EXECUTIVE SUMMARY

Brown & Root Environmental (B&R Environmental) has completed a Contamination Assessment (CA) at the above-referenced facility in accordance with the requirements of Chapter 62-770, Florida Administrative Code (FAC). The assessment report was submitted to the Florida Department of Environmental Protection (FDEP) for approval.

B&R Environmental performed the following tasks during the CA:

- Reviewed available Navy documents to identify potential sources and receptors for petroleum hydrocarbons in the vicinity, to evaluate private potable wells in a 0.25-mile radius and public water supply wells within a 0.50-mile radius, to locate nearby surface water bodies, and to determine surface hydrology and drainage;
- Reviewed previously prepared Closure Assessment for Tank G300 to determine appropriate boring locations and monitoring well placements;
- Conducted site survey to identify utilities and to construct a site plan;
- Performed direct push investigation which included the installation of 15 soil borings for collecting soil and groundwater samples for field screening of total petroleum hydrocarbons - diesel range organics (TPH-DRO) using a gas chromatograph.
- Installed four shallow permanent monitoring wells to approximately 15 feet below land surface (bls) and installed four shallow piezometer wells to approximately 14 feet bls.
- Collected groundwater samples from the permanent monitoring wells for laboratory analysis of the Kerosene Analytical Group parameters;
- Collected three soil samples for laboratory analysis of the Kerosene Analytical Group parameters;
- Surveyed monitoring well top of casing elevations and collected depth to groundwater measurements to evaluate the groundwater flow direction and gradient;
- Performed slug testing on three monitoring wells to evaluate the hydraulic conductivity of the surficial aquifer; and

Laboratory analytical results for groundwater samples indicate that the dissolved hydrocarbon concentrations meet the criteria established for No Further Action (NFA), as established in the FDEP's, October 1990, "No Further Action and Monitoring Only Guidelines for Petroleum Contaminated Sites", for all constituents of the Kerosene Analytical Group.

Evaluation of soil assessment data indicates that "excessively contaminated" soil, as defined by Chapter 62-770.200, FAC, is present at the site. The areal extent of the excessively contaminated soil is limited to

a small area adjacent to the southwest corner of building 300, and extends approximately 3 to 4 feet below the building footer. The proximity to the building footer makes it impracticable to remove the soil without adversely impacting the structural integrity of the building.

Although the dissolved hydrocarbon concentrations meet the criteria established for NFA, the site does not qualify for NFA due to the presence of excessively contaminated soil. Since it is impracticable to remove the excessively contaminated soil, it is recommended that a Monitoring Only Program (MOP) be implemented at the site. The MOP should include 6 months of monitoring for Total Volatile Organics and Polynuclear Aromatic Hydrocarbons.

1.0 INTRODUCTION

1.1 PURPOSE AND SCOPE

A Contamination Assessment (CA) was conducted by Brown and Root Environmental (B&R Environmental) for the US Navy (Navy) Southern Division Naval Facilities Engineering Command under Contract Task Order 0008, for the Comprehensive Long-term Environmental Action Navy (CLEAN III), Contract Number N62467-94-D-0888. The CA was conducted at Site G300 located at the Coastal Systems Station (CSS) in Panama City, Florida. The Florida Department of Environmental Protection (FDEP) Facility Identification Number is 038518667.

The purpose of this CA was to determine the nature and extent of petroleum hydrocarbon impacted soil and groundwater in accordance with the requirements of Chapter 62-770, Florida Administrative Code (FAC). On September 16, 1996, a discharge of diesel fuel to the ground surface was identified near the vent lines of a 150-gallon day tank used to store diesel fuel for a generator in Building 300. The discharge was identified by an inspector from the FDEP who was at the facility to oversee the removal of a 2,500-gallon underground storage tank (UST), which supplied diesel fuel to the day tank. A Discharge Notification Form was submitted to the FDEP by the CSS Environmental Department on September 17, 1996 and is included in Appendix A.

An Initial Remedial Action (IRA) was conducted to remove "excessively contaminated soil," as defined by Chapter 62-770, FAC, near the vent line for the day tank, however, the IRA was abandoned on September 23, 1996 after it became apparent that the amount of "excessively contaminated soil" may have been the result of various day tank overfills since 1972. Correspondences from the CSS Environmental Department concerning IRA removal activities are included in Appendix A. The 2,500-gallon diesel UST which had supplied diesel fuel to the day tank was removed on September 17, 1997. A Tank Closure Assessment Report was completed for the removal of the diesel UST and is provided in Appendix B.

A CAR Summary Sheet, as required by Chapter 62-770, FAC is included in Appendix C.

1.2 SITE DESCRIPTION

1.2.1 Location

The CSS facility is located on the western shore of St. Andrew Bay in Panama City, Bay County, Florida. The facility is bounded by US Highway 98 to the north, St. Andrew Bay to the east, State Road 292B (Magnolia Beach Road) to the south, and State Road 292 (Thomas Drive) to the west as shown on Figure 1-1. Specifically, the CSS facility is located within Section 33 of Township 3 South, Range 15 West and Section 4 of Township 4 South, Range 15 West, as shown on United States Geological Survey (USGS) Panama City Beach, 7.5 Minute Series Quadrangle and presented as Figure 1-2.

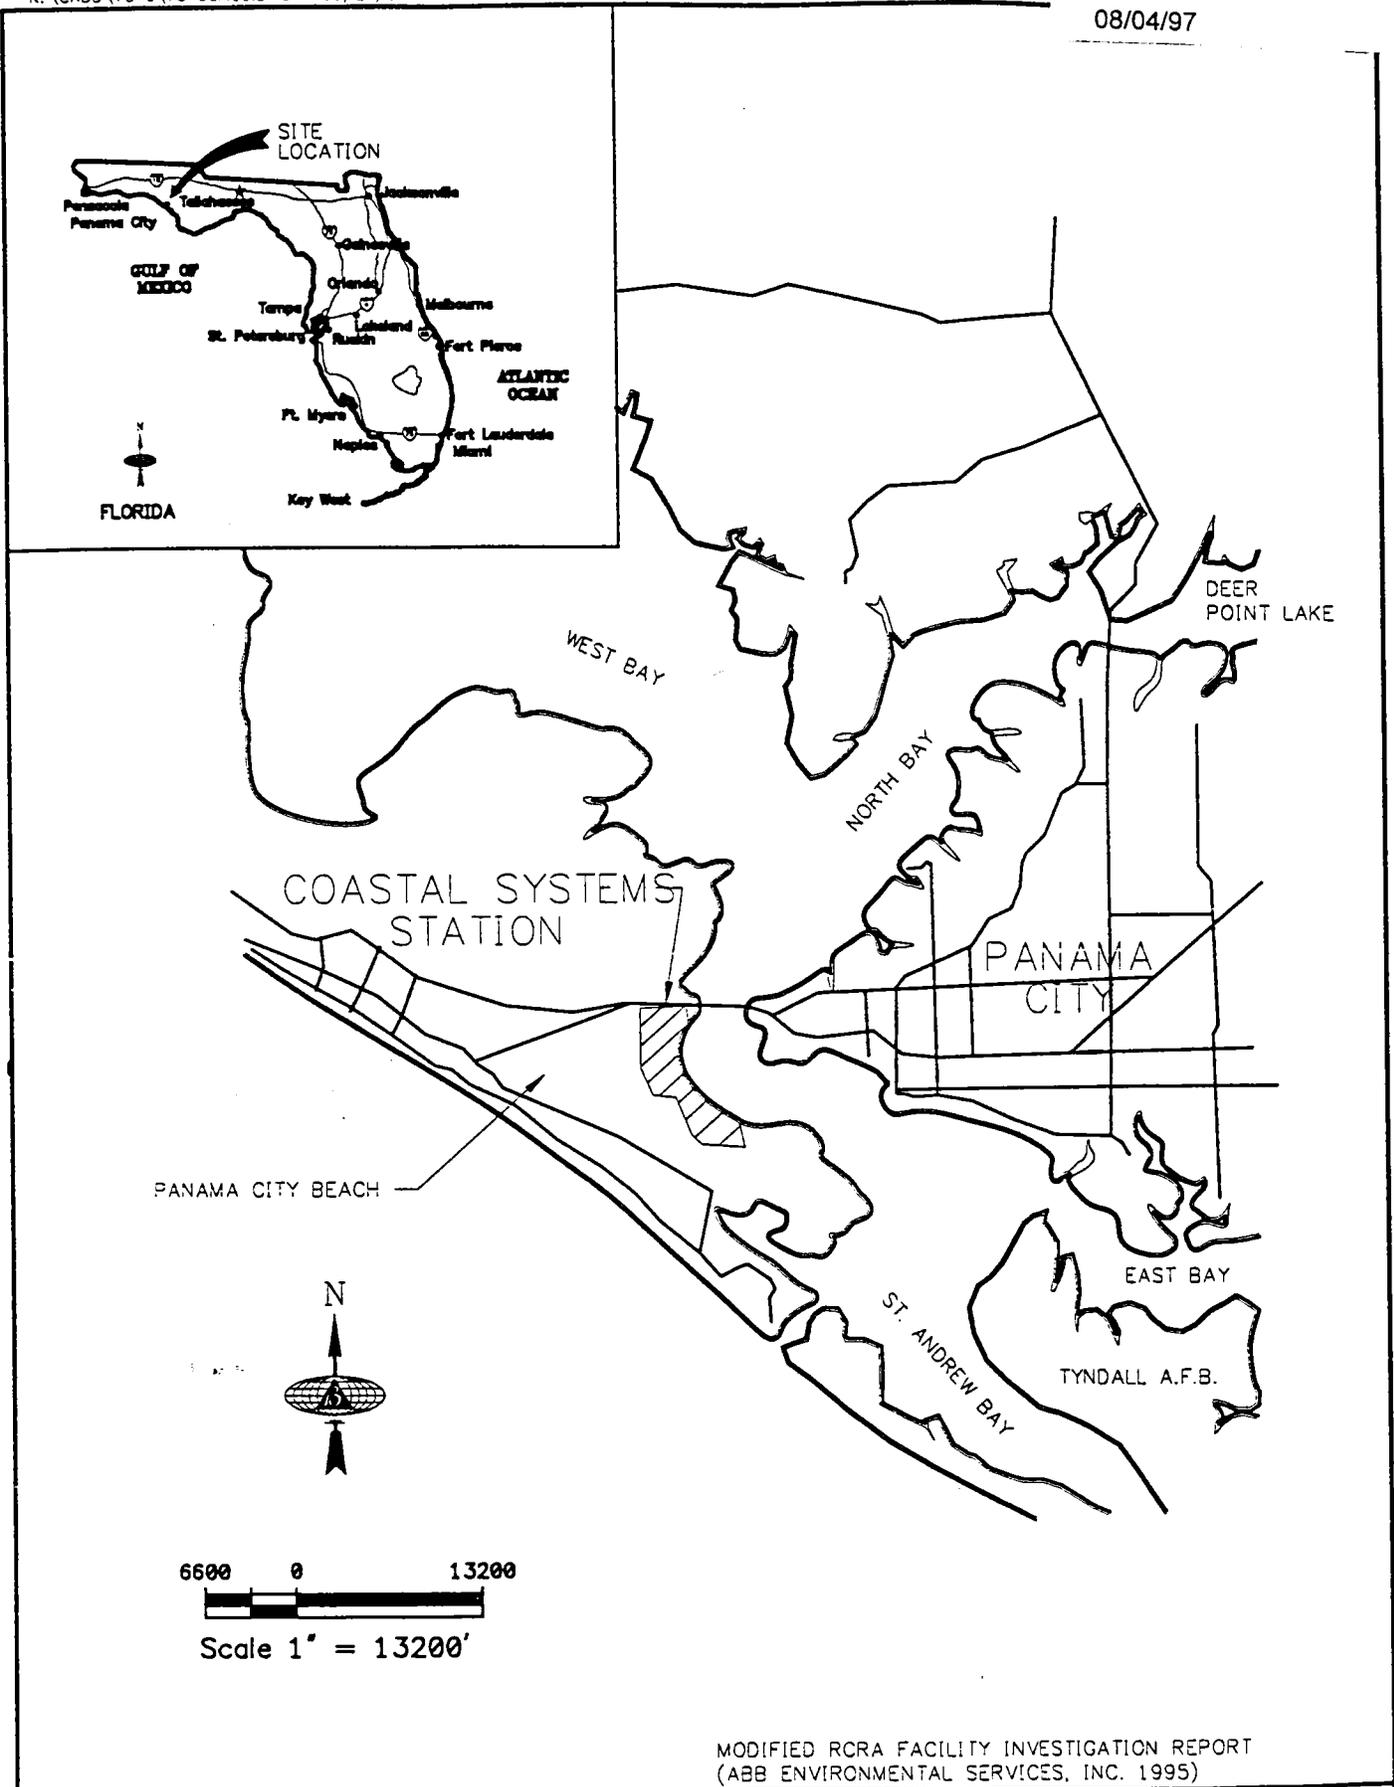

1.2.2 Topography and Drainage

The topography at the site is relatively flat with a ground surface which gently slopes towards the west. The site is located at an elevation of approximately 12 feet above National Geodetic Vertical Datum (NGVD). Locally, the ground surface grades toward Alligator Bayou located approximately 350 feet south of the former diesel underground storage tank (UST) system for Building 300. The altitude of the ground surface decreases by approximately 10 feet from Building 300 to Alligator Bayou.

The land surface at the area of the former diesel UST has a grass surface cover which allows rainfall to infiltrate into the subsurface. Precipitation run off drains toward a storm drain located approximately 60 feet northwest of the site. The nearest surface water body to the site is Alligator Bayou which is located approximately 350 feet south of the former diesel UST. Alligator Bayou is designated as a Class III surface water by the State of Florida, suitable for fish and wildlife propagation and water sports (ABB Environmental Services Inc., RCRA Facility Investigation (RFI) Report, 1995).

1.2.3 Regional Hydrogeology

The regional hydrogeology of CSS Panama City is described in the RFI Report (ABB Environmental Services, Inc., 1995). According to this report, surficial deposits at CSS are Pleistocene to Recent coastal plain sediments of marine and estuarine origin. They predominately consist of quartz sand, clayey sand, and gravel. These deposits vary in thickness from 70 to 100 feet in Bay County. The surficial aquifer is located within these deposits. Underlying the surficial deposits is the Intercoastal Formation of middle Miocene to late Pliocene. The Intercoastal Formation is composed of sand and poorly consolidated limestone interbedded with discontinuous clay and low permeability sandy limestone. This formation is

approximately 150 feet thick at CSS Panama City. The lower beds of the Intercoastal Formation are part of the Floridan aquifer system.

Groundwater at CSS occurs in two major aquifer systems: unconfined surficial aquifer and the Floridan aquifer system, which is under confined and artesian conditions. A third semi-confined aquifer exists in thin permeable sand and shell zones within the Intracoastal Formation, and is separated from the water table aquifer and from the Floridan aquifer system by interbedded low-permeability clay and limestone. The Intercoastal Formation does not produce enough water to be considered a significant water source. The Floridan aquifer is under confined and artesian conditions where low-permeable clays and limestone beds of the Intracoastal Formation separate the water table aquifer from the Floridan aquifer. The surficial aquifer is reported to have insufficient thickness to produce significant quantities of water and its quality is generally undesirable for human use (i.e., dissolved solids, acidity, and iron content). Low permeability clay lenses in the surficial aquifer and the Intercoastal Formation are discontinuous. The surficial aquifer may be hydraulically connected to the Floridan aquifer system through semiconfining strata of the Intercoastal Formation.

