reportedly did receive limited industrial wastewater from aircraft maintenance facilities. The lagoons were operated from 1969 until 1978, when the base connected its sewer system to the city of Millington's sewage treatment system. Four RFI wells (009G01LF, 02LF, 03LF, and 04LF) were installed at SWMU 9; all were screened in the alluvium. Figure 3-9 shows these well locations.

SWMU 14 (*Building S-140 Site and Seventh Avenue Ditch*) contained a paint spray booth, a paint removal area, and a paint wash-down area used to train Navy personnel in painting processes. It operated from 1943 until the building was demolished in 1985. Nine monitoring wells were installed during the RFI; five were screened in the loess and four were screened in the fluvial deposits. In April 2002, three additional loess wells were installed as part of the monitored natural attenuation treatability study. Figure 3-10 shows the monitoring well locations for SWMU 14.

Groundwater Well Management Plan

SWMU 59 (*Pesticide Storage Facility [Old Pesticide Shop]*) stored pesticides and fertilizers. The age of the facility is unknown. Four monitoring wells (059G01LS, 02LS, 03LS and 03UF) were installed by E/A&H in 1996 during the RFI; three were screened in the loess and one was screened in the fluvial deposits. One well, 059G02LS, was closed during demolition of Building S-235 in the summer of 1998 to facilitate a Voluntary Corrective Action being conducted by EnSafe. In 2002, 059G01LS was damaged during construction activities; therefore, it was closed. Figure 3-11 shows monitoring well locations for SWMU 59.

SWMU 65 (*Building S-362 [Training Mock-Up Site]*) was used to train personnel in aircraft start-up. The site operated from the early 1950s until 1995. Four shallow alluvium monitoring wells (065MW01UA, 02UA, 03UA and 04UA) were installed by Memphis Environmental Center in November 1992 to investigate a JP-5 jet fuel spill at the site. Four additional monitoring wells (065G05UA, 06DA, 06UA and 07UA) were installed in the alluvium by E/A&H in 1996 during the RFI. One alluvium monitoring well (065G05UA) and the four MEC wells were abandoned in November 1998. Figure 3-12 shows the location of monitoring wells for SWMU 65.

3.3.1.5 Assembly F

Assembly F includes SWMUs 17, 19, 20, 22/63, 30, and 39. These SWMUs required Confirmatory Sampling Investigations (CSIs) to verify whether releases had occurred and, if so, whether RFI characterization was necessary. No monitoring wells were installed at SWMUs 17, 19, 22/63, or 30.

SWMU 20 (*1594 Underground Waste Tank*) was an abandoned underground waste tank reported to have received waste oil and hydraulic fluid generated by the Air Traffic Control School. The installation date of the tank, which was removed in May 1992 is unknown. As part of an ongoing RFI, three piezometers (PZ01, PZ02, and PZ03) (May 1998) and one monitoring well (020GOLF1) (April 1999) were installed. Figure 3-13 shows the location of piezometers and monitoring wells for SWMU 20.

SWMU 39 (*S-74 PCB Storage Area*) consisted of a concrete slab outside of Buildings S-74 and S-212. Transformers and drums of oil were stored on the slab until Building S-74 was demolished in 1995. Building S-74 was built in 1943 and operated as a laundry facility until 1981 (38 years). Building S-212 was built in 1947 and stored solvents used at Building S-74. As part of an ongoing RFI, five piezometers (039GPZ01, PZ02, PZ03, PZ04 and PZ05) (three in May 1998 and two in December 1998) were installed. Three of these piezometers have since been closed with only PZ-04 and PZ-05 still open. In March 1999, nine monitoring wells (039G01LF - 039G09LF) were installed as part of the investigation; in May 2002, four additional monitoring wells (039G10LF - 039G13LF) were installed for the CMS. All wells and piezometers are screened in the fluvial deposits. Figure 3-14 shows the location of monitoring wells and piezometers at SWMU 39.

3.3.1.6 Assembly H

Assembly H includes SWMUs 23, 24, and 41. These SWMUs required Confirmatory Sampling Investigations (CSIs) to verify whether releases had occurred and, if so, whether RFI characterization was necessary. No monitoring wells were installed at SWMUs 23 or 24.

SWMU 41 (*Salvage Yard No. 2*) is an approximately 5,700-square-yard asphalt-covered storage yard used as a nonhazardous storage area. The salvage yard is reported to have been in operation since 1944. Although designated for nonhazardous storage, it may have received hazardous material. The yard was reported to have stored scrap metal, derelict equipment (planes, helicopters, etc.), tires, furniture, and batteries. Four monitoring wells (041G01DA - 041G04DA) screened in the alluvium were installed in April 1999 as part of the RFI. Figure 3-15 shows the location of the active monitoring wells for SWMU 41.

3.3.2 RFI Background Wells

Twenty-four background monitoring wells were installed at 14 locations around NSA Mid-South to establish ambient groundwater quality for the RFIs. The background wells were screened in either the loess, alluvium, upper fluvial deposits, lower fluvial deposits, or upper Cockfield Formation. Four of the wells have been closed. The background well sites are shown on the overview site maps (Northern and Southern Sections) located in Appendix C.

3.3.3 Leak Detection Wells

Eight NSA Mid-South sites have had leak detection wells. Four leak detection wells were installed at the Navy Exchange Service Station on Navy Road in 1987 by Professional Services Industries (PSI; formerly Pittsburgh Testing and Engineering). Engineering, Design, and Geosciences Group, Inc. (EDGE; currently Ogden Engineering and Environmental Services, Inc.), installed 37 leak detection wells at seven UST sites between late 1989 and early 1990 as part of a UST upgrade program. With the exception of two wells at the Navy Exchange Service Station, all of these leak detection wells have been closed as a result of UST removals or closures. Table 3-2 lists each tank site and the number of leak detection wells formerly associated with them. Location of leak detection wells are shown on the overview site maps (Northern and Southern Sections) located in Appendix C.

**Table 3-2

3.3.4 UST and Miscellaneous Investigations

Monitoring wells have been installed during environmental assessments at 10 UST sites at NSA Mid South under TDEC UST Division regulations. While completing UST-related investigations at these sites, EnSafe, E/A&H and other contractors have installed 73 monitoring wells screened in the loess. Table 3-3 summarizes the UST assessments.

**Table 3-3
 UST Environmental Assessments**

Navy Exchange (Building 757)

Resulting from a petroleum release in 1996, several investigations have been completed at the Navy Exchange Service Station. Since 1986, 19 monitoring wells have been installed by three different contractors: PSI, Harding-Lawson Associates, and EDGe. In 2001, CCI installed three recovery wells in the gravel backfill following a contaminated soil removal corrective action. A search of the Activity files and MSCHD records produced well construction logs for 21 of the 23 monitoring wells. Three monitoring wells (75702LS, 75712LS, and 75714LS) were closed in 2001 during the site's corrective action. Additionally, monitoring well 75715LS was closed at an

unknown date. Figure 3-16 shows the locations of active and abandoned wells at the Navy Exchange.

Navy Flying Club

A UST EA was completed at the Navy Flying Club in May 1993 to investigate petroleum releases from two USTs (T1205N and T1205S). Six monitoring wells (FCMW01LS -FCMW06LS) were installed by E/A&H and screened in the loess. The six EA monitoring wells were abandoned in March 1999 after TDEC approved closure of the site. Monitoring well locations are shown on the overview map (Northern Section) in Appendix C.

Southside Service Station (Building S-376)

In July 1992, four loess monitoring wells (S37601LS — S37604LS) were installed at the Southside Service Station (Building S-376) to assess a petroleum release. All four were screened in the loess and have been closed. Locations of these wells are shown on the overview map (Southern Section) in Appendix C.

North Fuel Farm (N-94 and N-126)

Four UST EAs were completed by EnSafe and E/A&H in the North Fuel Farm area. In October 1992, three loess monitoring wells (N9405LS, N9406LS, and N9407LS) were installed by EnSafe to complement four existing leak detection wells around the tank pits for tanks T301, T1242, and T1243. These wells (Figure 3-3) were used to assess possible releases from the vehiclefueling station at the N-94 Tank Farm Office. N9407LS was later renamed 007G08LS and functioned as the loess monitoring well in well cluster number 8 for the SWMU 7 RFI.

E/A&H completed a second UST EA around tanks T7, T303, and T1241 in May 1993, when six loess monitoring wells were installed. The 1993 wells are shown on Figure 3-3 as NFMW01LS through NFMW06LS. In July 1994, E/A&H installed three loess wells (N001LS, N002LS, N003LS) to assess the area around the third set of tanks (T304 and T1239). The 1993 and 1994 investigations were then combined. Tanks T304 and T1239 were removed by Morrison Knudsen Corp. in July 1997. Three monitoring wells (N001LS, N002LS, and N003LS) were abandoned and one recovery well (RW-1) was installed in the area during removal of the USTs. During September 1998, loess

monitoring well NFMW05LS was closed to remove impacted soil from the area. In October 1998, a 4-inch-diameter recovery well (N-MW-05) was installed to replace the abandoned NFMW05LS well. Both recovery wells (RW-1 and N-MW-05) and the five other NFMW wells have since been abandoned.

Four loess monitoring wells (N12G01LS through N12G04LS) were installed around Building N-12 (south of Hangar N-126 and east of North Fuel Farm) in January 1998 to investigate a release from a small fuel tank. These wells are currently open.

Aircraft Fire Fighting Training Area (SWMU 5)

During a UST EA at the AFFTA in 1992, E/A&H installed 11 monitoring wells screened in the loess. Three wells were installed around tank T1508 and eight were installed around tank T1489. In 1995, the TDEC UST Division instructed the Navy to incorporate the findings of the UST EA into the SWMU 5 RFI. Seven additional loess monitoring wells were installed around the facility during the RFI. Seven of the eleven UST wells have been closed, including 005FF08LS which was abandoned during a contaminated soil removal, then replaced with a 4-inch-diameter recovery well (005G08LS). Five of the seven loess wells installed during the RFI have been closed. Figure 3-2 shows the locations of AFFTA/SWMU 5 wells.

Building S-237

Memphis Environmental Center completed a UST investigation at Building S-237, where six monitoring wells (S23701LS - S32706LS) were installed in September 1992. No report on the effort was located during assembly of the original well management plan; however, well permits and well logs were on file at the MSCHD. All six monitoring wells have been abandoned. Monitoring well locations are shown on the overview map (Southern Section) in Appendix C.

Navy Hospital

Four loess monitoring wells were installed by E/A&H in May 1992 to assess the release of fuel oil at the east end of the Naval Hospital, Building H-100. Monitoring well NH02LS was abandoned in August of 1996 and the other three (NH01LS, NH03LS, and NH04LS) were closed in March 1999.

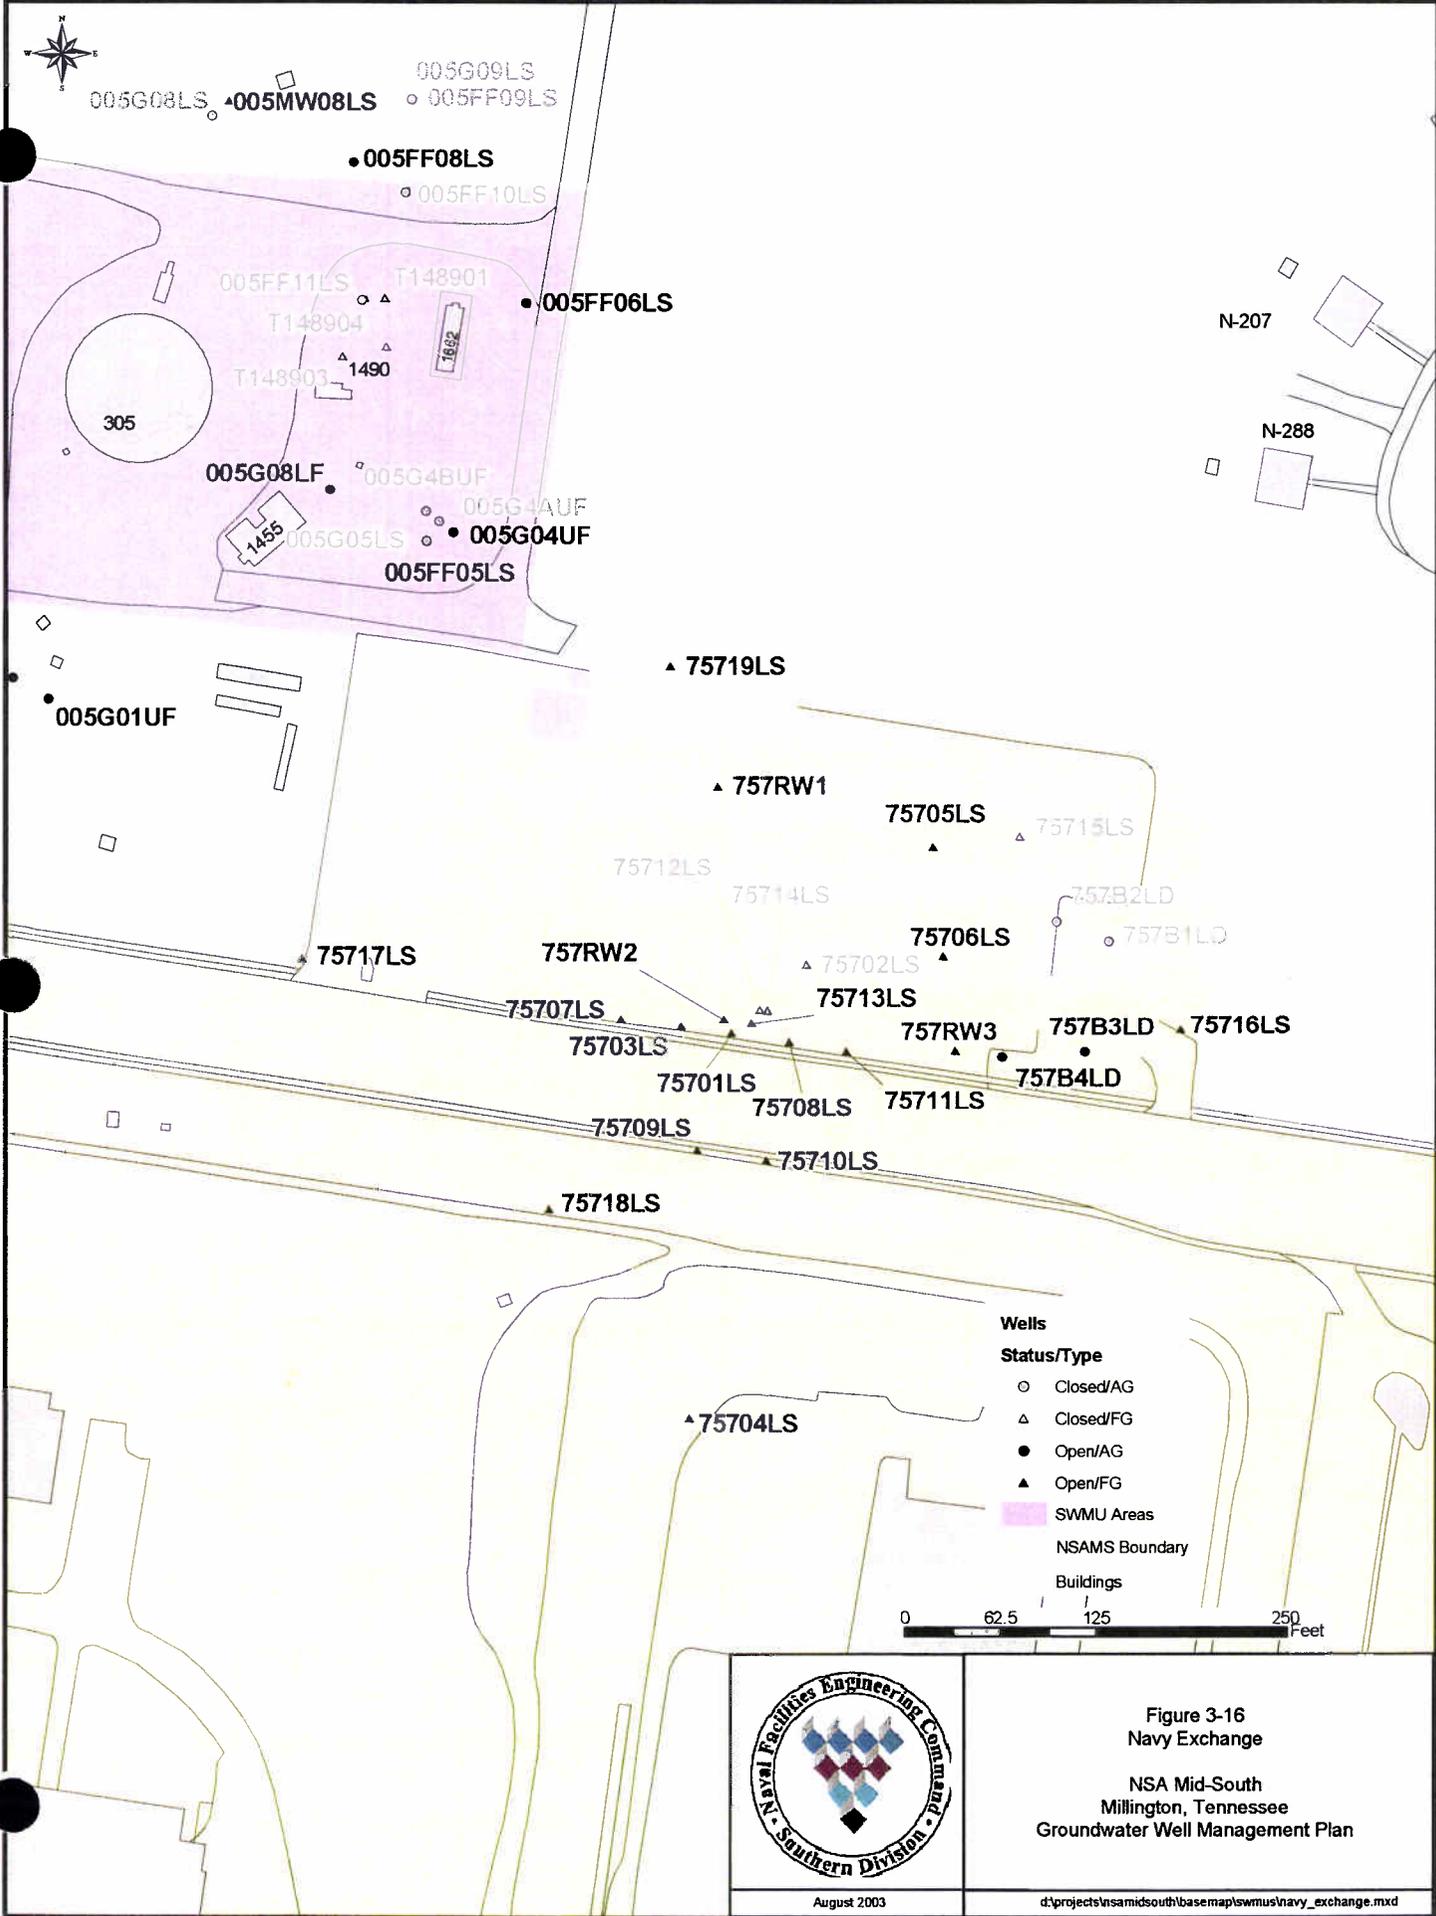

Figure 3-16
Navy Exchange
NSA Mid-South
Millington, Tennessee
Groundwater Well Management Plan

The Navy Hospital UST site was closed after approval of a report prepared in accordance with *Technical Guidance Document (TGD) — 015, Procedure to Obtain Closure for Sites in the Monitoring Only Program, State of Tennessee, Department of Underground Storage Tanks, August 1, 1996*. Monitoring well locations are shown on the overview map (Northern Section) in Appendix C.

Building S-50

During a UST EA completed in June 1993 by E/A&H to assess a fuel oil UST release at Building S-50, five loess monitoring wells were installed. TDEC granted site closure in early 1994, and the wells were abandoned in August 1994. Overview map (Southern Section) in Appendix C shows locations of Building S-50 abandoned wells.

