## RECORD OF DOCUMENT CHANGES

Revisions to this document were made based on comments received from the U.S. Environmental Protection Agency, Florida Department of Environmental Regulation, Florida Department of Natural Resources, and National Oceanic and Atmospheric Administration. All revisions are in bold and enclosed in brackets to denote changes to the last version of this document.

## EXECUTIVE SUMMARY

As part of the U.S. Navy's Installation Restoration Program, Phase I of the Contamination Assessment/Remedial Activities Investigation was conducted for the Dredge Spoil Fill Area (Site 14), located on the Naval Air Station in Pensacola, Florida. This work was performed by Ecology and Environment, Inc., (E & E) under contract to the U.S. Navy, Southern Division, Naval Facilities Engineering Command.

Site 14 is a dredge spoil fill area created in the late 1970s from the dredging of Pensacola Bay to create an aircraft carrier turning basin and port. The objective of the Phase I investigation at Site 14 was to identify principal areas and primary contaminants of concern at the site and to provide recommendations for subsequent phases of investigation. The recommendations for additional work at Site 14 are presented under a separate cover. The Phase I tasks included aerial photograph and existing data analysis; site reconnaissance; habitat/biota survey; surface emissions survey and particulate air sampling; radiation survey; utilities survey; the collection and analysis of sediment, soil, and groundwater samples; and a hydrologic assessment.

The results of this investigation indicate that sediment, soil, and groundwater contamination are present on and in the vicinity of Site 14. Metals, total recoverable petroleum hydrocarbons (TRPHs), volatile organic compounds (VOCs), polynuclear aromatic hydrocarbons (PAHs), and phenols are the primary contaminants. Some of the detected contamination is clearly associated with the dredge spoil contained within the fill area. However, additional sources of contamination are apparently impacting Site 14.

Two areas of sediment contamination appear to be present in water bodies surrounding the dredge spoil fill area. **An exposed clay layer along the eastern shoreline** exhibited slightly to moderately elevated levels of metals, TRPHs, PAHs, and phenols, similar to the concentrations found in soil samples collected from the fill area. Sediment samples collected in a drainage way from Chevalier Field near the southwestern corner of the site showed evidence of TRPE and PAE contamination. Fuel spills and contaminated runoff from Chevalier Field are the suspected sources of this contamination.

Soil contamination is evident along the perimeter of the dredge spoil settling basins and along the western side of the site adjacent to Chevalier Field. Sampling was not performed in the interior of the settling basins because of the unstable condition of the basins' subsurfaces. Elevated levels of metals, TRPEs, PAHs, and phenols are present in the spoil material within the settling basins. These contaminants do not appear to have spread to soils surrounding the fill area. **Highly elevated TRPE concentrations detected in soil borings adjacent to Chevalier Field** are possibly the result of fuel spills and contaminated runoff from the adjacent runways.

Groundwater contamination, which was limited to metals, also has two apparent sources. The highest concentrations of several metals (zinc, lead, and copper) occurred in groundwater samples collected from wells adjacent to Chevalier Field. However, concentrations of other metals (chromium, cadmium, and nickel) were highest in groundwater samples from wells on the central and southern berms. Based on the predicted easterly direction of groundwater flow, Chevalier Field appears to be the source of zinc, lead, and copper contamination, and the dredge spoil appears to be the source of chromium, cadmium, and nickel contamination. **Metals concentrations that exceed Florida standards occurred in six of the 10 groundwater samples, but these occurrences could reflect the fact that the turbid groundwater samples were not filtered prior to acid preservation.**

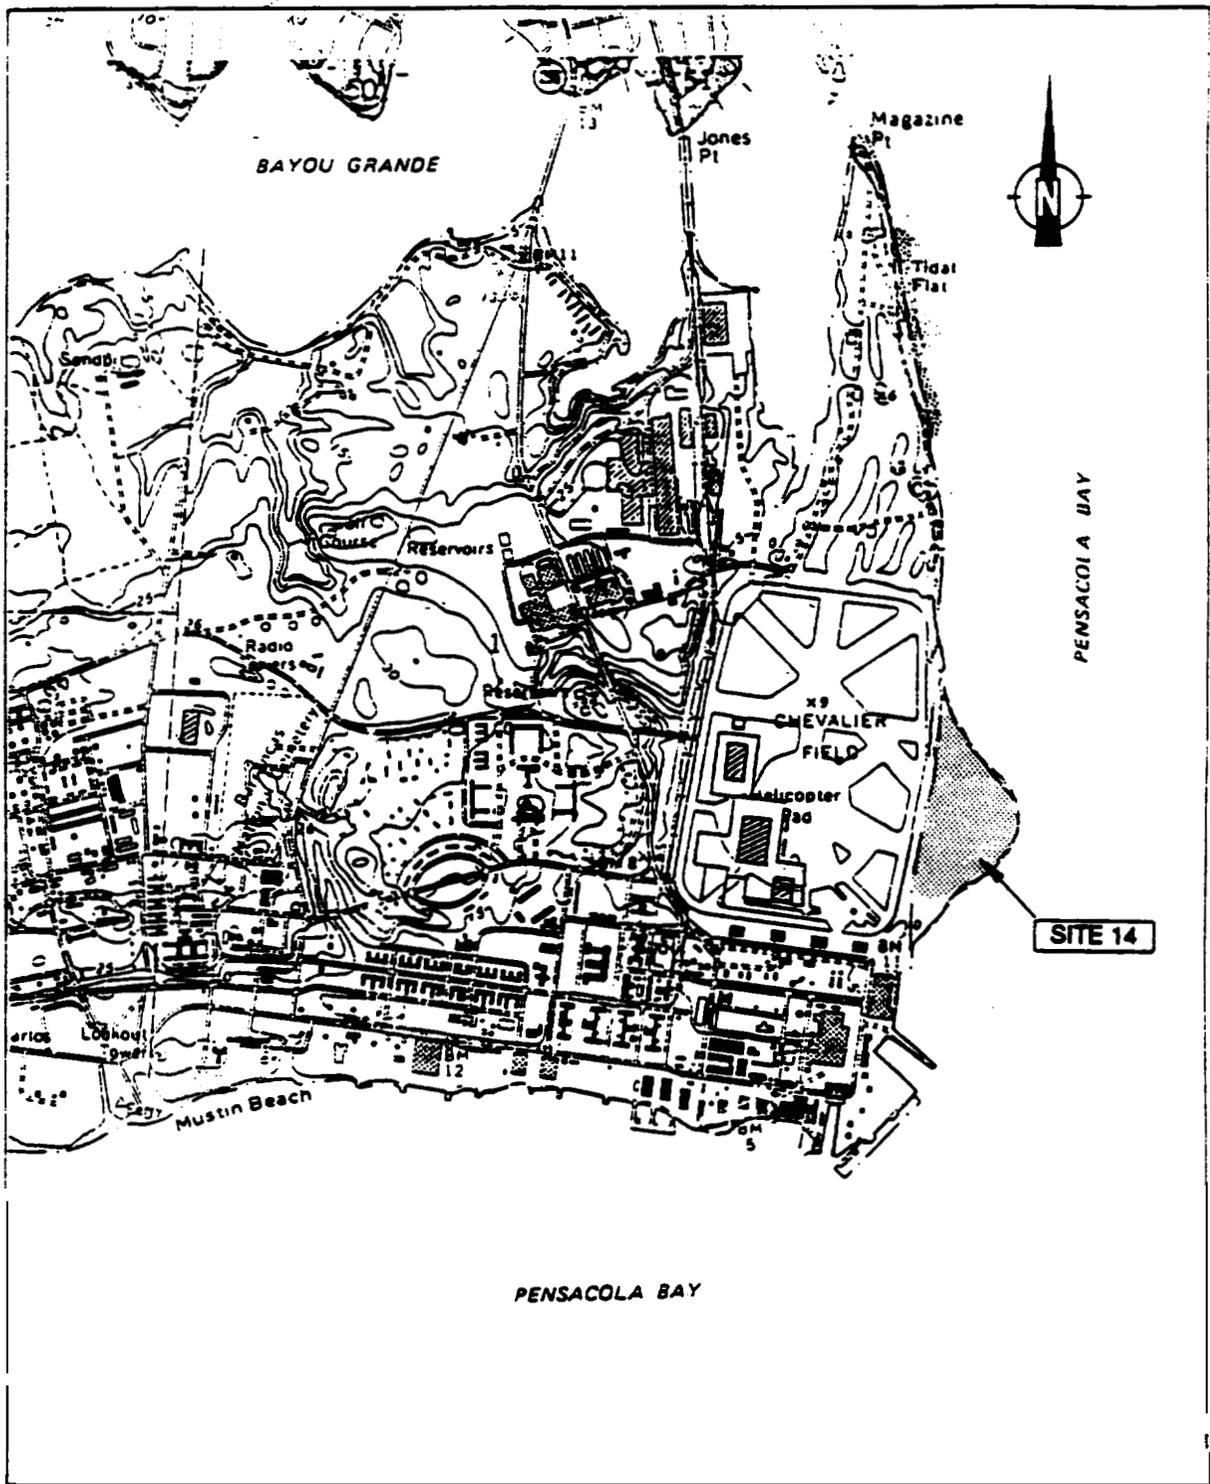

Further assessment activities are required at and in the vicinity of Site 14.

0000377

## 1. INTRODUCTION

This Interim Data Report presents the findings of the Phase I investigation activities performed for Site 14, the Dredge Spoil Fill Area, located at the Naval Air Station (NAS) in Pensacola, Escambia County, Florida (see figures 1-1 and 1-2). This report has been prepared by Ecology and Environment, Inc., (E & E) for the Southern Division, U.S. Navy, Naval Facilities Engineering Command, under Contract No. N62467-88-C-0200. The information presented in this report is based on information and file documents provided by the Navy and on information gathered during the Phase I fieldwork conducted on the site from October 1990 to February 1991. This investigation was conducted in accordance with the administrative documents prepared by E & E for this project, which include the (June 1990) Project Management Plan, [June 1990) Site Management Plan, [July 1990] Generic Quality Assurance Project Plan (GQAPP), [July 1990] General Health and Safety Plan, and [June 1990) Contamination Assessment/Remedial Activities Investigation Work Plan--Group C with appended Site-Specific Health and Safety Plan and Site-Specific Quality Assurance Plan. [All references to these documents in this report apply only to the 1990 versions.]

Site 14 lies along the waterfront east of Chevalier Field adjacent to the southern edge of Site 13 (see figures 1-1 and 1-2). The east side of Site 14 is bordered by Pensacola Bay. The site area was created by the dredging activities conducted in the late 1970s to create an aircraft carrier turning basin and port. [From 1986 to 1989, additional dredge spoil materials, which had been removed from the channel leading from the carrier port to Pensacola pass and to the Port of Pensacola, were disposed of at the site.] Since this area of land was created by

Figure 1-2 SITEMAP —NAS PENSACOLA SITE 14

No buildings, permanent monitoring wells, or paved areas are found on site. Two major basins are found within the site, one in the eastern area and a larger one along the western side of the site (see Figure 1-2). These basins were presumably created during the disposal of dredge material to act as settling basins to control turbid runoff during spoil discharge. The berms surrounding the basins are approximately 20 feet above mean sea level (MSL).

The purpose of the Phase I investigation was to identify principal areas and primary contaminants of concern at the site and to provide recommendations for subsequent phases of investigation. The Phase I fieldwork included a site reconnaissance; habitat/biota survey; surface emissions survey and particulate air sampling; radiation survey; utilities survey; and the collection and analysis of sediment, soil, and groundwater samples. In addition, a hydrologic assessment, which included the determination of groundwater and surface water elevations and groundwater flow direction and hydraulic gradient, was performed at the site. The recommendations for additional work at this site are presented in this submittal under separate cover.

## 2. INVESTIGATION METHODOLOGY

### 2.1 AERIAL PHOTOGRAPH AND EXISTING DATA ANALYSIS

Prior to the initiation of fieldwork, E & E personnel examined all available aerial photographs of NAS Pensacola for past and present conditions, features, and developments that might have had direct relevance to the fieldwork methodology. The aerial photograph analysis task involved assembling and stereoscopically analyzing historical photographic imagery and topographic maps available for the site area. Photographs were scaled to allow analysis of past and present surface conditions, drainage, and land use. The aerial photographs used in the analysis are listed in Table 2-1. The photographs were analyzed to obtain information regarding the evolution of site features that might have affected hydrologic conditions and to aid in the performance of such tasks as field reconnaissance and monitoring well placement.