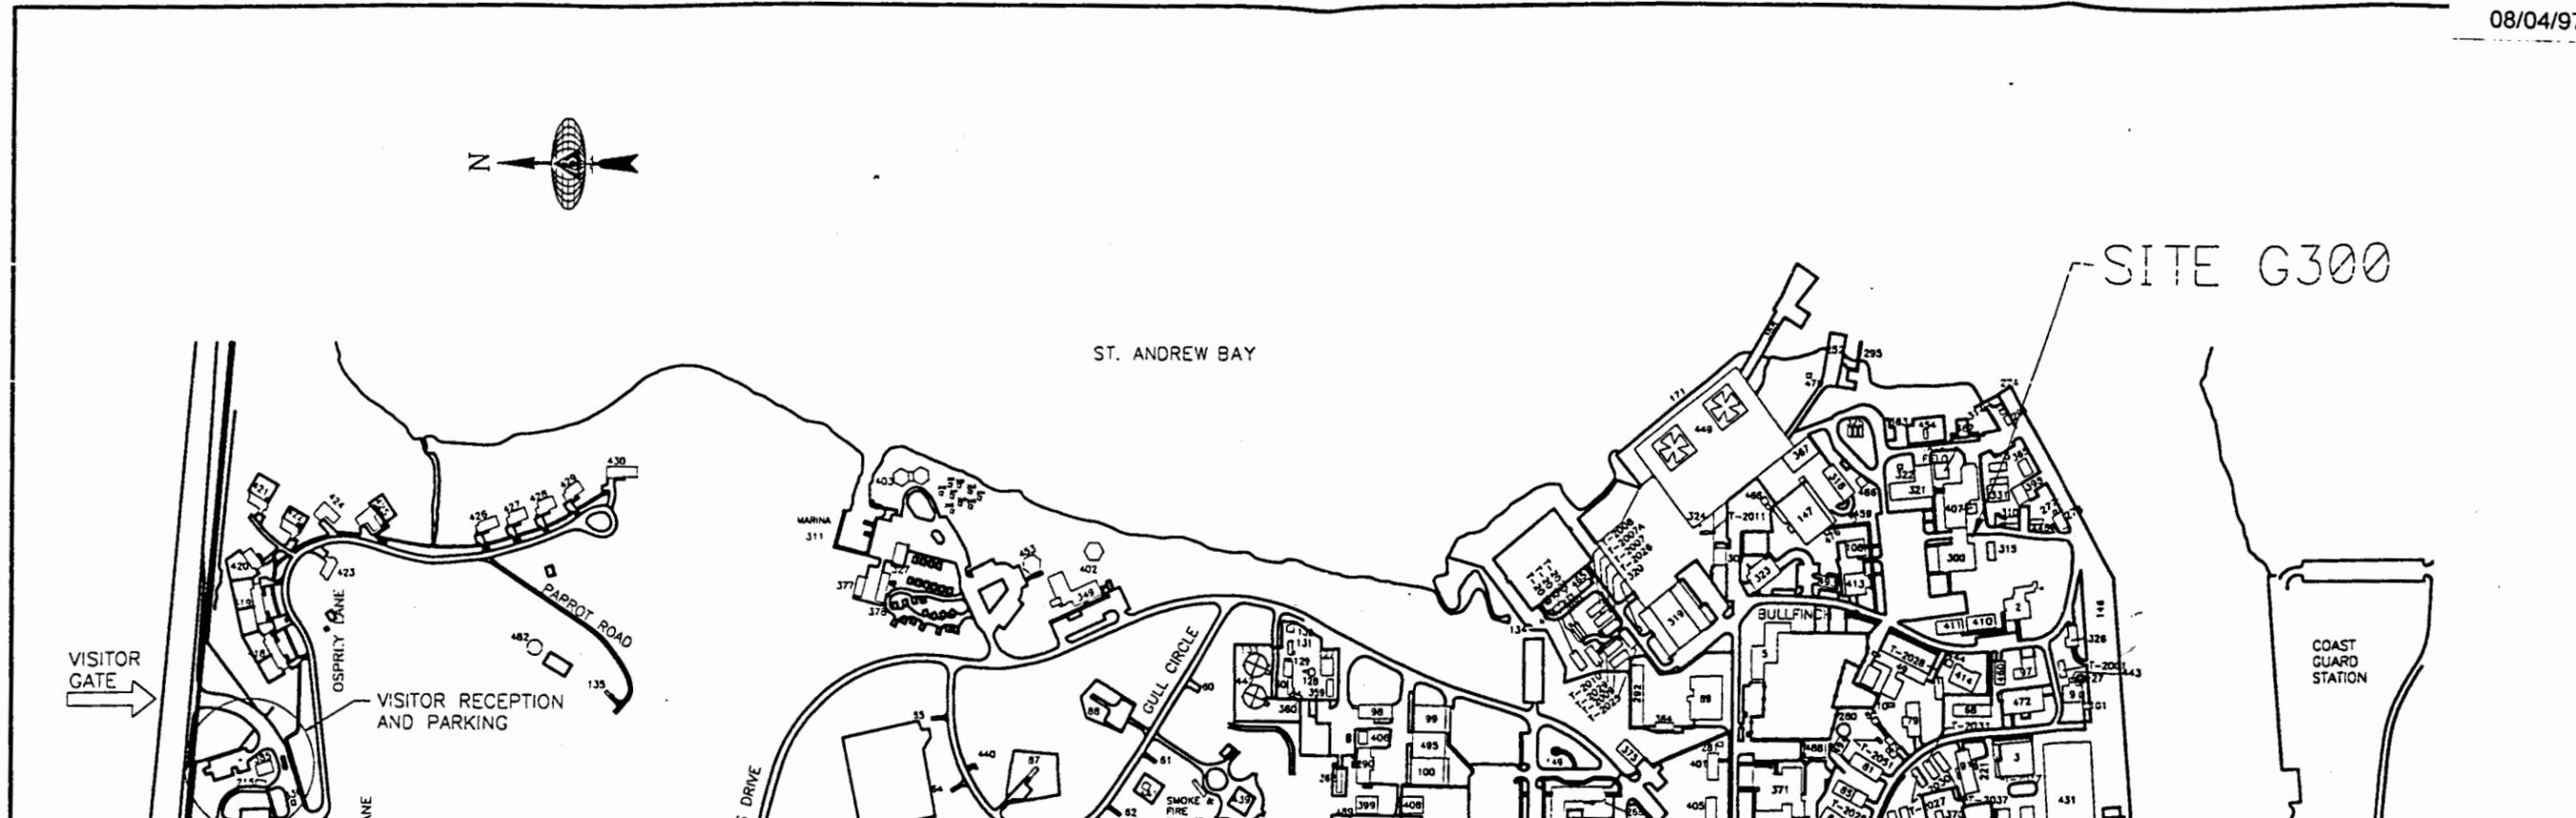

1.2.4 Land Use

Building 300 is located in the southeast area of the CSS property as shown on Figure 1-3. This area of the base is comprised of research facilities and various support activities for the Naval Experimental Dive Unit. No regulated underground storage tank systems are located at facilities adjacent to Building 300 (E.E. Jordan Company, Release Detection Program For Underground Storage Tanks, May, 1990).

1.2.5 Site Description

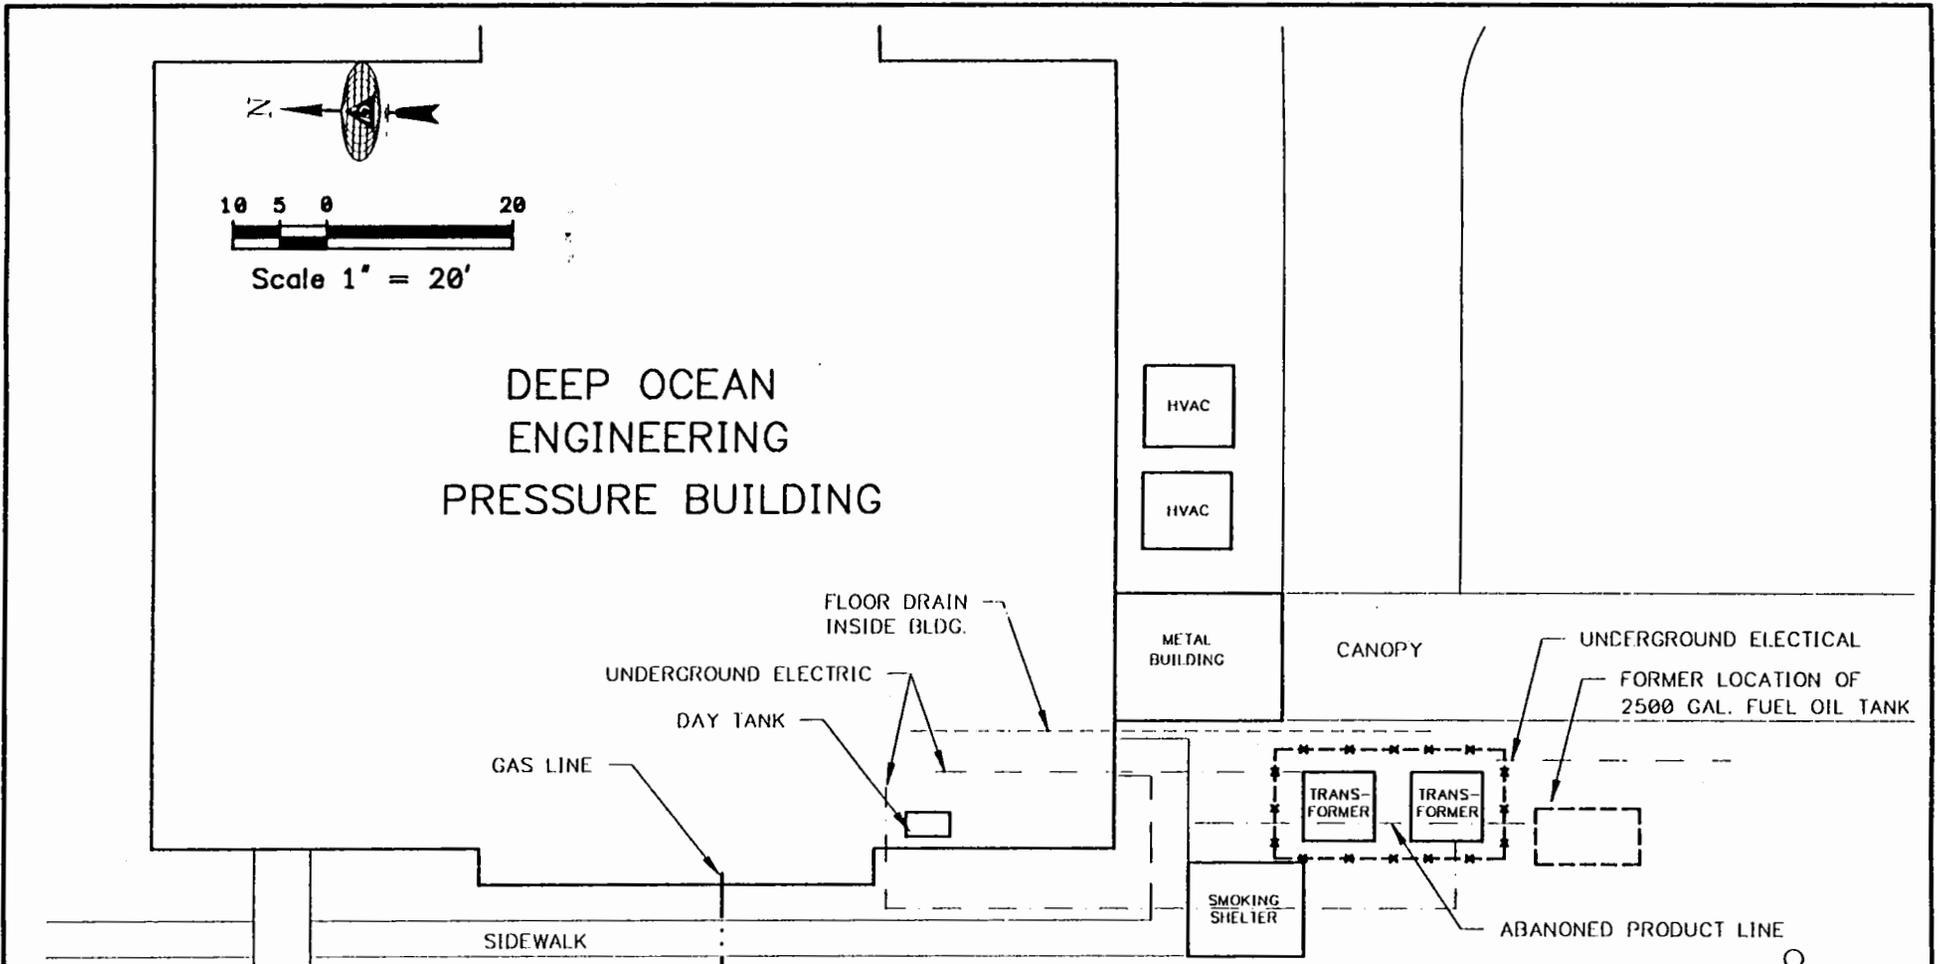

Site G300 contained one 2,500-gallon steel UST which stored diesel fuel. The UST supplied diesel fuel for an emergency generator located inside Building 300. The generator is located in the southwest corner of Building 300. A 150-gallon above ground day tank for the emergency generator is located inside the building. Fuel was pumped from the UST to the day tank as needed. A vent stack for the day tank extends outside the building. The vent pipe for the former UST was located immediately adjacent to the day tank vent. The UST was in service from approximately 1970 through 1996. The UST and product lines were removed on September 17, 1996, and an above ground tank was installed to store fuel for the emergency generator. The UST product line was cut, capped, and abandoned in place, where the line entered beneath structures. A site plan is shown as Figure 1-4.

1.2.6 Potable Water Well Survey

The potable water supply information presented in this report was obtained from RFI completed for CSS (ABB Environmental Services Inc., 1995). According to this report, potable water for most of Panama City and Panama City Beach, including CSS, is supplied by surface water. Panama City Beach also uses groundwater from the Floridan aquifer system, as do private and domestic water systems throughout Bay County.

The CSS is provided potable water from the Bay County Water System, operated by the Bay County Public Utilities Department. The system draws surface water from Deer Point Lake, located 7 miles northeast of CSS. The utilization of county water in urban areas such as Panama City, has been reported at 83 to 95 percent.