3.3.5 Other Water Wells

3.3.5.1 Production (Potable Water Supply) Wells

Four production wells currently supply NSA Mid-South with potable water. Table 3-4 lists their production capacity and total depth. A fifth production well (PW-N1), which is currently out of service, was active until November 30, 1994, when it was placed on emergency standby status as a precautionary measure because solvent contaminants were identified in the fluvial deposits nearby. Each production well is secured by a chain-link fence and locked gates. The Appendix C overview maps (Northern and Southern Sections) show the production well locations.

**Table 3-4
 Production Wells**

Production Wells	Depth (Feet)	Formation	Capacity (gpm ^a)
PW-N1	523	Memphis Sand	700-1,000
PW-N2	466	Memphis Sand	700-1,000
PW-N3	1,450	Fort Pillow	1,000-1,476
PW-S4	1,450	Fort Pillow	900-1,404
PW-S5	1,435	Fort Pillow	1,400-1,823

Note:

a — Gallons Per Minute

3.3.5.2 Non-Potable Water Supply Wells

Four of five non-potable water supply wells at NSA Mid-South are currently open. Table 3-5 lists these wells and their current use.

**Table 3-5
 Non-Potable Water Wells**

Well Number	Current Use	Formation	Building
V-107 (OCP-1)	Ambient Monitoring	Fluvial Deposits	Building S-89
V-57 (GC-1)	Irrigation	Memphis Sand	Building S-26A
V-81 (RWY-9)	Ambient Monitoring	Fluvial Deposits	West end of runway 9-27
V-77 (N761-1)	Ambient Monitoring	Cockfield Formation	Building N-761 Lakehouse
S172-1	Closed 11/96	Cockfield Formation	Building S-172/Lakehouse

OCP-1 is in the Bathhouse (Building S-198) next to a small boiler and was used to fill the Officers Club pool with water. This well is screened in the fluvial deposits. The pump housing and connector rods were removed by the U.S. Geological Survey in late 1995. This well is currently used for ambient water level monitoring. Overview map (Southern Section) in Appendix C shows monitoring well location.

GC-1 is across Attu Street Extended from the golf course club house (Building N-26A). A pump is mounted at the wellhead. This well supplies irrigation water from the Memphis Sand aquifer to the golf course and is not connected to the potable water system. No additional specifications have been obtained for this well. Overview site maps in Appendix C shows monitoring well location.

RWY-9 is at the edge of the farm field north of the approach end of Runway 9, east of the radio receiver, Building 382. The well has a 4-inch polyvinyl chloride (PVC) casing and is screened in the fluvial deposits. The age and use of this well were not determined; however, since it is in a farm area and shallow, this well was likely used for irrigation. Overview map (Northern Section) in Appendix C shows monitoring well location.

N761-1 is inside the dining room closet of the Lakehouse (Building N-761). The 4-inch PVC casing is flush mounted with the floor. The age and original purpose of this well are not known, but it is currently used for ambient water level monitoring. This well is screened in the Cockfield Formation. Overview map (Northern Section) in Appendix C shows monitoring well location.

S172-1 was a 4-inch PVC well in a small storage yard just east of the Lakehouse, and adjacent to Building S-172. This well was closed by grouting in place in accordance with MSCHD *Well Construction Codes* in November 1995 by E/A&H. The purpose and age of this well are not known. It was screened in the Cockfield Formation. Overview map (Northern Section) in Appendix C shows monitoring well location.

3.3.5.3 Abandoned Production and Test Wells

Six production wells supplied potable water to NSA Mid-South from 1942 until 1983. As part of the potable water system upgrade, four wells (N-2, S-1, S-2, and S-3) were closed due to poor water quality (i.e., high iron content and high dissolved solids). The wells are reported to be 340 to 510 feet deep and screened in the "500 Foot Sands" aquifer, also known as the Memphis Sand aquifer. These wells were closed by completely filling each well casing with concrete. The two remaining wells, No. 1 (PW-N1) and No. 2 (PW-N2), were upgraded and three new potable wells were installed (PW-N3, PW-S4, and PW-S5). As part of the upgrade, a test well (TW01) was installed to assess the use of the Fort Pillow Aquifer of the Wilcox group as a water supply at NSA Mid-South. TW01 is near PW-S4 in the northwest corner of the NSA Mid-South Southside. The wellhead is an 8-inch steel casing that has been welded shut and secured. Wells PW-N3, PW-S4, and PW-S5 were screened in the Fort Pillow aquifer.

**SOUTHERN DIVISION NAVAL FACILITIES
ENGINEERING COMMAND**

**GUIDELINES FOR GROUNDWATER MONITORING
WELL INSTALLATION**

PART 1: GENERAL

1.1 INTRODUCTION

Groundwater monitoring wells shall be located at sites approved by the Southern Division Engineer-In-Charge (EIC) and the Activity Environmental Coordinator (EC). All applicable local, state and federal regulations concerning well installations or soil borings shall be followed.

1.2 APPLICABLE PUBLICATIONS

The publications listed below form a part of this guideline to the extent referenced. The publications are referred to in this text by designation only. The latest revision of the specifications shall be followed.

**1.2.1 American Association of State Highway and Transportation
Officials (AASHTO)**

M 220 Epoxy Coatings Specifications

1.2.2 American Society of Testing and Materials (ASTM)

A 120 Pipe, Steel, Black and Hot-dipped, Zinc coated, welded and seamless

A 312 Seamless and Welded Austenitic Stainless Steel Pipe

B 209 Aluminum and Aluminum-alloy Sheet and Plate

C 150 Portland Cement

C 778 Standard Sand

D 1457 Polytetrafluoroethylene (PTFE) Molding and Extrusion Materials

D 1785 Standard Specification of Polyvinyl Chloride Pipe (PVC Pipe, Schedules 40, 80, 120)

D 1586 Method for Penetration Test and Split Barrel Sampling of Soils

GUIDELINES FOR GROUNDWATER MONITORING WELL INSTALLATION (cont'd)

2.1.6 Annular Space Fill Materials

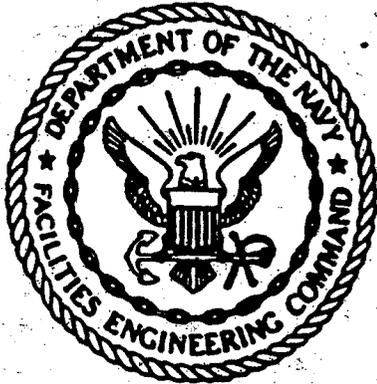

- a. Filter pack shall be 98% pure silica, cleaned with potable water, have a uniformity coefficient of 1-3, and a specific gravity of 2.6 - 2.7. The filter pack shall meet ASTM C 775 standard sand specifications.
- b. 1/4-inch bentonite pellets shall be 90% montmorillonite clay, with a bulk dry density 80 lbs/cu ft, a specific gravity 1.2, and a pH of 8.5-10.5.
- c. Granular bentonite shall conform to API std 13-A for bentonite.
- d. Portland Cement shall conform to ASTM C 150 Type I.

2.1.7 Surface Casing: shall be constructed of steel meeting ASTM A 120 and shall have a wall thickness as specified below.

- a. 24 inch diameter 0.25 inch wall thickness
- b. 20 inch diameter 0.25 inch wall thickness
- c. 16 inch diameter 0.25 inch wall thickness
- d. 10.75 inch diameter 0.25 inch wall thickness
- e. 24 inch diameter 0.50 inch wall thickness
- f. 20 inch diameter 0.50 inch wall thickness
- g. 16 inch diameter 0.50 inch wall thickness
- h. 10.75 inch diameter 0.365 inch wall thickness

2.1.8 Surface Completion: all materials provided for a well surface completion shall conform to the specifications listed below.

- a. Locking 16-gauge steel protective well cover, round or square and 5-ft in length
- b. Flush mount 22-gauge steel, water resistant welded box with 3/8-inch steel lid, locking device and padlock guard
- c. Concrete pad at ground surface (3' X 4' X 6") ASTM C 150
- d. Padlock (brass, corrosion resistant, keyed alike) ASTM F 883
- e. Steel protective post (4-inch diameter, 6-ft length, 1/4-inch thickness, concrete filled) ASTM A 120.
- f. Well designation sign, sheet aluminum, ASTM B 209, 1/8 inch by 18 inch by 6 inch, anchors and fasteners compatible with sign, designation to be provided by EIC, the designation shall be stamped into the plate with 4-inch letters and numbers.
- g. High visibility yellow epoxy paint AASHTO M220.

shrink and crack upon curing (Barcelona, Gibb, and Miller, 1983) and that the seal between the casing and grout may not be perfect, but the procedure described is generally accepted as the safest method of preventing downhole migration of contaminants. Expanding cements are being considered (Barcelona, Gibb, and Miller, 1983), but experimental data that compares the performance of different grout mixtures are not available.

5.5 SURFACE PROTECTION. The surface extension of the monitoring well is protected by an oversize, steel casing approximately 5 feet long. This casing is sleeved over the monitoring well and grouted from 2 feet below the ground surface to the ground surface. Three feet of the oversize casing extends to slightly above the top of the monitoring well cap. The protective casing may be set and grouted in place during monitor well completion; otherwise, the grouting of the annulus should be stopped about 2 feet below the surface to leave room for grouting the protective casing. A drain hole just above the final grout level will permit the escape of any water that might collect between the well casing and the protective casing. This drain is especially important if the well casing is plastic because during the winter season trapped water might freeze and rupture the well casing. Even during warm or cool seasons, trapped water would be stagnant, malodorous, and encourage pest growth.

If the ground-water monitoring well is located in a trafficked area, three or four protective posts in a triangular or rectangular pattern 3 to 4 feet from the well will protect the well from damage. Steel pipe, 4 to 6 inches in diameter, set 3 to 4 ft in concrete or cement grout and extending 4 to 5 feet above ground is sufficient protection. Larger diameter pipe, later filled with concrete, or steel I beams set 6 to 8 feet in concrete can be used in high threat areas. Treated posts set 2 to 3 feet in soil will protect the well from incidental traffic. All protective post, and casing, should be painted for both visibility and protection from the environment.

5.6 AQUIFER PROTECTION. Primary aquifer protection is afforded by the downhole bentonite sealer and grouted annulus, but repetitive sampling and the attendant foot traffic in the immediate vicinity of the well can encourage

STATE OF TENNESSEE
DEPARTMENT OF ENVIRONMENT AND CONSERVATION
Division of Water Supply

Nashville Tennessee 37243-1549

ANNOUNCEMENT

NEW RULES FOR WATER WELL CONSTRUCTION
TO BECOME EFFECTIVE AUGUST 5 1993 -

THE DEPARTMENT'S PROPOSED NEW RULES FOR WATER WELL CONSTRUCTION HAVE BEEN APPROVED BY THE ATTORNEY GENERAL AND FILED WITH THE SECRETARY OF STATE. THEY WILL BECOME EFFECTIVE AUGUST 5, 1993.

The most drastic change to be wrought by these new rules is the requirement for payment of a one-time registration/inspection fee of \$ 75.00 to be paid to the Department by the supervising driller when he files his report of well completion. All water wells drilled on or after August 5, 1993 must have the seventy five dollar (\$75) registration/inspection fee submitted with the well completion report. These reports must also be submitted within thirty days from date of completion of drilling each water well. Other major changes include increasing the minimum standards for steel well casing. For example, the nominal six-inch I.D. steel casing must have a minimum wall thickness of .185 inch and weigh almost 13 pounds per foot. The .155 inch wall thickness, 11-pound-per-foot, well casing can no longer be used.

Rules for disinfection and repair of water wells have also been revised and made more specific as to when and how water wells must be treated to avoid bacterial contamination. Similarly, requirements for well development have been strengthened to avoid "muddy wells."

Official copies of the new rules are being printed and will be circulated to all concerned as soon as they become available. In the meantime, the enclosed copy, which is a duplicate of the rules as they were submitted to the Attorney General's office, are essentially complete and correct. Please note that the old set of rules known as chapter 400-4-2 will be repealed in their entirety when the new rules become effective.

Instructions and guidelines will be forthcoming to assist all concerned in complying with the new rules for constructing and repairing "wells for the production of water." Please bear with us in this time for change. There are, to be sure, many questions to be answered and many procedures to be worked out to the satisfaction of all concerned. Hopefully, both the resource the business will benefit.

4. Cathodic protection wells.
 5. Wells used for dewatering purposes in construction work.
 6. Monitor wells, geotechnical test borings and piezometers that are regulated by rules of the Water Quality Control Board or otherwise by the Department.
 7. Ponds, pits, sumps and drainage trenches.
 8. Contaminant recovery wells otherwise regulated by the Department.
- (27) "Pumps" and "pumping equipment" means any equipment or materials utilized or intended for use in withdrawing or obtaining ground-water, including well seals.
- (28) "Recovery well" means any well constructed for the purpose of removing contaminated ground water or other liquids from the subsurface.
- (29) "Repair" means work involved in deepening, reaming, sealing, installing, or changing casing depths, perforating, screening, or cleaning, acidizing, or redevelopment of a well excavation, or any other work which results in breaking or opening a well seal.
- (30) "Standard Dimension Ratio (SDR)" means the quotient obtained when the outside diameter of thermoplastic well casing is divided by the wall thickness.
- (31) "Static water level" means the level at which the water stands in the well when the well is not being pumped and is expressed as the distance from a fixed reference point to the water level in the well.
- (32) "Supervision" means the act of overseeing, directing and managing workers engaged in the business of constructing wells, or installing pumps or installing water treatment equipment on well or spring supplies.
- (33) "Well" or "water well" means a hole drilled, re-drilled or dug into the earth, by boring or otherwise, for the production of water.
- (34) "Well construction" means all acts necessary to construct wells for the production of water including but not limited to the location and excavation of the well; placement of casings, screens and fittings; development and testing.
- (35) "Well development" means the procedures used to remove mud or fine material from the drilled borehole, correct any damage to the aquifer that occurred during drilling and improve the water passageways into the well from the aquifer.
- (36) "Well driller" or "water-well contractor" means any individual, firm or corporation engaged in the business of constructing wells.

- (37) "Well head" means the upper terminal of the well including adapters, ports, valves, seals, and other attachments.
- (38) "Well seal" means an approved arrangement or device used to cap a well or to establish and maintain a junction between the casing of a well and the piping or equipment installed therein, the purpose or function of which is to prevent pollutants from entering the well at the upper terminal.

Statutory Authority: T.C.A. 69-11-106 and T.C.A. 4-5-201 et. seq.

1200-4-9-.10 WELL CONSTRUCTION STANDARDS

These rules will apply solely to wells constructed for the production of water from underground sources and have no application to wells constructed for quarry blast holes or mineral prospecting, or any purpose other than production of water.

(1) Requirements

- (a) No person shall construct, reconstruct, or repair, or cause to be constructed, reconstructed or repaired any water well; nor shall any person install, repair, or cause to be installed or repaired any pump, pumping equipment, water filter or water treatment device to be used on a water well except in accordance with the provisions of the Water Wells Act (T.C.A. 69-11-101 et. seq.) and these rules.
- (b) Every well driller, within thirty (30) days after completion of a water well, shall submit a report on the construction or reconstruction of the well to the Department. The well completion report shall be made on form provided by the Department or a reasonable facsimile approved by the Department.

- (c) For each water well completed in Tennessee after the effective date of this rule, a one-time registration/inspection fee of seventy five dollars (\$75.00) shall be paid to the Department by the driller or contractor who supervised the drilling of the well.
1. The fee shall be submitted to the Department by the driller at the time of submission of the well completion report.
 2. The amount of the registration/inspection fee shall be reviewed annually by the Board and their recommendations for adjustment of the fee shall be presented to the Commissioner for final action.
 3. The requirement of payment to the Department of a one-time registration/inspection fee shall not apply to water wells drilled in any local jurisdiction which is authorized, by private act or pursuant to the provisions of an adopted "home rule" charter, to regulate the location and construction of water wells and which has established a fee for the inspection of water wells.
- (d) When strict compliance with these standards is impractical, the driller or installer shall make application to the Department for approval of equivalent alternative standards (a variance) prior to the work being done. The Department may grant the request for a variance based on if it determines the proposed standards offer an equivalent or higher level of protection to the environment. In an emergency or in exceptional instances, the Department will respond to a verbal request provided the applicant submits a written application within ten (10) days of the verbal application.

Statutory Authority: T.C.A. 69-11-106, T.C.A. 68-1-1303 and T.C.A. 4-5-201 et. seq.

(2) Location

- (a) The construction of a water well is prohibited at other than a safe distance from any known potential source of contamination. The minimum safe distances shown in Table A shall apply for the sources of contamination listed therein:
- (b) A water-supply well may be constructed in an area subject to flooding provided the top of the water tight casing terminates not less than two (2) feet above the maximum recorded flood elevation.
- (c) ~~Proximity~~ Proximity to buildings, pits, and basements:
1. A well located adjacent to a building shall be so located that the center line of the well extended vertically will clear any projection from the building by not less than five (5) feet.
 2. New wells shall not be constructed in pits or basements.
- (d) New wells shall not be constructed closer than 25 feet from property lines or highway rights-of-way.

TABLE A

**MINIMUM DISTANCES TO SEPARATE WATER WELLS
FROM POTENTIAL SOURCES OF CONTAMINATION**

<u>SOURCES OF CONTAMINATION</u>	<u>MINIMUM DISTANCES</u>
Animal pens or feed lots	100 feet
Leaching Pits sewage lagoons	100 feet
Pit Privys or sewer lines	75 feet
Sludge disposal sites	100 feet
Subsurface Sewage Disposal Systems	50 feet
Septic tanks and drain fields	50 feet

(3) Source of Water Supply

- (a) The source of water for any well shall be at least twenty (20) feet below the surface of the ground.
- (b) The driller shall develop the most favorable water-bearing zone(s) and seal off any source(s) of less desirable quality.
- (c) It shall be the duty of any person attempting to construct a water well to seal off salt water, oil, gas, or any other fluid or material which might contaminate a source of fresh water.

(4) Drilling Fluids

- (a) Water used for drilling shall be obtained from a potable water source, or shall be treated with enough liquid bleach or hypochlorite granules to retain a free-chlorine residual content of at least 5 parts per million (ppm).
- (b) Drilling fluids and additives shall be materials specified by the manufacturer for use in water well construction and approved by the Department.
- (c) During the course of drilling a water well with air rotary equipment, a minimum of three (3) gallons per minute of water must be injected or added into the air stream.

(5) Casing

- (a) Wells drilled for the production of water shall be cased with watertight casing extending from at least six (6) inches above to at least twenty (20) feet below the land surface. For wells located in areas subject to flooding, see rule 1200-4-9-.10(2)(b).

1. The watertight casing in wells constructed to obtain water from consolidated rock formation shall be firmly seated and sealed below all crevices that release inferior quality water or mud in the well or to a depth of at least five (5) feet below the top of the consolidated rock whichever is greater.

2. The watertight casing in wells constructed to produce water from an unconsolidated aquifer (such as saturated gravel or sand) shall extend at least to the top of the aquifer or to a depth of 20 feet which ever is greater.

(b) Except as otherwise specified in these regulations, the permanent well casing shall:

1. Be new, seamless or welded, black or galvanized steel pipe conforming to the weights and dimensions given in Table B and meeting the American Society for Testing and Materials (ASTM) Standards A53-87b or A589-85. Used or reject pipe shall not be used;
2. Have water-tight joints that may be welded, or threaded and coupled; and
3. Be equipped with a drive shoe if the casing is to be driven.
4. Pipe sizes that are not listed in Table B and are less than ten (10) inches in diameter shall match listed values as closely as possible.
5. Pipe sizes that are ten (10) inches in diameter or larger shall be Schedule 20 pipe as a minimum.