Existing data on metals concentrations in Pensacola Bay sediments collected in 1982 by the Florida Department of Environmental Regulation (FDER 1988; see Table 3-1 and Figure 3-1 of the Group C Work Plan) were used as comparative data in the analysis of analytical screening results. Results from FDER sediment sampling stations PNB-5 and PNB-6 were selected as representative of ambient bay conditions. Concentrations of metals (zinc, lead, cadmium, nickel, and copper) measured at these stations were used as background values for metals detected in sediments and spoil material at Site 14.

### 2.2 SITE RECONNAISSANCE

A field reconnaissance survey was conducted on and around the site. Available aerial photographs and maps were used as guides in locating surface features. Visual inspections were made of surface conditions, stressed vegetation, surface drainage patterns, areas of exposed site

0000336

debris, and leachate seeps. These observations of surface conditions on the site were used to update the site map.

The reconnaissance survey team utilized radiation and air monitoring equipment during walkovers of site areas, in accordance with Section 6.1.1 of the GOAPP. Areas with readings above background were flagged and identified on a site map for future reference. All findings of the physical reconnaissance were mapped in detail and recorded in the field logbook.

### **2.3 HABITAT/BIOTA SURVEY**

A habitat/biota survey was conducted for the site, and existing literature pertaining to NAS Pensacola was also examined to identify probable on-site biota. During the physical reconnaissance, E & E biologists determined the on-site terrestrial and aquatic habitats and the surrounding habitats that could be affected by off-site contaminant migration. Rare, threatened, and endangered species and their potential habitats were identified, and general site conditions were evaluated regarding the site's ability to support viable populations of plants and animals.

### **2.4 HNu/OVA SURFACE EMISSIONS SURVEY AND PARTICULATE AIR SAMPLING**

A surface emissions survey was conducted using HNu and/or organic vapor analyzer (OVA) air monitoring equipment. The survey was conducted in accordance with Section 6.1.1 of the GOAPP. Due to the steep slope of the berm and the unstable nature of the spoil material within the settling basins, the surface emissions survey could not be conducted according to a pre-established grid. Instead, a walkover survey was conducted, and readings were mapped accordingly. After the survey was completed, a grid was laid over the survey map to establish locational coordinates for the data points (see Figure 3-2). Grid coordinates were assigned as (x,y), with "x" being the coordinate east of the origin and "y" being the coordinate north of the origin. Measurements were made around the exterior perimeter of the berm, along the berm crests, and around the settling basin perimeters. All readings were recorded in the field logbook. In addition, preliminary air screening was conducted with a particulate monitor to determine if the site represents a source

of particulates in the air. The air sampling was conducted in accordance with Section 6.1.[1] of the GOAPP.

## 2.5 RADIATION SURVEY

Although the Group C work plan did not specify that a formal radiation survey be conducted at Site 14, an informal radiation survey was conducted using a Bicron Micro-R-meter in accordance with Section 6.3.[6] of the GOAPP. Again, due to the steep slope of the berm and the unstable subsurface of the spoil basins, the survey was not conducted according to a pre-established grid. All readings were recorded in the field logbook.

## 2.6 UTILITIES SURVEY

Prior to conducting any augering, boring, or drilling, E & E located all underground cables, pipes, utilities, and other subsurface features that could potentially be damaged, create a safety hazard, or otherwise hinder fieldwork. The appropriate authorities (e.g., NAS Pensacola Public Works and Southern Bell) were contacted to identify the location of all underground utilities in the site area. In addition, E & E examined available maps and documents and conducted a metal detector survey to determine the presence of any other potentially hazardous subsurface features on site. The locations of all underground utilities or other obstructing features were marked with surveyor flags, fluorescent paint, or by other methods, as appropriate.

## 2.7 DATA ANALYSIS

Information obtained from the results of the above-described physical surveys was given primary consideration in the development of placement strategies for the Phase I temporary monitoring wells, soil borings, and sediment samples. Prior to establishing the Phase I temporary monitoring well locations or other sampling points, the results of the aerial photograph analysis, site reconnaissance, surface emissions surveys and particulate air sampling, radiation survey, and utilities survey were evaluated to identify areas of potential surface or subsurface contamination, leachate seeps or streams, areas of stressed vegetation, and boundaries of spoil areas. The proposed Phase

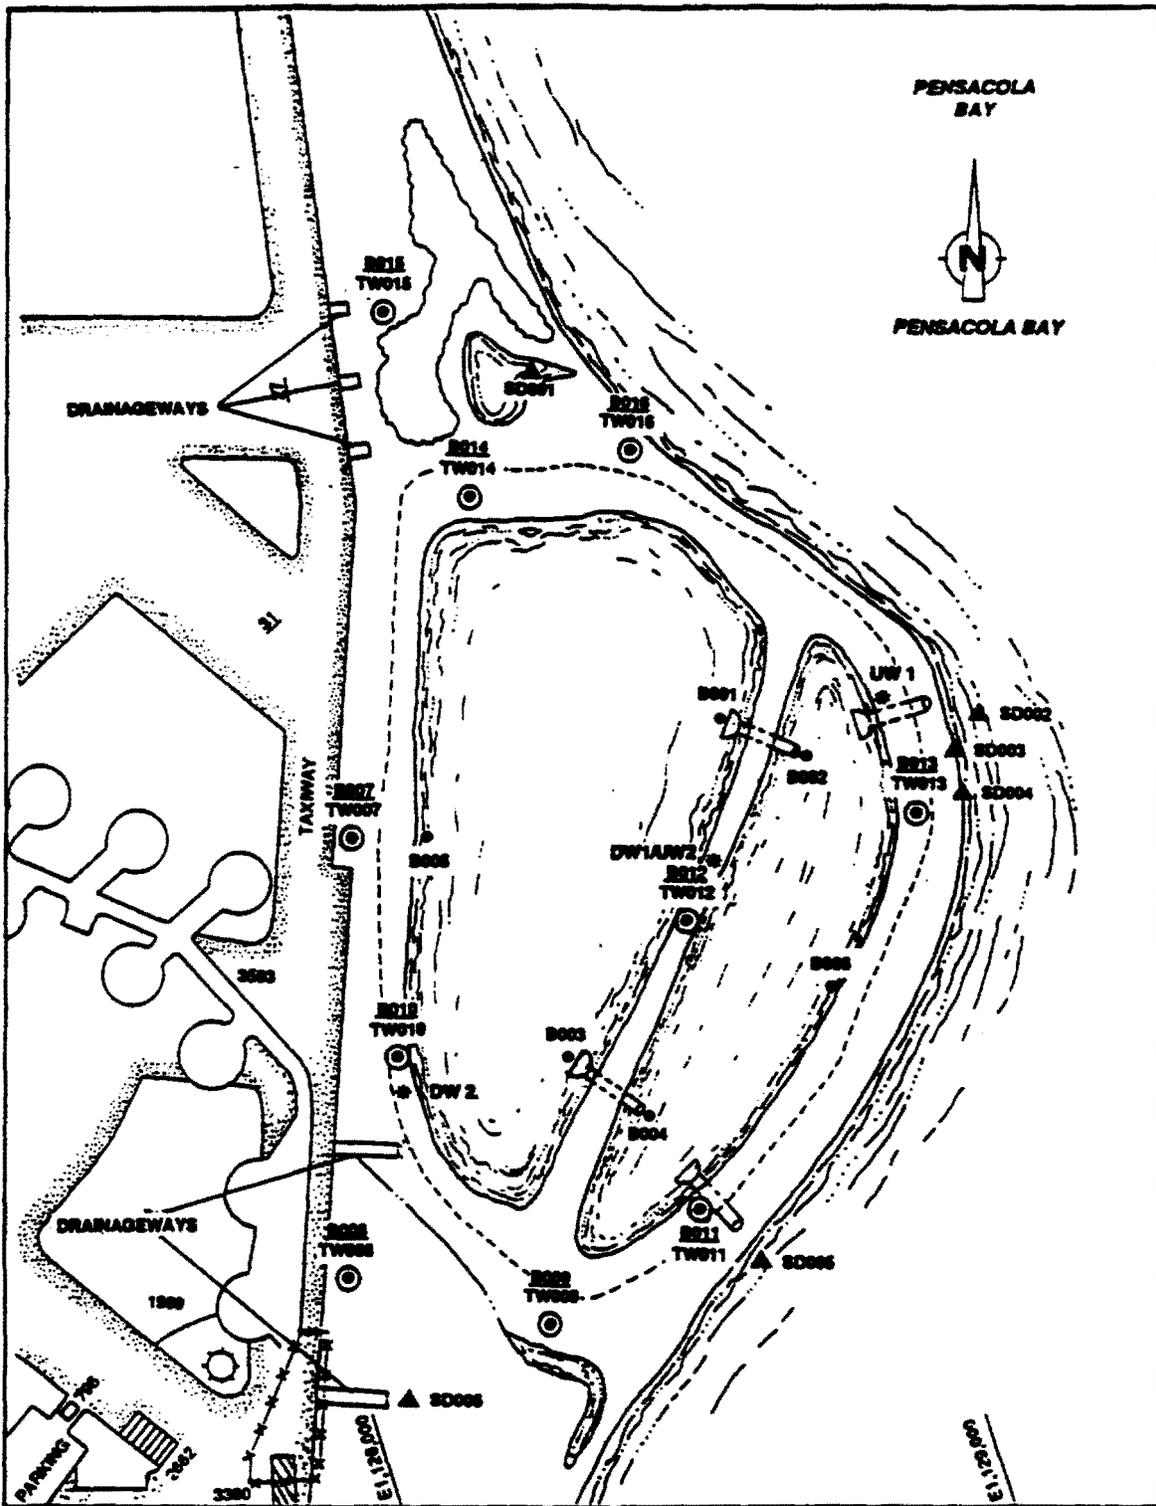

I temporary monitoring well locations and other sampling points, shown on Figure 14-2 of the work plan, were then revised, as appropriate upon approval by Southern Division.

## **2.8 SEDIMENT SAMPLING**

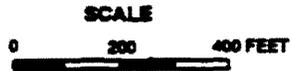

Six sediment samples were collected: one from the pond north of the fill area, two from nearshore sand substrate, two from a nearshore cohesive clay layer, and one from a drainage ditch northeast of Building 3380 (see Figure 2-1). At each location, the sediment sample was collected from the sediment surface to a depth of approximately 6 inches using a stainless-steel trowel. The composition of bottom materials retrieved during sampling was recorded in the field logbook. All sediment sampling and equipment decontamination activities were conducted in accordance with sections 6.9.2 and 6.10 of the GQAPP. All sediment samples were shipped to E & E's Analytical Services Center (ASC) and analyzed for the screening parameters listed in Table 2-2.

## **2.9 SOIL BORINGS AND TEMPORARY MONITORING WELL INSTALLATION**

Sixteen soil borings were completed at Site 14 (see Figure 2-1). At each boring location, samples were collected by compositing soils over 5-foot depth intervals from the land surface to the water table. Each 5-foot depth interval was assigned a letter designation as follows: A interval = surface to 5 feet below land surface (BLS); B interval = 5 to 10 feet BLS; C interval = 10 to 15 feet BLS; and so on to the water table. Samples were collected using either hand-operated bucket augers or a solid-stem auger powered by a drill rig. No soil samples were collected within the spoil basins per Navy directions due to the instability and unsupportive nature of the spoil material. Lithologic characteristics of the materials encountered in each borehole were recorded in the field notebook. All sampling, compositing, and lithologic logging activities were performed in accordance with Section 6.6 of the GQAPP. Equipment decontamination was performed in accordance with Section 6.10 of the GQAPP. All the soil samples collected from the soil borings were shipped to E & E's ASC and analyzed for the screening parameters listed in Table 2-2.

Key:

<sup>a</sup>Analytical suite designation is as follows:

A = Volatile organic compounds including chlorobenzene, polynuclear aromatic hydrocarbons, phenols, pesticides and total PCBs, total recoverable hydrocarbons, and metals (total, unfiltered).

<sup>b</sup>Specific constituents encompassed by the various chemical groups included within analytical suite A are identified in Tables 9-1 through 9-4 of the Generic Quality Assurance Project Plan.

<sup>c</sup>Groundwater samples and analyses shown are for temporary wells only.

Source: Ecology and Environment, Inc., 1991.