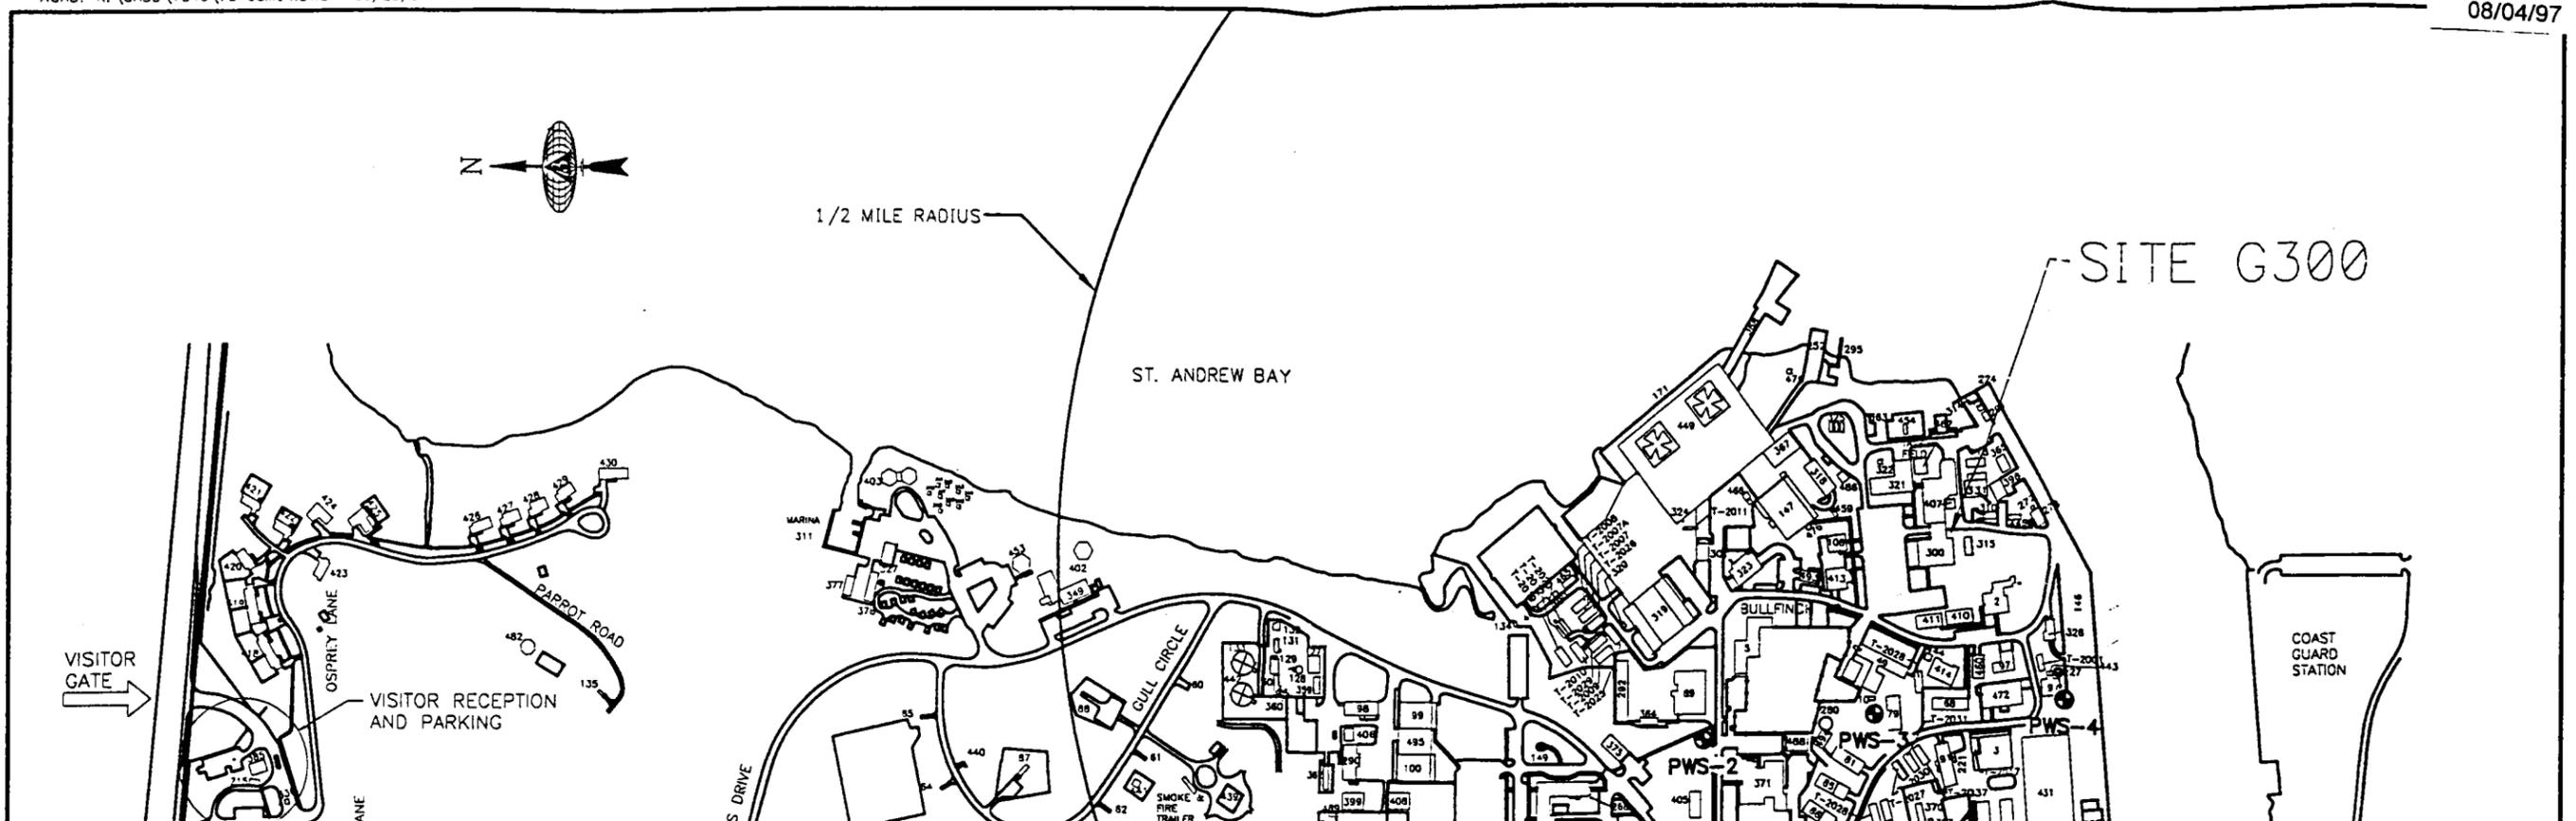

Panama City Beach operates a public water system which uses a combination of groundwater withdrawal and surface water. The groundwater is obtained from 13 wells located in western Bay County and surface water is purchased from the county water system.

The RFI indicates that records from the Northwest Florida Water Management District list 42 permitted wells screened in the surficial aquifer system in the vicinity of CSS. These 42 wells are classified as "domestic" or other "public supply". The permitted wells are 2-inch and 4-inch-diameter wells with yields of generally less than 20 gallons per minute.

Four public water supply wells are located at CSS. The location of the wells are provided on Figure 1-5. These wells have 12-inch diameter casings and are completed at depths of 350 to 400 feet bls. Of the four wells, only PWS-1, located near the housing area at Building 394, adjacent to highway 98, is currently in use. It is used to provide water for air conditioning and heat pumps only and draws water from the Floridan aquifer system at approximately 400 feet bls. The remaining wells are inactive.

No private potable wells or public potable supply wells were identified in the RFI Report as being within a 1/4-mile and 1/2-mile radius of the site, respectively.

This page intentionally left blank.

1.3 SITE HISTORY AND OPERATIONS

1.3.1 Site History

CSS is one of seven major research, test, and evaluation laboratories of the Space and Naval Warfare Systems Command. The site was first established in 1942 as a harbor for World War II convoy ships and as a liaison with a nearby shipyard. It later became an amphibious landing craft operations school. Research and development began in 1945 when the facility was renamed the US Navy Research Countermeasures Station. In 1952 a research and development program for the use of helicopters for mine countermeasures operations was implemented at the Base. The facility was redesignated as the Naval Coastal Systems Center in 1978 and again as Coastal Systems Station (CSS) in January 1992 (ABB Environmental Services, Inc. 1995).

The Navy Experimental Diving Unit Ocean Simulation Facility is located at Building 300. On September 7, 1996, the day tank used to store diesel fuel for an emergency generator located in the building, was overfilled during refueling of the day tank. The day tank, which has a float level and is equipped with a piping system which returns excess fuel to the source tank, could not accommodate the seven gallon per minute delivery rate of the emergency generator fuel pump, which was operated in the manual mode during the refueling of the tank. As a result, fuel was displaced into the day tank vent pipe, which extends outside Building 300, at the southwest corner of the building, approximately 10 feet above the top of the day tank. Eventually, fuel reached the end of the vent pipe, spilling to the ground at the southwest corner of Building 300 (Commanding Officer, Navy Experimental Diving Unit, 1996).

During the refueling of the tank, the pump was left unattended. Approximately one hour after the pump had been left unattended, a diesel fuel spill was discovered on the floor beneath the day tank and the pump was deactivated. Less than two quarts of diesel fuel had spilled on the floor and the spill was immediately cleaned up with absorbent pads. At the time, personnel were not aware a spill had occurred outside of Building 300. The spill outside the building was discovered on September 16, 1996, by a Florida State inspector who was at the site to inspect an unused underground storage tank which was being removed and noticed the smell at the site of the spill (Commanding Officer, Navy Experimental Diving Unit, 1996).

The Navy estimates approximately 132 gallons were spilled during the refueling of the day tank on September 7, 1996. This estimate is based on review of inventory records and fuel consumption rates for the outside diesel fuel tank from March 28, 1996 (Commanding Officer, Navy Experimental diving Unit, 1996).

1.3.2 Structural Integrity of Tanks and Lines

The UST G300 was unregulated, therefore no structural integrity testing of the tank and lines was performed on the diesel UST system. At the time the UST was removed in September 1996, the tank was observed to be in good condition. The structural integrity of the UST is described in the Tank Closure Assessment Report provided as Appendix C.

1.3.3 Initial Remedial Action

On September 20, 1996, Southern Earth Science Company of Panama City, Florida installed 17 soil borings to assess soil quality at the UST system tank field along the product line, and near the southwest corner of Building 300. Samples were collected from each of the borings for field screening with an organic vapor analyzer (OVA). The results of the field screening indicated "excessively contaminated soil," as defined by Chapter 62-770, FAC, at the southwest corner of Building 300. The soil contaminant plume was approximately 4 feet wide by 25 feet long and extended along the southwest corner of the building, sidewalk, and possibly under the building. In September 1997, an Initial Remedial Action (IRA) was performed to remove "excessively contaminated soil". During the IRA, soil excavation was halted after it became apparent the amount of "excessively contaminated soil" observed during the excavation, may have resulted from various generator day tank overfills. Figures showing the location of the soil borings and tables summarizing soil OVA sample intervals and vapor concentrations are included in the Fuel Spill Investigation Summary document provided in Appendix D.

1.3.4 Previous Investigations

During removal of the UST system, the US Navy Public Works Center (PWC) collected seven soil samples for hydrocarbon vapor screening using an organic vapor analyzer (OVA). The soil samples were collected at depths of 2 feet, 4 feet, and 8 feet bls from within the tank excavation. Soil vapor screening samples were collected from each side and the bottom of the tank excavation. Results of the soil screening identified no soil hydrocarbon vapors in soil samples collected from the vadose zone. The soil vapor sample locations and the depth of sample collection with corresponding OVA readings, are provided in Appendix C.

A temporary monitoring well was placed at the center of the UST excavation and groundwater samples were collected on March 25, 1997. Groundwater samples collected from the temporary monitoring well were analyzed using US Environmental Protection Agency (USEPA) Methods SW-846, 8260 and 8270. Results of the sampling reported no petroleum constituents above state target levels for storage tank

closure. Groundwater concentrations of chloroform, bromodichloromethane, and dibromochloromethane were reported at levels below the State of Florida Drinking Water Standards. The Storage Tank Closure Assessment Form is included in Appendix C.

This page intentionally left blank.

2.0 SUBSURFACE INVESTIGATION METHODS

2.1 QUALITY ASSURANCE

The site investigation was conducted in accordance with the Standard Operating Procedures prescribed by the FDEP Quality Assurance Section Document DER-001/92, and adopted by the B&R Environmental Comprehensive Quality Assurance Plan (CQAP) Number 870055G.

2.2 SOIL BORING PROCEDURES

2.2.1 Direct-Push Soil Borings

A soil hydrocarbon vapor assessment was conducted at the site by B&R Environmental on March 17 through March 21, 1997. Fifteen soil borings (SB-1 through SB-15) were advanced in the immediate area surrounding the former diesel UST system. Soil samples were collected from each boring for the purpose of organic vapor screening and for lithologic description. Soil borings were advanced using a Stratoprobe, truck mounted, direct-push, hydraulic soil probe. Soil samples were collected using two-foot long stainless steel split barrel samplers lined with plastic sleeves. Soil samples were collected at five foot intervals from the ground surface until the water table was encountered. At soil boring locations, SB-1, SB-2, SB-7, and SB-15, soil samples were collected continuously from the ground surface until the water table was encountered. Wet soils were present at depths ranging from approximately 8 to 9 feet bls. Soil boring locations and boring completion depths are summarized on Figure 2-1 and Table 2-1, respectively. Soil boring logs are provided in Appendix E.

Prior to the advancement of the soil probe at each boring location, the probe was decontaminated according to B&R Environmental's CQAP. Soil samples were visually inspected for evidence of oil staining. Soil vapor analysis was conducted on each soil sample collected from the vadose zone using an Organic Vapor Analyzer-Flame Ionization Detector (OVA-FID). Soil vapor analysis was performed in accordance with the headspace method prescribed by Chapter 62-770.200(2) FAC. This method of headspace screening is presented in detail in Appendix F. Headspace concentrations from soil vapor analysis are summarized in Table 2-1.

On April 23, 1997, B&R Environmental advanced three soil borings using a stainless steel, 3-inch, inside diameter (ID) hand-auger. The borings were advanced at locations SB01, SB04, and SB05 to collect soil samples for laboratory analysis to confirm the presence of petroleum-related compounds in the vadose zone soils. Sample locations and the depth of sample collection were based on the headspace readings obtained during the soil vapor analysis conducted during March 1997. Samples were collected at each boring location at a depth of 6 to 7 feet bls. Prior to advancing the hand-auger at each boring location, the hand-auger was decontaminated according to B&R Environmental's CQAP.

Decontamination of sampling equipment generated rinse water which was containerized in 55-gallon drums and will be removed for proper disposal by a Florida-licensed waste hauler.