TABLE B

MINIMUM DIMENSIONS AND WEIGHTS FOR WATER WELL CASING

Diameters in inches		Minimum Wall Thickness in Inches	Weights in Pounds per Foot Plain Ends Only	
External	Internal			
3.500	3.250	0.125	4.51	
4.000	3.732	0.134	5.53	
4.500	4.216	0.142	6.61	
5.500	5.192	0.154	8.79	
6.000	5.672	0.164	10.22	
6.625	6.255	0.185	12.72	
8.625	8.249	0.188	16.90	

(c) Thermoplastic well casing may be installed in wells constructed to obtain water from unconsolidated aquifers (such as saturated gravel, sand or overburden) provided:

1. The casing is new;
2. The casing meets or exceeds the requirements of ASTM Standard F-480-88 and bears the NSF (National Sanitation Foundation) seal in each section of casing;
3. The Standard Dimension Ratio (SDR) shall not exceed 26;

4. The casing is installed after the borehole has been drilled to the final depth of the finished well, and no additional drilling takes place after the casing has been installed; and
 5. Joints shall be solvent cemented with a quick-setting cement, or threaded and coupled.
- (d) In areas where the water is obtained from overburden above the consolidated rock surface, the casing shall be set at or just above the consolidated rock. A screen may be attached to the bottom of the casing or the lowermost few feet of the casing may be slotted or perforated to allow water to enter the well provided the top of the screen or the topmost perforation in the casing is at least 20 feet below land surface. The completed well shall be finished so that extraneous material such as sediment cannot enter the well.

(6) Backfilling and Grouting

- (a) The annular space between the casing and borehole wall of the well shall be backfilled with an impervious material such as grout, bentonite chips or cuttings mixed with bentonite granules or pellets.
- (b) Placement of the backfill material shall be done in such a way that there are no bridges or gaps in the annulus. The top of the backfill material shall remain level with the land surface surrounding the well.
- (c) If bentonite-based grout is used for backfill, it shall be placed in accordance with the manufacturers recommendations.
- (d) If cement-based grout is used for backfill, it shall be placed around the casing by one of the following methods:

1. Pressure

The annular space between the casing and the borehole wall shall be a minimum of one and five-tenths (1.5) inches, and grout shall be pumped or forced under pressure through the bottom of the casing until it fills the annular space around the casing and overflows at the surface; or

2. Pumping

The annular space between the casing and formation shall be a minimum of two (2) inches and grout shall be pumped into place through a pipe or hose extended to the bottom of the annular space which can be raised as the grout is applied, but the grout pipe or hose shall remain submerged in grout during the entire application; or

3. Other

The annular space between the casing and the borehole wall shall be a minimum of three (3) inches and the annular space shall be completely filled with grout by any method that will insure

complete filling of the space, provided the annular area does not contain water or other fluid. If the annular area contains water or other fluid, it shall be evacuated of fluid or the grout shall be placed by the pumping or pressure method.

(7) Well Screens

- (a) Any water well finished in an unconsolidated rock formation shall be equipped with a screen or perforated pipe that will adequately prevent the entrance of soil or formation material into the well after the well has been developed and completed by the well contractor.
- (b) The well screen shall:
1. Be of steel, stainless steel, plastic or other Department approved material and shall be of a strength to satisfactorily withstand chemical and physical forces applied to it during and after installation;
 2. Be of a design to permit optimum development of the aquifer with minimum head loss consistent with the intended use of the well;
 3. Have openings designed to prevent clogging and shall be free of rough edges, irregularities or other defects that may accelerate or contribute to corrosion or clogging; and
 4. Be provided with such fittings as are necessary to seal the top of the screen to the watertight casing and to close the bottom. If the screen is installed through the casing, a packer, seal or other approved design shall be used to prevent the entry of ground water into the well through any openings other than the screen.
- (c) Multi-screened wells shall not connect aquifers or zones which have differences in:
1. Water quality to the extent that intermixing of the waters would result in deterioration of the water quality in any aquifer or zone.
 2. Static water levels that would result in depletion of water from any aquifer or zone, or significant loss of head in any aquifer or zone.

(8) Gravel-Packed Wells

- (a) In constructing a gravel-packed well:
1. The gravel shall be composed of quartz, granite, or similar rock material and shall be clean, rounded, uniform, water-washed and free from clay, silt, or other deleterious material.
 2. The gravel shall be placed in the annular space around the screens and casing by any method that will insure accurate placement and avoid bridging or segregation.

3. The gravel pack shall have a minimum thickness of at least two (2) inches and shall not extend more than ten (10) feet above the top of the screen or perforated pipe.

4. The gravel shall be disinfected using water with a free chlorine residual of at least 50 parts per million (ppm).

(b) The gravel pack shall not connect aquifers or zones which have differences:

1. In water quality that would result in deterioration of the water quality in any aquifer or zone.

2. In static water levels that would result in depletion of water from any aquifer or significant loss of head in any aquifer or zone.

(9) Large Diameter Wells

(a) Large-diameter bored or augered wells may be cased with concrete pipe provided such wells are constructed as follows:

1. The bore hole shall have a minimum diameter of six (6) inches larger than the outside diameter of the casing.

2. The annular space around the casing shall be filled with grout to a depth at least five feet below the static water level or twenty (20) feet below land surface, whichever is greater. The grout shall be placed in accordance with the requirements of rule 1200-4-9-.10(6)(d).

3. The annular space around the casing below the grout shall be completely filled with sand or gravel that has been disinfected with water containing a free-chlorine residual of at least 50 parts per million (ppm).

4. The sand or gravel material shall be composed of quartz, granite, or similar rock material and shall be clean, rounded, uniform, water-washed and free from clay, silt, or other deleterious material.

(b) The wellhead shall be completed in the same manner as required for other water-supply wells.

(10) Well Development

Prior to completion of a well for water supply, the driller shall take all steps necessary to:

(a) Remove any mud, drill cuttings, or other foreign matter from the entire depth of the well;

(b) Correct any damage to the aquifer that might have occurred during drilling; and

(c) Disinfect the well.

(11) Wellhead Completion

- (a) The top of the casing shall be cut off smooth and level, be free from dents and cracks, and shall terminate at least six (6) inches above the land surface except in areas subject to flooding. See Rule 1200-4-9-.10(2)(b).
- (b) No well casing shall be cut off or cut into below ground surface except by a licensed driller or licensed installer to install a pitless unit or adapter. Pitless units or adapters shall comply with the Water Systems Council's Pitless Adapter Division (PAD) FAS-1 (6th Ed., March 1987) and shall bear the PAD symbol of certification or shall otherwise have been approved by the Department.
- (c) Pitless units or adapters shall be constructed and installed so as to prevent the entrance of contaminants into the well or potable water supply, conduct water from the well, protect the water from freezing, and provide access to water system parts within the well.
- (d) The surface surrounding the well head shall slope away from the well head in all directions.
- (e) Every water well that flows under natural artesian pressure shall be equipped with a valve so that the flow can be completely stopped.

Statutory Authority: T.C.A. 69-11-106 and T.C.A. 4-5-201 et. seg.

1200-4-9-.11 INSTALLATION OF PUMPS, FILTERS AND WATER TREATMENT UNITS

Primary responsibility for compliance with the provisions set forth herein for the installation of water well pumps, filters and water treatment units rests with the installer of these devices.

- (1) The capacity of the pump shall be consistent with the intended use and yield characteristics of the well.
- (2) The pump and related equipment for the well shall be conveniently located to permit easy access and removal for repair and maintenance.
- (3) The base plate of a pump placed directly over the well shall be designed to form a watertight seal with the well casing or pump foundation.
- (4) In installations where the pump is not located directly over the well, the annular space between the casing and pump intake or discharge piping shall be closed with a watertight seal designed specifically for this purpose.
- (5) The well shall be properly vented at the wellhead to allow for pressure changes within the well. The vent shall be screened to prevent entry of insects.

- (6) Any suction line installed underground between the well and pump shall be surrounded by six (6) inches of impervious material such as cement or encased in a larger pipe that is sealed at each end.
- (7) All conduits, valves and other plumbing fixtures used to convey water from a water-supply well to any building or other outlet shall be installed in accordance with manufacturer's requirements.
- (8) All pressure tanks shall be installed above ground unless the tank is specifically designated by the manufacturer for below ground burial.
- (9) The electrical wiring and equipment used in connection with the installation of a water well pump shall:
 - (a) Meet underwriters specifications;
 - (b) Be installed in accordance with the National Electrical Code or local codes and ordinances if the latter are more restrictive;
 - (c) Be equipped with a fused or circuit breaker disconnect switch.
 - (d) Be served by an entirely separate circuit from other equipment.
- (10) Water filters and water treatment units shall be installed and serviced to accommodate water quality problems as determined by physical, chemical or bacteriological evaluation or field test; and the function of the equipment shall achieve the results specified by the manufacturer. In servicing and installing treatment units the sanitation of the water supply shall be protected.

Statutory Authority: T.C.A. 69-11-106 and T.C.A. 4-5-201 et. seq.

1200-4-9-.12 DISINFECTION OF WATER WELLS

- (1) All water wells shall be disinfected upon completion of construction, reworking, pump installation or repairs as follows:
 - (a) A chlorine solution shall be placed in the well in sufficient dosage to produce a chlorine residual of at least one hundred (100) parts per million (ppm) in the water standing in the well (see Tables C and D for the correct amount). A chlorine solution may be prepared by dissolving dry hypochlorite granules (trade names include HTH, Chlor-Tabs, etc.) in water or by liquid bleach (trade names include Clorox, Purex, etc.). (CAUTION: When working with chlorine, persons should be in a well ventilated place. The powder or strong liquid should not come in contact with skin or clothing. Solutions are best handled in wood, plastic or crockery containers because metals are corroded by strong chlorine solutions).

Table C - Quantity of disinfectant required to produce a free chlorine residual of 100 parts per million (ppm) in drilled wells

Feet of Water	Liquid Bleach (Clorox, Purex, etc.) (5.25 % Chlorine)			Dry Granules (HTH, Clor-Tabs, etc.) (70% Chlorine)			Feet of Water
	Well Diameter			Well Diameter			
	4-inch	6-inch	8-inch	4-inch	6-inch	8-inch	
10	1/4 cup	1/2 cup	1 cup	1 tab.	2 tabs.	1/2 oz.	10
20	1/2 cup	1 cup	1 pt.	2 tabs.	4 tabs.	1 oz.	20
30	3/4 cup	1 1/2 cups	1 1/2 pts.	3 tabs.	1 oz.	1 1/2 ozs.	30
40	1 cup	1 pt.	1 3/4 pts.	4 tabs.	1 1/4 ozs.	2 ozs.	40

120	1 1/3 pts.	1 1/2 qts.	2 1/2 qts.	1 1/2 ozs.	3 1/2 ozs.	6 ozs.	120
140	1 1/2 pts.	1 3/4 qts.	3 qts.	1 3/4 ozs.	4 ozs.	7 ozs.	140
160	1 3/4 pts.	2 qts.	3 1/2 qts.	2 ozs.	4 1/2 ozs.	1 1/2 lbs.	160
180	1 qt.	2 1/4 qts.	1 gal.	2 1/4 ozs.	5 ozs.	2 2/3 lbs.	180
200	1 1/4 qts.	2 1/2 qts.	1 1/4 gal.	2 1/2 ozs.	6 ozs.	3 3/4 lbs.	200
250	1 1/2 qts.	3 qts.	1 1/2 gals.	3 1/4 ozs.	1 1/2 lb.	1 lbs.	250
300	2 qts.	1 gal.	1 3/4 gals.	5 ozs.	2 2/3 lb.	1 lbs.	300
400	9 1/2 qts.	1 1/4 gal.	2 1/4 gals.	6 1/4 ozs.	3 3/4 lbs.	1 1/2 lbs.	400
500	2 3/4 qts.	1 1/2 gal.	2 3/4 gals.		1 lbs.	2 lbs.	500

Measures: 2 cups = 1 pint (pt)
 2 pints = 1 quart (qt)
 4 quarts = 1 gallon (gal)

7 tablets = 1 ounce (oz)
 8 ounces = 1/2 pound (lb)
 16 ounces = 1 pound (lb)

Equations for calculating amount of disinfectant required to chlorinate drilled wells with diameters larger than 8 inches:

Pints of liquid bleach = $D^2 h + 1500$

Ounces of dry granules = $D^2 h + 1300$,

where: D = Diameter of well in inches

h = height of water above bottom of well in feet.

- (b) Place the required amount of liquid bleach or dry granules in the well by one of the following methods:
 1. Dry granules or tablets may be dropped in the top of the well and allowed to settle to the bottom; or
 2. Liquid bleach may be mixed with water and poured in the top of the well and allowed to settle to the bottom.
- (c) Agitate the water in the well to insure thorough dispersion of the chlorine throughout the entire length of the well.
- (d) The well casing, pump column and any other equipment above the water level in the well, shall be thoroughly rinsed with the chlorine solution as a part of the disinfecting process.
- (e) The chlorine treated water shall stand in the well for a period not less than twelve (12) hours. The well shall, thereafter, be pumped until the odor of the chlorine is no longer detectable.

1200-4-9-.13 REPAIR OF WATER WELLS

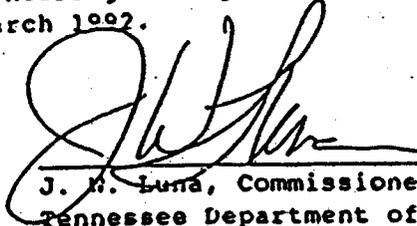

- (1) All materials used in the replacement or repair of any water well shall meet the requirements for a new installation.
- (2) Plastic pipe approved by the National Sanitation Foundation (NSF) and rated at 160 psi (SDR = 26) may be used for liner casing. The liner casing shall be installed with centering guides to insure proper centering in the well and the annular space around the liner casing shall be completely sealed at both ends to repel the inflow of extraneous material from the lined interval.
- (3) Repairs to wells completed with the top of the well casing terminating below ground shall include extending the well casing above land surface in accordance with rule 1200-4-9-.10(5)(a).

Statutory Authority: T.C.A. 69-11-106 and T.C.A. 4-5-201 et. seq.

1200-4-9-.14 WELL REGISTRATION - IDENTIFICATION

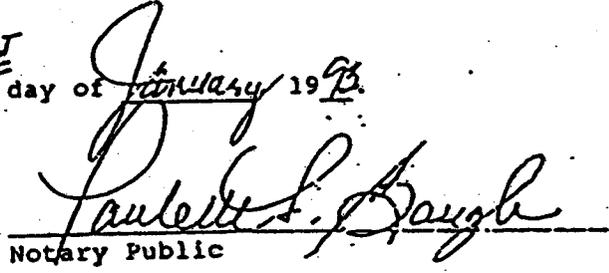

- (1) Each water well constructed or reconstructed after the effective date of this rule shall be equipped immediately upon completion by the driller of the well with an identification tag or decal bearing a registration number to be supplied by the Department.
- (2) The identification tag or decal shall be securely attached to the well casing or other appurtenance where it is readily visible.
- (3) The identification tag or decal shall not be removed from the well unless otherwise approved by the Department.

I certify that this is an accurate and complete copy of rulemaking hearing rules, lawfully promulgated and adopted by the Department of Environment and Conservation on the 21st day of January, 1993. Further, I certify that these rules are properly presented for filing, a notice of rulemaking hearing has been filed in the Department of State on the 27th day of January, 1992 and such notice of rulemaking hearing having been published in the February, 1992, issue of the Tennessee Administrative Register, and such rulemaking hearing having been conducted pursuant thereto on the 17th, 18th, and 19th day of March 1992.

J. W. Luna, Commissioner
Tennessee Department of Environment
and Conservation

Subscribed and sworn to before me this the 21st day of January, 1993.

Notary Public

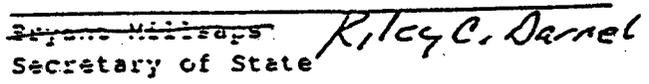

My commission expires on the 27th day of July, 1996.

All rulemaking hearing rules provided for herein have been examined by the Attorney General and Reporter of the State of Tennessee and are approved as to legality pursuant to the provisions of the Administrative Procedures Act, Tennessee Code Annotated, Title 4, Chapter 5.

Charles W. Burson
Attorney General and Reporter

The rulemaking hearing rules set out herein were properly filed in the Department of State, and will be effective on the 5 day of August, 1993.

Secretary of State

STORAGE TANKS

ENVIRONMENTAL
ASSESSMENT
GUIDELINES

JANUARY 1994

II. GROUND WATER INVESTIGATION PROCEDURES

A. Number, Type and Location of Monitoring Wells

A minimum of four (4) single cased or open hole monitoring wells shall be required to begin the ground water investigation. These wells shall be constructed by converting borings B-1 through B-4 into monitoring wells.

All single cased or open hole monitoring wells shall be installed to monitor the uppermost water bearing zone.

If site specific data or geologic conditions require the monitoring of aquifers other than the uppermost, then double cased monitoring wells shall be required. To prevent the vertical movement of contaminants within a borehole or to prevent the cross contamination of multiple aquifers, double cased monitoring wells shall be installed when monitoring a separate, deeper aquifer for contamination. If conditions exist where double cased monitoring wells are required to seal off contaminant zones, the Division shall be contacted and prior approval received before proceeding.

After the installation and sampling of the first four (4) soil borings and monitoring wells the site shall be ranked in accordance with Technical Guidance Document - 014. If the owner/operator decides to proceed with the investigation or is required to based on the site ranking, additional monitoring wells may be required. These additional monitoring wells will be required if the ground water contamination has not been defined to the applicable cleanup levels. If additional monitoring wells are installed they shall not be placed within fifty (50) feet of any other monitoring wells unless prior approval has been granted by the Division.

Prior to installing additional ground water monitoring wells, the following innovative ground water investigative technologies may be used if site conditions are suitable:

1. A soil vapor survey, either active or passive, to estimate the size and location of the ground water contaminant plume and optimize the placement of additional monitoring wells; or,

2. A direct push or hydraulic push instrument to retrieve ground water samples. Once the extent of the ground water contamination is defined, additional ground water wells shall be required for future monitoring.

The Environmental Assessment Report (EAR) shall contain written documentation of the order in which each additional monitoring well was installed, the date of installation, and the rationale for the placement of each monitoring well. The rationale shall include, but not be limited to the distance, depth, and direction of the monitoring wells from all previous monitoring well, taking into consideration:

1. The estimated and/or known contaminant levels in all previously installed monitoring wells;
2. The estimated rate of contaminant migration based on site specific data gathered from all previously installed monitoring wells;
3. The estimated or known ground water flow direction and other factors that could influence the direction of the ground water contaminant plume migration;
4. The estimated and/or known rate of the decline of contaminant levels between all previously installed monitoring wells; and
5. The results of a soil vapor survey, if performed.

The objective in selecting the additional monitoring well locations is to define the outer limits of the ground water contaminant plume without installing a number of intermediate monitoring wells. Without proper rationale for the placement of additional monitoring wells, the cost of the work may not be reimbursed from the Petroleum Underground Storage Tank Fund.

B. Drilling Methods

The following drilling methods are acceptable to the Division:

1. Hollow Stem Auger
2. Air Rotary (downhole hammer or tri-cone)

The following drilling methods shall be allowed only upon special approval of the Division:

1. Mud Rotary
2. Cable Tool

3. Rock Coring
4. Wash Rotary (Tri-Cone)

C. Special Procedures for Documenting Results of Bedrock Sections

1. Camera Logging Procedures

Approval shall be received from the Division prior to camera logging any bedrock wells. Approval shall be granted on a well by well basis. All bedrock wells allowed to be camera logged shall be properly developed prior to logging. The development shall consist of purging the well with a pump to remove particulate matter derived from the drilling process. The pump shall be raised and lowered throughout the water column during purging operations. A minimum of three (3) well volumes shall be purged from the well and the well shall remain undisturbed for a minimum of twenty four (24) hours prior to logging.

All video tapes produced shall be labeled with the following information: facility name, facility ID, monitoring well number, date, time, logging company name and name of professional in charge. All logs shall have a depth indicator visible on the video image. A copy of each log shall be submitted with the EAR.

2. Rock Coring

Approval shall be received from the Division prior to rock coring any bedrock wells. Approval shall be granted on a well by well basis. The core shall be logged and photographed.

D. Single Cased Monitoring Well Installation Procedures

1. Casing and Screen Type

The casing and screen shall be constructed of two (2) inch I.D., pre-cleaned, flush threaded, Schedule 40 PVC. The screen shall have 0.01 inch factory milled slots. The well screen shall be terminated with a threaded end cap and the casing shall be terminated with a locking, watertight cap. If free product is encountered, larger diameter wells may be installed for free product recovery.