Temporary stainless-steel monitoring wells were installed in 10 of the 16 soil borings (see Figure 2-1). Each well was constructed with 5 feet of 0.01-inch slotted screen and installed to a depth that allowed the well screen to bracket the water table. The wells were installed using solid-stem augers powered by a drill rig. Lithologic characteristics of materials encountered during installation of the wells were recorded in the field logbook. All equipment decontamination activities were performed in accordance with Section 6.10 of the GQAPP. All of the soil boring and temporary monitoring well information and the lithologic logs are contained in Appendix C.

## 2.10 GROUNDWATER SAMPLING

Ten groundwater samples and one duplicate sample were collected from the 10 temporary monitoring wells shown in Figure 2-1. Weather conditions; water levels; purge volumes; and groundwater pH, specific conductance, and temperature measurements were recorded in the field logbook prior to sampling. In addition, prior to purging, each well was checked for the presence of floating and/or sinking immiscible hydrocarbons using an MMC International oil-water probe. Each groundwater sample was collected immediately following well purging. All well purging and sampling activities were performed in accordance with sections 6.8 and 6.11 of the GQAPP. Equipment decontamination was performed in accordance with Section 6.10 of the GQAPP. All of the groundwater samples collected from the temporary monitoring wells were analyzed for the screening parameters listed in Table 2-2.

## 2.11 HYDROLOGIC ASSESSMENT

The hydrologic assessment of the site and surrounding areas included the determination of water level elevations in the 10 temporary monitoring wells. Wellhead top-of-casing (TOC) elevations and static water levels in the temporary monitoring wells were measured relative to the top of a driven reference stake located adjacent to each well using a spirit level and tape measure. Following groundwater sampling and removal of the temporary monitoring wells, the elevations of the driven reference stakes were surveyed using a transit with reference to U.S.

Geological Survey (USGS) Benchmark No. A161. The static water levels in the temporary monitoring wells were used to establish groundwater flow directions and horizontal hydraulic gradients in the shallow aquifer in the site vicinity.

In conjunction with the wellhead survey, the elevations of on-site water bodies (i.e., the pond north of the spoil fill area and the two spoil settling basins) were established.

## **2.12 FIELD QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)**

All field tasks performed during the investigation were documented in the field logbooks according to the procedures specified in Section 7.2 of the GQAPP.

### **2.12.1 Field QA/QC Samples**

Field QA/QC samples were prepared for all samples collected at the site during the Phase I investigation according to the procedures described in Section 6.12 of the GQAPP. Chain-of-custody was maintained for all samples collected, packaged, and shipped to E 6 E's ASC for analysis. Sample management was performed as specified in Section 7 of the GOAPP. The collected field QA/QC samples and corresponding analytical parameters are listed in Table 2-2.

### **2.12.2 Decontamination Procedures**

All equipment used during field activities was decontaminated in accordance with Section 6.10 of the GQAPP.

## **2.13 INVESTIGATION-DERIVED WASTE MANAGEMENT**

Excess soil material generated during soil boring and temporary monitoring well installation activities was temporarily contained adjacent to the well or boring and then backfilled into the borehole after the auger flights or temporary well casings had been removed following sample collection. Any soil material remaining after completion of borehole backfilling was placed in 55-gallon drums, sealed, labeled, and moved to a central area on the site. Each drum has a painted-on label listing the site number and the type of material contained in the drum.

All water generated during development and purging of the temporary monitoring wells was temporarily contained adjacent to the well and then poured back into the well following collection of samples.

Potentially contaminated clothing and disposable materials, wastes generated during decontamination activities, and other potentially contaminated, investigation-derived materials were placed in 55-gallon drums, labeled, and moved to a central area on the site. These drums are sealed and labeled "trash." All drummed investigation-derived materials were subsequently picked up and disposed of by NAS Pensacola.

### 3. RESULTS

#### 3.1 **AERIAL PHOTOGRAPHS AND EXISTING DATA ANALYSIS**

The dredged spoil fill area composing Site 14 was created in the late 1970s from the dredging of Pensacola Bay to create a turning basin and port for an aircraft carrier. Review of aerial photographs prior to this time indicated that during the 1950s, Site 14 was shallow bay bottom and a narrow, linear beach paralleled the eastern edge of Chevalier Field. By 1961, a broad spit that projected 1900 feet into the bay had formed. Review of the October 12, 1961, aerial photograph revealed the initial formation of a tidal pond at the northwestern corner of the site and a drainage ditch that extended from the edge of Chevalier Field southeasterly to a small tidal pond at the southwestern corner of the site. These surface water and drainage features were evident in the 1964 and 1968 aerial photographs, although the ponds' tidal inlets appeared to be isolated from the open bay by 500 feet of beach. During the period between 1961 and 1968, shrubby vegetation became established around both ponds and along the northern portion of the spit. An east-west trending dune system with sporadic shrubs also developed during this period.

The May 4, 1973, and April 28, 1976, aerial photographs indicated that the spit had diminished to 1,400 feet in length and that the northern pond had been reduced from a width of approximately 180 feet to 80 feet. The photographs also showed the presence of medium-sized trees along the northern and southwestern portions of the spit and well-established dune vegetation in the interior of the spit.

The 1981, 1983, and 1986 aerial photographs revealed an artificially-created berm encircling most of the spit, which had been reduced to a length of 1,000 feet. The northern and southern wetland areas were excluded from the encircling berm. The eastern half of the

spit was heavily vegetated with trees and shrubs, but the western half was composed of bare sand, presumably dredged spoil. Six linear features of unknown purpose or origin extended approximately 100 feet into the spoil from the eastern border of Chevalier Field.

[Additional dredged spoil materials from various sources were disposed of at the site] between 1986 and 1989. The October 26, 1989, photograph revealed that the berm was widened (and probably heightened) and that a north-south trending berm was added to split the spoil area into two settling basins, with the eastern basin about half the size of the western basin. The trees and vegetation of the eastern half of the spit were removed, and both basins contained water. The locations of the two water control structures on the center berm were evident. Large trees were present in the northern and southern wetland areas; sparse vegetation was present on the berm.

### 3.2 SITE RECONNAISSANCE

During the site reconnaissance, visual inspections were made of the spoil berms, settling basins, beach, and northern and southern wetland areas. The spoil berm are approximately 20 feet high and encircle a settling basin split into two by a central dividing berm. A "dune" picket fence runs the length of the top of the western berm along Chevalier Field. Water control structures made of 36-inch diameter corrugated, galvanized steel pipe transect the central dividing berm at two locations and the eastern berm at two locations (see Figure 1-2). These structures are apparently designed to route overflow water from the western settling basin into the eastern basin and eventually into Pensacola Bay. Plastic sheeting appears to underlie at least portions of the central berm.

Shallow pools of water were present in portions of both settling basins. The dried portions of the basin floors were composed of soft, fine, gray-brown sediments with dessication cracks. A strong organic odor was evident on the downwind side of the ponds and was apparently emanating from the pond areas. A rusty, 55-gallon drum was found in the western basin near the northeast corner. The drum was not labeled and appeared to be empty.

A 50- to 100-foot wide beach borders the eastern berm. The berm has been partially eroded by wave action. A 4- to 5-inch outcropping layer of black, clayey, cohesive sediments, similar to the sediments in the settling basins, was found to extend under the eastern berm onto the beach and nearshore bay bottom south of the northern water control structure. Chunks of this clayey material were also found littered along the beach and nearshore waters.

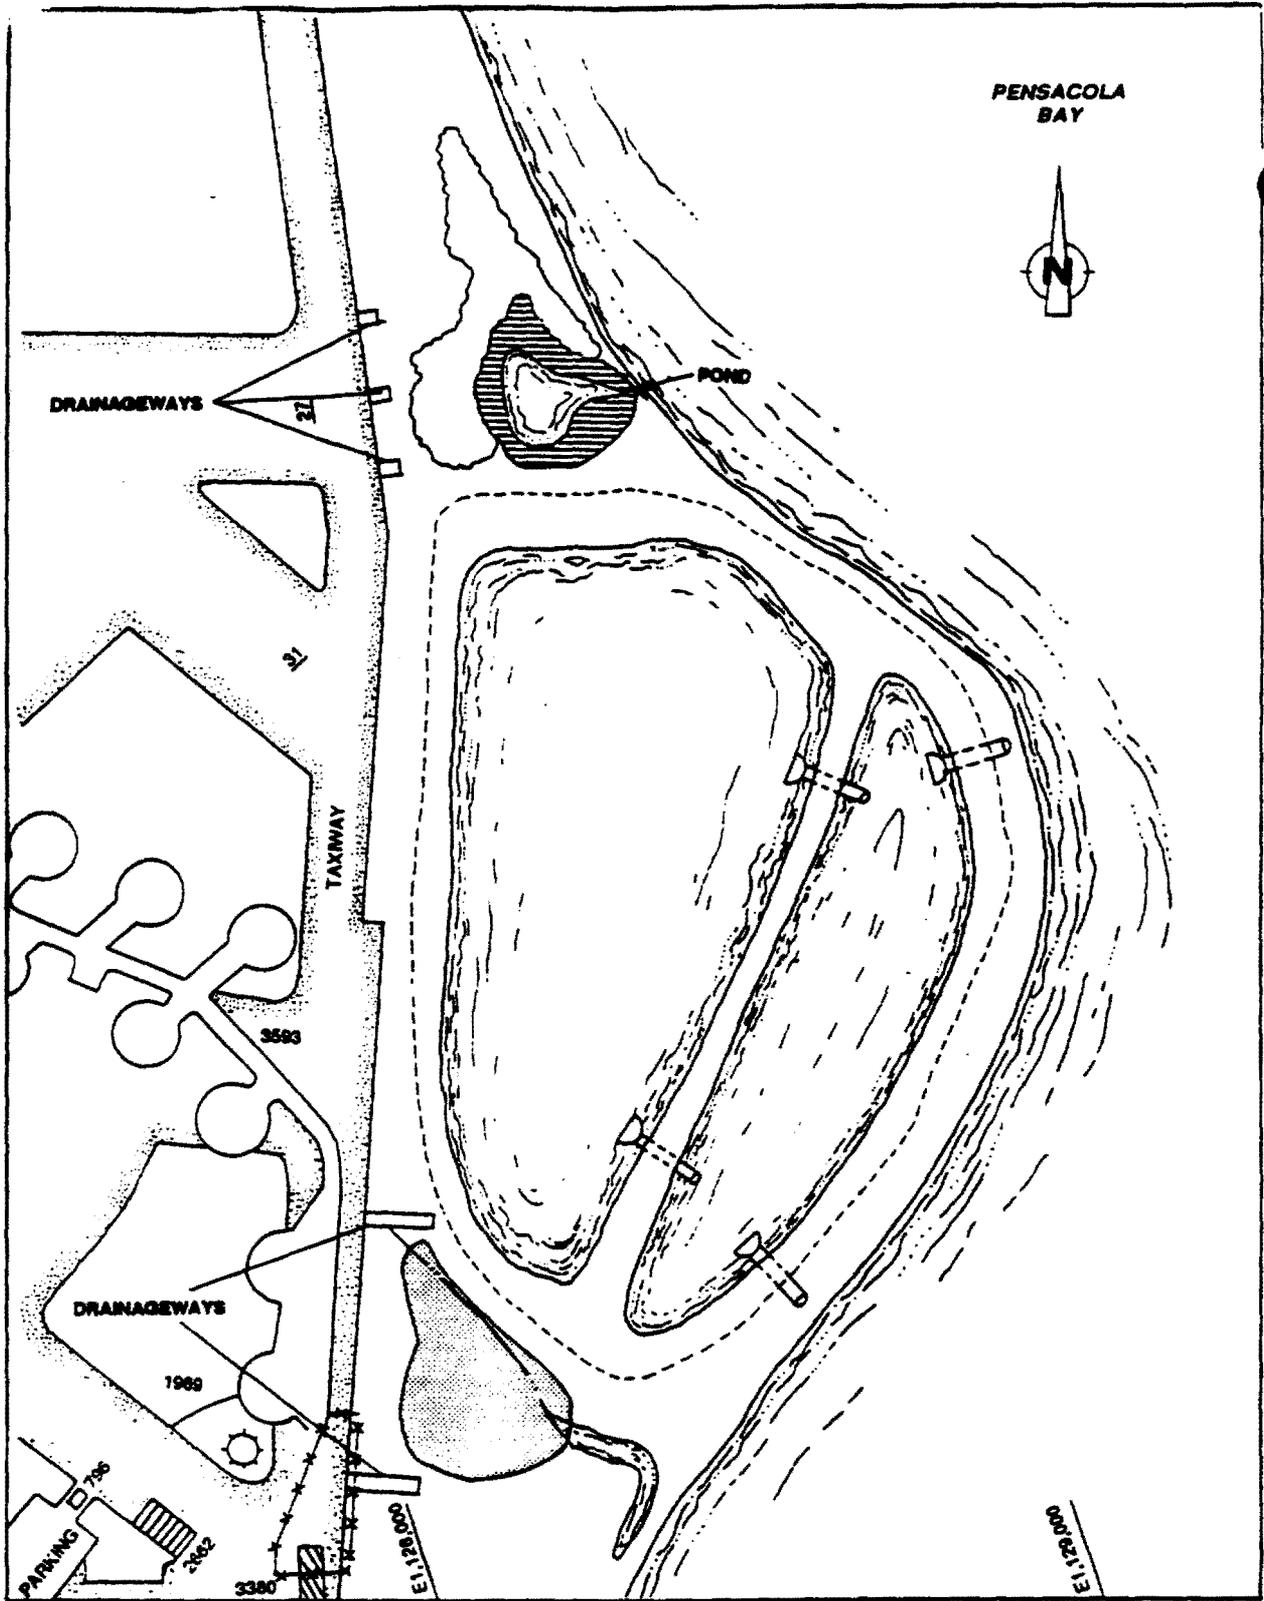

No leachate seeps or other obvious signs of contamination were seen in the vicinity of the wetland areas north and south of the spoil area.