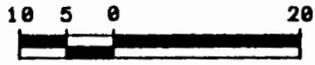

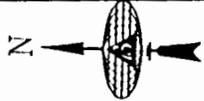

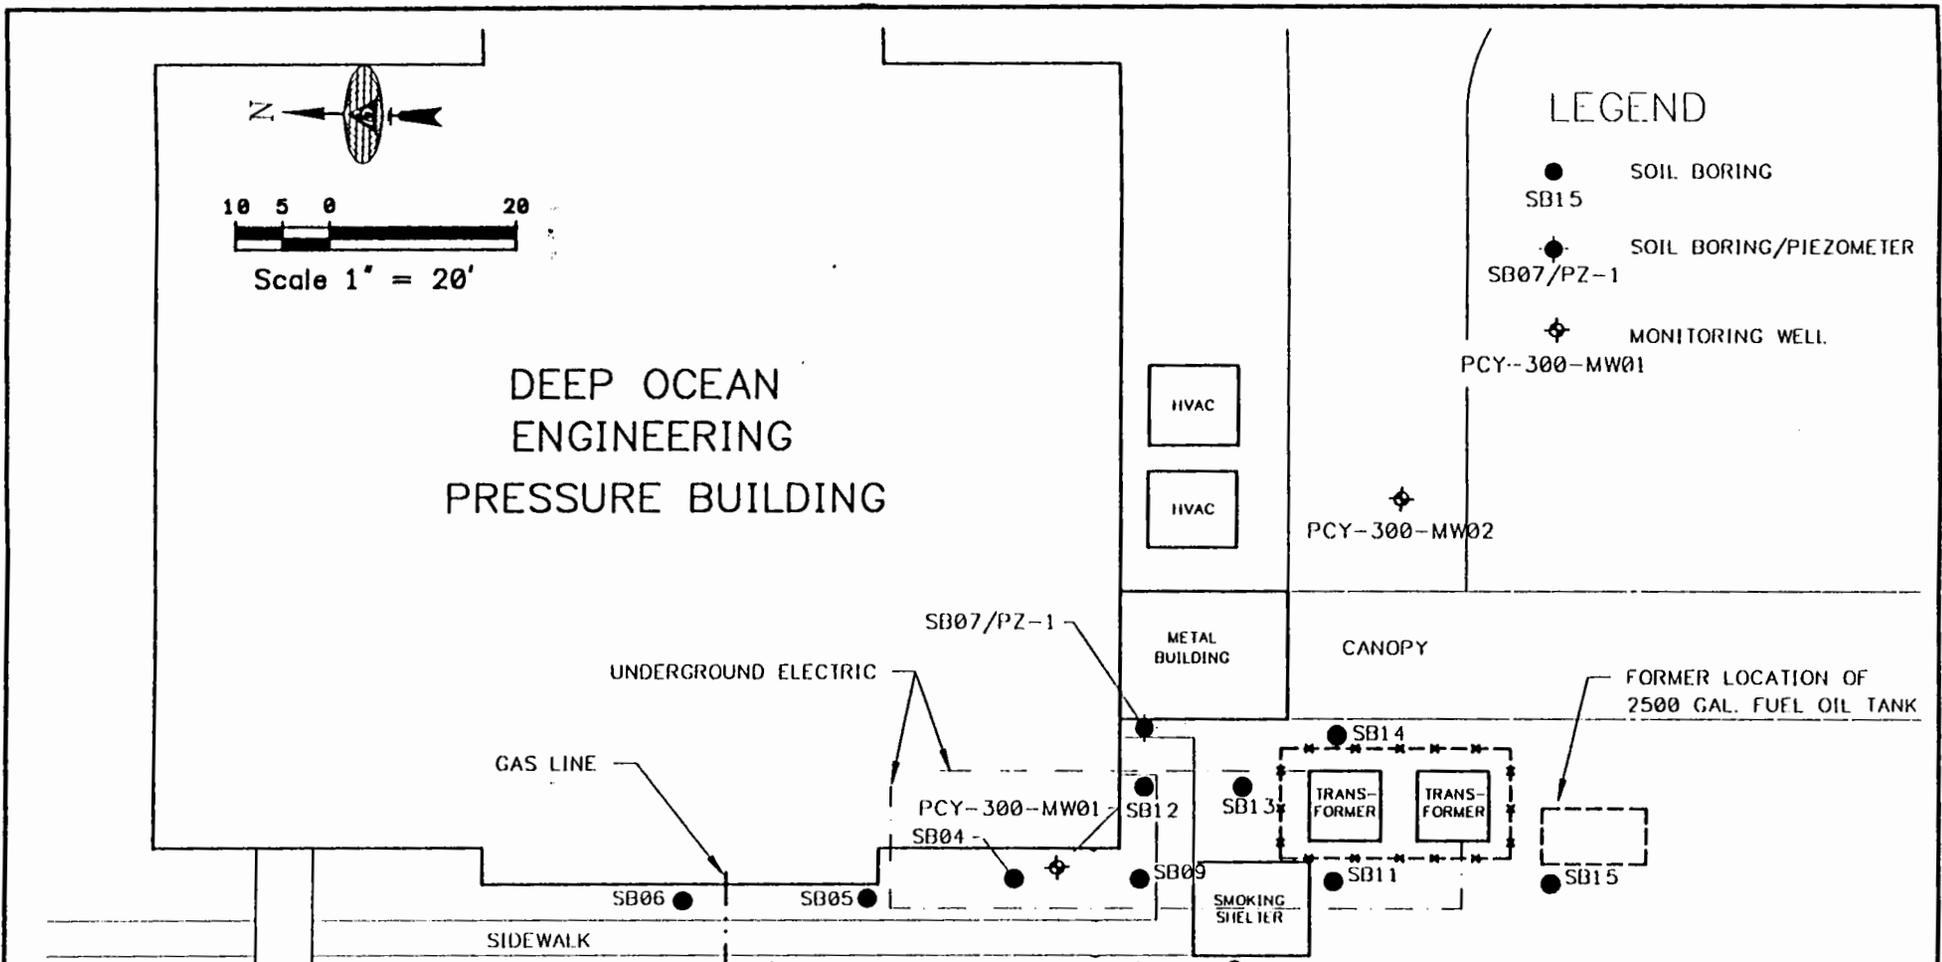

2.2.2 Drilling and Soil Sampling Methods

On April 22, 1997, four borings, PCY-300-MW01, PCY-300-MW02, PCY-300-MW03, and PCY-300-MW04, were drilled by Gulf Atlantic Drilling under the supervision of a B&R Environmental geologist. These borings were advanced for the installation of groundwater monitoring wells. Soil grab samples collected during borehole advancement were used to characterize the site lithology and/or provide additional assessment data on soil vapor concentrations in the area. The location of the monitoring wells are shown on Figure 2-1. Soil boring logs are included in Appendix E.

Underground utilities were investigated at each boring location by advancing the soil boring with a post hole digger from 0 to 4 feet bls. The borings were continued with a truck-mounted drill rig, using 4 1/4-inch ID hollow-stem augers. Prior to the collection of the soil samples and well installations, the auger flights were decontaminated according to B&R Environmental's CQAP.

Soil vapor analysis was performed on soil grab samples in accordance with the headspace prescribed in Chapter 62-770.200(2) FAC. This method of headspace screening is presented in detail in Appendix F. Hydrocarbon vapor concentrations from soil vapor analysis are summarized in Table 2-1.

Soil cuttings generated during the well installations were placed in a 55-gallon steel drums. A composite soil sample was collected from the drums and analyzed by USEPA Methods SW-846 8010 (volatile organic hydrocarbons), 8020 (volatile organic aromatics), 8100/FLPRO (polynuclear aromatic hydrocarbons and total recoverable petroleum hydrocarbons), total halides, and eight

Note

- = not analyzed

bls = below land surface

ppm = part per million equivalent methane

Wet soils encountered at approximately 6 to 7 feet bls.

RCRA metals. The soil will be removed for proper disposal by a Florida-licensed waste hauler. Pre-burn soil laboratory data sheets are included in Appendix G.

2.3 WELL CONSTRUCTION

2.3.1 Piezometer Construction

Piezometer wells were installed in conjunction with the soil boring procedures discussed above in Section 2.2.1. Soil borings SB-7, SB-8 and SB-10 were converted into piezometers PZ-1, PZ-2 and PZ-3, respectively. The piezometers were used to obtain water level measurements to determine relative groundwater elevations and flow direction. The piezometers were constructed of 1.25-inch ID, flush-threaded, schedule 40 PVC riser from 0 to 4 feet bls with 0.010-inch slotted screen interval from 4 to 14 feet bls. Native aquifer material was used as the filter media from 3 to 14 feet bls. A 1-foot layer of bentonite pellets was placed above the natural sand pack and hydrated. The remainder of the annulus was grouted to within 3-inches of the top of casing with a Type I Portland Cement/Bentonite slurry. The piezometers were secured with a locking water tight cap within an 8-inch diameter steel manhole. Well completion logs are provided in Appendix H.

2.3.2 Monitoring Well Construction

Monitoring wells were installed in conjunction with the soil boring procedures discussed above in Section 2.2.2. The wells were screened to intersect the water table. Monitoring well placements were selected to provide spatial coverage around the former diesel UST for groundwater sampling. Results of the sampling were used to evaluate if a dissolved hydrocarbon plume exists in the area of the former diesel UST system.

The monitoring wells were installed using a RAM 10 Deep Rock drill rig. Wells PCY-300-MW01, PCY-300-MW02, PCY-300-MW03, and PCY-300-MW04 were advanced using 4 1/4-inch ID hollow-stem augers. Each well was constructed of 2-inch ID, threaded, schedule 40 PVC solid riser and 0.010-inch slot well screen with silt trap and well bottom cap. Each well was installed to approximately 15 feet bls and was completed with a 10 foot screen section. Each annulus was filled to approximately 2 feet above the well screen with US Standard Sieve size 20/30 silica sand. A 6-inch layer of bentonite pellets was placed above the sand pack and hydrated. The remainder of the annulus was grouted to the surface. Each well is secured with a locking, water-tight cap

within a steel, 8-inch diameter steel manhole. The manhole was set within a 24-inch square concrete apron finished slightly above grade. Well completion logs are provided in Appendix H.

Each well was developed using a centrifugal pump. During well development, field measurements of pH, temperature, and specific conductance were monitored from the purge water generated. The wells were developed up to a maximum of one hour or until the field measurements became stable and the purge water clear. Water quality stabilization was determined using the following criteria: temperature $\pm 0.5^{\circ}\text{C}$, pH ± 0.1 unit, and specific conductance ± 10 $\mu\text{mhos/cm}$. The wells were developed under the supervision of a geologist. All development water was containerized for disposal.

2.4 LITHOLOGIC SAMPLING

Representative soil samples were collected during the soil vapor assessment to assess the shallow subsurface geologic conditions at the site. Samples used for lithologic description were collected from a stainless steel split spoon sampler lined with plastic sleeves. Grab samples from soil cuttings generated during monitoring well installations were also used for lithologic description. Soil boring logs are included as Appendix E.

2.5 SOIL VAPOR ANALYSIS

Headspace analysis was conducted on soil samples collected during the soil vapor assessment (direct push borings and monitor well installation borings) using an OVA-FID. The soil vapor analysis was performed according to the headspace method prescribed in Rule 62-770.200 (2) FAC. Screened soil samples with corrected headspace levels in excess of 50 ppm are defined as "excessively contaminated soil" at diesel contaminated sites. The Headspace Methodology for Determining Soil Organic Vapor Concentrations is described in detail in Appendix F.

2.6 SOIL SAMPLING

Upon completion of each soil boring during the direct-push sampling investigation, a soil sample was retained from the sample interval which exhibited the highest OVA reading. The sample was placed in a 4-ounce glass jar and immediately provided to TEG for screening of TPH-DRO, by USEPA Modified Method SW-846 3550/8015. TEG provided an on-site mobile laboratory for screening purposes. Data reports for the field screening of TPH-DRO are included in Appendix I.

Soil samples for laboratory analysis were collected at SB01, SB04, and SB05 and analyzed by USEPA Methods 8010 (volatile organic halocarbons), 8020 (volatile organic aromatics), and 8100 (polynuclear aromatic hydrocarbons). Samples were also analyzed for total recoverable petroleum hydrocarbon (TRPH) by the FLPRO analytical method, and for lead by SW-846 7421. These samples were collected to confirm the presence of petroleum-related compounds. The laboratory data reports are included in Appendix J.

2.7 HYDROLOGIC INVESTIGATION

2.7.1 Water Level Measurements

The depths to groundwater in monitoring wells PCY-300-MW01, PCY-300-MW02, PCY-300-MW03, PCY-300-MW04, and piezometer wells PZ-1, PZ-2 and PZ-3 were collected on April 23, 1997. Measurements were collected from the north rim of the top of well casings using an electronic water level indicator. The water level measurements were collected to determine the depth to water in the surficial aquifer. The water level measurement field forms are provided in Appendix K.

The elevation of the north rim for each top of well casing was surveyed by B&R Environmental to the nearest 0.01 foot relative to an on-site datum. An arbitrary benchmark was established using the top of well casing for PZ-2. A relative elevation of 10.00 feet was assigned to the bench mark. An auto-level transit and surveying rod were used to survey the casing elevations. The relative elevation was calculated by subtracting the depth to water from the top of casing elevation.

2.7.2 Aquifer Characteristics

On April 2, 1997, B&R Environmental performed aquifer slug tests on monitoring wells PCY-300-MW02, PCY-300-MW03, and PCY-300-MW04. Each test was performed by displacing a volume of water with a "slug" and recording the recharge rate of the displaced water in the well. The recharge rate was recorded using an electronic data logger and pressure transducer. The Bouwer and Rice methodology for partially penetrating wells in unconfined aquifers was utilized to calculate hydraulic conductivity values for the three monitoring wells as described in Bouwer, 1989 and Bouwer and Rice, 1976. Calculations were performed using the Aqtesolv™ aquifer characterization program as described in Duffield and Rumbaugh, 1991. Slug test data and calculations used to determine hydraulic conductivity are included in Appendix L.

2.7.3 Groundwater Flow Velocity and Transmissivity

The horizontal groundwater gradient across the site was evaluated from water level measurements collected on April 23, 1997. The groundwater gradient was calculated by determining the perpendicular distance between groundwater contours developed from groundwater elevation data. Groundwater gradient calculations are included in Appendix M.

The groundwater flow gradient was determined using the following equation:

$$i = \frac{h_1 - h_2}{d}$$

where:

- i = the hydraulic gradient
- h_1 = the water elevation at point 1
- h_2 = the water elevation at point 2
- d = the distance between point 1 and point 2

Potential movement of groundwater at the site may be described in terms of transportation by natural flow in the saturated zone while assuming groundwater flow follows Darcy's Law. Darcy's Law may be expressed as:

$$V = \left(\frac{K}{n} \right) \times i$$

where:

- V = average seepage velocity
- K = hydraulic conductivity
- n = effective porosity (assumed)
- i = average hydraulic gradient

Site specific transmissivity is calculated using the following equation:

$$T = Kb_e$$

where:

T = transmissivity

K = hydraulic conductivity

b_e = affected aquifer thickness

The groundwater seepage velocity and aquifer transmissivity calculations are included in Appendix M.

2.7.4 Tidal Influence Survey

A tidal survey was conducted during the RFI to determine if the potentiometric surface at locations close to Alligator Bayou are influenced by tidal fluctuations. Continuous water level measurements were obtained from several selected monitoring wells for a period of 24 hours. Monitoring wells PCY-14-5 and PCY-1-3 were selected at SWMU 1 and Area of Concern (AOC) 2, to evaluate the effects of tidal influence near Alligator Bayou. Monitoring well PCY-14-5 is located 40 feet from the seawall at Alligator Bayou and was paired with PCY-1-3, located 200 feet from the Bayou.

2.8 WATER SAMPLING

2.8.1 Free Product Sampling

Prior to groundwater sampling on April 23, 1997, B&R Environmental personnel checked each well for free product using a clean disposable bailer. The bailer was used to extract a water sample from the top of the well's water column to visually inspect for free product. Free product was not encountered during the CA by B&R Environmental personnel.

2.8.2 Groundwater Sampling Direct-Push Investigation

During the direct-push field investigation, each soil boring was continued into the saturated zone to collect groundwater samples for mobile laboratory screening. The samples were collected using a detachable drive tip attached to a 24-inch long, retractable, stainless steel well screen encased in the lead probe tube. After the water sampler was advanced into the water bearing zone, the probe was withdrawn 24 inches to allow the retractable screen to open to the formation.

For groundwater recovery a length of Tygon tubing was inserted into the probe and connected to a peristaltic pump. Several screen volumes were then pumped from the probe in order to reduce the turbidity level. After sufficient purging, groundwater samples were collected by pumping directly into 40 ml vials. The samples were immediately taken to the on-site mobile laboratory for screening for TPH-DRO constituents. All purge water was placed in 55-gallon drums on-site for later characterization and disposal. The results of the mobile laboratory screening are presented in Appendix I.

2.8.3 Groundwater Sampling of Monitoring Wells

Groundwater sampling of monitoring wells was performed to determine the presence or absence of dissolved petroleum hydrocarbons in groundwater in the vicinity of the diesel UST system. Groundwater samples were collected by B&R Environmental personnel from well PCY-300-MW01, PCY-300-MW02, PCY-300-MW03, and PCY-300-MW04 on April 23, 1997. Groundwater samples collected from each monitoring well were analyzed using USEPA Method 239.2 for lead (unfiltered), USEPA Method 504.1 for gas chromatograph (GC) extractable volatile organics (1,2-dibromoethane or EDB), USEPA Method 601 for GC purgeable halocarbons, and USEPA Method 602 for GC purgeable aromatics (benzene, toluene, ethylbenzene, xylenes, and methyl-tert butyl ether), USEPA Method 8100 for GC PAHs, and Florida PRO for TRPH. The groundwater samples were collected using new tygon tubing and a peristaltic pump. Approximately five well volumes of groundwater were removed from each well using the peristaltic pump and tygon tubing. Temperature, pH, specific conductance measurements, and well purge volumes were recorded at the time of sample collection and are provided in Appendix K. Groundwater samples were placed on ice and shipped to Accutest Laboratories, Inc., in Orlando, Florida.

All sampling activities were performed in accordance with the procedures prescribed in the FDEP Quality Assurance Section's Standard Operating Procedures for Laboratory Operations and Sample Collection Activities, (DER-001/92), adopted by B&R Environmental's CQAP. In accordance with DER-001/92 section 4.4.2, sample preservation was accomplished by obtaining pre-preserved containers from a laboratory with a DER approved CQAP (Accutest Laboratories, Inc.). During the sampling events, quality control samples (e.g. equipment blanks) were prepared and submitted to the laboratory as required by the approved CQAP. Sampling activities were documented in a site-specific field logbook, and samples were transmitted under chain-of-custody protocols to the laboratory. Groundwater laboratory data sheets are included in Appendix N.

3.0 RESULTS OF INVESTIGATION

3.1 SITE HYDROGEOLOGY

3.1.1 Lithology

The site is underlain by sediments composed predominately of light gray to white to yellowish orange, fine grained sand, with little to no fines. This soil type extends to at least 15 feet bls, which was the maximum depth drilled during the contamination assessment investigation. Due to the homogeneity of the subsurface, no lithologic cross-section was constructed. Soil boring logs are included as Appendix E.

3.1.2 Aquifer Characteristics and Classification

Based on water level data collected from site monitoring wells on April 23, 1997, the depth to the shallow aquifer across the study area is approximately 7 to 9 feet bls. The groundwater level measurements are presented in Table 3-1. The water level measurement field forms are provided in Appendix K. The aquifer is classified as a G-II aquifer based on dissolved solids content typically associated with the surficial aquifer in the area of CSS.