2. Screen Length and Placement

The screen length and placement shall be such that the screen intersects the water table at all times. If the screen is placed such so that ground water does not enter the well, the cost for the installation of the monitoring well may not be reimbursed from the Petroleum Underground Storage Tank Fund. Typical placement is such that seven (7) feet of screen is in the water table within three (3) feet of screen above or ten (10) feet of screen in the water table and five (5) feet of screen above. Longer screen lengths may be necessary for areas with large seasonal ground water fluctuations. A centralizer shall be used in all single cased monitoring wells with a total depth greater than twenty (20) feet.

If free product is encountered, greater screen lengths (i.e. 20 feet) may be warranted in order to allow for depression of the water table during free product removal operations provided the extra depth does not result in the breaching of a confining unit.

If a confined aquifer is encountered, the water bearing section of the aquifer shall be screened.

3. Minimum Borehole Diameter

The borehole diameter shall be a minimum of four (4) inches larger than the outside diameter (O.D.) of the well casing. For example, a 2.5-inch O.D. casing would require a 6.5 inch diameter borehole. A waiver is granted in cases if a 5.5 inch O.D. or larger core barrel will be used to drill the bedrock portion of the hole.

4. Placement and Type of Filter Pack

A minimum of six (6) inches of the filter pack material shall be placed under the bottom of the well screen to provide a firm footing. The filter pack shall extend two (2) feet above the top of the screened section. A weighted tape shall be used to help prevent bridging and ensure the proper placement of the filter pack. If the total depth of the borehole exceeds thirty (30) feet, a tremie pipe shall be utilized to properly place

the filter pack unless the well is being installed through a hollow stem auger. The filter pack shall consist of clean, washed, well sorted silica sand.

5. Placement and Type of Filter Pack Seal

The filter pack seal shall be placed atop the filter pack and have a minimum thickness of two (2) feet. The filter pack seal shall consist of a high solids, pure bentonite material. A weighted tape shall be used to help prevent bridging and ensure the proper placement of the filter pack seal. If the total depth to the top of the filter pack exceeds thirty (30) feet, a tremie pipe shall be utilized to place the filter pack seal unless the well is being installed through a hollow stem auger. If the bentonite seal is placed above the water table, two (2) gallons of potable water shall be used to hydrate the pellets. The hydration time for the bentonite pellets shall be a minimum of one (1) hour.

6. Placement and Type of Annular Grout

The annular grout shall extend from the top of the filter pack seal to within two feet of the surface. The annular grout shall consist of a mixture of Portland cement and 4%-6% powdered bentonite. A grout density of 13.5 to 14.1 lbs/gal shall be obtained and verified with a mud balance prior to placement. If water is present in the boring or the depth to the filter pack seal is greater than thirty (30) feet, a tremie pipe shall be used to place the annular grout unless the well is being installed through a hollow stem auger.

7. Surface Completion

The final two (2) feet of the annular space shall be filled with concrete terminating with a flush-mounted manhole with a watertight, bolt-down loadbearing cover unless alternate construction is approved by the Division in writing. These manholes shall be concreted in place and sloped so that surface drainage will be diverted. A locking, watertight cap shall be used if surface completion is below grade. A locking cap shall be used on all wells completed above ground level. Above ground protective covers may be used if required by site conditions. All

monitoring wells shall be clearly marked as monitoring wells and numbered.

E. Double Cased Monitoring Well Installation Procedures

1. Casing and Screen Type

The outer casing shall be decontaminated black steel. If site specific conditions and drilling methods are compatible (i.e. hollow stem auger drilling) schedule 80 PVC may be used in lieu of black steel with prior approval by the Division. The inner casing and screen shall be constructed of pre-cleaned, flush threaded, Schedule 40 PVC. The screen shall have 0.01 inch factory milled slots. The screened section shall be terminated with a threaded end cap and the casing shall be terminated with a locking, watertight cap.

2. Outer Casing Placement

The outer casing shall be set at least two (2) feet into competent bedrock, the confining layer or five (5) feet below the last indication of soil contamination, if applicable. The casing shall then be grouted into place using a bentonite/cement grout. The grout shall consist of a mixture of Portland cement and 4%-6% powdered bentonite. A grout density of 13.5 to 14.1 lbs/gal shall be used. If water is present in the boring or the total depth of the borehole is greater than thirty (30) feet, a tremie pipe shall be used to place the grout unless the well is being installed through a hollow stem auger. The grout shall be allowed to set for a minimum of 24 hours before continuation of drilling activities.

3. Screen Length and Placement

The screen length and placement shall be such that the screen intersects the water table at all times. If the screen is placed so such that ground water does not enter the well, the cost for the installation of the monitoring well may not be reimbursed from the Petroleum Underground Storage Tank Fund. Typical placement is such that seven (7) feet of screen is in the water table with three (3) feet of screen above or ten (10) feet of screen in the water table and five (5) feet of screen above. Longer screen lengths may be necessary for areas with large seasonal ground water fluctuations. A centralizer shall be used in all

monitoring wells greater than twenty (20) feet in depth. The centralizer shall be placed below the screened interval at the bottom of the well.

If free product is encountered, greater screen lengths (i.e. 20 feet) may be warranted in order to allow for depression of the water table during free product removal operations provided the extra depth does not result in the breaching of a confining unit.

If a confined aquifer is encountered, the water bearing section of the aquifer shall be screened.

4. Minimum Borehole Diameter

The outer borehole diameter shall be a minimum of 4.0 inches larger than the outside diameter (O.D.) of the well casing. For example, a 8.0 inch O.D. casing would require a 12.0 inch diameter borehole. The annular space between the inner casing and the outer casing shall also be 4.0 inches. A waiver is granted in cases where a 5.5 inch O.D. or larger core barrel will be used to drill the bedrock portion of the hole.

5. Placement and Type of the Filter Pack

A minimum of 6.0 inches of the filter pack material shall be placed under the bottom of the well screen to provide a firm footing. The filter pack shall extend two (2) feet above the top of the screened section. A weighted tape shall be used to help prevent bridging and ensure the proper placement of the filter pack. If the total depth of the borehole exceeds thirty (30) feet, a tremie pipe shall be utilized to properly place the filter pack unless the well is being installed through a hollow stem auger. The filter pack shall consist of clean, washed, well sorted silica sand.

6. Placement and Type of the Filter Pack Seal

The filter pack seal shall be placed atop the filter pack and have a thickness of two (2) feet. The filter pack seal shall consist of a high solids, pure bentonite material. A weighted tape shall be used to help prevent bridging and ensure the proper placement of the filter pack seal. If the total depth to the filter pack exceeds thirty (30) feet, a tremie pipe

shall be utilized to place the filter pack seal unless the well is being installed through a hollow stem auger. If the bentonite seal is placed above the water table, two (2) gallons of potable water shall be used to hydrate the pellets. The hydration time for the bentonite pellets shall be a minimum of one (1) hour.

7. Placement and Type of the Inner Annular Grout

The inner annular grout shall extend from the top of the filter pack seal to within two (2) feet of the surface. The annular grout shall consist of a mixture of Portland cement and 4%-6% powdered bentonite. A grout density of 13.5 to 14.1 lbs/gal shall be used. If water is present in the boring above the filter pack seal or the depth to the filter pack seal is greater than thirty (30) feet, a tremie pipe shall be used to place the annular grout unless the well is being installed through a hollow stem auger.

8. Surface Completion

The final two feet of the annular space shall be filled with concrete terminating with a flush-mounted manhole with watertight, bolt-down loadbearing cover unless alternate construction is approved by the Division in writing. These manholes shall be concreted in place and sloped so that surface drainage will be diverted. A locking, watertight cap shall be used if surface completion is below grade. A locking cap shall be used on all wells completed above ground level. Above ground protective covers may be used if required by site conditions. All monitoring wells shall be clearly marked as monitoring wells and numbered.

F. Open-Hole Well Installation Procedures

Open hole monitoring wells may be used in areas where competent bedrock is encountered and geologic conditions (e.g. karst terrain) dictate their use.

In constructing an open hole monitoring well, the surface casing shall be set at least two (2) feet into competent bedrock. The surface casing shall be black steel in all cases. The casing shall be grouted into place using a bentonite/cement grout. The grout shall consist of a mixture of Portland cement

and 4%-6% powdered bentonite. A grout density of 13.5 to 14.1 lbs/gal shall be used. If water is present in the boring or the total depth of the borehole is greater than thirty (30) feet, a tremie pipe shall be used to place the grout. The grout shall be allowed to set for a minimum of 24 hours before continuation of drilling activities.

Upon setting the surface casing, a borehole with a minimum diameter of three and one-half (3.5) inches shall be advanced to the desired depth.

The final two (2) feet of the annular space shall be filled with concrete terminating with a flush-mounted manhole with a watertight, bolt-down loadbearing cover unless alternate construction is approved by the Division in writing. These manholes shall be concreted in place and sloped so that surface drainage will be diverted. A locking, watertight cap shall be used if surface completion is below grade. A locking cap shall be used on all wells completed above ground level. All monitoring wells shall be clearly marked as monitoring wells and numbered.

G. Well Development

Monitoring well development shall not begin until at least 24 hours following completion of the well and shall continue until such time as the water column is free of visible sediment. Should development procedures not produce a water column that is sediment free, development shall continue until pH, specific conductance, and temperature have stabilized.

The following methods shall be used individually or in combination for well development:

1. Bailing
2. Pumping
3. Surging

All down-hole equipment shall be new and disposable or shall be properly decontaminated.

RULES AND REGULATIONS OF WELLS
IN
SHELBY COUNTY

PURSUANT TO THE AUTHORITY GIVEN IN THE ORDINANCES OF SHELBY COUNTY AND THE MUNICIPALITIES THEREIN WHICH ESTABLISHED THE GROUND WATER QUALITY CONTROL BOARD FOR SHELBY COUNTY; TO ESTABLISH INSPECTION AND PERMIT FEES; TO CONTROL AND REGULATE THE LOCATION, CONSTRUCTION, AND MODIFICATION OF ALL TYPES OF WELLS IN SHELBY COUNTY; AND TO PROVIDE PENALTIES FOR THE VIOLATION THEREOF.

SECTION 1 -- GENERAL PROVISIONS

1.01 -- Statutory Authority

The Ground Water Quality Control Board for Shelby County establishes and adopts the following regulations in accordance with the authority granted by the ordinances of Shelby County and the municipalities therein which established the Ground Water Quality Control Board for Shelby County:

1.02 -- Scope and Applicability

- A. Minimum requirements are hereby prescribed in these Rules and Regulations governing the location, design, installation, use, disinfection, modification, repair and abandonment of water wells and associated pumping equipment, or any other type of well. No person shall conduct any activity contrary to the provisions of these regulations, and all such activities which are contracted for shall be carried out only by those persons having a valid Tennessee License for Water Well Drillers, and Pump Installers and/or those engineers or geologists registered in the State of Tennessee. These regulations supersede all other well construction regulations.
- B. These regulations apply to well construction activities from the initial penetration or excavation of the ground, through development, modification, equipment installation, repair and disinfection. Set up of construction equipment before actual penetration or excavation is not considered part of the construction.
- C. The regulations apply to the construction activities of any and all types of wells.

D. The installation of all wells or other activities conducted for the purpose of obtaining geologic or hydrologic information shall receive prior approval from the Department in the form of a Well Construction Permit.

E. Amendments may be made to inspection and permit fees to reflect reasonable costs of services provided by the Memphis and Shelby County Health Department and to establish well water conservation fees as a means of controlling the usage of water or waste of groundwater by way of private wells.

1.03 -- Health Department Powers and Duties

The Department has general supervision and authority over water quality matters as they relate to the protection and conservation of the groundwater; over the location, construction, repair, and modification of water wells and all other types of wells and for the administration of these Rules and Regulations. The Board shall adopt and amend rules and regulations; establish policies declared by these Rules and Regulations and establish policies reasonably necessary to effectuate the statement of policy declared by these Rules and Regulations. Such rules, regulations and policies shall provide criteria for the proper location and construction of any type of well in Shelby County; to safeguard the public health against problems which pertain to water quality; and for the protection and conservation of groundwater. The Board shall conduct public hearings, upon not less than thirty (30) days prior notice, in connection with proposed rules and regulations and amendments thereto; and exercise such other powers as are practical and reasonably necessary to carry out and enforce the provisions of these Rules and Regulations.

Section 2 -- SHORT TITLE

Shelby County Well Construction Code

Section 3 -- DEFINITIONS

- 3.01 -- Abandoned Well: Any type of well that has been permanently discontinued for further use. A well shall be declared abandoned when the pump has been disconnected or removed for reasons other than repair or replacement; when the well is in such a state of disrepair that continued use for the purpose intended is impracticable; or when the well is not maintained in such a condition that allows for periodic sampling and testing by the Department.
- 3.02 -- Abandonment: The act of properly sealing an abandoned well.
- 3.03 -- Adequate Water Supply: A well which after installation will supply enough water in a capacity so that the well can be used for drinking, culinary, food processing and other purposes.
- 3.04 -- Agricultural Well: A well constructed for the primary purpose of providing a source of water for agriculture.
- 3.05 -- Agriculture: The term agriculture is defined as the art of being engaged in farming as the leading pursuit and includes cultivating the soil; producing crops; and/or raising livestock, poultry, or fish; and in varying degrees the preparation of these products for human use.
- 3.06 -- Aquifer: A geologic formation, group of formations or part of a formation capable of yielding a significant amount of groundwater to wells, springs, or surface water.
- 3.07 -- Auxiliary Intake: Any source of water system, piping, connection, or device whereby water may be secured other than that normally used.
- 3.08 -- Bentonite Grouts: A Bentonite grout shall consist of a high solid sodium montmorillonite. The grout shall yield solids ranging from twenty to thirty (20-30%) percent, with a minimum density equal to or greater than 9.4 pounds per gallon, and a permeability of

approximately 1×10^{-7} centimeters per second or less. The manufacturers mixing instructions shall be followed and any polymer added to bentonite slurry mixes must be approved by the Department prior to use.

- 3.09 -- Board: The Ground Water Quality Control Board for Shelby County.
- 3.10 -- Commercial Well: A well constructed for the purpose of providing groundwater to a commercial business, facility, or premise for use as a potable water supply when public water is not available; for air conditioning, and other heat exchange systems; sprinkler systems for landscaping and other land beautification uses; nurseries; filling and retaining levels of lakes in subdivisions, apartment complexes, and similar multiple dwelling facilities; and any other such commercial uses.
- 3.11 -- Contaminated Well: Any type of well containing a foreign substance, either chemical, radiological, or biological, which tends to degrade the quality of the water so as to constitute a hazard or impair the usefulness of the water.
- 3.12 -- Contamination: Alteration of the physical, chemical, or biological quality of the water so that it is harmful or potentially injurious to the health of the users or for the intended use of the water, or to the extent it poses a danger of polluting the groundwater aquifers.
- 3.13 -- Cross Connection: An actual or potential connection, arrangement or condition by or through which a supply of potable water could be contaminated, polluted or infected.
- 3.14 -- Deep Well: Any type of well constructed to a depth that penetrates the stratum of clay known as the Jackson Formation, the water bearing formation known as the Memphis Sands, or the water bearing formation known as the Fort Pillow Sands. Any well is considered a deep well if the Jackson Formation is not found to exist at the construction site.
- 3.15 -- Delinquent: Unpaid or past due well fees that are subject to additional fees or penalties.
- 3.16 -- Department: The Memphis and Shelby County Health Department.

supply to the premise whether from a public source or from an existing well that can be modified to produce the needed volume of water.

- 3.29 -- Modification: Alteration, rework or repair involving a material change in the design or construction of a well including but not limited to deepening, reaming, casing, re-casing, perforating, re-perforating, installation of liner pipe, packers and seals, screen removal and replacement, or redeveloping a well by surging, chemical treatment, jetting, etc.
- 3.30 -- Monitoring Well: A well constructed for monitoring Groundwater quality and/or water level.
- 3.31 -- Municipality: A political unit having corporate status and powers of self-government and, includes any other form of government within the political jurisdiction of Shelby County.
- 3.32 -- Observation Well: A well constructed for the primary purpose of obtaining accurate, periodic measurements of groundwater.
- 3.33 -- Owner: Any person or his legal representative, agent, or assign who owns, leases, operates, or controls any parcel of land where a well is or may be located.
- 3.34 -- Permit: An official document issued by the Department granting the specific activity set forth in the document.
- 3.35 -- Person: Any individual, firm, association, organization, partnership, business, institution, enterprise, municipality, commission, political subdivision or duly established entity, trust, corporation, company, contractor, supplier, installer, user or owner, or any Federal, State or Local government agency or public district or any officer or employee thereof.
- 3.36 -- Potable Water Supply: Any source of water which is satisfactory for drinking, culinary, and domestic purposes, and meets the requirements of the Department.
- 3.37 -- Premise: A tract of land with the buildings thereon.
- 3.38 -- Private Water Supply: Any groundwater supply located on

- 3.17 -- Dewatering or Drainage Well: A well constructed for the primary purpose of lowering the water table for the construction of footings, sewer lines, building foundations, elevator shafts, etc.
- 3.18 -- Domestic Well: A well constructed for the primary purpose of providing a source of drinking water to a single family residence.
- 3.19 -- Emergency: Unforeseen circumstances that exist beyond the control of the applicant.
- 3.20 -- Geothermal Well: A well constructed for the primary purpose of adding or removing British Thermal Units (Btu) from groundwater for heating or cooling purposes.
- 3.21 -- Groundwater: Water occurring naturally in underground formations that are saturated with water and includes but is not limited to perched water tables and aquifers or zones that are seasonally, periodically or permanently saturated.
- 3.22 -- Groundwater Heat Pump: Any mechanical device used for heating or cooling, which adds or removes British Thermal Units (Btu) from groundwater.
- 3.23 -- Grout: A stable, impervious, minimum-shrinkage bonding material that is capable of producing a water tight seal required to protect against the intrusion of contamination.
- 3.24 -- Health Director: The Director of the Memphis and Shelby County Health Department.
- 3.25 -- Industrial Well: A well constructed for the purpose of providing water for use in processing, washing, packaging or manufacturing of a product.
- 3.26 -- Injection Well: A well used to inject fluid into the subsurface.
- 3.27 -- Irrigation Well: A well constructed for the primary purpose of providing a source of water by way of sprinklers, artificial ditches or channels, or by any other means for use in nurseries, golf courses, land beautification, silviculture, growing sod, greenhouses, and any other such uses.
- 3.28 -- Justifiable Need: A genuine need for a private water supply as determined by the Board and, which need is based upon the availability of an adequate water

a premise that is not obtained from a public water system.

- 3.39 -- Public Water Supply: Any publicly or privately owned water system operating as a public utility which operates fifteen (15) or more service connections or regularly serves twenty-five (25) people sixty (60) or more days per year.
- 3.40 -- Pump Installer: Any person who installs or repairs water well pumps or who installs filters and water treatment devices.
- 3.41 -- Quasi-Public Water Supply: A water supply used or made available by a person to his employees, tenants, members or guests for drinking; or in connection with the manufacturing or handling of ice, foods, or drinks, such as candy, ice cream, milk, ice bottled drinks, and any other food or drink products. The source of quasi-public water supply may be a private well, or the public water supply.
- 3.42 -- Reasonable Use: That use of water which is ordinarily required by industries, firms, and individuals in the usual operation of their business or residence.
- 3.43 -- Recovery Well: A well constructed for the purpose of recovering products which have intersected the water table by way of leaking underground storage tanks, surface spills, etc.
- 3.44 -- Repair: Any modification, replacement, or other alteration of any well, or pumping equipment which requires a breaking or opening of the well seal or any waterlines up to and including the pressure tank and any coupling appurtenant thereto.
- 3.45 -- Shallow Well: Any type of well constructed to a depth shallower than the stratum of clay known as the Jackson Formation which is found just above the water bearing sands known as the Memphis Sands.
- 3.46 -- Site: Any one legal unit of a subdivision, parcel of land, or location where drilling activities are to take place.
- 3.47 -- Soil Boring: Any hole that is drilled, cored, dug, washed, driven, jetted, redrilled, bored, or otherwise constructed, which exceeds thirty (30) feet, for the purpose of determining geological formations, water level, or for the purpose of founding structures.