### 3.3 HABITAT/BIOTA SURVEY

Site 14 encompasses several habitat types disturbed by previous base activities (see Figure 3-1). Periodic blooms of algae or bacteria occur in the pools of temporary standing water within the settling basins, coloring the water and surrounding substrate pink or magenta. The high sand berms surrounding the settling basins are vegetated with small shrubs and herbaceous plants. Dominant groundcover species identified on the berm include *Diodia teres*, *Heterotheca subaxillaris*, *Triplasis purpurea*, and *Panicum amarum*.

A brackish pond and emergent wetland north of the fill area have numerous water fowl, including seven species of ducks and five species of wading birds. The pond is surrounded by dense stands of *Phragmites australis*, *Spartina patens*, *Panicum repens*, and *Ludwigia* sp.

Another brackish wetland located south of the spoil area has been ditched and planted with slash pine. *P. australis* is the dominant species in this area with other typical wetland species, including those common to disturbed areas but occurring in various densities. These species include catbrier (*Smilax* sp.), wax myrtle (*Myrica cerifera*), marsh hay cordgrass (*S. patens*), cattails (*Typha* sp.), snowbush (*Baccharis halimifolia*), and broomsedge (*Andropogon* sp.). A drainage channel from the wetland, connected to the bay during extreme high tides, contains blue crabs and small baitfish. Sea oats, which are protected by state law, are prevalent along the back beach south of the spoil area. More than 30 species of shorebirds feed along the beachfront or within the settling basins (see Appendix A). Marsh rabbits also inhabit the site. No rare, threatened, or endangered

species were observed. Vegetation does not appear to be stressed, and no obvious impacts from hazardous wastes were observed on site.

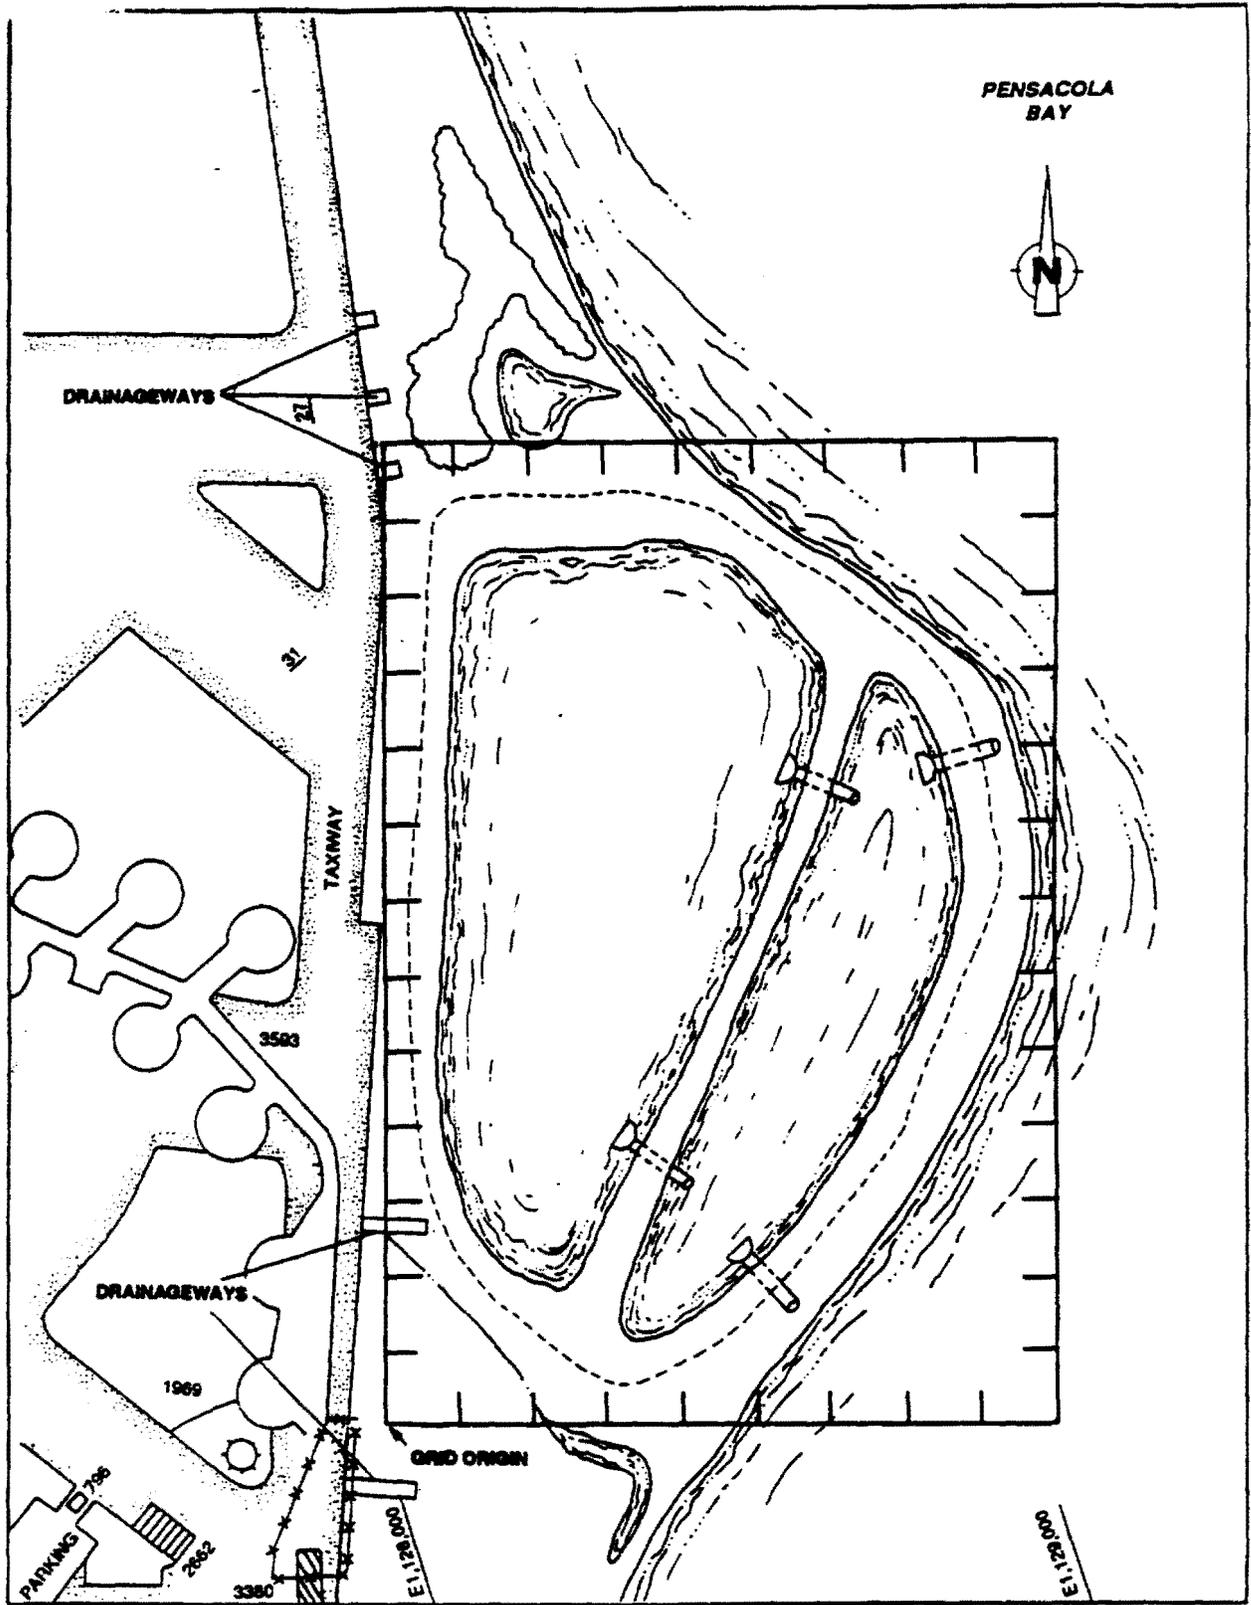

### 3.4 SURFACE EMISSIONS SURVEY AND PARTICULATE AIR SAMPLING

An OVA was used to monitor surface emissions in and around the exterior perimeter of the berm, along the crest of the berm, and around the perimeters of the settling basins. No elevated surface emissions readings were measured. Appendix B presents the grid coordinates for each point where surface emission readings were taken (see Figure 3-2). Background readings were recorded in the field logbooks.

On November 13, 1990, a Mini-Ram particulate air monitoring device was used to determine if Site 14 could represent a source of particulates in the air. [Figure 2-1 presents the particulate air sampling locations at Site 14.] Two tests were performed to monitor both settling basins. Wind velocity during both tests was northeast 5 to 10 miles per hour (mph). The time-weighted average (TWA) of particulates at the first upwind station [(UW1)], located on the northeastern corner of the spoil berm, was 0.07 milligrams per cubic meter ( $\text{mg}/\text{m}^3$ ) after 15.2 minutes. A station located on the center of the central dividing berm served as the downwind station for the first test and the upwind station for the second test [(DW1/UW2)]. The TWA after 15.0 minutes was 0.04  $\text{mg}/\text{m}^3$ . The TWA at the second downwind station [(DW2)], located on the southwestern corner of the spoil berm, was 0.07  $\text{mg}/\text{m}^3$  after 15.0 minutes. Based on these results, the site does not appear to be a significant source of particulates.

### 3.5 RADIATION SURVEY

[A radiation survey was conducted at Site 14, as described in Section 2.5.] Background radiation levels for [~~gamma~~ radiation at] NAS Pensacola were 2 to 3 microRoentgens per hour ( $\mu\text{R}/\text{h}$ ). No readings above this background level were found on Site 14. Appendix B presents the grid coordinates for each point where radiation readings were taken (see Figure 3-2).

### 3.6 HYDROLOGIC ASSESSMENT

#### 3.6.1 Shallow Subsurface Lithology

Appendix-C presents the lithologic logs for the 16 soil borings completed at Site 14. Based on the information collected during the augering of the boreholes, the shallow subsurface lithology beneath Site 14 can be generally characterized as white to light brown, fine- to coarse-grained quartz sand with shell fragments. The borings located around the perimeters of the settling basins (B001 through B006) consisted of a 1.5 foot to 4.0 foot layer of dark blue to black, cohesive, dredge material composed of clays and silts overlying white to tan, fine-to medium-grained sand. Borings B007 and B008 along the western perimeter of the site near Chevalier Field contained red, medium- to coarse-grained sand in the upper 2 feet.

Boring B013 located on the northeastern corner of the berm contained some organic material intermixed with sand from 20 to 23.5 feet BLS. This organic material may be from the same layer as the material found on the beach northeast of B013 during the site reconnaissance. Whether this material is a naturally occurring stratigraphic layer or dredge spoil that has escaped through the berm from the eastern settling basin is unknown. All the other borings located on the berm consisted of only sand and shell fragments from land surface to the water table.