Rising-head slug tests conducted at wells PCY-300-MW02, PCY-300-MW03, and PCY-300-MW04 were used to estimate the hydraulic conductivity of the surficial aquifer at Building 300. The geometric mean hydraulic conductivity for the surficial aquifer was estimated 10.24 ft/day as shown by the hydraulic conductivity calculations provided in Appendix L.

Using the groundwater flow gradient equation presented in Section 2.8.3, a hydraulic gradient of 0.01 feet/foot to the south-southeast was calculated from the data collected on April 23, 1997. The groundwater flow direction is depicted in Figure 3-1.

Lithologic data and available literature indicate the effective porosity of the soils comprising the surficial aquifer is approximately 0.30 (Heath, 1994).

Using a hydraulic conductivity of 10.24 feet/day, the hydraulic gradient of 0.01 feet/foot, an inferred effective porosity value of 0.30, and Darcy's Equation as stated in Section 2.8.3, the groundwater seepage velocity across the site was calculated at 0.34 feet/day in a south-southeast direction. The transmissivity of the surficial aquifer was calculated at 4.9×10^{-2} ft²/day. Groundwater gradient and transmissivity calculations are included in Appendix M.

3.1.3 Tidal Influence

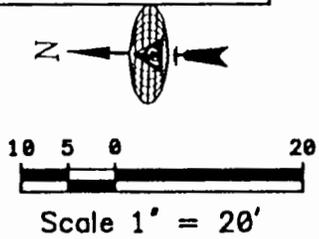

Results of the tidal survey conducted previously at monitoring wells PCY-14-5 and PCY-1-3 indicate that at SWMU 1 and AOC 2, the distance in which significant tidal influence was observed, was less than 40 feet from Alligator Bayou, and less than 200 feet from the shoreline at St. Andrew Bay. The presence of a sea wall at the bayou may interfere with natural groundwater flow and impede tidal influence in the area near the bayou (ABB Environmental Services Inc., 1995). Building 300 is located approximately 500 feet east of SWMU 1 and AOC 2, 350 feet north of Alligator Bayou, and 400 feet west of St. Andrew Bay. Therefore, significant tidal influence is not expected at Site G300.

3.2 SOIL QUALITY

The vertical and horizontal extent of petroleum impacted soil in the vadose zone was assessed through soil vapor analysis performed during the direct-push investigation and monitoring well installation as described in Section 2.2.1 and 2.2.2 of this report. The highest soil vapor concentrations detected in vadose zone soils were 300 parts per million (ppm), 110 ppm, and 100 ppm, at boring locations SB-4, SB-5 and SB-9 respectively. These samples were collected at depths of six to seven feet bls. These data indicate that "excessively contaminated" soil (greater than 50 ppm OVA response as defined by Chapter 62-770.200, FAC) are present in the vicinity of borings SB-4, SB-5, and SB-9. Soil vapor screening results are presented in Table 2-1. Soil boring locations and vapor readings are depicted on Figure 3-2.

Analysis of soil samples for field screening of TPH-DRO constituents using a mobile laboratory indicated that petroleum-related compounds were present in the vadose zone soil. TPH-DRO concentrations were detected in soil samples from borings SB-4, SB-5, SB-9 and SB-13. The TPH-DRO concentrations ranged from 22.1 milligrams per kilogram (mg/kg) in SB-13 to 7280 mg/kg in SB-4. TPH-DRO concentrations in soil samples from the remaining borings were below method detection limits. The mobile laboratory results indicate a similar distribution of contaminants as the OVA results. The TPH-DRO concentrations are shown on Figure 3-3.

Soil samples collected for laboratory analysis at SB01, SB04, and SB05 identified petroleum compounds characteristic of diesel fuel in vadose zone soils adjacent to the southwest corner of Building 300. The highest concentrations of petroleum constituents were detected in soil samples SB04 and SB05. The soil sample at SB04 contained naphthalene, 1-methylnaphthalene and 2-methylnaphthalene at concentrations of 19,500 micrograms per kilogram (ug/kg), 55,600 ug/kg, and 63,300 ug/kg, respectively. TRPH concentrations were detected in samples at SB04 and SB05 at 5,390 mg/kg and 2,020 mg/kg respectively. Concentrations of ethylbenzene and xylene were reported in the samples from SB04 and SB05. The highest concentrations of ethylbenzene and xylene were detected in SB04 at 1,260 ug/kg and 4,320 ug/kg, respectively. Soil quality data is summarized on Table 3-2.

3.3 WATER QUALITY

Groundwater quality results from the mobile laboratory field screening reported TPH-DRO constituents in groundwater grab samples collected from soil boring locations SB-4, SB-9, SB-12, SB-12, SB-13 and SB-14. The TPH-DRO concentrations ranged from 875 µg/l in SB-13 to 17,400 µg/l in SB-9. TPH-DRO concentrations in groundwater samples from the remaining soil borings were below method detection limits. TPH-DRO concentrations in groundwater are presented in Figure 3-4.

Groundwater laboratory results from samples collected from monitoring wells on April 23, 1997 reported the following:

Concentrations of volatile organic aromatics (VOAs) were reported below laboratory detection limits in groundwater samples collected from PCY-300-MW03 and PCY-300-MW04. Benzene was detected at 8.2 ug/L and 1.8 ug/L in samples collected from PCY-300-MW01 and PCY-300-MW02, respectively. These concentrations are above the FDEP target level of 1 ug/L for benzene, established in Chapter 62-770, FAC. Total VOAs (the total sum of benzene, toluene, ethylbenzene, and xylenes) concentrations were detected in samples from wells PCY-300-MW01 and PCY-300-MW02, at concentrations of 26 ug/L and 1.8 ug/L, respectively. These concentrations are below the FDEP target level of 50 ug/L for total VOAs. Benzene and total VOA groundwater concentrations are provided on Figure 3-5.

 TPH-DRO CONCENTRATION (ug/L)
DEPTH OF SAMPLE
- ND NOT DETECTED

500 ug/L DISSOLVED TPH-DRO

Low concentrations of 1,2-dichloroethane were reported in groundwater samples from PCY-300-MW01 and PCY-300-MW02, at concentrations of 2.1 ug/L and 1.7 ug/L, respectively. These concentrations are below the FDEP target level of 3.0 ug/L. Low levels of 1,2-dichloroethane were detected in the trip blank and equipment blank samples which may have attributed to the levels of 1,2-dichloroethane being detected in the groundwater samples. All other volatile organic halocarbon constituents were reported below laboratory detection limits in the remaining samples.

1,2-dibromoethane (EDB) was reported below laboratory detection limits in all samples analyzed.

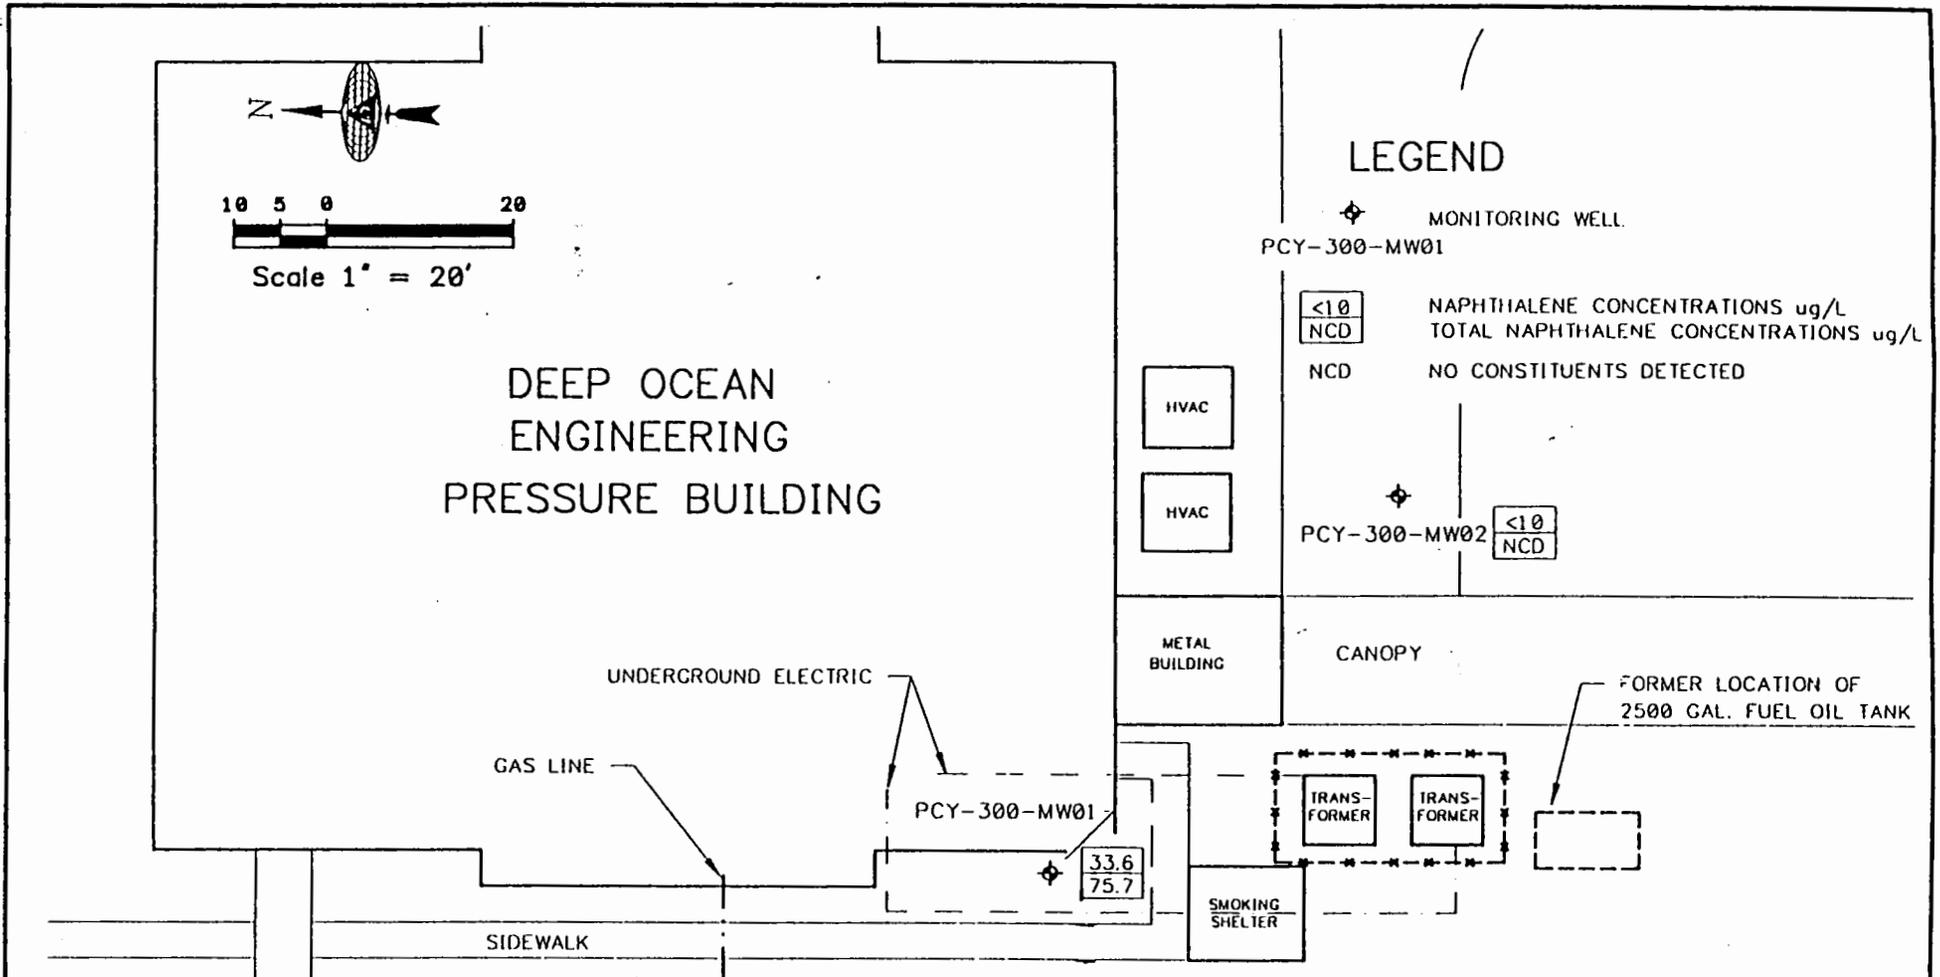

Concentrations of total PAHs (excluding naphthalene and methylnaphthalenes) were below laboratory detection limits in samples from PCY-300-MW01 and PCY-300-MW02, and PCY-300-MW04. A naphthalene concentration of 33.6 ug/L was reported in the groundwater sample collected from PCY-300-MW01. 1-Methylnaphthalene and 2-methylnaphthalene were detected in PCY-300-MW01 at concentrations of 18 ug/L and 24.1 ug/L, respectively. The total naphthalene concentration (sum of naphthalene and methylnaphthalenes) of 75.5 ug/L is below the FDEP target level of 100 ug/L for total naphthalene. Naphthalene and total naphthalene groundwater concentrations are shown on Figure 3-6.

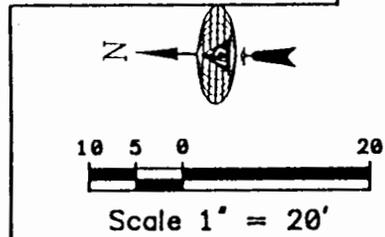

Groundwater samples from PCY-300-MW01 and PCY-300-MW02 detected TRPH concentrations at 3.95 mg/L and 0.846 mg/L, respectively. These concentrations are at levels below the TRPH target level of 5 mg/L. Groundwater TRPH concentrations are depicted on Figure 3-7.

Total lead was detected in groundwater samples from PCY-300-MW01 and PCY-300-MW02 at concentrations of 0.005 mg/L and 0.0094 mg/L, respectively. These concentrations are below the target level for lead established at 0.05 mg/L. Total lead groundwater concentrations are provided on Figure 3-8.

A summary of groundwater analytical results from the April 23, 1997 sampling event are presented in Table 3-3. Groundwater laboratory analytical results are provided as Appendix N. Field sampling forms are included in Appendix K.

4.0 DISCUSSION

"Excessively contaminated" soil, as defined by Chapter 62-770.200 FAC, was detected within the vadose zone by B&R Environmental during this CA. The "excessively contaminated soil" was identified at depths of 6 to 7 feet bls in an area adjacent to the day tank vent line which extends along the southwest corner of Building 300. These soils exhibited hydrocarbon staining, emitted diesel like odors, and generated headspace readings of greater than 50 ppm. Soil vapor analysis and TPH-DRO concentrations from the soil samples indicate the areal extent of "excessively contaminated soil" is limited to a small area south and southwest of the southwest corner of Building 300. The proximity of the building and the building's footers to the soil contamination makes it impractical to assess soil conditions beneath the building and/or remove the soil without adversely impacting the structural integrity of the building. "Excessively contaminated soil" at the southwest corner of the building was excavated to approximately 5 feet bls during the Tank Closure Assessment. This has minimized the amount of hydrocarbons available to leach from the soil matrix into the groundwater. Soil contamination, if present under the building, would be capped by the building foundation, restricting precipitation from percolating through the vadose zone soils, and would retard the leaching of petroleum hydrocarbons into the groundwater beneath the building. No hydrocarbon vapors were detected in soil samples collected during the Tank Closure Assessment for the 2,500 gallon diesel UST. The 2,500 gallon UST was located approximately 40 feet south of the southwest corner of Building 300. The absence of soil contamination near the former 2,500 gallon UST supports the overspill at the day tank vent line as being the point source for the diesel release. No free product was encountered during the CA.

Laboratory analysis of groundwater samples collected during the CA indicate dissolved hydrocarbon concentrations above FDEP target levels for benzene are present in the groundwater at the site. The highest benzene concentration of 8.2 ug/L was detected in source well PCY-300-MW01. Benzene was reported at a concentration of 1.8 ug/L in downgradient delineation well PCY-300-MW02, slightly above the FDEP target level of 1 ug/L. Benzene was reported at non-detectable levels in groundwater samples analyzed from the remaining perimeter wells. Naphthalene above the method detection limit was only detected in the source well PCY-300-MW01. Naphthalene and total naphthalenes were reported at non-detectable levels in groundwater samples from the remaining perimeter wells. The dissolved hydrocarbon plume appears to be oblate in shape and approximately 50 feet long by 20 feet wide. The plume is delineated by monitoring wells PCY-300-MW02, PCY-300-MW03 and PCY-300-MW04. Based on

petroleum hydrocarbon concentrations detected in monitoring wells downgradient from the site, Alligator Bayou does not appear to be threatened by the levels of hydrocarbons detected at the site.