- 3.48 -- Temporary Abandonment: Means any observation or monitoring well covered with a secure cap that is water tight and which is being used for the investigation or management of groundwater by a governmental agency.
- 3.49 -- Test Well: Any excavation, either cased or uncased, that is constructed for the purpose of determining the location or physical characteristics of underground formations or for evaluating or monitoring the characteristics or behavior of the formations or the water contained therein, or for obtaining the information needed to design a well prior to its construction.
- 3.50 -- Utilities: Any power lines or underground cables which supply electrical power, telephone lines, cable television lines, natural gas lines, water mains, water lines, or sewer lines.
- 3.51 -- Water Well: Wells which are constructed and so equipped with casings, screens, pumps, fittings, etc., and have been developed for the primary purpose of producing a supply of water regardless of the intended usage for said supply.
- 3.52 -- Water Well Contractor: Any person, firm, or corporation who has duly registered as such with the State of Tennessee and shall have paid the annual registration fee and obtained a permit to contract for construction of wells as therein provided and, who has obtained the necessary privilege license to construct, repair, and service wells in Shelby County.
- 3.53 -- Well: A well is any hole that is drilled, cored, dug, washed, driven, jetted, redrilled, bored, or otherwise constructed which intersects the water table for: the production of water; monitoring of contaminants; recovering product; dewatering or drainage purposes; determining water levels; lowering the water table; or any boring into the subsurface thirty (30) feet or deeper.
- 3.54 -- Well Construction: Any type of work that is performed on a well including but not limited to the installation of new wells; the modification, alteration, or repair of existing wells; or, their abandonment.
- 3.55 -- Well Driller: Any person who manages or supervises the digging, drilling or redrilling of well.

3.56 -- Well Logs: A record of geologic formations penetrated in drilling a water well, monitoring, recovery, dewatering, observation or any other type of well; or any boring into the subsurface thirty (30) feet or deeper.

Section 4 GENERAL REQUIREMENTS AND PROCEDURES

4.01 -- Applications

- A. Any person requesting the installation, modification, repair, or abandonment of a water well or any other type well shall make application to the Department.
- B. All applications requesting new well installation or the modification of an existing well shall be accompanied by a plot plan showing the location of all underground utilities within fifty (50) feet of the proposed well; grade elevations in relation to adjoining areas and drainage patterns of the area; location of the residence, business, etc.; locations of septic tanks and field lines when applicable; other existing and proposed buildings and structures; any water service lines that may exist on the premises; any drainage ditches, lakes, ponds, streams, etc., that may exist at the premise; any roads or dedicated right-of-ways or easements; and any other pertinent information deemed necessary by the Department. The application shall also include a sketch of how the well is to be constructed.
- C. A water well cannot be sited or placed in service within a half-mile of the designated boundaries of a listed federal or State Superfund site or Resource Conservation and Recovery Act corrective action site, unless the well owner can make a demonstration that the well will not enhance the movement of contaminated groundwater or materials into the shallow or deep aquifer.
- D. An application may be obtained from the Department, and if approved, such application shall be in force and in effect for ninety (90) days from the date of its issuance. If work has not commenced within ninety (90) days of issuance, an extension may be granted by the Department upon request by the applicant.
- E. A processing fee shall be submitted with all

applications for new wells and said fee is not refundable, regardless of the status of approval.

- F. The Department shall issue a notice of rejection whenever it determines that an application for a permit fails to meet the requirements of these Rules and Regulations, or any rules, order, regulation or standard adopted pursuant thereto; or that the proposed well will be harmful or potentially harmful to the water resources of Shelby County or, if it is determined by the Department that an adequate water supply is available to the premise without the need to construct a well. Said water supply may be from an existing water well or from a public system. Permits for wells to supply water for purely aesthetic purposes (i.e. waterfalls, landscaping enhancement, fountains, etc.) may be approved by the Department if conservation steps are taken to limit water usage as established by the Board.

4.02 -- Permits Required

- A. A permit shall be obtained from the Department prior to beginning the installation, modification, repair, or abandonment of a water well or any other type of well, soil boring or pumping equipment within Shelby County.
- B. The issuance of a construction permit is dependent upon:
1. the application being on the proper form and containing the required information, provided that the proposed construction or repair will not be contrary to applicable laws, rules, orders, or regulations of the Department or other government agencies;
 2. additional information which may be required as the Department deems necessary such as geophysical logs, geologic samples and logs, and well pumping tests; and
 3. the justifiable need for a well.
- C. If a well application is approved by the Department, the well driller shall be issued a permit. Receipt of the permit shall constitute permission to begin well construction upon prior notification to the Department.

- D. Permission to begin construction of a water well or any other type of well may be applied for by telephone when emergency conditions exist which would justify such a request. The Department may, at its discretion, grant such emergency permits with an additional fee of fifty (\$50) dollars.
- E. A written permit shall be obtained from the Department and renewed annually to operate or maintain a commercial or industrial well regardless of the intended usage of said well.
- F. A written permit shall be obtained from the Department and renewed annually for wells constructed at residential premises where public water is available regardless of the intended usage of said supply.
- G. A written permit shall be obtained from the Department and renewed annually to operate or maintain a quasi-public water supply.
- H. All renewable permits shall be valid for one year, and, may be renewed at the expiration thereof upon payment of the fees hereinafter set forth. Such permits may be revoked by the Department upon the violation by the holder of any terms of the permit or these Rules and Regulations or in any emergency when, in the judgement of the Department, the continued operation of the quasi-public or private water supply or maintenance of a well for any reason shall constitute a health hazard. The holder of such permit, after such revocation, shall have the right of appeal.

4.03 -- Fees Required

- A. All applications requesting a permit to construct water wells or any other wells shall require a processing fee of twenty-five (\$25.00) dollars be paid to the Department when such applications are submitted. The processing fee is not refundable, regardless of the status of approval.
- B. The yearly permit to operate or maintain a quasi-public or a private water supply or well, other than a domestic well shall not be issued until an inspection fee of one hundred (\$100.00) dollars per well is paid each year to the Department.
- C. An inspection fee of one hundred (\$100.00) dollars

per site shall be paid to the Department for wells constructed for the primary purpose of monitoring, observation, testing, recovery, and/or any other usage which does not require the permanent installation of a pump within the well casing.

- D. Dewatering or drainage wells require an inspection fee of one hundred (\$100.00) dollars per site.
- E. Owners of domestic wells shall not be liable for an annual inspection fee, except when public water becomes available to a residential premise, then the well being used at said premise shall be subject to applicable fees being paid.
- F. Any new water wells constructed within the calendar year shall be subject to the inspection fee being paid at the time the well construction permit is issued. This fee will be prorated on a quarterly basis.
- G. Any construction permits issued on an emergency basis require an additional processing fee of fifty (\$50.00) dollars be paid to the Department.
- H. All inspection fees are due upon notification by the Department and are delinquent thirty (30) days after said notification.
- I. An annual fee of twenty (\$20.00) dollars per well shall be assessed for all active monitoring, vent, air sparging and recovery wells, or any other type well related to the remediation of groundwater at a site located within Shelby County.

4.04 -- Well Driller

- A. All water production wells to be constructed in Memphis and Shelby County shall be constructed only by persons having a valid license under the TENNESSEE DEPARTMENT OF ENVIRONMENT AND CONSERVATION, Division of Groundwater Protection.
- B. A well driller shall have in his possession a valid well construction permit before any construction is to begin.
- C. The well driller to whom a well construction permit is issued is responsible for the construction of the well in accordance with the permit and

applicable laws and regulations.

- D. It shall be the well driller's duty to inform persons requesting the services of his company, to construct, repair, alter, modify, or to perform any other service related to a well of the requirements of these Rules and Regulations.
- E. The well driller shall be held liable for any type of well work initiated prior to the Department issuing a written permit.
- F. It shall be the duty of the well driller to notify the Department when construction on a well is to begin and when the work is completed so that proper inspections can be made during and after construction, and for the purpose of collecting samples from production wells.
- G. The well driller shall notify the Department when repair or modification work, as directed within these Rules and Regulations, is done on a well.
- H. Within thirty (30) days after a well has been constructed or modified, the well driller shall submit a report of construction (well log) to the Department on such forms as are prescribed or which may be furnished by the Department.
- I. The well driller shall notify the Department prior to beginning abandonment procedures on a well.

Section 5 -- WELL CONSTRUCTION STANDARDS FOR WATER WELL

5.01 -- General

- A. All wells shall be constructed in a manner that will guard against waste and contamination of the groundwater aquifers underlying Memphis and Shelby County. No person shall construct, repair, modify, or abandon or cause to be constructed, repaired, modified, or abandoned any well contrary to the provisions of these Rules and Regulations.

5.02 -- Siting Criteria

A proposed well location shall satisfy the following minimum horizontal separation distance requirements:

- 1. Fifty (50) feet from a property line, to allow access to the well without encroaching on adjoining properties; to provide adequate

distance from field lines and other sources of contamination that may exist or may be planned on adjacent properties; and, to reduce the potential for interfering with other wells drilled on other properties.

2. Twenty-five (25) feet from a road or dedicated right-of-way or easement.
3. Fifteen (15) feet from a building foundation for the purpose of protecting the well from a foundation of soil treated to control pests, insects, or vermin.
4. One hundred (100) feet from any subsurface sewage disposal system such as a septic tank and/or field lines.
5. One hundred (100) feet from any identifiable sources of contamination such as but not limited to disposal fields, seepage pits, manure piles, barns, underground fuel tanks, etc.
6. Fifty (50) feet from any storm drain or sanitary sewer that flows by gravity.
7. One hundred (100) feet from any sewage force main.
8. Fifty (50) feet from any drainage canal, ditch, stream, lake, or similar body of water.
9. Fifteen (15) feet from power lines and underground cables for electrical power.
10. Twenty-five (25) feet from natural gas lines
11. Twenty-five (25) feet from any water main as defined by the utility owner.

B. The well site shall not be subject to flooding and shall be at least two (2) feet above the 100-year recurrence flood level for the area. If necessary, the area shall be filled with material approved by the Department, properly graded and maintained to prevent the accumulation or retention of surface water.

C. Lots requiring a well for a potable water supply and a septic tank system for sewage disposal shall be a minimum of four (4) acres in size.

- D. All parcels of land requiring a well for a source of potable water shall be self-supporting in that sharing a water supply shall not be allowed. A water line shall not cross property boundaries for the purpose of providing potable water to a premise on a permanent basis.
- E. A well cannot be sited or placed in service within a half-mile of the designated boundaries of a listed federal or State Superfund site or Resource Conservation and Recovery Act corrective action site, unless the well owner can make a demonstration that the well will not enhance the movement of contaminated groundwater or materials into the shallow or deep aquifer.

5.03 -- Sanitary Protection of Wells

- A. All water used in the construction of a well shall be from an approved potable water supply. Water obtained from lakes, ponds, streams, and other such surface water sources is not approved and shall not be used in the well construction process.
- B. It shall be the responsibility of the well driller to protect the opening made in drilling the well against any foreign material or any other type of contamination from entering the opening.
- C. In the event a well becomes contaminated or obstructed, the well driller shall take whatever measures necessary to clear the well of contamination or obstruction. Should he decide to abandon the well for any reason, the well shall be filled in a manner prescribed by Section 9 of these Rules and Regulations.
- D. Whenever construction stops before the well is grouted and pumping equipment is installed, the open annular space shall be covered and the well casing capped. The cap shall be either threaded onto the casing secured by a friction type device which locks onto the casing, welded, or secured by such other device or method as may be approved by the Department. It shall be the responsibility of the owner to maintain the integrity of the protective device placed on the well opening by the well driller.
- E. A well shall be drilled to a size that will permit the outer casing to be surrounded by a water tight seal a minimum of two (2) inches thick. All wells

shall be grouted as soon as possible but not later than twenty-four (24) hours after the well casing has been set in place and all drilling has been completed.

- F. The well driller shall notify the Department at least twenty-four (24) hours in advance of grouting wells to provide the Department the opportunity to observe the procedure. Such a condition shall be specified on the well construction permit. The grout material shall consist of a mixture of neat Portland Class A Cement or quick setting cement in a ratio of not over six (6.0) gallons of water per ninety-four (94) pound sack of cement, or a coarse grained high solids non drilling mud grade bentonite slurry, such as Baroid Benseal, American Colloid or equal. The bentonite slurry shall be mixed in accordance with the manufacturers recommendations. Bentonite alone is not an acceptable grouting material. The relative proportion by weight for each component shall meet the following requirements:

Portland Cement:	92%	Portland Cement:	74%
Bentonite:	8%	or Bentonite:	6%
		Sand:	20%

For each two (2) percent addition of bentonite an additional (1.3) gallons of water should be added to the slurry mixture. A maximum of two (2) percent by weight of calcium chloride may be added. Other grouting materials or methods or any special conditions for grouting a well may be made by the Department within the well construction permit. The use of bentonite drilling clay as a grouting material is prohibited, except as an additive to neat cement grout. Only bentonite grout approved by the National Sanitation Foundation (NSF) shall be approved by the Department as appropriate grouting material.

- G. The method of grouting the annular space of a well shall be throughout the entire length of the casing from the bottom of the casing to the ground surface and shall be pressure grouted through a tremmie pipe from the bottom to the top in one continuous operation in order to avoid gapping or dilution of grout material. The return at the top shall be of the same consistency as the material that is pumped

into the tremmie pipe. During the grouting procedure any proposed changes to the approved grouting material will not be allowed by the Department.

- H. Upon completion, the well shall be treated with a sufficient dosage of chlorine so that a concentration of at least fifty (50 ppm) parts per million free chlorine shall be obtained in all parts of the well for a period of twenty-four (24) hours. The well is then to be pumped free of chlorine and a water sample collected for bacteriological analysis. The result shall be required to be negative for E. coliform bacteria prior to putting the well into service.

5.04 -- Construction Materials And Other Requirements

All materials, components, parts, etc., used in the installation of a water well or any other type of well, such as the casing, screen, pumping equipment, pressure tank, wiring, pipe, and any other such components, must comply with the standards as established in the ,RULES OF THE TENNESSEE DEPARTMENT OF ENVIRONMENT AND CONSERVATION, DIVISION OF WATER SUPPLY, CHAPTER 1200-4-9, entitled WATER WELL LICENSING REGULATIONS AND WELL CONSTRUCTION STANDARDS. When deemed necessary, the Department may require standards and specifications to be more stringent than those required by the State of Tennessee.

5.05 -- Sanitary Protection Of The Well Pumping Facilities

- A. A sanitary well seal that is water tight shall be provided at the terminal of any well casing in order to prevent any contamination from entering the well casing. The well casing shall terminate no less than one (1) inch above the foundation of the well.
- B. If the well is to be vented, it shall be required to have an inverted screened vent.
- C. The pump base foundation shall be reinforced, if the forces exerted are such that reinforcement is required, and shall be a minimum of two (2) inches larger than the base plate. The concrete used shall be of a strength suitable to withstand any vibrations, etc., to which it may be subjected.

- D. All water wells shall be provided with a readily accessible faucet or tap on the well discharge line at the well head for the collection of water samples.
- E. Where pitless adapters are used, they shall be required to meet National Sanitation Foundation (NSF) specifications for subsurface installations and shall bear the NSF seal.
- F. The water tight casing or curbing of any well shall extend not less than six (6) inches above the established ground surface or twenty-four (24) inches above the maximum high water level where flooding occurs.
- G. Any oil-lubricated pump installed in a well shall utilize oil or grease lubricants which carry a USDA H-1 rating. The installer must supply the Department documentation to verify that the lubricant used has an H-1 rating.

5.06 -- Maintenance of Wells

- A. Wells shall be maintained in an operative condition at all times in order for water samples to be collected for analytical purposes.
- B. A source of power shall be made available to the well either by a permanent connection or by way of a temporary source such as a generator.
- C. All wells shall be maintained in a condition whereby they are not a hazard to health or environment nor a source of potential contamination to the groundwater aquifers.
- D. When a well is determined to be abandoned as defined by these Rules and Regulations, the owner shall be ordered to seal the well in accordance with the requirements of the Department.

5.07 -- Disinfection of Wells

Every newly constructed well, modified well, or well that has been repaired shall be assumed to be contaminated by microorganisms. Before initiation of use each well must be thoroughly and carefully cleaned and treated to ensure that all pathogenic organisms are eliminated. Care shall be exercised to make certain that all areas of a well come in

full contact with a solution containing enough available chlorine to completely destroy all pathogenic microorganisms. An initial chlorine concentration of fifty (50 ppm) parts per million with a residual chlorine requirement of twenty-five (25 ppm) parts per million after twenty-four (24) hours is considered adequate for this purpose. Domestic laundry bleaches containing sodium hypochlorite either in powder or tablet form may be used. The well shall be allowed to remain undisturbed after the treatment for a period of twenty-four (24) hours and then tested for residual chlorine of at least twenty-five (25 ppm) parts per million must remain. After successful treatment all water remaining in the well and supply system shall be pumped free of residual chlorine and a sample of fresh water from the well shall be collected by and tested by the Department for bacteriological purity.

5.08 -- Sampling of a Well

- A. After a well has been drilled, modified, or repaired, a negative bacteriological sample shall be obtained prior to placing the well into service.
- B. A well shall not be connected into a premise until a sample has been collected which produces negative bacteriological results.
- C. If a sample collected from a newly constructed well is positive for E. coliform bacteria, it shall be the well driller's responsibility to take whatever steps are necessary to properly disinfect the well. Two (2) consecutive bacteriological samples producing negative results must be obtained prior to placing the well into service.
- D. Whenever a well is repaired or modified, it shall be the responsibility of the well driller to notify the Department upon completion of work to sample the well for bacteriological purity. It shall be the well driller's responsibility to properly disinfect the well upon completion.

Section 6 -- MONITORING AND RECOVERY WELLS CONSTRUCTION STANDARDS

6.01 General

- A. A construction permit is required for monitoring and recovery wells.

- B. All wells shall be constructed in a manner that will guard against contamination of the groundwater aquifers underlying Shelby County. No person shall construct, repair, modify, or abandon or cause to be constructed, repaired, modified, or abandoned any well contrary to the provisions of these Rules and Regulations.
- C. Within thirty (30) days after well construction the well driller or authorized contractor responsible for well installation shall submit a well drillers log for every well installed at a site. Any sample analysis results for a monitoring or recovery well shall be submitted with the logs of the well.

6.02:

Siting Criteria

When a well site is subject to flooding it shall be cased to a point at least two (2) feet above the 100-year recurrence flood level for the area. In the case of a flush mount, the well shall have a waterproof seal with a lockable leakproof inner cap. If necessary, the area shall be filled with material approved by the Department, properly graded and maintained to prevent the accumulation or retention of surface water.

6.03

Sanitary Protection of Wells

- A. All water used in the construction of a well shall be from an approved potable water supply. Water obtained from lakes, ponds, streams and other such surface water sources is not approved and shall not be used in the well construction process.
- B. It shall be the responsibility of the well driller to protect the opening made during the drilling and to prevent any type of contamination from entering.
- C. Should a well be abandoned for any reason, the well shall be filled in a manner prescribed by Section 9 of these Rules and Regulations.
- D. Whenever construction stops before the well is grouted the open annular space shall be covered and the casing capped. The casing cap shall be either threaded onto the casing, secured by a friction type device which locks onto the casing welded or secured by such other device or method as may be approved by the Department. It shall be the responsibility of the owner to maintain the integrity of the protective device placed on the

well opening by the well driller.

E. A well shall be drilled to a size that will permit the outer casing to be surrounded by a water tight seal, a minimum of two (2) inches thick. All wells shall be grouted as soon as possible but not later than twenty-four (24) hours after the well casing has been set in place and all drilling has been completed.