The upper layers of sand at borings B015 and B016, located near the northern wetland, also contained dark gray organic material.

[OVA readings taken in the open borehole during drilling ranged from 0 to 9 parts per million (ppm). OVA readings from open boreholes are presented in Appendix C.]

#### 3.6.2 Water Levels and Groundwater/Surface Water Flow

Table 3-1 lists the water level elevations measured in the temporary monitoring wells, pools in the two settling basins, and the pond north of the spoil area. Based on the measurements taken from the soil borings and temporary monitoring wells, the depth to the water table across the site ranges from greater than 23 feet BLS on top of the berm to 2 to 3 feet BLS around the perimeter of the site. Depth to the water table within the settling basins is 4.0 to 5.5 feet BLS.

### 3.6.2.1 Groundwater Plov

Figure 3-3 illustrates the water level elevations and the groundwater flow direction in the upper portion of the surficial zone of the Sand-and-Gravel Aquifer at Site 14; the surface water elevations in the settling basins and northern pond are also shown. Based on the groundwater elevations, the main directional component of shallow groundwater flow is easterly, and the hydraulic gradient ranges from 0.003 at the southern portion of the site to 0.008 at the northern portion. Because of the proximity of this site to Pensacola Bay, groundwater flow direction probably varies as a result of tidal fluctuations.

### 3.6.2.2 Surface Water Plov

As discussed in Section 3.2, the water control structures located in the central dividing and eastern berms appear to be designed to discharge overflow from the western settling basin into the eastern basin and then into Pensacola Bay. The vertical pipes on the control structure are approximately 20 feet above land surface and are constructed of galvanized steel: consequently, the basins would have to fill to 20 feet above land surface before overflow would occur.

Open, concrete drainageways at the eastern edge of Chevalier Field channel surface runoff from the asphalt runways into the ponds and associated wetlands north and south of the spoil area (see Figure 1-2). These brackish water ponds have relic tidal inlets that have been closed off by natural beach accretion and berm construction and are nonfunctional except during extreme high tides. Thus, these standing water bodies have no net flow.

## 3.7 CHEMICAL ANALYSES

[The following section presents the results of the laboratory analyses of the sediment, soil, and groundwater samples. The specific analytical parameters and parameter groups are listed or referenced in Table 2-2.]

### 3.7.1 Sediment

Table 3-2 summarizes the analytical screening results for sediment samples collected at Site 14. Figure 2-1 shows the locations of the sediment samples at the site. The complete analytical screening results for sediment samples are presented in Appendix D.

In general, at least one sediment sample collected at Site 14 exhibited elevated levels of metals, total recoverable petroleum hydrocarbons (TRPHs), and polynuclear aromatic hydrocarbons (PAHs). Pesticides and PCBs were not detected in any sediment samples. Volatile organic compounds (VOCs) and phenols were detected only in low concentrations. Contaminant concentrations tended to be highest in two fine-grained samples collected near the northeastern water control structure outfall and in a sediment sample from a drainage channel near the southwestern corner of the site. This distribution of contaminants suggests that sediments are being impacted by different sources of contamination.

#### 3.7.1.1 Metals

Chromium and zinc were the only metals present in all of the sediment samples; lead, nickel, and copper were also present in two samples. Arsenic, cadmium, and silver were not detected in any sediment samples. Figure 3-4 presents total metals concentrations detected in the sediment samples.

Total metals concentrations were highest in two sediment samples (SD003 and SD004) collected from the nearshore clay layer near the northeastern water control structure. In these two samples, the chromium and zinc concentrations present were the primary contaminants and were 10 to 20 times higher than those concentrations detected in samples collected from nearshore sandy areas. [Nickel] and copper detected in these two samples were also elevated relative to background levels measured by FDER in Pensacola Bay (FDER 1988). No other sediment samples exhibited significantly elevated levels of metals compared to ambient levels in the bay. This distribution of metals suggests that metals in nearshore sediments are confined to an outcropping of a fine-grained sediment layer.

(ND) Not Detected

**Figure 3-4 TOTAL METALS AND TRPH CONCENTRATIONS IN SEDIMENT SAMPLES —  
NAS PENSACOLA SITE 14**

### 3.7.1.2 TRPHs

An elevated TRPH concentration (2,500 milligrams per kilogram [mg/kg]) was detected in sediment sample SD006, which was collected in a drainageway near the southwestern corner of the site (see Figure 3-4). This sample had a gasoline and diesel fuel odor, which suggests that the drainage way most likely had been contaminated by fuel draining off of the adjacent runway from Chevalier Field. No other sediment samples exhibited significant TRPH levels, although SD001 collected from the northern pond exhibited a slightly elevated concentration (22 mg/kg) compared to trace TRPH levels detected in the four nearshore samples. Contaminated runoff from Chevalier Field is also a possible source of TRPHs to this pond, which receives surface runoff from a series of concrete drainageways (see Figure 2-1).

### 3.7.1.3 VOCs

Methylene chloride was detected in all sediment samples at concentrations as high as 8,300 micrograms per kilogram ( $\mu\text{g}/\text{kg}$ ). However, this common laboratory solvent was also detected at similar levels in all of the laboratory method blanks (see Section 3.9.2); therefore, the presence in the sediment samples is attributable to laboratory-derived contamination. No other VOCs were detected in sediment samples at Site 14.

### 3.7.1.4 PAHs

PAHs were detected in all sediment samples at generally low levels. As with the TRPH results, sample SD006, collected from the drainage channel near the southwestern corner of the site, exhibited the highest PAH concentration (4,700  $\mu\text{g}/\text{kg}$ ) of all samples. Concentrations of PAHs in the other five samples ranged from below the detection limit (1,000  $\mu\text{g}/\text{kg}$ ) to 1,900  $\mu\text{g}/\text{kg}$  at SD004 near the northeastern water control structure.

### 3.7.1.5 Phenols

Phenols were present in four of the sediment samples (SD001 through SD004) in concentrations ranging from below the detection limit of 2,000

0000391

µg/kg in sample SD003 to 4,300 µg/kg in sample SD002. These concentrations occurred mainly in sediments near the northeastern water control structure.

#### **3.7.1.6 Pesticides and PCBs**

Pesticides and PCBs were not detected in any sediment samples at Site 14.

#### **3.7.2 Soil**

Table 3-3 summarizes the analytical screening results for soil samples collected at Site 14. Figure 2-1 shows the boring locations at Site 14. The complete analytical screening results for soil samples are presented in Appendix E.

In general, three or more of the soil samples collected at Site 14 exhibited elevated levels of metals, TRPHs, VOCs, and phenols. Pesticides and PCBs were not detected in any of the soil samples. PAHs were detected at low levels in about 50% of the soil samples. The highest contaminant concentrations were usually detected in samples collected from the A interval, except for those samples collected from soil borings located on the berm, in which the highest levels usually occurred in the C, D, or E interval.

##### **3.7.2.1 Metals**

Most metals contamination occurred in soil samples collected from borings within the settling basins (B001 through B006), although concentrations were generally only slightly to moderately elevated compared to ambient sediment data for Pensacola Bay (FDER 1988). Metals concentrations detected in borings on the berm usually occurred in the lower sampling intervals (C, D, or E), close to the same elevation relative to HSL as the A interval samples from within the settling basins. Of the five soil samples collected from borings outside the berm, only three samples exhibited detectable levels of metals at very low concentrations.

[Figure 3-5 illustrates the distribution of chromium and cadmium concentrations detected in Site 14 soil samples.] Concentrations of metals in soil samples from within the settling basins were relatively

0000395

uniform among borings, with total metals concentrations ranging from 31.1 mg/kg to 56.2 mg/kg (see Figure 3-[6]). Chromium, zinc, cadmium, and copper were detected in all the settling basin soil borings (B001 through B006). Lead was detected in only one soil boring (B012), located in the middle of the central dividing berm in the D interval. Chromium and zinc were the only metals detected in the soil borings located on the berm surrounding both settling basins (B010 through B014), and both metals were detected in very low concentrations (1.0 mg/kg to 1.6 mg/kg and 2.2 mg/kg to 4.2 mg/kg, respectively). Arsenic, nickel, and silver were not detected in any soil samples at Site 14.

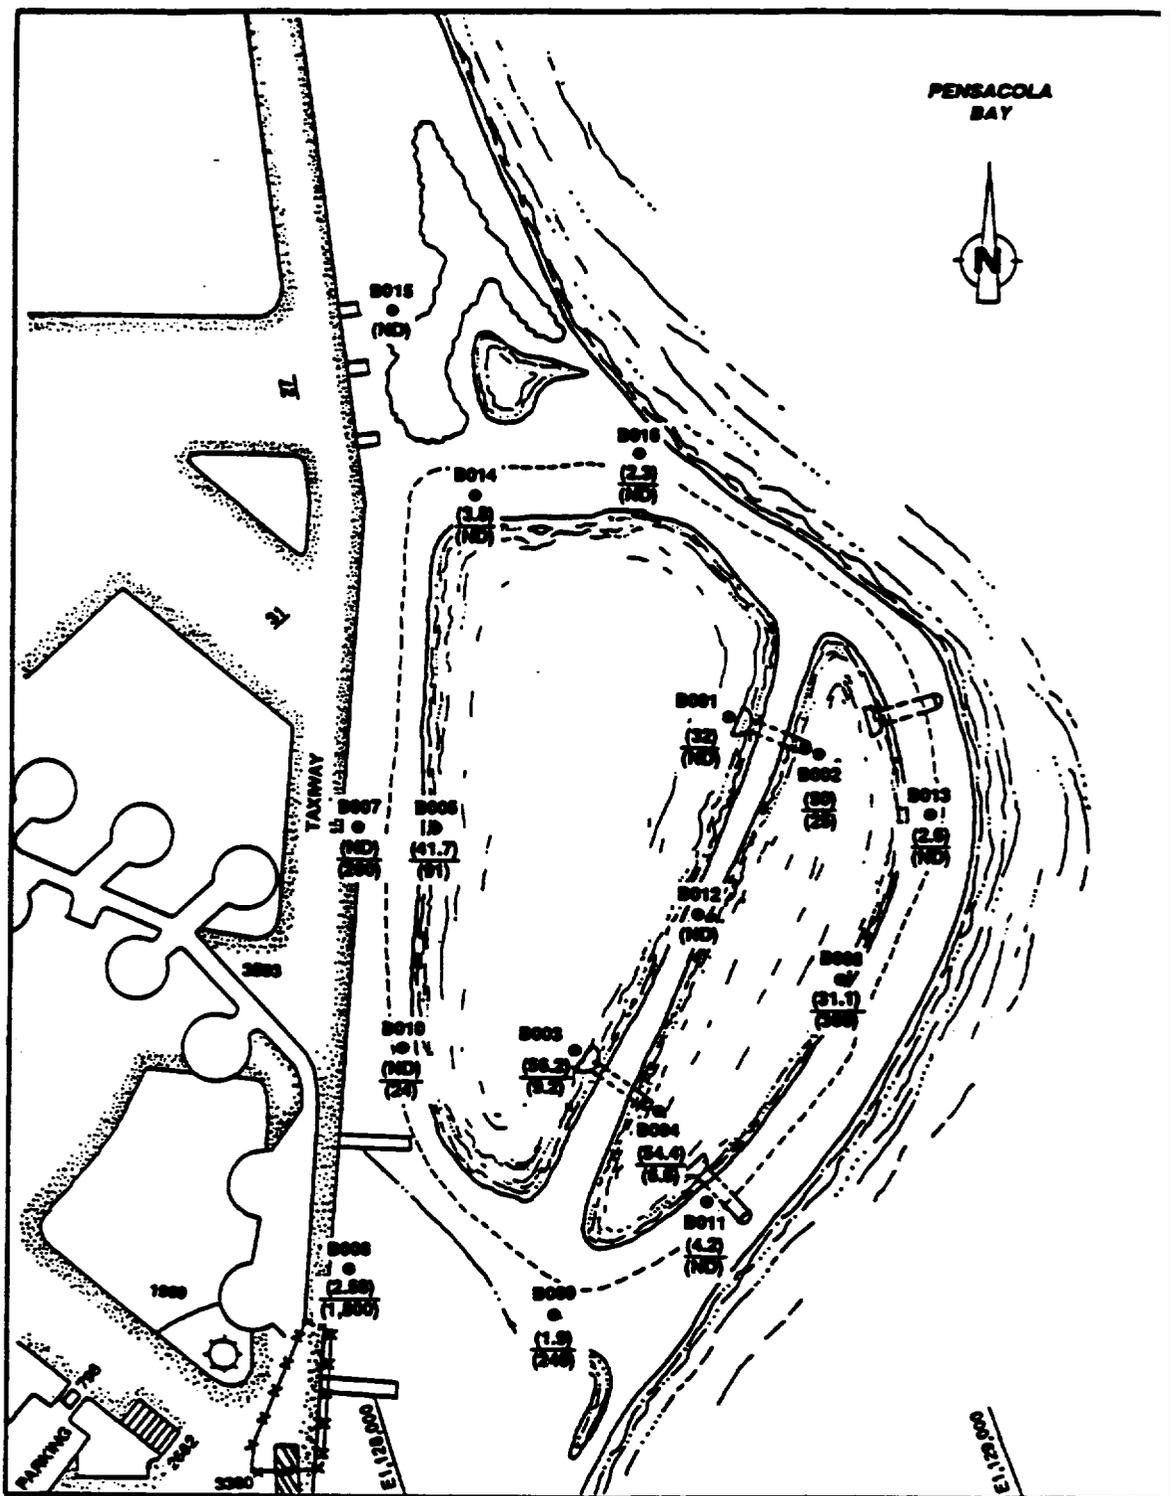

This distribution of metals concentrations in soil borings indicates that elevated levels of metals are confined to the fine-grained sediments in the two settling basins. No other sources or occurrences of metals contamination in soil are apparent at Site 14.