The predominant soil type of the surficial aquifer is sand. No vertical delineation wells were installed due to the initial response activities to remove "excessively contaminated" soil at the time the surface spill was detected and the relatively low concentrations of dissolved hydrocarbons detected in the groundwater during the CA investigation.

Depth to water in the surficial aquifer was determined to be approximately 8 feet bls. No subsurface utilities were identified within the area of the dissolved hydrocarbon plume which could potentially intersect the water table and provide a preferential pathway for the migration of dissolved hydrocarbons. Subsurface gas, telephone, electric, and sewer lines were identified in the area however these utilities are typically completed at depths of 4 feet bls. The direction of groundwater flow for the surficial aquifer is toward the south-southeast toward Alligator Bayou. The groundwater flow velocity was calculated at 0.34 feet/day. The total dissolved solids content in the surficial aquifer in the area of CSS qualifies the aquifer as a G-II aquifer (Chapter 62-3.403 FAC).

The effects of tidal influence on the groundwater flow direction at the site is negligible. A sea wall constructed at Alligator Bayou restricts the natural flow of groundwater in the area and limits the effects of tidal influence. Alligator Bayou acts as the natural discharge point for the surficial aquifer downgradient of the site. However, the seawall does create a vertical component of groundwater flow as groundwater which normally discharges to the bayou tries to flow under and/or along the seawall.

No well fields and surface water intakes which supply drinking water to the local area are located within a 0.50-mile radius of the site. No domestic water wells were identified within 0.25-mile of the site. Surface water bodies and freshwater aquifers utilized in the study area are not likely to be threatened by the levels of hydrocarbons detected at the site.

5.0 CONCLUSIONS AND RECOMMENDATION

The results of the CA at CSS Building 300 suggest the following:

- Groundwater in the surficial aquifer at the site has a G-II classification;
- Private potable water wells were not identified within 0.25-mile radius of the site. Municipal well fields were not identified within a 0.50-mile radius of the site;
- During the CA "excessively contaminated" soil was encountered at 6 to 7 feet bls adjacent to the northwest corner of Building 300 near the day tank vent line.
- Given the close proximity of the excessively contaminated soil to Building 300, removal of the soil is impractical due to the potential impact on the structural integrity of the building; and
- Free product was not encountered at the site.

Analysis of groundwater samples from site monitoring wells show naphthalene being detected in groundwater above the State Target Level of 10 ug/L in monitor well PCY-300-MW01 and total naphthalene in the well at a concentration below the State Target Level of 100 ug/L. Naphthalene and total naphthalene were detected in PCY-300-MW01 at concentrations of 22.6 ug/L and 75.7 ug/L respectively. Well PCY-300-MW01 was the only well where concentrations of naphthalenes were detected in groundwater samples.

The remaining Kerosene Analytical Group parameters analyzed from groundwater samples were at non-detectable concentrations and/or at concentrations below FDEP target levels. Kerosene and Gasoline Analytical Group groundwater concentration criteria for No Further Action (NFA) criteria for G-II aquifer without wells is presented in Table 5-1 (FDEP, 1990).

Laboratory analytical results for groundwater samples indicate that the dissolved hydrocarbon concentrations meet the criteria established for No Further Action (NFA), as established in the FDEP's, October 1990, "No Further Action and Monitoring Only Guidelines for Petroleum Contaminated Sites", for all constituents of the Kerosene Analytical Group.

Evaluation of soil assessment data indicates that "excessively contaminated" soil, as defined by Chapter 62-770.200, FAC, is present at the site. The areal extent of the excessively contaminated soil is limited to a small area adjacent to the southwest corner of building 300, and

extends approximately 3 to 4 feet below the building footer. The proximity to the building footer makes it impracticable to remove the soil without adversely impacting the structural integrity of the building.

Although the dissolved hydrocarbon concentrations meet the criteria established for NFA, the site does not qualify for NFA due to the presence of excessively contaminated soil. Since it is impracticable to remove the excessively contaminated soil, it is recommended that a Monitoring Only Program (MOP) be implemented at the site. The MOP should include 6 months of monitoring for Total Volatile Organics and Polynuclear Aromatic Hydrocarbons using the following wells.

<u>Monitoring Well</u>	<u>Rationale</u>
PCY-300-MW01	Source well in area of highest dissolved hydrocarbons
PCY-300-MW02	Downgradient area of dissolved hydrocarbons
PCY-300-MW04	Upgradient of the area of dissolved hydrocarbons

If the dissolved hydrocarbon concentrations remain at or below NFA levels for two consecutive quarterly sampling events the site should be considered for NFA status.

DISCHARGE NOTIFICATION FORM AND FDEP CORRESPONDENCE

Florida Department of Environmental Regulation... Tallahassee, Florida 32399-2400

Form with fields for Discharge Reporting Form, Issue Date (December 19 1996), and DER Application No.

Discharge Reporting Form

Use this form to notify the Department of Environmental Regulation of:

- 1. Results of tank tightness testing that exceed allowable tolerances within ten days of receipt of test result.
2. Petroleum discharges exceeding 25 gallons on pervious surfaces as described in Section 17-761.460 F.A.C. within one working day of discovery.
3. Hazardous substance (CERCLA regulated), discharges exceeding applicable reportable quantities established in 17-761.460(2) F.A.C., within one working day of the discovery.
4. Within one working day of discovery of suspected releases confirmed by: (a) released regulated substances or pollutants discovered in the surrounding area...

Subject: Initial Remedial Action follow-up report

Dear Mr. Ericson:

This is a follow-up to our letter of September 23, 1996 (faxed on 9/20/96) regarding the initial remedial action in the vicinity of our AST #G300R1.

This initial remedial action was abandoned on 9/23/96 after it became apparent that the amount of excessively contaminated soil was not the result of just the discharge discovered and reported on 9/17/96. We believe that this contamination resulted from various generator day-tank overfills since 1972.

It is our intent at this time to fill the hole with clean backfill and to initiate a Contamination Assessment Report in accordance with F.A.C. Rule 62-770.

If you require additional information at this time, please call me at (904) 234-4743 or Mike Cross at (904) 234-4744. I will be out of the office until Monday, 10/7/96.

Subject: Re: Initial Remedial Action - Coastal Systems Station

Regarding the Discharge Reporting Form which reported a 9/17/96 discovery of contamination at Coastal Systems Station (DEP #03/8518667 and Navy Tank #G300R1), this office referred the initial investigation of the discovery to the Bay County Public Health Unit (BCPHU). The BCPHU is under contract with the DEP to investigate initial discoveries of contamination as well as perform annual inspections of all regulated pollutant storage tanks in Bay County, Florida.

Mr. Drew Pinkovsky or his associate from the BCPHU will perform an inspection of this discovery and a letter to perform a Florida Chapter 62-770 Remedial Action should be sent by his office. From that point on, our Federal Facilities Coordinator, Mr. Eric Nuzie will become your point of contact related to submittals and reviews of Chapter 62-770 technical documents. In the Pensacola DEP District Office, we are concerned about what happens in our District, but we feel that it would be most appropriate if you eliminated us, the "middleman" from your technical document submittals.

Although you will be submitting the Chapter 770 cleanup documents to Mr. Nuzie, if it is possible, will you please send copies of your letters of transmittals to Mr. Nuzie to us at our District Office? Sending the District Office copies of the letters of transmittals is not required, but it will help us monitor your progress.

If we can help, please feel free to call.

Drew Pinkovsky - Bay County Public Health Unit - (904) 872-4815
Eric Nuzie - FDEP Federal Facilities Coordinator - (904) 488-3935
Eric Ericson - FDEP Northwest District - (904) 444-8360

Thanks,

Eric Ericson, Supervisor
Storage Tank Section

Naval Surface Warfare Center
Coastal Systems Station
Panama City, Bay County, Florida

2.0 Operator

Commanding Officer, Coastal Systems Station
Dahlgren Division, Naval Surface Warfare Center
6703 West Highway 98, Code 051 EMC
Panama City, Florida 32407-7001

3.0 Site Location

See Figure 1.

4.0 Date of Closure

17 September 1996

5.0 Tank Status

There was one 2500 gallon underground storage tank (UST) removed from the southwest corner of Building 300 by the Public Works Center (PWC) as depicted by Figure 2. The UST was emptied prior to commencement of work by the Coastal Systems Station (CSS). The UST was completely decontaminated and rendered unuseable by PWC. The UST was properly disposed as scrap metal.

6.0 Tank Contents

Diesel

7.0 Tank Condition

The UST was in good condition at the time of removal.

8.0 Tank Area

The size of the excavation, was approximately twelve (12) feet wide by twenty (20) feet long and eight (8) feet deep. The excavation was filled with clean fill and compacted to grade.

9.0 Soil Screening

- Seven (7) soil samples were collected for headspace screening with an organic vapor analyzer (OVA). The samples were extracted at each side and underneath the UST is depicted by Figure 2.
- The soil screening was conducted in accordance with the headspace screening criteria in Chapter 62-770 FAC and PWC's Comprehensive Quality Assurance Plan.

10.0 Groundwater Analysis

A temporary groundwater monitoring well was placed at the center of the UST excavation, the well was developed and groundwater samples were collected on 25 March 1997. The samples were transported to the PWC Laboratory in Pensacola, Florida. The samples were analyzed using U.S. Environmental Protection Agency (EPA) Methods 8260 and 8270.

11.0 Conclusions

There were no indications of petroleum contamination noted above the state target levels for storage tank closures.

There were low levels of Chloroform, Bromodichloromethane, and Dibromochloromethane. The levels were below the State of Florida Drinking Water Standards (62-550.310 (2)(a)). There may be a leak in the local water supply or water treatment systems.

12.0 Recommendations

No further action.

13.0 Closure Assessment

Performed by the Public Works Center (PWC) Pensacola, Florida.

14.0 Project Manager

Mr. Paul R. Semmes, P.E.

15.0 Project Number

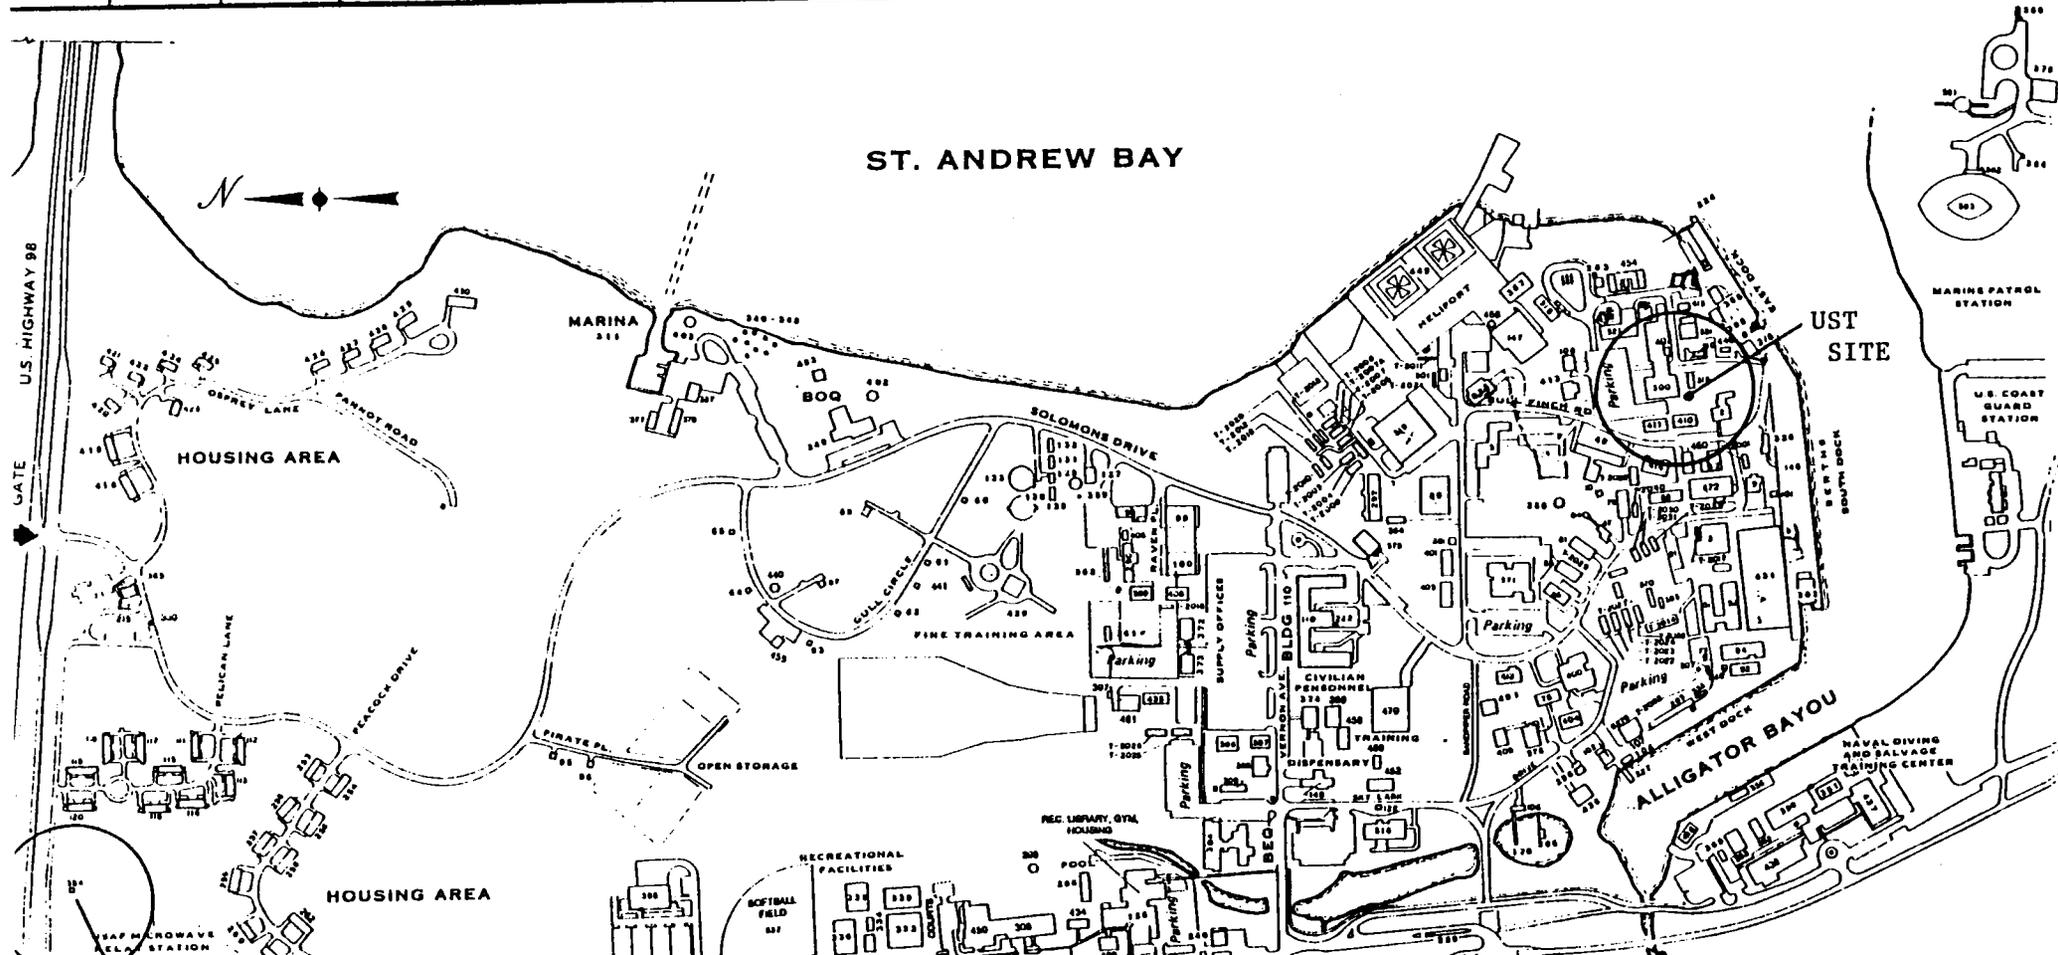

1395003

16.0 Report Date

APPLICATION FOR CLOSURE OF POLLUTANT STORAGE TANK SYSTEM

Provide the facility information requested below.