F. The well driller shall notify the Department at least twenty-four (24) hours in advance of grouting wells to provide the Department the opportunity to observe the procedure. Such a condition shall be specified on the well construction permit. The grout material shall consist of a mixture of neat Portland Class A Cement or quick setting cement and water in a ratio of six (6.0) gallons of water per ninety-four pound sack of cement, or a coarse grained high solids non drilling mud grade bentonite slurry, such as Baroid Benseal, American Colloid or equal. The bentonite slurry shall be mixed in accordance with the manufacturers recommendations. A portland cement grout and bentonite combination is acceptable. The relative proportion by weight for each component of the cement grout bentonite combination shall meet the following requirements:

Portland Cement: 92%	Portland Cement: 74%
Bentonite: 8%	Bentonite: 6%
	Sand: 20%

For each two (2) percent addition of bentonite an additional 1.3 gallons of water should be added to the slurry mixture. A maximum of two (2) percent of calcium chloride may be added. Any special conditions for grouting a well may be made by the Department within the well construction permit. The use of bentonite drilling clay as a grouting material is prohibited, except as an additive to neat cement grout. Only bentonite grout approved by the National Sanitation Foundation (NSF) shall be approved by the Department as appropriate grouting material.

G. The method of grouting the annular space of a well shall be throughout the entire length of the casing in one continuous operation from the top of the screen or bentonite seal to the ground surface.

The grout mixture may be pumped from the surface when:

- (a) water will not be encountered, and
- (b) the depth is less than twenty (20) feet.

Pressure grouting is required if the aforementioned conditions are not met. Pressure grouting will be accomplished using a tremmie pipe. When the tremmie pipe is encased in the grout, it must have the same protection as the casing. (refer to paragraph 6.03 D)

- H. The borehole shall not hydraulically connect separate aquifers.

6.04 -- Construction Materials And Other Requirements

- A. All materials, components, parts, etc., used in the installation of a monitoring or recovery well, such as the casing, screen, pumping equipment, pressure tank, wiring, pipe and other such components, must comply with the standards as established in the RULES OF THE TENNESSEE DEPARTMENT OF ENVIRONMENT AND CONSERVATION, DIVISION OF WATER SUPPLY, CHAPTER 1200-4-10, entitled WELL CONSTRUCTION AND ABANDONMENT STANDARDS. When deemed necessary, the Department may require standards and specifications to be more stringent than those required by the State of Tennessee.
- B. The well shall be backfilled to a point, a minimum of two (2) feet above the top of the screen with filter sand, followed by a minimum of two (2) feet bentonite pellet seal above, which shall be grouted in accordance with Section 6.03.
- C. All piping materials shall be flush joint and threaded pipe. No solvent weld cements or other components shall be allowed. End points shall have threaded ends or be riveted on. Slip on ends are not allowed. Top caps shall be threaded or have some type of locking feature.
- D. Bentonite pellets shall have a maximum size of one quarter (1/4) inch to prevent bridging and shall then be activated with potable water.

6.05 -- Protection of the Well

- A. When a well site is to be subject to flooding, it shall be cased to a point: 1. at least two (2)

feet above the 100-year recurrence flood level for the area, or, 2. in the case of flush mount, have a waterproof seal with a lockable leakproof inner cap. When necessary the area shall be filled with material approved by the Department, properly graded and maintained to prevent the accumulation of retention of surface water.

- B. Until the well is abandoned and closed in accordance with these regulations, that portion of the well above the ground level shall be protected against tampering or destruction.

6.06 -- Maintenance of Wells

- A. Wells shall be maintained in an operative condition at all times in order for water samples to be collected for analytical purposes and shall have at least one (1) keyed lock to prevent tampering. Because of the potential for surface runoff to enter the below grade protective structure and/or well, installation of a removable cover with a flexible o-ring or gasket attached at the point where the cover fits over the protective structure and/or well will be necessary to prevent surface runoff from entering the well.
- B. All wells shall be maintained in a condition whereby they are not a hazard to health or environment nor a source of contamination to the groundwater aquifers.
- C. When a well is determined to be abandoned, as defined by these rules and regulations, the owner shall be ordered to seal the well in accordance with the requirements of Section 9 of these regulations.

Section 7 -- SOIL BORINGS

7.01 -- Regulations

- A. Any soil boring of thirty (30) feet or less shall not require a permit or require professional supervision for the purposes of this ordinance.
- B. All borings to a depth greater than thirty (30) feet but less than one hundred (100) feet shall require a permit and must be under the supervision of a licensed water well driller or an engineer or geologist registered in the

into the hole. When the hole does not stand open it will be necessary to pressure grout from the top of the water bearing material as required in Section 7.03 C. below. In all cases the driller shall ascertain that the bentonite pellets are in fact filling the hole from the bottom up to the required elevation. When the borings are made using a drilling fluid to keep the hole open the boring shall be filled as specified in 7.03 C. below.

- C. For deep borings, greater than one hundred (100) feet, the borehole shall be sealed by pressure grouting through a tremmie pipe from the bottom upward in one (1) continuous operation. The grouting materials shall be neat Portland Class A or quick setting cement in a ratio of not over seven (7) gallons of water per ninety-four pounds of cement; or a coarse grained high solids non drilling mud grade bentonite grout slurry, such as Baroid Benseal, American Colloid, or equal. The bentonite grout shall be mixed in accordance with the manufacturers recommendations. A Portland cement grout and bentonite combination is acceptable. The relative proportion of each component shall meet the following requirement:

Portland cement	=	92%
Bentonite	=	8%
or: Portland cement	=	74%
Bentonite	=	6%
Sand	=	24%

For each two (2) percent addition of bentonite an additional 1.3 gallons of water should be added to the slurry mixture. A maximum of two (2) percent by weight of calcium chloride may be added. The use of bentonite drilling clay as a grouting material is prohibited except as an additive to neat cement grout. Only bentonite grout approved by the National Sanitation Foundation (NSF) shall be approved by the Department as appropriate grouting material.

Section 8 -- INSPECTIONS

- A. During the construction, modification, repair, or abandonment of any well the Department may conduct such periodic inspections as it deems

necessary to insure conformity with applicable standards. Duly authorized representatives of the Department may, at reasonable times, enter upon and shall be given access to any premise for the purpose of such inspection.

B. When during construction, modification, repair, or abandonment of any well the Department finds the work is not being done in accordance with rules, regulations and standards as required the Department shall give the owner and well driller written notice stating which rules, regulations or standards are being violated. At such time the Department may order that necessary corrective action be taken within a reasonable time to be prescribed in such order. Any such order shall become final unless the person or persons named therein requests, by written petition, a hearing before the Board no later than fourteen (14) days after the date such order is served. Failure to act in accordance with the order of the Department after receipt of written notice shall be grounds for revocation of the permit.

C. All private water supplies shall be subject to inspection by the Department and when deemed necessary, said supplies shall be made available for the collection of samples in order to determine the purity of the supply. When a water sample is found to have contamination the owner shall be required to take whatever steps necessary to correct the contamination problem.

D. All wells shall be subject to inspection by the Department and shall be made available for the collection of samples in order to determine the purity of the supply.

Section 9 -- ABANDONMENT OF WELLS

9.01 -- General Requirements

The objective of the requirements described in this Section is to restore as nearly as possible those subsurface conditions which existed before the well was constructed. A well penetrating several aquifers or formations, must be filled and sealed in such a way as to prevent the vertical movement of water from one aquifer to another. The

Department shall require that certain abandonment procedures be followed in order to avoid or reduce water quality and/or water quantity problems.

- A. All abandoned wells shall be filled with Portland cement grout, a high solids bentonite grout, or a Portland cement grout and bentonite combination in such a way that they do not produce water or act as a conduit for the interchange of waters of undesirable quality with those whose quality is desirable, or present a hazard to the safety and well being of people and/or animals.
- B. The owner shall submit a plan to fill at the owners expense any abandoned or condemned well within thirty (30) days after receipt of notice from the Department.
- C. All abandoned wells shall be filled only by a person having a valid drillers license from the Tennessee Department of Environment and Conservation, or be an engineer or geologist registered with the State of Tennessee.
- D. Within thirty (30) days of filling an abandoned well, the driller, engineer or geologist responsible for the well abandonment shall submit to the Department a well abandonment report. The report must be completely filled out and signed by the authorized contractor responsible for well abandonment.
- E. The Department may require any well owner to have an abandoned well sealed when the well:
 - 1. is contaminated;
 - 2. is a potential source of contamination to the groundwater aquifers underlying Shelby County;
 - 3. is not maintained in an operative condition for the purpose of collecting samples.
- F. Observation and monitoring wells being actively used for the investigation or management of groundwater by federal, state or local governmental agencies or research

organizations may be classified as temporarily abandoned and shall be covered with a secure cap such that the cover is water tight and cannot be removed except with the aid of equipment or the use of tools.

- G. All wells for which a replacement well construction permit has been issued, must be abandoned as set forth in these regulations unless specific written approval for maintaining the replaced well is granted by the Department.

9.02 Sealing And Fill Materials

- A. Portland Class A cement grout, a high solids bentonite grout, or a Portland cement grout and bentonite combination are considered sealing material and may be used to fill an abandoned well.

- B. The grouting materials shall be neat Portland Class A or quick setting cement in a ratio of not over seven (7.0) gallons of water per ninety-four (94) pounds of cement; or a coarse grained high solids non drilling mud grade bentonite slurry such as Baroid Benseal, American Colloid or equal. The bentonite grout shall be mixed in accordance with the manufacturers recommendations. Bentonite alone is not an acceptable grouting material. A Portland cement grout and bentonite combination is also acceptable. The relative proportion for each component shall meet the following requirements:

Portland cement	=	92%
Bentonite	=	8%
or: Portland cement	=	74%
Bentonite	=	6%
Sand	=	20%

For each two (2) percent addition of bentonite an additional 1.3 gallons of water should be added to the slurry mixture. A maximum two (2) percent by weight of calcium chloride may be added. The use of bentonite drilling clay as a grouting material is prohibited except as an additive to neat cement grout. Only bentonite grout approved by the National Sanitation Foundation (NSF) shall be approved by the

Department as appropriate grouting material.

- C. Other grouting materials and methods may be used, if approved by the Department.

9.03 -- Abandonment Procedures

- A. Prior to filling the well, a plan shall be submitted within thirty (30) days containing a description of the general condition of the well. All available information about the construction of the well or information that any obstructions exist which would interfere with the filling and sealing process of the well shall be submitted with the application. Should any obstructions exist they shall, if practical as determined by the Department, be removed by cleaning out the hole or redrilling.
- B. All wells shall be filled with the required sealing or fill materials from the bottom of the well up, by methods that avoid separation or dilution of the seal material.
- C. The grout shall be pumped into the well through a tremmie pipe in one continuous operation.
- D. The tremmie pipe may be moved upward as the well is filled from the bottom up, if the pipe extends at least one (1) foot into the seal material.
- E. Before abandonment procedures begin an abandoned well shall have all pumping or plumbing equipment removed to insure freedom from obstructions that may interfere with the sealing operation.
- F. The well shall be chlorinated prior to sealing by addition of sufficient quantities of liquid bleach or dry hypochlorite granules.

Section 10 -- CROSS CONNECTION CONTROL

All groundwater in Shelby County is deemed potable and shall be protected against contamination by way of backflow through private water supplies.

- A. All cross connection requirements for private

water supplies, quasi-public water supplies, public water supplies, and all other potable water supplies shall fall within the guidelines of the Memphis and Shelby County Cross Connection Board, as established by City and County Resolution in October 1980, or as later modified.

Section 11 -- LIMITATION ON USE OF WATER

- A. Water pumped by private and/or quasi-public water supplies for residential, commercial and industrial purposes shall be limited to reasonable use.
- B. The waste of groundwater from water wells by way of continual discharges or from any type of equipment utilizing well water shall not be permitted.
 - 1. Any person requesting a permit to construct a water well for use in an underground heat pump system; in retaining levels of lakes, ponds, or similar bodies of water; in commercial and industrial processes; irrigation; or in any other uses whereby a continual groundwater discharge may occur shall limit such discharges by taking conservation steps established by the Department. Failure to comply with this section shall result in the rejection of the permit application.
 - 2. Any person having an existing well whereby a continual discharge occurs shall be required to take whatever conservation steps the Department may deem necessary to prevent such discharges. Failure to comply with this section is a misdemeanor and upon conviction the violator shall be fined a minimum of twenty-five (\$25.00) dollars per day up to a maximum of five hundred (\$500.00) dollars per day with each day such violation of this section occurs constituting a separate offense.
- C. The Department shall take whatever steps it deems necessary to conserve groundwater obtained by way of private water supplies for cooling, refrigeration and air conditioning

systems. The Department shall require the reuse of water for cooling through the use of cooling towers, evaporative condensers, or some other such device or method approved by the applicable code.

- D. All residential, commercial and industrial heat pump systems, shall be a horizontal closed loop system with no discharge. The design of such heat pump systems, shall be approved by the applicable code, and the owner shall have a valid mechanical permit.
- E. Non-aqueous heat pump systems shall be prohibited.

Section 12 -- AVAILABILITY OF PUBLIC WATER

12.01 -- Public Water Available To A Premise

- A. Public water shall be deemed available to a premise other than a subdivision when it is located within three hundred (300) feet of said premise.
- B. When proposed subdivisions are comprised of premises used or intended for human habitation or other establishments where a water supply is or may be used for human consumption and where such subdivision is located within one quarter (1/4) mile of public water distribution facilities in existence in a dedicated right-of-way, the developer of such subdivision shall extend the water supply mains and connect all lots thereto.
- C. The distance between an existing water main in a dedicated right-of-way and a premise or proposed subdivision shall be measured by an actual or imaginary straight line upon the ground or in the air between the point within the premise or subdivision nearest to the existing water main in dedicated right-of-way and the point where the existing water main in a dedicated right-of-way comes into closest proximity with the premise or proposed subdivision.
- D. The connection to a public water supply shall be made in accordance with the requirements of all applicable rules and regulations of any

county, state, or municipal agency having jurisdiction thereof.

- E. The provisions of this section relate to single-family, multi-family, commercial and industrial-zoned lots and are applicable to new subdivisions, and existing subdivisions which are unplatted or unrecorded.
- F. The provisions of this section shall not apply when a utility cannot provide a public water distribution system due to the utility's franchise limitation or the inability or unwillingness of a city to extend its public water distribution system.
- G. The construction of a well shall not be permitted at a premise where public water is available and which said water supply has a yield and pump capacity to provide the quantity of water which the user has stated is necessary for purposes for which the water is intended to be used unless otherwise provided by this code.
- H. When a public water system (pws) is available to a residential premise the potable water shall be obtained from the public water system. A well may be approved by the Department for construction on a residential premise where public water is available under the following circumstances:
 - 1. For filling a lake, providing such lake, pond or similar continuous body of water is not less than one (1) acre in size, with the total parcel of land being no less than four (4) acres in size.
 - 2. For irrigation, provided such parcel of land is no less than four (4) acres in size.
 - 3. For watering livestock, provided the parcel of land to be served is no less than four (4) acres in size.
- I. A well may be approved by the Department for construction on a commercial and/or industrially zoned premise where public water is available, provided the owner demonstrates to the Department that no reasonable

alternative water supply to the proposed well exists. The potable water supply shall be obtained from the public water system.

- J. The construction of a water well or any other type of well regardless of use on a lot or premise less than four (4) acres in size utilizing a septic tank system for sewage disposal, shall not be permitted by the Department.

12.02 -- Public Water Not Available To A Premise

- A. Public water shall be deemed not available to a premise if it is located a distance greater than three hundred (300) feet of said premise.
- B. Public water may be deemed not available to a premise if the topography and land surface features are such that they economically or structurally prevent connecting to public water.

12.03 -- Auxiliary Intake

No auxiliary intake for a potable water supply shall be made or permitted unless the source and use of the auxiliary supply and the location and arrangement of the intake are approved by the Department in writing.

Section 13 -- INJECTION WELLS

No injection wells of any type shall be allowed in Memphis and Shelby County for the injection of surface or groundwater, or chemically or thermally altered water, or any other fluids into the underground formations. No well constructed shall be used for recharge, injection, or disposal purposes. Injection wells for the purpose of improving groundwater quality may be considered under Section 14.02, but approval of these wells will not release the appellant of any applicable requirements under state or federal law for the remediation of contaminated groundwater or materials at the site.

Section 14 -- VARIANCES

14.01 -- Existing Wells

Wells in existence on the effective date of this Act shall be required to conform to the provisions of these Rules and Regulations, or any rules or regulations

adopted pursuant thereto, where such provisions relate to assessment of fees, cross connection control, improperly maintained wells, abandoned wells, and wells constructed in such a way that create serious health hazards, and any other items deemed necessary by the Department.

14.02 -- Appeals -- Procedure

Any person who feels aggrieved by an order of the Department issued pursuant to these Rules and Regulations shall be entitled to a hearing before the Board upon request.

A. The Board shall have and exercise the power, duty and responsibility to hear and decide all matters concerning a variance to or an exception taken to any decision, ruling, requirement, rule, regulations or order of the Board or the Department. Such appeal shall be made within fifteen (15) days after receiving notice of such decision, ruling, requirement, rule, regulation, or order by filing a written notice of appeal directly to the Board specifying the grounds thereof and the relief requested. Such an appeal shall act as a stay of decision, ruling, requirement, rule, regulation, or order in question until the Board has taken final action on the appeal, except when the Department has determined that a health hazard exists. The Board shall, not less than thirty (30) days after the date of the receipt of the notice of appeal, set a date for the hearing and shall give notice thereof by certified mail to the interested parties.

B. Hearing before the Board shall be conducted in the following manner:

(1) The technical secretary of the Board or his/her representative shall act as the hearing officer to conduct such hearing.

(2) Any person making an appeal may appear in person or by agent or attorney and present evidence, both written and/or oral, pertinent to the issues involved and may examine and cross-examine witnesses.

(3) All testimony shall be presented under oath and recorded. The Board is

authorized to have all such testimony transcribed and a transcript of such testimony shall be made available to the appellant or any party to the hearing upon payment of the normal fee established by the Department.

- (4) After due consideration of the written and oral statements and the testimony and arguments submitted at the hearing upon such appeal or upon default in appearance of the appealing party on the date specified in the formal notice of the hearing, the Board shall issue and enter such final order to make such final determination as it shall deem appropriate, within thirty (30) days of the hearing date and shall immediately notify all interested parties thereof in writing by certified mail.

- C. An appeal from the Board shall be to a court of competent jurisdiction in Shelby County, Tennessee.

Section 15 -- RULES AND REGULATIONS OF THE DEPARTMENT

The Board shall adopt and amend rules and regulations reasonably necessary to effectuate the policy and standards and intent declared by these Rules and Regulations, not inconsistent with these Rules and Regulations or with the Constitution or laws of the State.

Section 16 -- CONSTITUTIONALITY OF ORDINANCE

If any part or parts of these Rules and Regulations shall be declared unconstitutional it shall not affect the validity of any other part of these Rules and Regulations.

Section 17 -- CONFLICT OF LAWS

All laws and parts of laws in conflict with the provisions of these Rules and Regulations shall be repealed upon adoption of these Rules and Regulations.