#### 3.7.2.2 TRPHs

TRPEs were detected in all but three soil borings at Site 14 (see Figure 3-[6]). Elevated concentrations of **TRPHs** (200 mg/kg to 1,800 mg/kg) were detected in two soil borings adjacent to Chevalier Field (B007 and B008) and a third boring located near a drainage channel conducting runoff from the Field (B009), suggesting that Chevalier Field may be a source of TRPE contamination. TRPE concentrations in soil borings within the two settling basins ranged from undetectable (<5.0 mg/kg) at B001 to 300 mg/kg at B006. TRPEs also were detected in samples collected from three of the berm soil borings. Borings B012 and B013 exhibited TRPEs only in samples from the E interval, and boring B014 exhibited TRPEs in samples from the B, C, and D intervals. Concentrations of TRPEs in these soil samples varied from 6.0 mg/kg to 16 mg/kg.

#### 3.7.2.3 VOCs

Methylene chloride was detected in many of the soil samples at concentrations as high as 2,700 µg/kg. However, as in the case of the sediment samples, this common laboratory solvent was also detected at similar levels in several of the laboratory method blanks (see Section

SOURCE: Ecology and Environment, Inc. 1991

**Figure 3-6 TOTAL METALS AND TRPH CONCENTRATIONS IN A-INTERVAL SOIL SAMPLES — NAS PENSACOLA SITE 14**

3.10.2); therefore, the presence in the soil samples is attributable to laboratory-derived contamination.

Trans-1,2-dichloroethene and 1,1,1-trichloroethane were each detected in three soil borings. Trans-1,2-dichloroethene occurred in A interval samples from soil borings near the north end of the site (B014 through B016) at concentrations from 1,100  $\mu\text{g}/\text{kg}$  to 2,100  $\mu\text{g}/\text{kg}$ . 1,1,1-trichloroethane was present in samples collected from berm borings B011 and B012 in the A, B, C, and D intervals at concentrations ranging from 1,500  $\mu\text{g}/\text{kg}$  to 3,300  $\mu\text{g}/\text{kg}$  and B014 in the D-interval at 1,200  $\mu\text{g}/\text{kg}$ .

#### 3.7.2.4 PAHs and Phenols

PAHs and phenols were detected in all the soil samples collected within the settling basins. PAHs occurred at concentrations ranging from below the detection limit (1,000  $\mu\text{g}/\text{kg}$ ) to 2,800  $\mu\text{g}/\text{kg}$ ; phenol levels varied from 3,300  $\mu\text{g}/\text{kg}$  to 20,000  $\mu\text{g}/\text{kg}$ . One of the berm soil borings (B010) also exhibited slightly elevated levels of PAHs and phenols in the C interval. Phenols were also detected in the C interval at B012, located on the central dividing berm. PAHs and phenols were not detected in any other soil borings. These results suggest that the dredge spoil is a source of PAHs and phenols.

#### 3.7.2.5 Pesticides and PCBs

Pesticides and PCBs were not detected in any soil samples collected at Site 14.

### 3.7.3 Groundwater

#### 3.7.3.1 Field Parameters

Table 3-4 lists the groundwater pH, temperature, and specific conductance values measured for the samples collected from the temporary monitoring wells. Specific conductance measurements for wells TW011 through TW016 exceeded the reported range of values for ambient groundwater in Escambia County (Clemens et al. 1989). This occurrence is probably due to saltwater intrusion from Pensacola Bay. All other field parameter measurements for Site 14 wells were within the reported range of values for ambient groundwater in Escambia County. [The range of pH values is 5.40 to 7.54.] No floating or [sinking] immiscible

0000297

hydrocarbons were observed in any of the wells. Appendix C presents the temporary monitoring well information including field parameter and groundwater elevation data.

### 3.7.3.2 Analytical Screening Parameters

Table 3-5 summarizes the analytical screening results for the groundwater samples collected from the 10 temporary monitoring wells installed on Site 14. Figure 2-1 shows the temporary monitoring well locations at Site 14. The complete analytical screening results for the groundwater samples are presented in Appendix F.

In general, about half of the groundwater samples collected at Site 14 exhibited elevated levels of metals. However, as will be discussed in Section 3.8, the elevated metals concentrations detected probably reflect leaching or dissolution of aquifer matrix sediments entrained in the unfiltered samples by the acid preservative rather than actual groundwater contamination. TRPHs, VOCs, pesticides, and PCBs were not detected in any of the groundwater samples. PAHs and phenols were detected only at trace levels in two samples.

**Metals.** Chromium was detected in nine of the 10 groundwater samples, three of which (GW011, GW012, and GW015) exhibited concentrations that exceed the Florida Primary Drinking Water Standard (FPDWS) of 50 micrograms per liter ( $\mu\text{g}/\text{L}$ ; Chapter 17-550, Florida Administrative Code [FACJ]). Concentrations of cadmium at 13  $\mu\text{g}/\text{L}$  and 11  $\mu\text{g}/\text{L}$  in samples GW011 and GW012, respectively, exceeded the FPDWS of 10  $\mu\text{g}/\text{L}$ . Nickel was detected in only these two groundwater samples at Site 14. [Figure 3-7 illustrates the distribution of Chromium, lead, and cadmium concentrations detected in Site 14 groundwater samples.]

Zinc was detected in all the groundwater samples collected at Site 14, although none of the concentrations measured exceeded the Florida Secondary Drinking Water Standard of 5,000  $\mu\text{g}/\text{L}$ . Groundwater samples collected from wells TW007 and TW008, located adjacent to Chevalier Field, exhibited the highest concentrations of zinc, as well as lead and copper. TW010, also located near Chevalier Field on the western berm,

0000399

was the only other well that also contained lead. The lead concentrations detected in all three of these groundwater samples exceeded the FDPWS for lead (50 µg/L).

The distribution of total metals concentrations in groundwater at Site 14 (see Figure 3-[8]) shows that the highest levels of metals contamination occur along the western border of the site in wells TW007 and TW008, suggesting that Chevalier Field may be a greater source of metal contaminants than the dredge spoil. However, significantly elevated concentrations of metals are also present near the center (TW012) and southeastern portion (TW011) of the spoil fill area. Low concentrations of total metals near the bayshore perimeter of the fill area (TW009, TW013, TW014, and TW016) indicate that the level of metals contamination in the shallow aquifer on Site 14 may be diminished as groundwater migrates to Pensacola Bay.