FDEP Facility # 03/8518667 Facility Name U. S. Navy

Facility Location Naval Surface Warfare Center, Coastal Systems Station

Property Owner Commanding Officer, NSWCCSS (Code CP2F)

Property Owner Address 6703 West Highway 98, Panama City, FL 32407-7001

Phone (904) 235-5859

Method of Tank Closure Removal

Pollutant Storage Systems Specialty Contractor (PSSSC) who will be on site supervising closure activities. Attach copy of PSSSC license.

Individual Licensed as PSSSC N/A PSSSC # N/A

Firm U.S. Navy - Public Works Center (PWC)

Address 310 John Tower Road, Pensacola, FL 32508

Indicate the firm (s) that will degas, remove, and transport the tank(s), and the method of degassification.

Degassification Method Air Eduction (API 1604-4.2.5)

Firm Removing Tanks U.S. Navy - Public Works Center (PWC)

Contact Mr. Paul Semmes, P.E. Phone (904) 293-0635

Firm Transporting Tanks U. S. Navy - Public Works Center (PWC)

Contact Mr. Paul Semmes, P.E. Phone (904) 293-0635

Firm Receiving Tanks for Ultimate Disposal U.S. Navy - DRMO

Contact Ms. Gayle Brown Phone (904) 452-3459

Indicate the laboratory that will conduct groundwater analysis.

Contracted Laboratory U.S. Navy - PWC Phone (904) 452-4728

Contact Mr. Joe Moore FDEP QA/QC 920121G

Indicate firm(s) transporting and disposing of contaminated soils.

Firm Transporting Soils N/A

Contact _____ Phone _____

Firm Remediating/Disposing Soils _____

Contact _____ Phone _____

Disposal/Remediation Method _____

Indicate the firm(s) that will transport and ultimately dispose of residual product and sludge from the tanks.

Firm Transporting Residual Product and Sludge U.S. Navy - PWC

Contact Mr. Jerry Levins Phone (904) 452-8237

Firm Receiving/Disposal Residual Product and Sludge DRMO

Contact Ms. Gayle Brown Phone (904) 452-3459

Indicate the firm and names of personnel that will conduct field sampling.

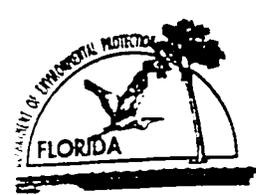

Contracted Firm U.S. Navy - Public Works Center (PWC)

Contact Mr. Paul Semmes, P.E. Phone (904) 293-0635

Person (s) Sampling Mr. Paul Semmes, P.E.

Equipment used for soil screening (Specific Make and Model) Organic Vapor Analyzer

(OVA) Thermo Environmental (680 HVM) equipped w/Flame Ionization Detector (FID).

Florida Department of Environmental Protection

Twin Towers Office Bldg. • 2600 Blair Stone Road • Tallahassee, Florida 32399-2400

DEP Form # 62-761.200(5)
Underground Storage Tank Installation
Form Title: Removal Form for Certified Contractors
Effective Date: December 10, 1990
DEP Application No. (Filed in by DEP)

Underground Storage Tank Installation and Removal Form
For Certified Contractors

Pollutant Storage Systems Contractor as defined in Section 489.105, Florida Statutes (certified contractors as defined in Section 62-761.200, Florida Administrative Code) shall use this form to certify that the installation, replacement or removal of the storage tank system(s) located at the address listed below was performed in accordance with Department Reference Standards.

General Facility Information

- 1. DEP Facility Identification No.: 03/8518667
2. Facility Name: US NAVY - NSWC, CSS Telephone: (904) 235-5859
3. Street Address (physical location): 6703 WEST HIGHWAY 98, PANAMA CITY, FLORIDA 32407 - 7001
4. Owner Name: COMMANDING-OFFICER, NSWC, CS Telephone: (904) 235-5859
5. Owner Address: CO, NSWC, SS (CODE CP25) 6703 WEST HIGHWAY 98, PANAMA CITY, FL 32407
6. Number of Tanks: a. Installed at this time 0 b. Removed at this time 1
7. Tank(s) Manufactured by: UNKNOWN
8. Date Work Initiated: 17 SEPTEMBER 1996 9. Date Work Completed: 17 SEPTEMBER 1996

Underground Pollutant Tank Installation Checklist

Please certify the completion of the following installation requirements by placing an (X) in the appropriate box.

- 1. The tanks and piping are corrosion resistant and approved for use by State and Federal Laws.
2. Excavation, backfill and compaction completed in accordance with NFPA (National Fire Protection Association) 30(96), API (American Petroleum Institute) 1615, PEI (Petroleum Equipment Institute) RP100-94 and the manufacturers' specifications.
3. Tanks and piping pretested and installed in accordance with NFPA 30(96), API 1615, PEI/RP100-94 and the manufacturers' specifications.
4. Steel tanks and piping are cathodically protected in accordance with NFPA 30(96), API 1632, UL (Underwriters Laboratory) 1746, STI (Steel Tank Institute) R892-89 and the manufacturers' specifications.
5. Tanks and piping tested for tightness after installation in accordance with NFPA 30(96) and PEI RP100-94.
6. Monitoring well(s) or other leak detection devices installed and tested in accordance with Section 62-761.640, Florida Administrative Code (F.A.C.)
7. Spill and overflow protection devices installed in accordance with Section 62-761.500, F.A.C.
8. Secondary containment installed for tanks and piping as applicable in accordance with Section 62-761.500, F.A.C.

Please Note: The numbers following the abbreviations (e.g. API 1615) are publication or specification numbers issued by these institutions.

Underground Pollutant Tank Removal Checklist

- 1. Closure assessment performed in accordance with Section 62-761.800, F.A.C.
2. Underground tank removed and disposed of as specified in API 1604 in accordance with Section 62-761.800, F.A.C.

Certification

I hereby certify and attest that I am familiar with the facility that is registered with the Florida Department of Environmental Protection; that to the best of my knowledge and belief, the tank installation, replacement or removal at this facility was conducted in accordance with Chapter 489 and Section 376.303, Florida Statutes and Chapter 62-761, Florida Administrative Code (and its adopted reference sources from publications and standards of the National Fire Protection Association (NFPA), the American Petroleum Institute (API), the National Association of Corrosion Engineers (NACE), American Society for Testing and Materials (ASTM); Petroleum Equipment Institute (PEI); Steel Tank Institute (STI); Underwriters Laboratory (UL); and the tank and integral piping manufacturers' specifications; and that the operations on the checklist were performed accordingly.

The owner or operator of the facility must register the tanks with the Department upon completion of the installation. The installer must submit this form no more than 30 days after the completion of installation to the Department of Environmental Protection at the address printed at the top of page one.

Form Title: Closure Assessment Form
Effective Date: December 10, 1990
DEP Application No. (Filed in by DEP)

Closure Assessment Form

of storage tank systems that are replacing, removing or closing in place storage tanks shall use this form to demonstrate that a storage closure assessment was performed in accordance with Rule 62-761.800(3) or 62-762.800(3), Florida Administrative Code.

Please Print or Type
Complete All Applicable Blanks

- 1. Date 21 FEBRUARY 1997
2. DEP Facility ID Number: 03/8518667 3. County BAY
4. Facility Name: US NAVY - NAVAL SURFACE WARFARE CENTER, COASTAL SYSTEMS STATION
5. Facility Owner: COMMANDING OFFICER, NSWC CSS, CODE CP2F
6. Facility Address: BUILDING 300, COASTAL SYSTEMS STATION
7. Mailing Address: 6703 WEST HIGHWAY 98, PANAMA CITY, FLORIDA 32407-7001
8. Telephone Number: (904) 235-5859 9. Facility Operator: MR MIKE CLAYTON
10. Are the Storage Tank(s): (Circle one or both) A. Aboveground or B. Underground
11. Type of Product(s) Stored: DIESEL
12. Were the Tank(s): (Circle one) A. Replaced B. Removed C. Closed in Place D. Upgraded (aboveground tanks only)
Number of Tanks closed: ONE 14. Age of Tanks:

Facility Assessment Information

- Yes No Not Applicable
1. Was a Discharge Reporting Form submitted to the Department?
If yes, When: Where:
2. Is the depth to ground water less than 20 feet?
3. Are monitoring wells present around the storage system?
If yes, please specify Vapor Monitoring Water Monitoring
4. Is there free product present in the monitoring wells or within the excavation?
5. Were the petroleum hydrocarbon vapor levels in the soil greater than 500 parts per million for gasoline?
Specify sample type: Vapor Monitoring wells Soil sample(s)
6. Were the petroleum hydrocarbon vapor levels in the soils greater than 50 parts per million for diesel/kerosene?
Specify sample type: Vapor Monitoring wells Soil sample(s)
7. Were the analytical laboratory results of the ground water sample(s) greater than the allowable state target levels?
(See target levels on reverse side of this form and supply laboratory data sheet(s).)
8. If a used oil storage system, did a visual inspection detect any discolored soil indicating a release?
9. Are any potable wells located within 1/4 of a mile radius of the facility?
10. Is there a surface water body within 1/4 mile radius of the site? If yes, indicate distance: 300 ft.
11. A detailed drawing or sketch of the facility that includes the storage system location, monitoring wells, buildings, storm drains, sample locations, and dispenser locations must accompany this form.
12. If a facility has a pollutant storage tank system that has both gasoline and kerosine/diesel stored on site, both EPA method 602 and EPA method 610 must be performed on the ground water samples.

DEP Form # 62-761.900(1)
Form Title: Closure Assessment Form
Effective Date: December 18, 1998
DEP Application No. _____ (Filled in by DEP)

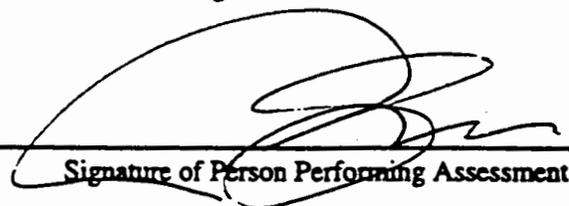

13. Amount of soils removed and receipt of proper disposal.
14. If yes is answered to any one of questions 5-9, a Discharge Reporting Form 62-761.900(1) indicating a suspected release shall be submitted to the Department within one working day.
15. A copy of this form and any attachments must be submitted to the Department's district office in your area and to the county within 60 days of completion of tank removal or filling a tank with an inert material.

Subj: FUEL SPILL INVESTIGATION SUMMARY

Encl: (1) Summary of the Command Investigation of the Building 300 Fuel Spill of
7 Sep 96

1. Enclosure (1) is forwarded as requested.

J. R. WILKINS III

**Summary of the Command Investigation of the Building 300 Fuel Spill of
7 September 96**

Attachment: Southern Earth Sciences Soil Core Sample Data Sheets

The following is a summary of the Command Investigation which determined the cause and estimated the extent of a diesel fuel spill that occurred 07 September 96 outside the NEDU Ocean Simulation Facility (OSF), Building 300. The extent of the spill was estimated using Emergency Diesel Generator (EDG) Operation Logs and fuel consumption data from the EDG manufacturer.

Findings of Fact

On 7 September 96, a Navy sailor standing watch at NEDU started the EDG day tank refueling pump in the manual mode. The tank has a float level that indicates the fuel level. The sailor left the pump running unattended for approximately one hour, and the day tank was filled beyond capacity...

While the day tank is equipped with a piping system that returns excess fuel to the source tank, because that piping is the same internal diameter as the supply piping, it could not accommodate the seven gallon per minute delivery rate of the EDG day tank fuel pump. As a result, fuel was displaced into the day tank vent pipe, which extends outside the OSF, at the Southwest corner the building, approximately 10 feet above the top of the day tank. Eventually, fuel reached the end of the vent pipe, spilling to the ground at the Southwest corner of the OSF.

During a security check approximately one hour after leaving the pump unattended, the sailor discovered a diesel fuel spill on the floor in the OSF machinery spaces, at the base of the day tank. Realizing he'd left the pump running, he immediately shut it off. The spill was less than two quarts, and the sailor immediately took affirmative steps to clean it up, using a mop and absorbent pads. At that time, he was not aware that the spill had occurred outside the OSF.

The outside spill was discovered on 16 Sep 96, by a Florida State inspector, who was at NEDU to inspect an unused underground fuel tank that was being removed, and noticed the smell at the site of the spill. A crew was assigned to excavate the area of the spill, in an attempt to remove all fuel contaminated-soil. Soil was removed to about four feet below the surface, placed in a large dumpster, and covered with plastic sheeting until it could be properly disposed.

Subsequently, NEDU commissioned Southern Earth Science Co., Panama City, FL, to characterize the impact of the spill on the soil surrounding the OSF; the results of that study were provided to NEDU 20 Sep 96. Soil core samples were taken in the immediate area of the spill, and along the walls extending from the corner (see

Enclosure (1)

enclosure). These samples strongly suggest a long history of repeated diesel fuel spills in the vicinity from other sources, as high concentrations of diesel fuel were found 10 feet deep, as far as approximately 8 feet from the corner along the South wall, and 24 feet from the corner along the West wall.

The outside diesel fuel tank has a capacity of 750 gallons. The last time it was filled prior to this incident was on 28 Mar 96. Since then, the EDG had been run a total of approximately 34.1 hours. The published EDG fuel consumption rates were used to characterize fuel consumption, based on the average electrical load the EDG was sustaining during each recording period. Based on this analysis, approximately 522 gallons had been consumed by running the EDG since 28 Mar 96.

On 24 Sep 96, the outside EDG tank was refilled, taking 654 gallons to fill it to capacity, suggesting the outside tank still held approximately 95 gallons of fuel. This accounts for a total of approximately 617 gallons of diesel fuel, leaving approximately 132 gallons unaccounted for, and presumed spilled outside the OSF in the vicinity of the vent pipe during this incident.

APPENDIX F

HEADSPACE METHODOLOGY FOR DETERMINING SOIL ORGANIC VAPOR CONCENTRATIONS

HEADSPACE METHODOLOGY FOR DETERMINING SOIL ORGANIC VAPOR CONCENTRATION

Soil headspace readings were obtained utilizing the following method which conforms to the requirements of Rule 62-770.200(2), FAC.

Two 16 ounce glass soil jars were half-filled with soil sample (duplicate samples). The soil jars were then sealed utilizing "mason jar" type open top screw on caps with foil in place of the conventional solid jar tops. The soil samples were allowed to equilibrate to ambient temperature which was within the FDEP temperature range.

The samples were tested with a Foxboro Century 128, an organic vapor analyzer (OVA) equipped with a flame ionization detector (FID). Prior to each days activities, the OVA was field calibrated with 100 ppm methane in air, in accordance with the manufacturers specifications. Sample testing was performed by inserting the OVA probe through the foil sample cover and recording the highest OVA reading. Following collection of this OVA reading, the OVA was fitted with a granular activated carbon filter probe. The OVA was then used to test the headspace above the duplicate sample. Carbon absorbs petroleum hydrocarbons and thus the filtered reading is assumed to represent naturally occurring organic vapors.

Upon completion of the screening exercise, the carbon filtered result was subtracted from the un-filtered result, to obtain a net petroleum vapor value. In accordance with Rule 17(62)-770.200(2), FAC, and Guidelines for Assessment and Remediation of Petroleum Contaminated Soil (May 1994) corrected headspace levels in excess of 50 ppm is defined as excessively contaminated soil for diesel contaminated soil. Corrected headspace levels in excess of 10 ppm but less than 50 ppm are considered as contaminated, though not excessively contaminated.