Section 18 -- ENFORCEMENT AND PENALTIES

18.01 -- Enforcement

- A. If the Department determines that the holder

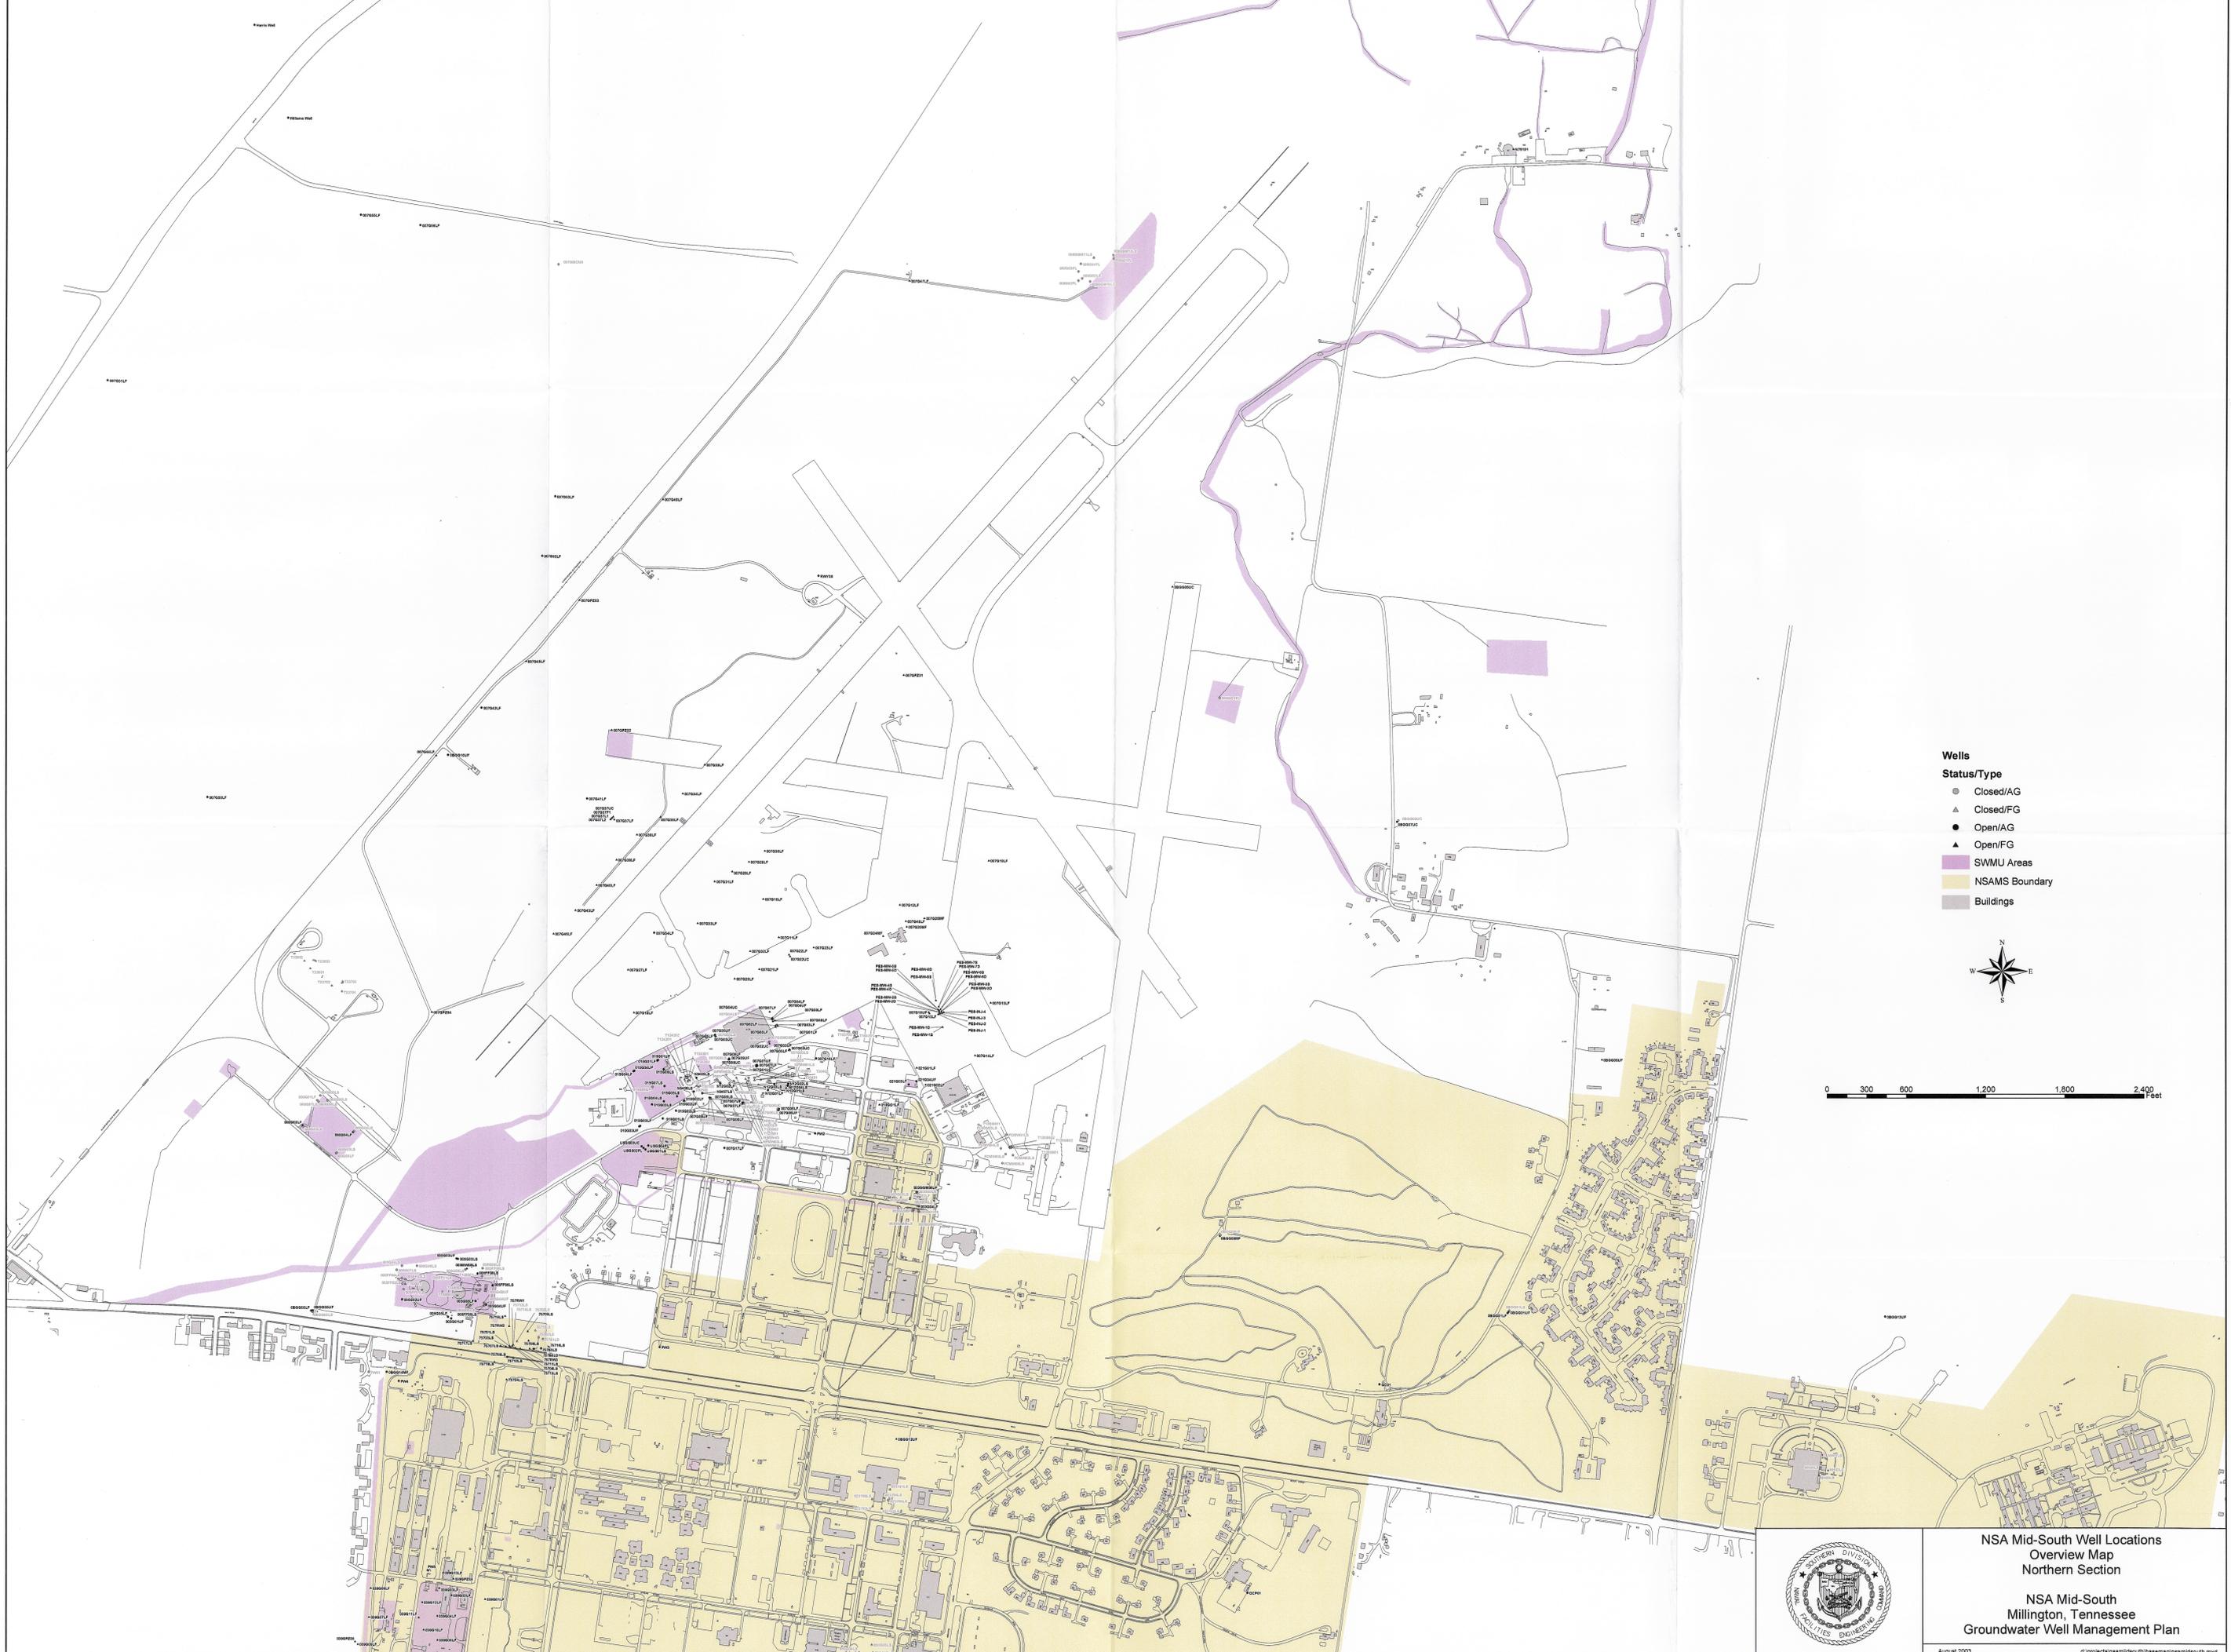

of any permit issued pursuant to these Rules and Regulations has violated any provisions of this act, or any rule or regulation adopted pursuant thereto, the Department may suspend or revoke any such permit. The Department may place on probation a person whose permit has been suspended. The Department may reprimand a permittee for a violation of this act or a rule or regulation adopted pursuant to these Rules and Regulations.

- B. The Department may petition a court of competent jurisdiction for injunctions or other appropriate relief to enforce the provisions of these Rules and Regulations. The attorney of the appropriate jurisdiction shall represent the Department when requested to do so.
- C. Any person who willfully violates any of the provisions of these Rules and Regulations is guilty of a misdemeanor.
- D. Any well owner who knowingly causes or permits a hazardous or potentially hazardous condition to exist due to well construction or any other reasons as outlined in these Rules and Regulations which could cause deterioration of groundwater aquifers in the system shall forfeit his right to an approved, certified permit. He shall also be liable to enforcement action.

18.02 -- Penalties

The well driller or any other person who fails to comply with these Rules and Regulations or the rules and regulations promulgated hereunder shall be guilty of a misdemeanor, and upon conviction be fined a minimum of twenty-five dollars (\$25) per day or a maximum of five hundred dollars (\$500) per day and each day such violation of these Rules and Regulations occur shall constitute a separate offense.

Location: *Millington, TN Background Site #1*

Project No.: *N0094*

Surface Elevation: *feet msl*

Started at *1545 on 1-09-95*

TOC Elevation: *286.57 feet msl*

Completed at *1645 on 1-09-95*

Depth to Groundwater: *30.53 feet*

Measured: *3/31/95*

Drilling Method: *Rotasonic*

Groundwater Elevation: *256.04 feet msl*

Drilling Company: *North Star Drilling*

Total Depth: *68.0 feet*

Geologist: *BB, JC, JAK, RL, HP*

Well Screen: *54.8 to 64.8 feet*

DEPTH IN FEET	LITHOLOGIC SAMPLE	ANALYTICAL SAMPLE	SAMPLE NO.	% RECOVERY	PID (ppm)	GRAPHIC LOG	SOIL CLASS	GEOLOGIC DESCRIPTION	ELEV. (ft-msl)	WELL DIAGRAM
45			9	100	BG		BG			
50			10	100	BG		GP			
55			11	95	BG		BG	Sand, fine, dark yellowish orange to yellowish gray, ferrigenous layers, wet.		
65			12	100	BG		SC	Clay, sandy and silty, medium gray to moderate dark gray.		
70								End of boring at 68'.

LOG OF BORING NO. A2 LOG OF WELL NO. MEM-T304-2

DEPTH IN FEET	SYMBOL	SAMPLES (LAB)	MATERIAL DESCRIPTION	WELL CONSTRUCTION
0.0				BRASS ID MARKER
0.0				FLUSH MOUNTED MANHOLE COVER
0.0				2' x 2' x 6" CONCRETE PAD
0.0				LOCKING WELL CAP
1.0			SILTY BROWN	CEMENT GROUT MIXTURE
1.5				BENTONITE SEAL
2.5			COARSE GRAVEL	2" PVC RISER
2.5				FLUSH THREADED JOINT
5.0			SILT, CLAYEY, BROWN	2" PVC SCREEN #10 SLOT
10.0			SILT, CLAYEY, GRAY, MOIST MODERATE HYDROCARBON ODOOR	FILTER PACK #16 SIZE SILICA
12.3			24 HOUR WATER LEVEL	
13.0			SILT, CLAYEY, GRAY, W/ STRONG HYDROCARBON ODOOR	
15.0			TERMINATED @ 15.0	BOTTOM OF WELL 15.0'

Boring Completion Date: JAN. 9, 1990

Well Completion Date: JAN. 9, 1990

Well Development Date: N.A.

Drilling Method: POWER AUGER

Depth to Water: 12.3'

Boring Diameter: 6.75"

Ground Elevation: 283.83'

Top of Casing Elevation:

Driller: B. ELDER

Logged by: L. RICHARDS

WELL CONSTRUCTION DETAILS

SOUTHERN DIVISION
 NAVAL FACILITIES ENGINEERING COMMAND
 2155 EAGLE DR. P.O. BOX 10068
 CHARLESTON, S.C. 29411-0068

WELL NUMBER MEM-T304-2

DATE OF INSTALLATION 1-9-90

1. Height of Casing above ground 2 inches
2. Depth to first Coupling 2.5 ft.
Coupling Interval Depths 2.5 ft., 5.0 ft., 15.0 ft.
3. Total Length of Blank Pipe 2.5 ft.
4. Type of Blank Pipe Schedule 40 P.C.
5. Length of Screen 12.5 ft.
6. Type of Screen Schedule 40 PVC "0.02" slots
7. Length of Sump 0
8. Total Depth of Boring 15 ft. Hole Diameter 3 inch
9. Depth To Bottom of Screen 13.0 ft.
10. Type of Screen Filter Quartz sand
Quantity Used 14.66 ft.³ Size #35 U/C
11. Depth To Top of Filter 1 ft.
12. Type of Seal Bentonite pellets
Quantity Used 1.05 ft.³
13. Depth To Top of Seal 0 ft.
14. Type of Grout Cement
Grout Mixture 100%
Method of Placement Pour

COMMENTS ON INSTALLATION _____

Location of Well MEM-757-11

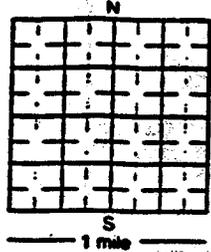

County Shelby Township Number Range Number Section No. Fraction

Property owner's name and address NAS Memphis Millington, Tennessee

Street Address and City or Distance and Direction from Road Intersections

Excchange Service Station, Navy Road

How exact location of well in section grid with an 'x' Sketch map of well location

Addition Name Block Number Lot Number

Well depth 26.0' Datum point from which all measurements are taken Ground Surface

Method of Drilling: Cable tool, Direct rotary, Reverse rotary, Hollow rod, Air rotary, Jetted, Driven, Bucket auger, Flight auger

Use: Domestic, Irrigation, Test Well, Public supply, Municipal, Heating or cooling, Industrial, Commercial, Monitoring

Casing Type: Steel, Galv, PVC, Liss, Threaded, Welded, Solvent welded, Height above/below surface, Drive shoe? Yes/No, Wgt, Sch No

Remarks, Elevation, Source of Data, etc. Elevation of Top of Casing (TOC): 271.22 ft (msl)

Borehole data

Table with 5 columns: Formation Log, Color, Hardness, From, To. Rows include ASPHALT, SILTY CLAY, CLAYEY SILT, etc.

Intake Portion of Well: Screen type Schedule 40, Manufacturer Brainard Kilman, Material PVC, Diameter 4", Length 20.0'

Filter Pack: Source, Method of installation, Gradation Sand, Volume used 2.0 frs, Depth to top of fp 3'

Grout: Used? Yes/No, Volume used 1.0 ft^3, Method of installation, Depth from 0.5 ft to 1.5 ft

Development: Method Hand Bailing, Dates 11-5-87, Duration, Sand content after

Static Water Level: 11.61 ft, Date measured 11-6-87

Pumping Water Level: N/A

Specific Capacity: N/A

Pump: N/A, Date installed, Manufacturer, Model No, Capacity, Depth of pump intake setting, No of stages

Well Head Completion: Pressure adaptor, Basement offset, Distance above grade

Nearest Sources of Possible Contamination: Well disconnected upon completion? Yes/No