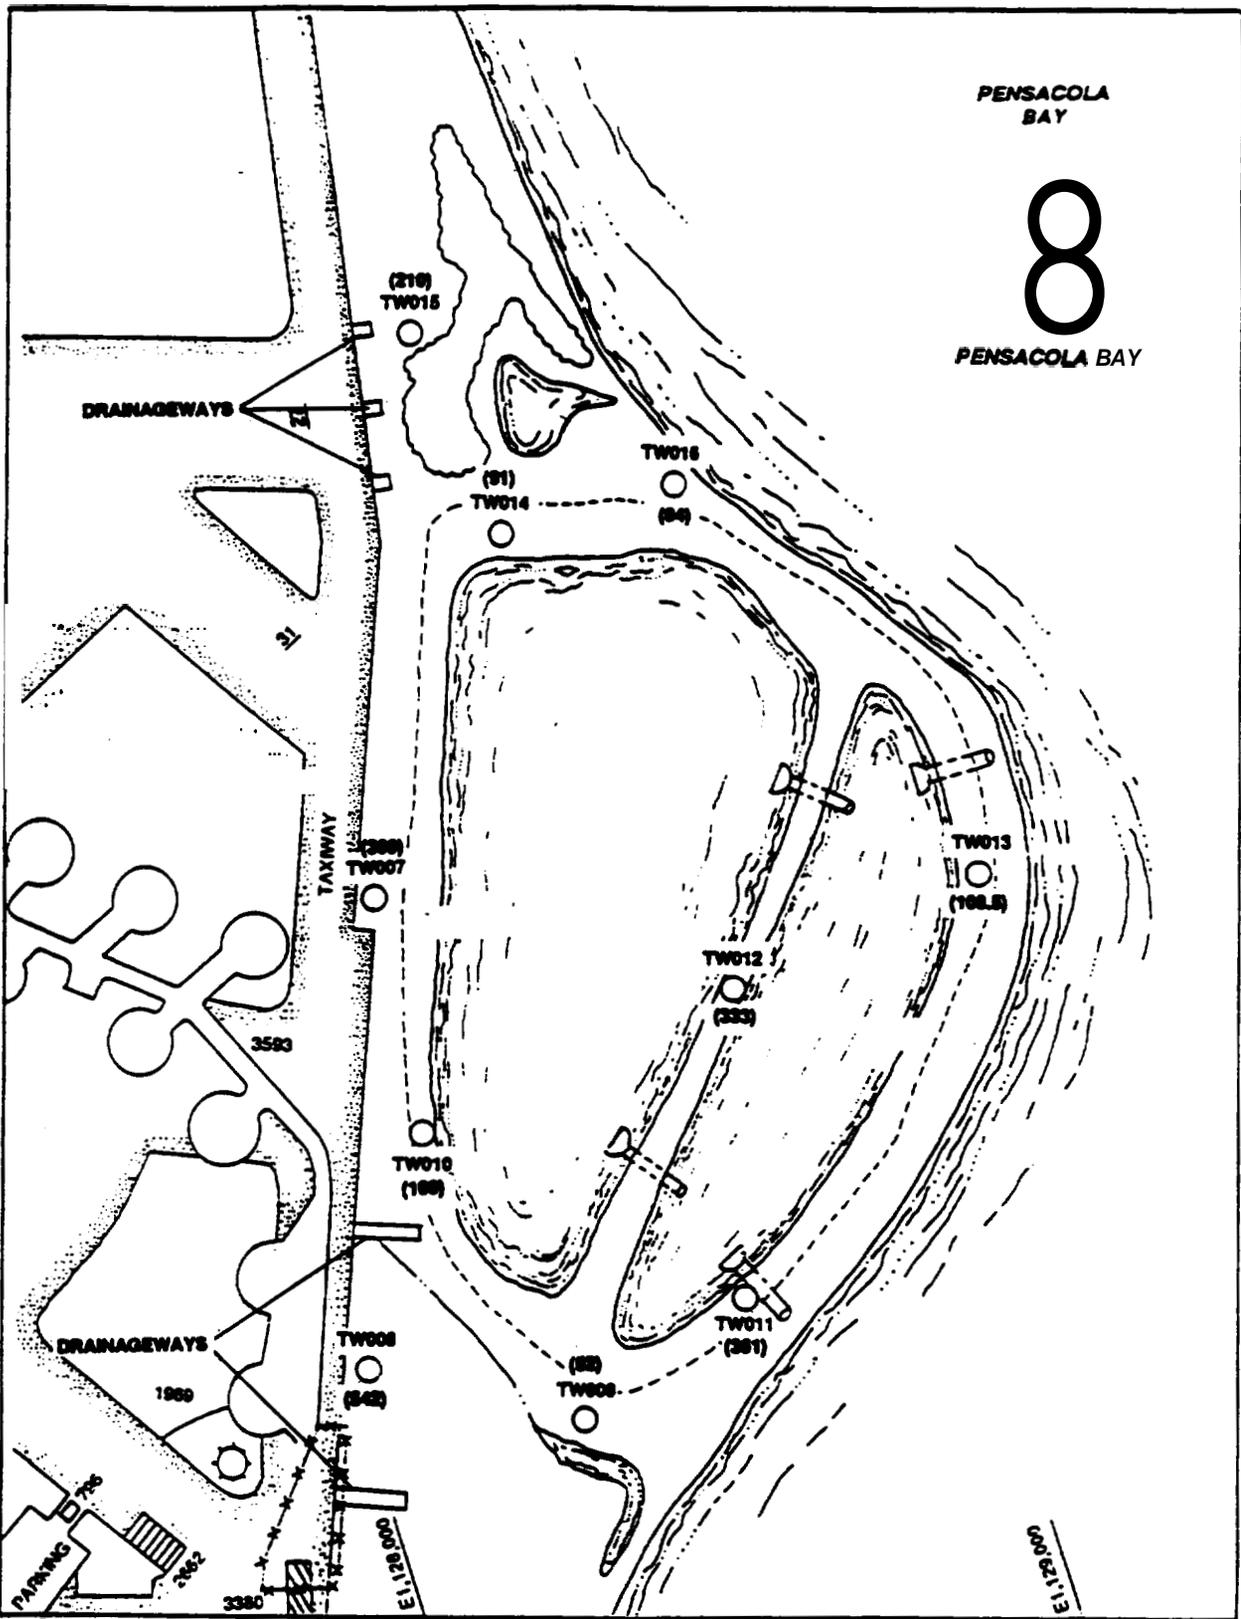

### 3.8 **CONTAMINATION DISTRIBUTION/SOURCE** DISCUSSION

All three of the media (sediment, soil, and groundwater) sampled at Site 14 exhibit at least trace levels of metals contamination. Elevated concentrations of TRPHs and PAHs were detected in sediment samples, and evidence of TRPH, VOC, and phenol contamination was present in soil samples. Some of the detected contamination appears associated with the fine-grained dredge spoil; however, the Phase I results also appear to indicate the presence of another source of contamination impacting Site 14. In the following sections, each of the sampled media will be discussed separately regarding the nature, distribution, and potential source(s) of contamination.

#### 3.8.1 Sediment

One or more of the sediment samples collected at Site 14 exhibited elevated levels of metals, TRPHs, and PAHs. Low levels of methylene chloride and phenols were detected in some sediment samples. Pesticides and PCBs were not detected in any of the sediment samples at Site 14.

Host of the elevated contaminant concentrations occurred in two sediment samples collected near shore in the vicinity of the northeastern water control structure and a third sample from a drainage

0000400

channel near the southwestern corner of the site. The distance between these sample locations suggests that two sources of contamination may affect the site.

Elevated concentrations of metals were limited to two samples collected from a nearshore clay layer, which either emanated from the spoil fill area or is naturally occurring. Based on a comparison with background sediment metals data, zinc and copper appear to be the primary metal contaminants in these samples. Chromium, for which no reliable background data is available, was also present in these samples at moderately elevated concentrations in comparison to chromium levels measured in adjacent sandy samples and in samples from Site 2 along the waterfront. These elevated concentrations of metals appear to be associated with the clay layer from which these samples were collected. This association suggests that metals contamination in the nearshore sediments is apparently restricted to the extent of the clay layer, which outcrops from the beach 15 feet south of the northeastern water control structure and continues for approximately 180 feet south.

Fuel spills from off-site activities appear to be the obvious source of significant TRPA and PAH contamination in the drainage channel near the southwestern corner of Site 2. The presence of a gasoline or diesel odor from the channel was confirmed during sampling. A concrete drainageway connecting this channel to the east side of Chevalier Field could conduct spills from adjacent runways and parking areas. Also, construction equipment used during trenching activities in this vicinity at the time of sampling could also have been a possible source of the fuel.

Phenol concentrations detected in sediment samples collected near the northeastern water control structure were similar to phenol levels measured in soil samples collected within the settling basins. This finding may indicate that fine-grained material found on the beach and nearshore area is contaminated dredge spoil that has escaped from the settling basins or that has been exposed by erosion of the berm.

### 3.8.2 Soil

Elevated levels of metals, TRPHs, VOCs, and phenols were detected in three or more soil samples collected at Site 14. The highest

contaminant concentrations were usually detected in the A intervals, except for those soil borings located on the berm. In these borings, the highest levels usually occurred in the deeper sampling intervals (C, D, or E interval). The E interval corresponds approximately to the same elevation relative to the water table as the A interval in the settling basins. Pesticides and PCBs were not detected in any of the soil samples. Low levels of PAHs were measured in about half of the soil samples at Site 14.

Chromium, zinc, cadmium, and copper were the primary metal contaminants detected. All of these metals occurred in all of the soil samples collected within the settling basins. Concentrations of each metal were uniform among these samples. This distribution of contamination within the settling basins provides evidence that these bay bottom sediments were contaminated with metals prior to dredging and settled out of the liquefied dredge spoil evenly throughout the basins. However, soil samples from the interior of the settling basins are necessary to substantiate this conclusion.

Elevated levels of metals, PAHs, and phenols were not detected in the berm or in locations outside the berm, indicating that the berm has been effective in restricting these contaminants to the settling basins. **TRPH** contamination [~~was detected in~~] the settling basins [~~and~~] at several locations west and south of the berm. [~~The highly elevated TRPH concentrations detected in the locations west and south of the berm were~~] probably caused by fuel spills and/or contaminated runoff from the adjacent runways at Chevalier Field.

VOCs were detected in three of the berm soil borings and at two borings north of the spoil fill area. Because VOCs were detected in soil samples from disparate locations and were not detected in the groundwater samples, VOC contamination probably did not originate from point sources, such as buried drums. Rather, the distribution of VOCs detected ~~may~~ not be indicative of the actual occurrence because, relative to the detection limits, the VOCs were detected at low concentrations, and, therefore, may also be present below the detection limits elsewhere on the site. A widespread occurrence of VOCs would indicate the presence of an ambient source, such as solvents used on the base or aircraft fuel from aircraft overflights.

### 3.8.3 Groundwater

Metals were the only significant groundwater contaminant at Site 14. PAHs [were present below detection limits in one sample,] and phenols were present below the detection limits in two samples adjacent to Chevalier Field. TRPHs, VOCs, pesticides, and PCBs were not detected in any of the groundwater samples at Site 14.

Six of the 10 groundwater samples exceeded the FPDWS for at least one metal. Chromium, lead, and cadmium were the primary metal contaminants. However, given that these samples were very turbid and not subjected to filtration, these elevated concentrations probably reflect leaching/dissolution of aquifer matrix sediments entrained in the unfiltered groundwater samples by the acid used as a preservative, rather than actual groundwater contamination. Evidence that this type of contamination occurs has been provided by the analytical results for metals samples collected from the existing permanent monitoring wells on sites 1, 11, and 15 during the corresponding Phase I investigations. Groundwater samples from these wells are much less turbid, exhibit much lower total metals concentrations than nearby Phase I temporary monitoring well samples, and exhibit even lower dissolved (millipore-filtered) metals concentrations.

Thus, groundwater metals contamination is possibly not as serious or widespread on Site 14 as suggested by the Phase I analytical results. However, two groundwater samples from temporary monitoring wells (TW007 and TW008) adjacent to Chevalier Field had the highest concentrations of zinc, lead, and copper. Lead levels in these two samples were 3 to 6 times greater than the FPDWS. Although these metals Concentrations might have been elevated by leaching or dissolution of aquifer matrix sediments, in conjunction with the sediment and soil analytical results, the concentrations appear to substantiate the conclusion that the western side of Site 14 has been impacted by activities at Chevalier Field.

## 3.9 QA/QC

### 3.9.1 Field QA/QC Samples

Three field duplicate samples were collected for the Site 14 soil screening samples; one field duplicate sample was collected for the

groundwater screening samples. The analytical results for the duplicate samples are presented in the summary tables for the respective media (see tables 3-3 and 3-5). No duplicate sample was collected for the sediment screening samples, because this medium was added as part of an amended scope of work for Site 14. A duplicate sample was not included in the amended plan. The soil and groundwater duplicate samples were in agreement, within acceptable limits, with the results for the original samples.

### 3.9.2 Laboratory QA/QC Samples

Methylene chloride is a common laboratory-derived contaminant (EPA 1988) and was present in several of the sediment and soil method blanks analyzed at E & Es ASC. Methylene chloride was not detected in any of the groundwater method blanks, nor was it detected in any of the groundwater samples. The concentrations of methylene chloride were within the range of those concentrations present in the method blanks; therefore, the presence detected in the sediment and soil samples can be attributed to laboratory-derived contamination.

#### 4. CONCLUSIONS

Sediment, soil, and groundwater contamination are all present on Site 14. Metals, TRPHs, VOCs, PAHs, and phenols are the primary contaminants. Some of the detected contamination is clearly associated with the dredged material contained in the fill area. However, contaminant sources from Chevalier Field, adjacent to the western boundary of the site, also are apparently impacting Site 14.

Two areas of sediment contamination appear to be present in water bodies surrounding the spoil fill area. Contamination of nearshore sediments appears to be restricted to an outcropping of cohesive, fine-grained sediments. This material exhibited similar levels of metals, TRPHs, PAHs, and phenols as found in soil samples collected from the settling basins. Sediment samples collected from the drainage channel at the southwestern corner of the site exhibited elevated levels of TRPHs and PAHs. Fuel spills and contaminated runoff from Chevalier Field are the likely sources of this contamination.

Soil contamination appears to be confined primarily to the spoil fill areas. Elevated levels of metals, TRPHs, PAHs, and phenols were present in soil samples collected from the perimeter of the settling basins, although the interior of the basins were not sampled due to the unstable and unsupportive nature of the spoil material. Soil samples collected from the berms generally exhibited lower concentrations of these contaminants and relatively low levels of VOCs. The source of these VOCs is unknown. Significant levels of soil contamination were also detected in samples collected along the western edge of the site, where highly elevated TRPA concentrations were detected in samples from two soil borings (TW007 and TW008). Fuel spills from Chevalier Field are the suspected source of this contamination.

Metals were the only significant groundwater contaminant detected at Site 14. Metals concentrations that exceed Florida standards occurred in six of the 10 groundwater samples, but these occurrences could reflect the fact that the turbid groundwater samples were not filtered prior to acid preservation. Based on the predicted direction of groundwater flow, most of the groundwater contamination appears to be associated with runoff from Chevalier Field. However, elevated concentrations of several metals detected in samples collected from monitoring wells on the central and southeastern ~~bars~~ indicate that the dredge spoil material may also contribute to groundwater contamination.

Date

APPENDIX A  
BIRDS OBSERVED DURING HABITATIBIOTA SURVEY

Table A-1

BIRDS OBSERVED DURING HABITAT/BIOTA SURVEY  
OCTOBER 1990

Mature pine forest, including grassy margins along dirt roads and thickets bordering forests.

Gray Catbird	<u>Dumetella carolinensis</u>
Rufous-sided Towhee	<u>Pipilo erythrophthalmus</u>
Yellow-throated Vireo	<u>Vireo flavifrons</u>
House Wren	<u>Troglodytes aedon</u>
Bluejay	<u>Cyanocitta cristata</u>
Eastern Phoebe	<u>Sayornis phoebe</u>
Mourning Dove	<u>Zenaida macroura</u>
Common Grackle	<u>Quiscalus quiscula</u>
White-eyed Vireo	<u>Vireo griseus</u>
Northern Mockingbird	<u>Mimus polyglottos</u>
Cardinal	<u>Cardinalis cardinalis</u>
Carolina Wren	<u>Thryothorus ludovicianus</u>
Boat-tailed Grackle	<u>Quiscalus major</u>
Brown Thrasher	<u>Toxostoma rufum</u>

Upland mature hardwood forest with some mix of pines.