APPENDIX K

FIELD MEASUREMENTS AND SAMPLING FORMS

Brown & Root Environmental SAMPLING LOG Page 1 of 1

BRE Project No: 7540 Date: 3/11/97 Sampler(s): G. & Good

Client Site ID: CTD0027 Facility Address:

Weather: Overcast 70°F Sampling Method: Teflon Bailer Y (N) Other NA SOP Cleaning (N)

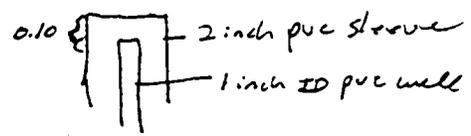

Comments: well development: purged 2 gallons from well using peristaltic pump and tygon tubing. Used new section of tygon tubing for development.

GROUNDWATER SYSTEM PERFORMANCE AND QUALITY CONTROL SAMPLES										TEST PARAMETERS			
A	B	C	D	E	Sample ID	Time	Source	pH	Temp.	Sp. Cond.	Test Method	Container Type	Preserv. Type
							GWS Influent				A		
							GWS Effluent				B		
							Equipment Blank				C		
							Equipment Blank				D		
							Tra Blank				E		
							Duplicate 1						
							Duplicate 1						

GROUNDWATER SAMPLES							TD	Csg Dia (in)	DTW	Purge Vol		
			PZ-2	8:45		6.95	21.3	560	14'	1"	8.37	2 gal
				8:55		6.97	19.7	320				
				9:05		6.99	19.4	290				
Water visually clear after development												
Total depth of well measured at 14' b/s												

UNITS: TEMPERATURE = DEGREES CELSIUS/pH = STANDARD UNITS/SPECIFIC CONDUCTANCE = UMHOS/CM
WELL CASING VOLUMES (GALLONS/FT OF SATURATED CASING, FOR 5x PURGE) 1.25" = 0.32 / 2" = 0.32 / 4" = 3.27 / 6" = 7.35
NOTE: A 3x PURGE IS OK FOR: 4" = 1.96 / 6" = 4.41. PROVIDED 3 CONSISTENT REPEAT FIELD METER READINGS ARE OBSERVED

Depth to groundwater taken from reverse side of top of sleeve casing (2-inch PVC)

APPENDIX L

SLUG TEST DATA AND HYDRAULIC CONDUCTIVITY CALCULATIONS

HYDRAULIC CONDUCTIVITY GEOMETRIC MEAN

The Bouwer and Rice methodology for partially penetrating wells in unconfined aquifers was utilized to calculate hydraulic conductivity values for the three wells (Bouwer, 1989; Bouwer and Rice, 1976). Calculations were performed using the Aqtesolv™ aquifer characterization program (Duffield and Rumbaugh, 1991). The slug test data and Aqtesolv™ results are included in this appendix. Hydraulic conductivity (K) values in the aquifers immediately surrounding the monitoring wells were calculated to be:

$$\text{PCY-300-MW02} = 0.005074 \text{ feet/min} = 2.58 \times 10^{-3} \text{ cm/sec}$$

$$\text{PCY-300-MW03} = 0.01451 \text{ feet/min} = 7.37 \times 10^{-3} \text{ cm/sec}$$

$$\text{PCY-300-MW04} = 0.004891 \text{ feet/min} = 2.48 \times 10^{-3} \text{ cm/sec}$$

The average hydraulic conductivity was determined by calculating the geometric mean of the three values as follows:

$$\begin{aligned} &= e^{\left[\frac{\ln x_1 + \ln x_2 + \dots + \ln x_n}{n} \right]} \\ &= e^{\left[\frac{\ln x_1 + \ln x_2 + \ln x_3}{3} \right]} \\ &= e^{\left[\frac{\ln(0.005074 \text{ ft/min}) + \ln(0.01451 \text{ ft/min}) + \ln(0.004891 \text{ ft/min})}{3} \right]} \\ &= e^{\left[\frac{-14.84 \text{ ft/min}}{3} \right]} \\ &= 0.007114 \text{ ft/min} \\ &= 3.61 \times 10^{-3} \text{ cm / sec} \\ &= 10.24 \text{ ft/day} \end{aligned}$$

SLUG TEST METHOD FOR UNCONFINED AQUIFERS

REFERENCE: Bouwer, H. and R. C. Rice, 1976. A slug test method for determining hydraulic conductivity of unconfined aquifers with completely or partially penetrating wells, Water Resources Research, vol. 12, no. 3, pp. 423-428.

SOLUTION:

$$\ln s_0 - \ln s_t = \frac{2 K L t}{r_c^2 \ln(r_e/r_w)}$$

where:

s_0 = initial drawdown in well due to instantaneous removal of water from well [L]

s_t = drawdown in well at time t [L]

L = length of well screen [L]

r_c = radius of well casing [L]

$\ln(r_e/r_w)$ = empirical "shape factor" determined from tables provided in Bouwer and Rice (1976)

r_e = equivalent radius over which head loss occurs [L]

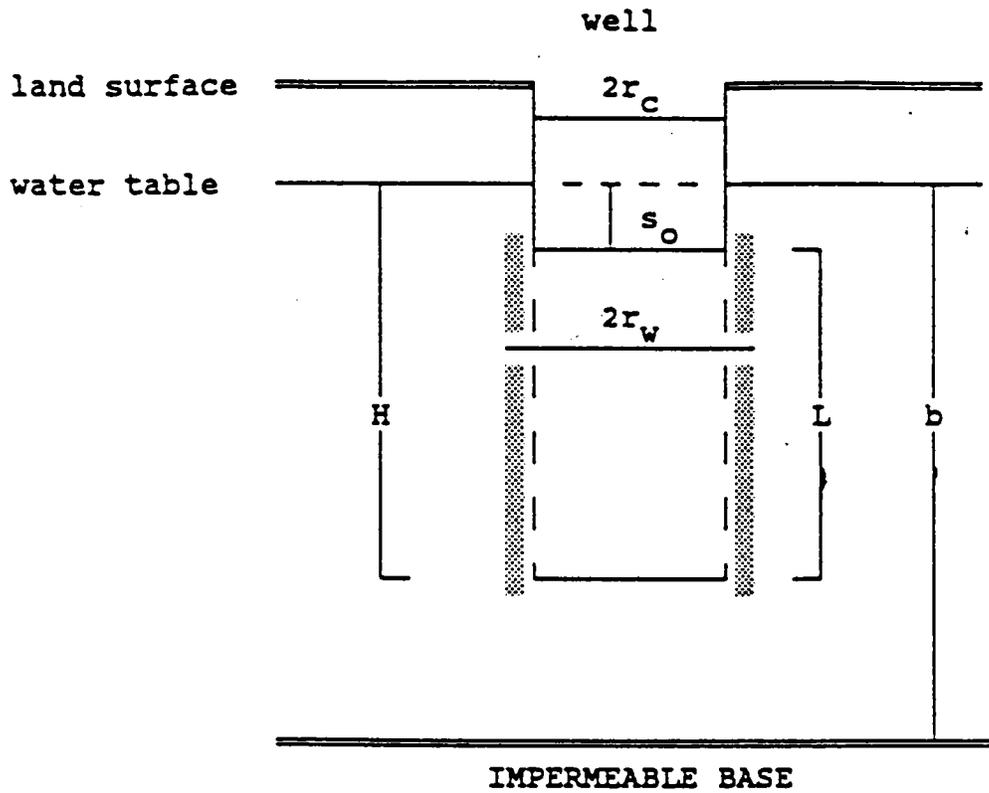

r_w = radius of well (including gravel pack) [L]

H = static height of water in well [L]

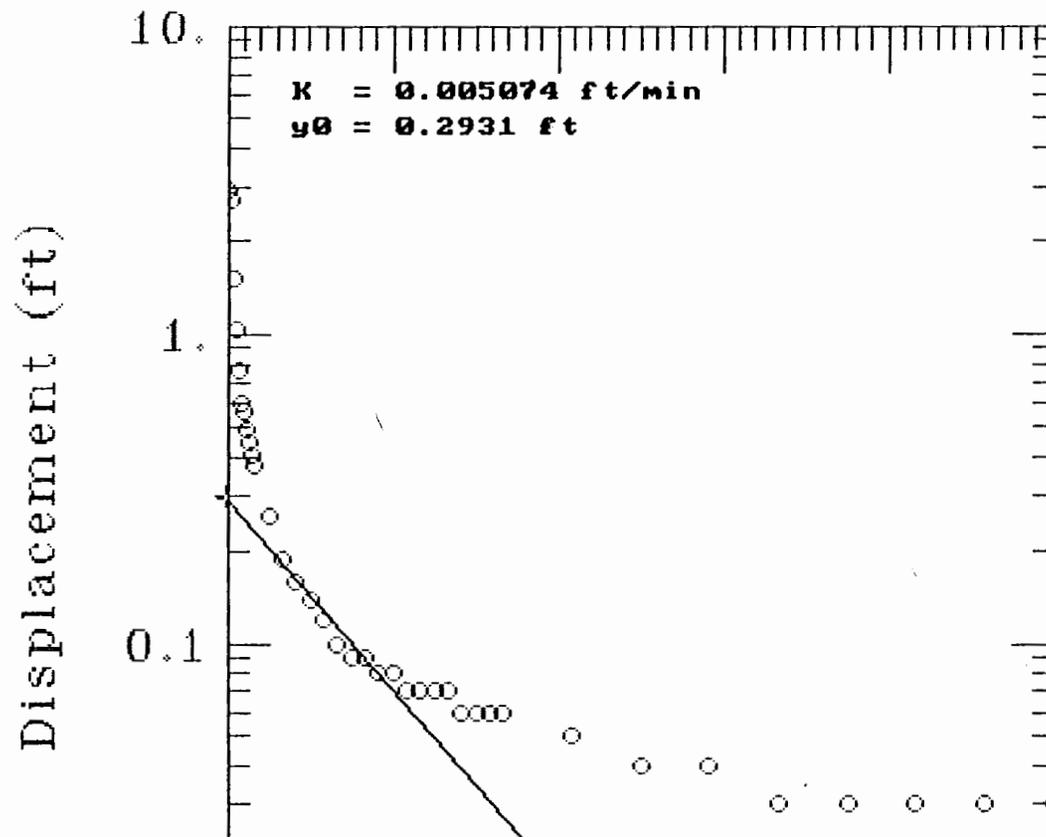

b = saturated thickness of aquifer

APPENDIX M

**GROUNDWATER GRADIENT, GROUNDWATER FLOW, AND
TRANSMISSIVITY CALCULATIONS**

GROUNDWATER FLOW GRADIENT

The groundwater flow gradient was determined using the following equation:

$$i = \frac{h_1 - h_2}{d}$$

where:

i = the hydraulic gradient

h_1 = the water elevation at point 1

h_2 = the water elevation at point 2

d = the distance between point 1 and point 2

The distance and groundwater elevations were obtained from Figure 3-1.

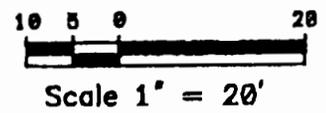

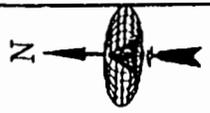

April 23, 1997

The gradient across the site was calculated after constructing groundwater contours from the April 23, 1997, depth to water data, determining the perpendicular distance between two of these contours, and utilizing the following calculation:

$$i = \frac{1.63 \text{ ft} - 1.30 \text{ ft}}{47 \text{ ft}}$$

$$i = \frac{0.33 \text{ ft}}{47 \text{ ft}}$$

$$i = 0.01 \text{ ft/ft}$$

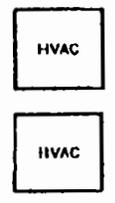

$$\Delta H = 0.30 \text{ Ft.}$$
$$d = 47 \text{ Ft.}$$

$$\frac{\Delta H}{d} = \frac{0.30 \text{ Ft.}}{47 \text{ Ft.}} = .01$$

FORMER LOCATION OF
2500 GAL. FUEL OIL TANK

GROUNDWATER FLOW VELOCITY

Potential movement of groundwater at the site may be described in terms of transportation by natural flow system in the saturated zone, assuming groundwater flow follows Darcy's Law. Darcy's Law may be expressed as:

$$V = \left(\frac{K}{n} \right) \times i$$

where:

V = average velocity

K = hydraulic conductivity = 10.24 ft/day

n = effective porosity (assumed) = 0.30

i = average hydraulic gradient = 0.01 ft/ft

therefore:

$$V = \left(\frac{10.24 \text{ ft/day}}{0.30} \right) \times 0.01 \text{ ft/ft}$$

$$V = 0.34 \text{ ft/day}$$

TRANSMISSIVITY

Transmissivity can be determined by multiplying the hydraulic conductivity by the effective aquifer thickness (b_e). The effective aquifer thickness is defined as depth to the top of the water table to (approximately 8 feet bls) to the top of a limestone of the Intracoastal Formation (encountered at CSS at depths of 48 feet and 63 feet bls) The transmissivity was calculated as follows:

$$T = Kb_e$$

where:

T = transmissivity

K = hydraulic conductivity = 10.24 ft/day

b_e = affected aquifer thickness = 48 ft

therefore:

$$T = 10.24 \text{ ft/day} \times 48 \text{ ft}$$

$$T = 4.92 \times 10^2 \text{ ft}^2/\text{day} \times 7.48 \text{ gal/ft}^3$$

$$T = 3.68 \times 10^2 \text{ gal/day/ft}$$

Note: Depth to Intracoastal Formation obtained from data presented in the RCRA Facility Investigation Report (ABB Environmental Services, Inc., 1995).

10061-01-5	cis-1,3-Dichloropropene	ND	1.0	ug/l	
124-48-1	Dibromochloromethane	ND	1.0	ug/l	
75-71-8	Dichlorodifluoromethane	ND	1.0	ug/l	
75-34-3	1,1-Dichloroethane	ND	1.0	ug/l	
107-06-2	1,2-Dichloroethane	2.2	1.0	ug/l	
75-35-4	1,1-Dichloroethene	ND	1.0	ug/l	
156-60-5	trans-1,2-Dichloroethene	ND	1.0	ug/l	
10061-02-6	trans-1,3-Dichloropropene	ND	1.0	ug/l	
78-87-5	1,2-Dichloropropane	ND	1.0	ug/l	
100-41-4	Ethylbenzene	ND	1.0	ug/l	
75-09-2	Methylene chloride	ND	5.0	ug/l	
1634-04-4	Methyl Tert Butyl Ether	ND	1.0	ug/l	
79-34-5	1,1,2,2-Tetrachloroethane	ND	1.0	ug/l	
127-18-4	Tetrachloroethene	ND	1.0	ug/l	
108-88-3	Toluene	ND	1.0	ug/l	
71-55-6	1,1,1-Trichloroethane	ND	1.0	ug/l	
79-00-5	1,1,2-Trichloroethane	ND	1.0	ug/l	
79-01-6	Trichloroethene	ND	1.0	ug/l	
75-69-4	Trichlorofluoromethane	ND	1.0	ug/l	
75-01-4	Vinyl chloride	ND	1.0	ug/l	
541-73-1	1,3-Dichlorobenzene	ND	1.0	ug/l	
106-46-7	1,4-Dichlorobenzene	ND	1.0	ug/l	
95-50-1	1,2-Dichlorobenzene	ND	1.0	ug/l	
1330-20-7	Xylenes (total)	ND	3.0	ug/l	
156-69-4	cis-1,2-Dichloroethene	ND	1.0	ug/l	
540-59-0	1,2-Dichloroethene (total)	ND	2.0	ug/l	

ND = Not detected

RDL = Reported Detection Limit

E = Indicates value exceeds calibration range

J = Indicates an estimated value

B = Indicates that analyte is found in associated method blank

N = Indicates presumptive evidence of a compound

Report of Analysis

Client Sample ID: 300-MW04-001	Date Sampled: 04/23/97
Lab Sample ID: F582-2	Date Received: 04/25/97
Matrix: AQ - Ground Water	Percent Solids: n/a
Method: EPA 601/602	
Project: Site G300 CTO 0027	

	File ID	DF	Analyzed	By	Prep Date	Prep Batch	Analytical Batch
Run #1	EF002007.D	1	04/25/97	AW	n/a	n/a	GEF50
Run #2							

VOA PPL List

CAS No.	Surrogate Recoveries	Run# 1	Run# 2	Limits
460-00-4	4-Bromofluorobenzene	94%		75-125 %