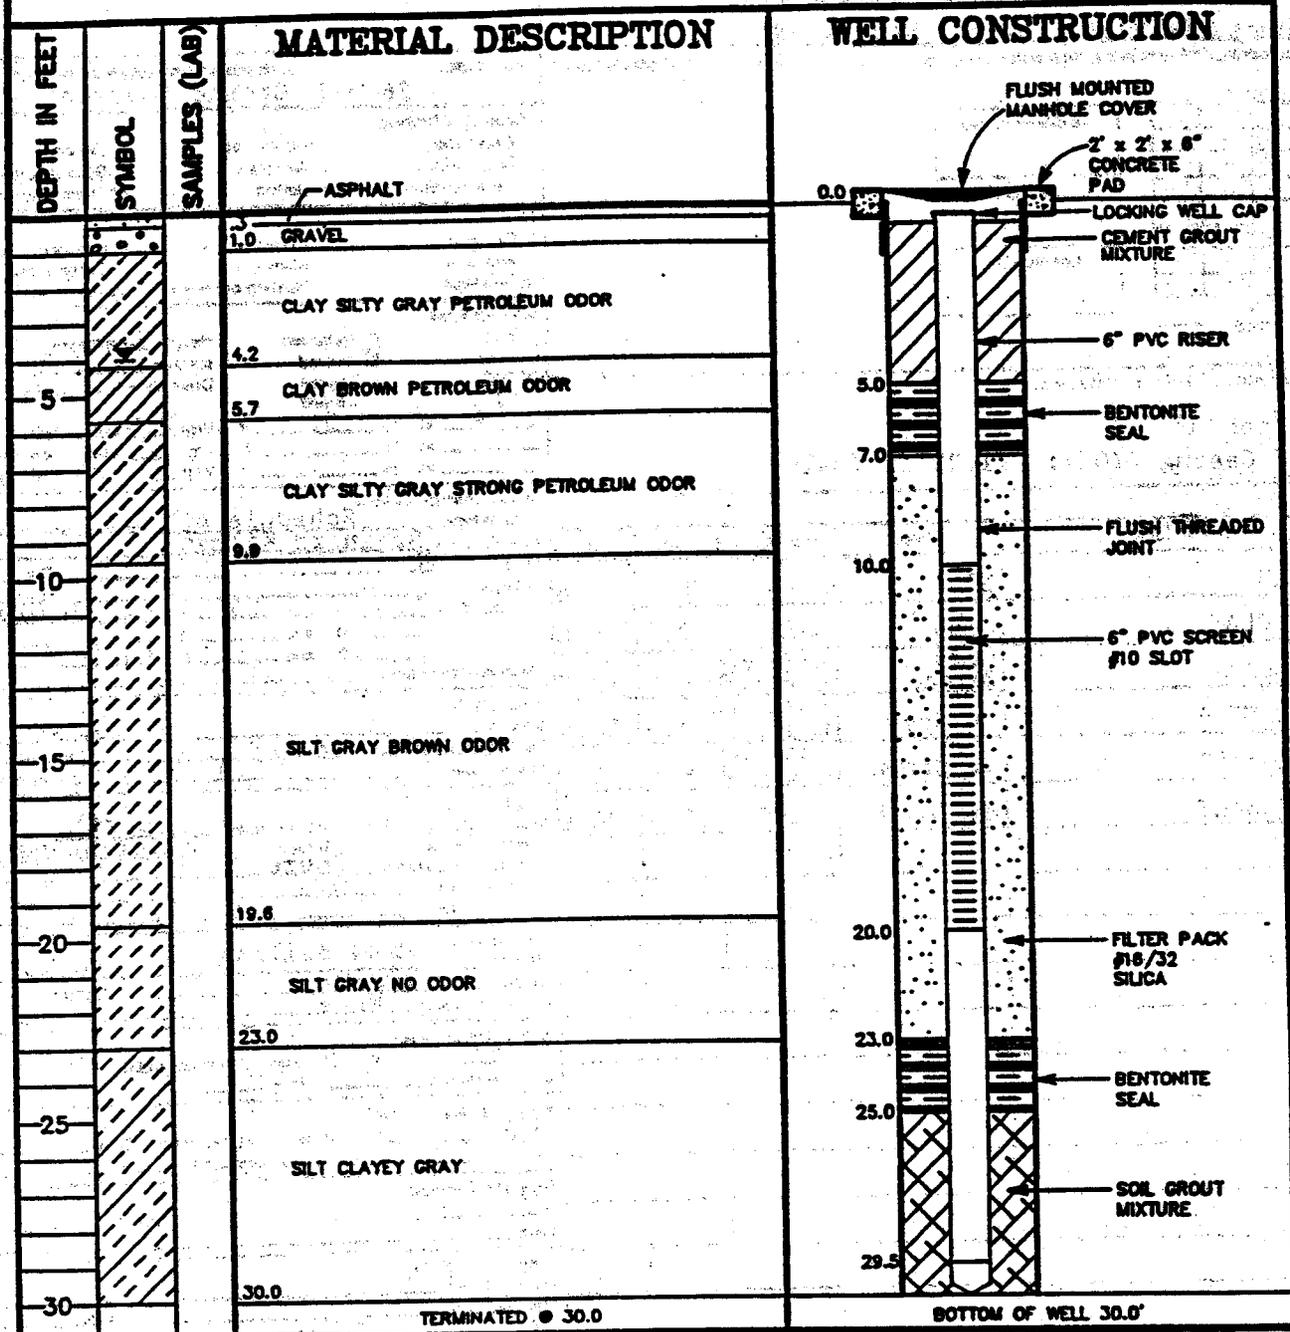

Geophysical Logs Run: None

Driller Name and Address: Professional Services Industries, Inc. 4161 Ridgemoor Ave., Memphis, TN 38118

Water Quality: Industrial & Environmental Analysts, Inc.

WELL CONSTRUCTION DETAILS

WELL NUMBER MEM-T337-3

DATE OF INSTALLATION 1/3/90

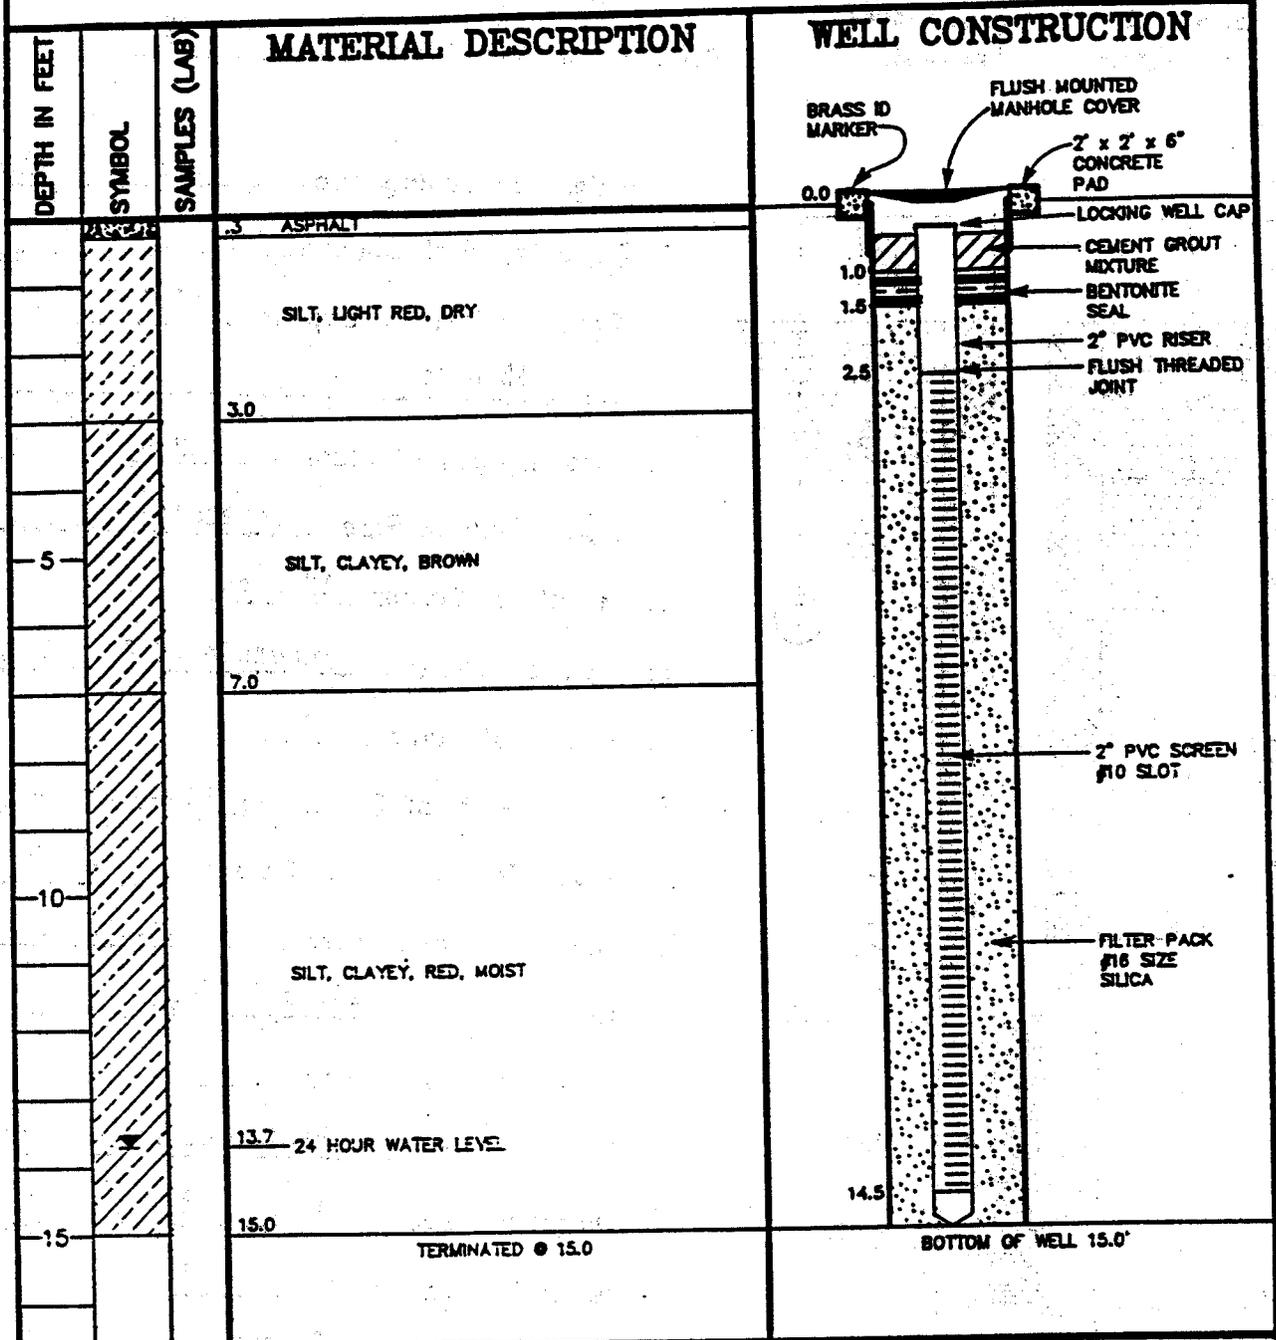

1. Height of Casing above ground 0 ft.
2. Depth to first Coupling 2.5 ft.
Coupling Interval Depths 2.5 ft., 5.0 ft.
15.0 ft.
3. Total Length of Blank Pipe 2.5 ft.
4. Type of Blank Pipe Schedule 40 PVC
5. Length of Screen 7.5 ft.
6. Type of Screen Schedule 40 PVC (0.01")
7. Length of Sump 0 ft.
8. Total Depth of Boring 10.0 ft Hole Diameter 6.25"
9. Depth To Bottom of Screen 10.0 ft.
10. Type of Screen Filter Quartz sand
Quantity Used 1.7 ft.³ Size #16 U/C
11. Depth To Top of Filter 2.0 ft.
12. Type of Seal Bentonite pellets
Quantity Used 0.2 ft.³
13. Depth To Top of Seal 1.0 ft.
14. Type of Grout Cement
Grout Mixture 1010%
Method of Placement Pour

USGS MONITORING WELLS

USGS 02 FL

WELL CONSTRUCTION LOG

installed by U.S. Army Corps of Engineers, Memphis District

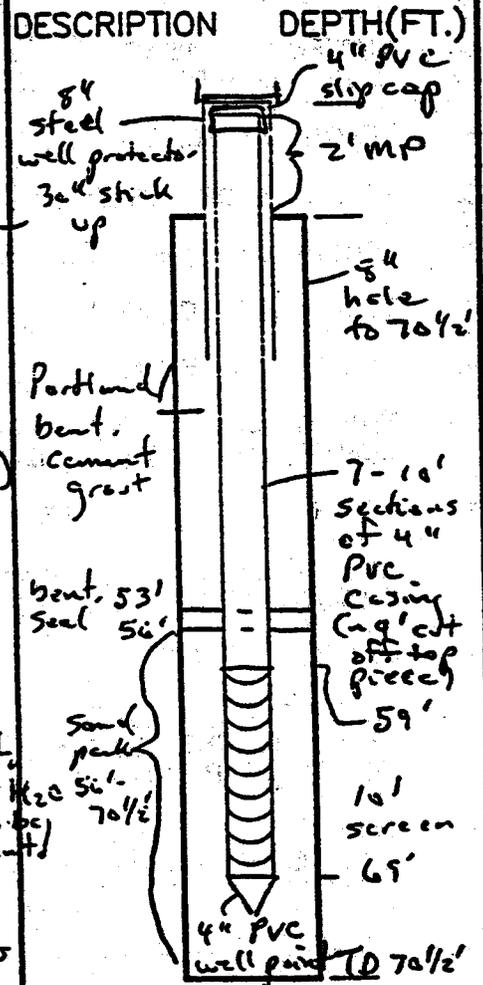

WELL LOCATION observation well cluster W. of N-1694, center well

DATE INSTALLED 4/15/95 (granted 4/15/95)

TYPE OF WELL 4" PVC observation well for water-level measurements in the fluvial deposits

1. HEIGHT OF CASING ABOVE GROUND 2'
2. WATER SURFACE ELEV. 4/26/95 18.00' BLS.
- a) DEPTH TO SATURATED ZONE _____
3. TOP OF CASING ELEV. ~ 275' (land surface ~ 273')
4. PROTECTIVE CASING YES NO
- a) CASING LENGTH ~ 4'
5. LENGTH OF SCREEN 10'
6. SIZE \ TYPE OF SCREEN 4" PVC Sch 40 #10 slt
7. LENGTH OF SUMP ~ 9"
8. TOTAL DEPTH OF BORING 70 1/2" HOLE DIAMETER ~ 8"
9. SCREENED INTERVAL ~ 59'-69'
10. TYPE OF SCREEN FILTER PACK silice sand (10-20)
QUANTITY USED 6 bags SIZE 50 lbs U/C
11. DEPTH TO TOP OF FILTER ~ 56'
12. TYPE OF SEAL bentonite pellets
QUANTITY USED 1 50 lb bucket (? c. ft) ~ 5 gallons
13. DEPTH TO TOP OF SEAL ~ 53'
14. TYPE OF GROUT Portland cement w/ ~ 5% bent.
GROUT MIXTURE 6 bags (100 lbs) w/ ~ 45 gallons H₂O
METHOD OF PLACEMENT 1" PVC techie pipe 4 3/8" bet bent.
15. COMMENTS cuttings from hole placed in 9 drums; hole drilled to 13' w/ bsk auger. hyd. rotary 13'-70 1/2'; no WL measurements made because WL in well artificially high after installation

WELL CONSTRUCTION LOG

Installed by U.S. Army Corps of Engineers, Memphis District

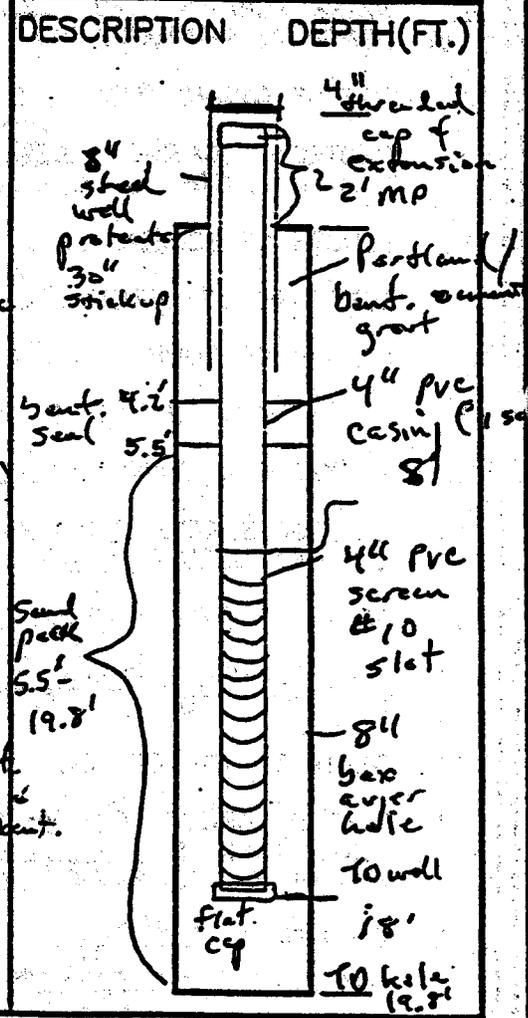

WELL LOCATION observation well cluster W of N-1694, SE well

DATE INSTALLED 4/12/95 (grouted 4/14/95)

TYPE OF WELL 4" PVC observation well for water-level measurements in blue loess/alluvium

1. HEIGHT OF CASING ABOVE GROUND 2'
2. WATER SURFACE ELEV. 4/15/95: 5.7' BLS
a) DEPTH TO SATURATED ZONE ~12' (4/14/95)
3. TOP OF CASING ELEV. ~275' (land surface ~273')
4. PROTECTIVE CASING YES NO
a) CASING LENGTH 29'
5. LENGTH OF SCREEN 10'
6. SIZE \ TYPE OF SCREEN 4" PVC sch 40 #10 slot
7. LENGTH OF SUMP ~3"
8. TOTAL DEPTH OF BORING 25' HOLE DIAMETER 8"
9. SCREENED INTERVAL 8'-18'
10. TYPE OF SCREEN FILTER PACK silica sand (20-40)
QUANTITY USED 3 bags SIZE 100/60 U/C
11. DEPTH TO TOP OF FILTER ~5.5'
12. TYPE OF SEAL benznite pellets
QUANTITY USED 1/2 50 lb bucket (~25 gallons)
13. DEPTH TO TOP OF SEAL ~4.2'
14. TYPE OF GROUT Portland cement w/ ~5% bent.
GROUT MIXTURE 2-100lb bags w/ ~12 1/2 gallons H₂O
METHOD OF PLACEMENT pouring ~16 oz bent.
15. COMMENTS cuttings from hole placed in one drum; hole drilled w/ box auger; well originally had Q ~ 12' BLS but had to be 5' BLS after ~24 hours

WELL CONSTRUCTION LOG

Installed by U.S. Army Corps of Engineers, Memphis District

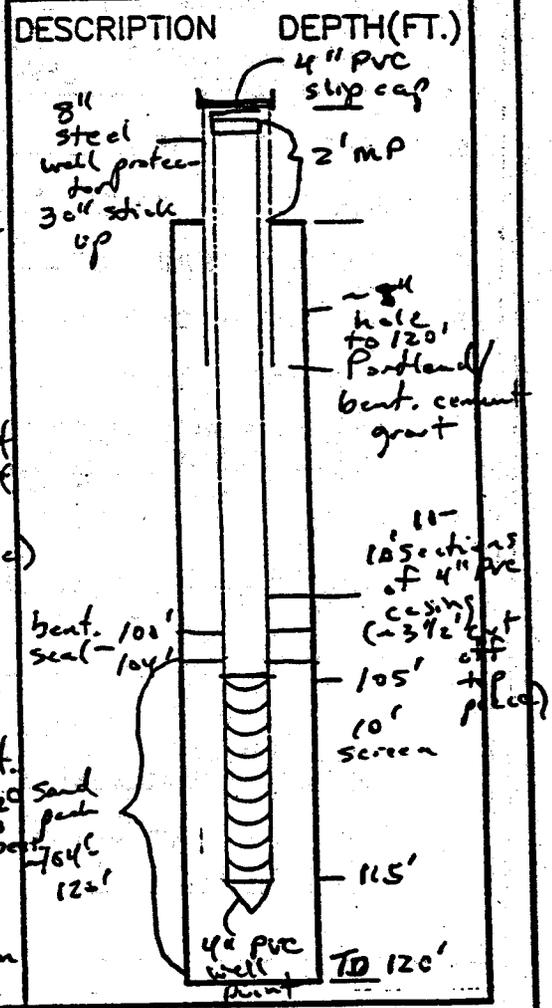

WELL LOCATION: observation well cluster w. of N-1624, NW well

DATE INSTALLED: 4/14/95 (grouted 4/15/95)

TYPE OF WELL: 4" PVC observation well for water-level measurements in the Cockfield formation

1. HEIGHT OF CASING ABOVE GROUND 2'
2. WATER SURFACE ELEV. 4/26/95 14.78' BLS.
- a) DEPTH TO SATURATED ZONE _____
3. TOP OF CASING ELEV. ~275' (land surface ~273')
4. PROTECTIVE CASING YES NO
- a) CASING LENGTH 24'
5. LENGTH OF SCREEN 10'
6. SIZE/TYPE OF SCREEN 4" PVC Sch 40 #10 slot
7. LENGTH OF SUMP ~9"
8. TOTAL DEPTH OF BORING 120' HOLE DIAMETER ~8"
9. SCREENED INTERVAL ~105'-115'
10. TYPE OF SCREEN FILTER PACK silica sand (10-20 #)
 QUANTITY USED 200 lbs SIZE U/C neutral
each, 200 lbs bags, + gravel collapse
11. DEPTH TO TOP OF FILTER ~104'
12. TYPE OF SEAL benzoinite pellets
 QUANTITY USED 1 1/2 50 lb bucket (cut)
13. DEPTH TO TOP OF SEAL ~100' ~7.5 gallons
14. TYPE OF GROUT Portland cement w/ ~5% bent.
 GROUT MIXTURE 9 bags (100 lbs) w/ ~160 gallons H₂O
 METHOD OF PLACEMENT 1" PVC drainage pipe + 1 1/2 bags bent.
15. COMMENTS cuttings from hole placed in 15 drums; hole drilled to 12' w/ box eye; hyd. rotary 12'-120'; Shelby tube samples from 12'-14' & 120'-122.5'; no WL measurements made because WL in well artificially high after installation