Prairie Warbler	<u>Dendroica discolor</u>
Northern Mockingbird	<u>Mimus polyglottos</u>
Mississippi Kite	<u>Ictinia mississippiensis</u>
Red-tailed Hawk	<u>Buteo jamaicensis</u>
Mourning Dove	<u>Zenaida macroura</u>
Ovenbird	<u>Seiurus aurocapillus</u>
Tufted Titmouse	<u>Parus bicolor</u>
Carolina Chickadee	<u>Parus carolinensis</u>
Golden Crowned Kinglet	<u>Regulus satrapa</u>
Ruby Crowned Kinglet	<u>Regulus calendula</u>
Nashville Warbler	<u>Vermivora ruficapilla</u>
Bluejay	<u>Cyanocitta cristata</u>

Beachfront, including shoreline along waterfront apron; Pensacola Bay open water; Bayou Grande open water; shoreline along dredge spoil fill area; interior mudflats of dredge spoil fill area; and primary dune/scrubby areas of beach.

Forester's Tern	<u>Sterna forsteri</u>
Herring Gull	<u>Larus argentatus</u>
Semi-palmated Plover	<u>Charadrius semipalmatus</u>
Great Blue Heron	<u>Ardea herodias</u>
Semi-palmated Sandpiper	<u>Calidris pusilla</u>
Willet	<u>Catoptrophorus semipalmatus</u>
Ruddy Turnstone	<u>Arenaria interpres</u>
Royal Tern	<u>Sterna maxima</u>
Sandwich Tern	<u>Sterna sandircensis</u>
Roseate Tern	<u>Sterna dougallii</u>
Common Tern	<u>Sterna hirundo</u>
Brown Pelican	<u>Pelecanus occidentalis</u>
Killdeer	<u>Charadrius vociferus</u>
Chipping Sparrow	<u>Spizella passerina</u>
Eastern Wood Pewee	<u>Contopus borealis</u>
Bluejay	<u>Cyanocitta cristata</u>
Osprey	<u>Pandion haliaetus</u>
Belted Kingfisher	<u>Ceryle alcyon</u>
Fish Crow	<u>Corvus ossifragus</u>
Mourning Dove	<u>Zenaidura macroura</u>
Double Crested Cormorant	<u>Diomedea eximias</u>
Northern Mockingbird	<u>Mimus polyglottos</u>
Sanderling	<u>Calidris alpina</u>
Least Sandpiper	<u>Calidris minutilla</u>
Little Blue Heron	<u>Egretta caerulea</u>
Short-billed Dowitcher	<u>Limosa melanotos</u>
Laughing Gull	<u>Larus atricilla</u>
Black-bellied Plover	<u>Pluvialis squatarola</u>
Tree Swallow	<u>Tachycineta bicolor</u>
Acadian Flycatcher	<u>Empidonax vireescens</u>
House Wren	<u>Troglodytes aedon</u>

0000410

Marshland, including emergent vegetation found along Bayou Grande,  
Pensacola Bay, and brackish-water ponds.

Pied-billed Grebe	<u>Podilymbus podiceps</u>
Great Blue Heron	<u>Ardea herodias</u>
Great Egret	<u>Casmerodius albus</u>
Snowy Egret	<u>Egretta thula</u>
Little Blue Heron	<u>Egretta caerulea</u>
Tricolored Heron	<u>Egretta tricolor</u>
Green-winged Teal	<u>Anas crecea</u>
Mottled Duck	<u>Anas fulvigula</u>
Blue-winged Teal	<u>Anas discors</u>
Northern Shoveler	<u>Anas clypeata</u>
Lesser Scaup	<u>Aythya affinis</u>
American Coot	<u>Fulica americana</u>
Mourning Dove	<u>Zenaida macroura</u>
Northern Flicker	<u>Colaptes auratus</u>
Bluejay	<u>Cyanocitta cristata</u>
Red-winged Blackbird	<u>Agelaius phoeniceus</u>
Belted Kingfisher	<u>Ceryle alcyon</u>
Rufous-sided Towhee	<u>Pipilo erythrophthalmus</u>
Cardinal	<u>Cardinalis cardinalis</u>
Yellowthroat	<u>Geothlypis trichas</u>
Forester's Tern	<u>Sterna forsteri</u>
Osprey	<u>Pandion haliaetus</u>
House Wren	<u>Troglodytes aedon</u>
Yellow-rumped Warbler	<u>Dendroica coronata</u>
'Northern Mockingbird	<u>Mimus polyglottos</u>

Forested wetland area, including mature hardwoods and thick undergrowth mixed with emergent vegetation such as cattails.

Yellow-bellied Sapsucker	<u>Sphyrapicus varius</u>
Brown Thrasher	<u>Toxostoma rufum</u>
Harsh Wren	<u>Cistothorus palustris</u>
American Goldfinch	<u>Carduelis tristis</u>
Prairie Warbler	<u>Dendroica discolor</u>
Northern Flicker	<u>Colaptes auratus</u>
Cardinal	<u>Cardinalis cardinalis</u>
Bluejay	<u>Cyanocitta cristata</u>
Northern Mockingbird	<u>Mimus polyglottos</u>
Wood Thrush	<u>Hylocichla mustelina</u>

**APPENDIX C**  
**TEMPORARY MONITORING WELL, SOIL BORING,**  
**AND LITHOLOGIC INFORMATION**

SOIL BORING/TEMPORARY MONITORING WELL INFORMATION

- 1) Site no.: 14
- 2) Boring no./Well no.: P14B001
- 3) Drilling firm: Thomason Drilling Service
- 4) Drilling method: HA
- 5) Date drilled/installed: 01/03/91
- 6) Geologist: J. Strickland
- 7) Depth of boring (BLS): 5.5
- 8) Depth to water in borehole (BLS): 5.5
- 9) Highest open-borehole OVA/HnU reading (ppm): 0
- 10) Depth of well (BLS): NA
- 11) Length of well screen: NA
- 12) Length of casing (BLS): NA
- 13) Aprox. height of casing above land surface: NA
- 14) Depth to water in well (BTOC): NA
- 15) Elevation of TOC: NA
- 16) Water level elevation: NA
- 17) Date groundwater sampled: / /
- 18) pH (units): NA
- 19) Temperature (degrees C): NA
- 20) Specific conductance (umhos/cm): NA
- 21) Borehole/Well abandonment method: Backfilled with cuttings.
- 22) Comments:

---

BOREHOLE LITHOLOGIC LOG

Sample Depth (BLS)	Sample Description
0-2.5	Sand, white, medium grained in upper 6 inches, then clayey silt with sand, dark blue-black, very fine grained dredge material.
2.5-5.5	Sand, white to tan, fine to medium grained with shell fragments to 5.5 ft.

---

Notes: All depths, lengths, heights, and elevations are measured in feet. All boreholes are 4 inches in diameter. All well casings and screens are 2-inch-diameter; well screen slot sizes are .010 inches. No annular material (i.e. filter pack, seal or grout) was used in well installation. Unless otherwise noted, all sand grains are quartz.

NA = not applicable  
 SSA = solid stem auger  
 HA = hand auger

BLS = below land surface  
 TOC = top of casing  
 BTOC = below top of casing

BOREHOLE LITHOLOGIC LOG

<u>Sample Depth (BLS)</u>	<u>Sample Description</u>
0-2	Sandy, white fine to medium grained.
2-3.5	Silty clay, black to blue.
3.5-4	Sand, white, fine to medium grained. Water at 4 ft.

---

Notes: All depths, lengths, heights, and elevations are measured in feet. All boreholes are 4 inches in diameter. All well casings and screens are 2-inch-diameter; well screen slot sizes are .010 inches. No annular material (i.e. filter pack, seal or grout) was used in well installation. Unless otherwise noted, all sand grains are quartz.

NA = not applicable

BOREHOLE LITHOLOGIC LOG

Sample Depth (BLS)	Sample Description
0-3	Sand, dark gray, possible organic decay, coarse grained with shell fragments. Water at 3 ft.

Notes: All depths, lengths, heights, and elevations are measured in feet. All boreholes are 4 inches in diameter. All well casings and screens are 2-inch-diameter; well screen slot sizes are .010 inches. No annular material (i.e. filter pack, seal or grout) was used in well installation. Unless otherwise noted, all sand grains are quartz.

NA = not applicable  
 SSA = solid stem auger  
 HA = hand auger

BLS = below land surface  
 TOC = top of casing  
 BIOC = below top of casing

MEMORANDUM

TO: John Barksdale  
FROM: Gary Hahn *GH*  
DATE: February 27, 1991  
SUBJECT: UH-6000 Pensacola Report  
REF: 9100.290  
CC: Lab File

Attached is the laboratory report of the analysis conducted on six samples received at the Analytical Services Center on February 12, 1991. Analysis was performed according to the screening procedures set forth in "Generic Quality Assurance Project Plan, Contamination Assessments and Remedial Activities, Naval Air Station Pensacola, Pensacola, Florida," July 1990.

All samples on which this report is based will be retained by B & B for a period of 30 days from the date of this report, or otherwise instructed by the client. If additional storage of samples is requested by the client, a storage fee of \$1.00 per sample container per month will be charged for each sample, with such charges accruing until destruction of the samples is authorized by the client.

TO : John Barksdale  
FROM: Gary Hahn *G. Hahn*  
DATE: February 1, 1991  
SUBJECT: UH-6000 Pensacola Report  
REP: 9100.092  
CC: Lab File

Attached is the laboratory report of the analysis conducted on five samples received at the Analytical Services Center on January 14, 1991. Analysis was performed according to the screening procedures set forth in "Generic Quality Assurance Project Plan, Contamination Assessments and Remedial Activities, Naval Air Station Pensacola, Pensacola, Florida," July 1990.

All samples on which this report is based will be retained by E & E for a period of 30 days from the date of this report, unless otherwise instructed by the client. If additional storage of samples is requested by the client, a storage fee of \$1.00 per sample container per month will be charged for each sample, with such charges accruing until destruction of the samples is authorized by the client.

MEMORANDUM

TO: John Barksdale  
FROM: Gary Hahn *G. Hahn*  
DATE: January 30, 1991  
SUBJECT: UH-6000 Pensacola Report  
REF: 9100.102  
CC: Lab Pile

Attached is the laboratory report of the analysis conducted on six samples received at the Analytical Services Center on January 15, 1991. Analysis was performed according to the screening procedures set forth in "Generic Quality Assurance Project Plan, Contamination Assessments and Remedial Activities, Naval Air Station Pensacola, Pensacola, Florida," July 1990.

All samples on which this report is based will be retained by B 6 B for a period of 30 days from the date of this report, unless otherwise instructed by the client. If additional storage of samples is requested by the client, a storage fee of \$1.00 per sample container per month will be charged for each sample, with such charges accruing until destruction of the samples is authorized by the client.

M E H O R A N D U H

TO : John Barksdale  
FROM : Gary Hahn *GHahn/BJK*  
DATE : January 18, 1991  
SUBJECT : UH-6000 Pensacola Report  
REF : 9100.039  
CC : Lab File

Attached is the laboratory report of the analysis conducted on five samples received at the Analytical Services Center on January 9, 1991. Analysis was performed according to the screening procedures set forth in "Generic Quality Assurance Project Plan, Contamination Assessments and Remedial Activities, Naval Air Station Pensacola, Pensacola, Florida," July 1990.

All samples on which this report is based will be retained by E & E for a period of 30 days from the date of this report, unless otherwise instructed by the client. If additional storage of samples is requested by the client, a storage fee of \$1.00 per sample container per month will be charged for each sample, with such charges accruing until destruction of the samples is authorized by the client.

APPENDIX E  
SOIL SAMPLING ANALYTICAL SCREENING RESULTS

M E M O R A N D U M

TO : John Barksdale  
FROM : Gary Hahn *GHahn/JSK*  
DATE : January 17, 1991  
SUBJECT: UH-6000 Pensacola Report  
REF : 9100.026  
CC : Lab File

Attached is the laboratory report of the analysis conducted on twenty-seven samples received at the Analytical Services Center on January 5, 1991. Analysis was performed according to the screening procedures set forth in "Generic Quality Assurance Project Plan, Contamination Assessments and Remedial Activities, Naval Air Station Pensacola, Pensacola, Florida," July 1990.

All samples on which this report is based will be retained by E & E for a period of 30 days from the date of this report, unless otherwise instructed by the client. If additional storage of samples is requested by the client, a storage fee of \$1.00 per sample container per month will be charged for each sample, with such charges accruing until destruction of the samples is authorized by the client.
