ABSTRACT (Continue on reverse if necessary and identify by block number) <p>This Interim Data Report contains the results of Phase I of the Contamination Assessment/Remedial Activities Investigation conducted at the Solvent North of Building 3557 (Site 34), located on the Naval Air Station in Pensacola, Florida. This work was conducted as part of the U. S. Navy's Installation Restoration Program. The objective of the Phase I investigation at Site 34 was to identify principal areas and primary contaminants of concern at the site and to provide recommendations for subsequent phases of investigation. This investigation was the first step in the completion of a RCRA Facility Investigation/Corrective Measures study for the site. Soil and groundwater contamination are present of Site 34. Metals, TRPHs, PAHs, and phenols are the primary contaminants. Further assessment activities are required at or in the vicinity of site 34.</p>

RECORD OF **DOCUMENT CHANGES**

Revisions to this document were made based on comments received from the U.S. Environmental Protection Agency, Florida Department of Environmental Regulation, Florida Department of Natural Resources, and National Oceanic and Atmospheric Administration. All revisions are in bold and enclosed in brackets to denote changes to the last version of this document.

[**Bold items** enclosed in brackets denote **changes** to last version of **document**]

EXECUTIVE SUMMARY

As part of the U.S. Navy's Installation Restoration Program, Phase I of the Contamination Assessment/Remedial Activities Investigation was conducted for the Solvent North of Building 3557 (Site 34), located on the Naval Air Station in Pensacola, Florida. This work was performed by Ecology and Environment, Inc., (E & E) under contract to the Southern Division, U.S. Navy, Naval Facilities Engineering Command.

Site 34 is located at the western edge of Chevalier Field and immediately north of Building 3557 (see figures 1-1 and 1-2). The southern portion of the site is covered by the Chevalier Field concrete apron. A tank farm, consisting of seven vertical and one horizontal aboveground storage tanks on a raised concrete foundation, is located on the site approximately 150 feet north of Building 3557. A drainage ditch crosses the unpaved northern portion of the site, and the asphalt-paved surface of Chevalier Field forms the north perimeter (see Figure 1-2). A central sump pit is located beneath the northern half of the building. This sump pit is concrete-lined and extends to a depth of 25 feet below land surface. Because of groundwater infiltration, the sump pit is continuously pumped at a rate of 50,000 to 70,000 gallons per day.

During May 1984, a leak occurred in a pipeline located between the tank farm and Building 3557. The leak reportedly resulted in the loss of 45,000 gallons of a solvent detergent containing 1.7% chlorinated aromatic hydrocarbon solvent.

The purpose of the Phase I investigation was to identify principal areas and primary contaminants of concern at the site and to provide recommendations for subsequent phases of investigation. The Phase I fieldwork included a site reconnaissance; surface emissions survey and particulate air screening; utilities survey; the collection and analysis

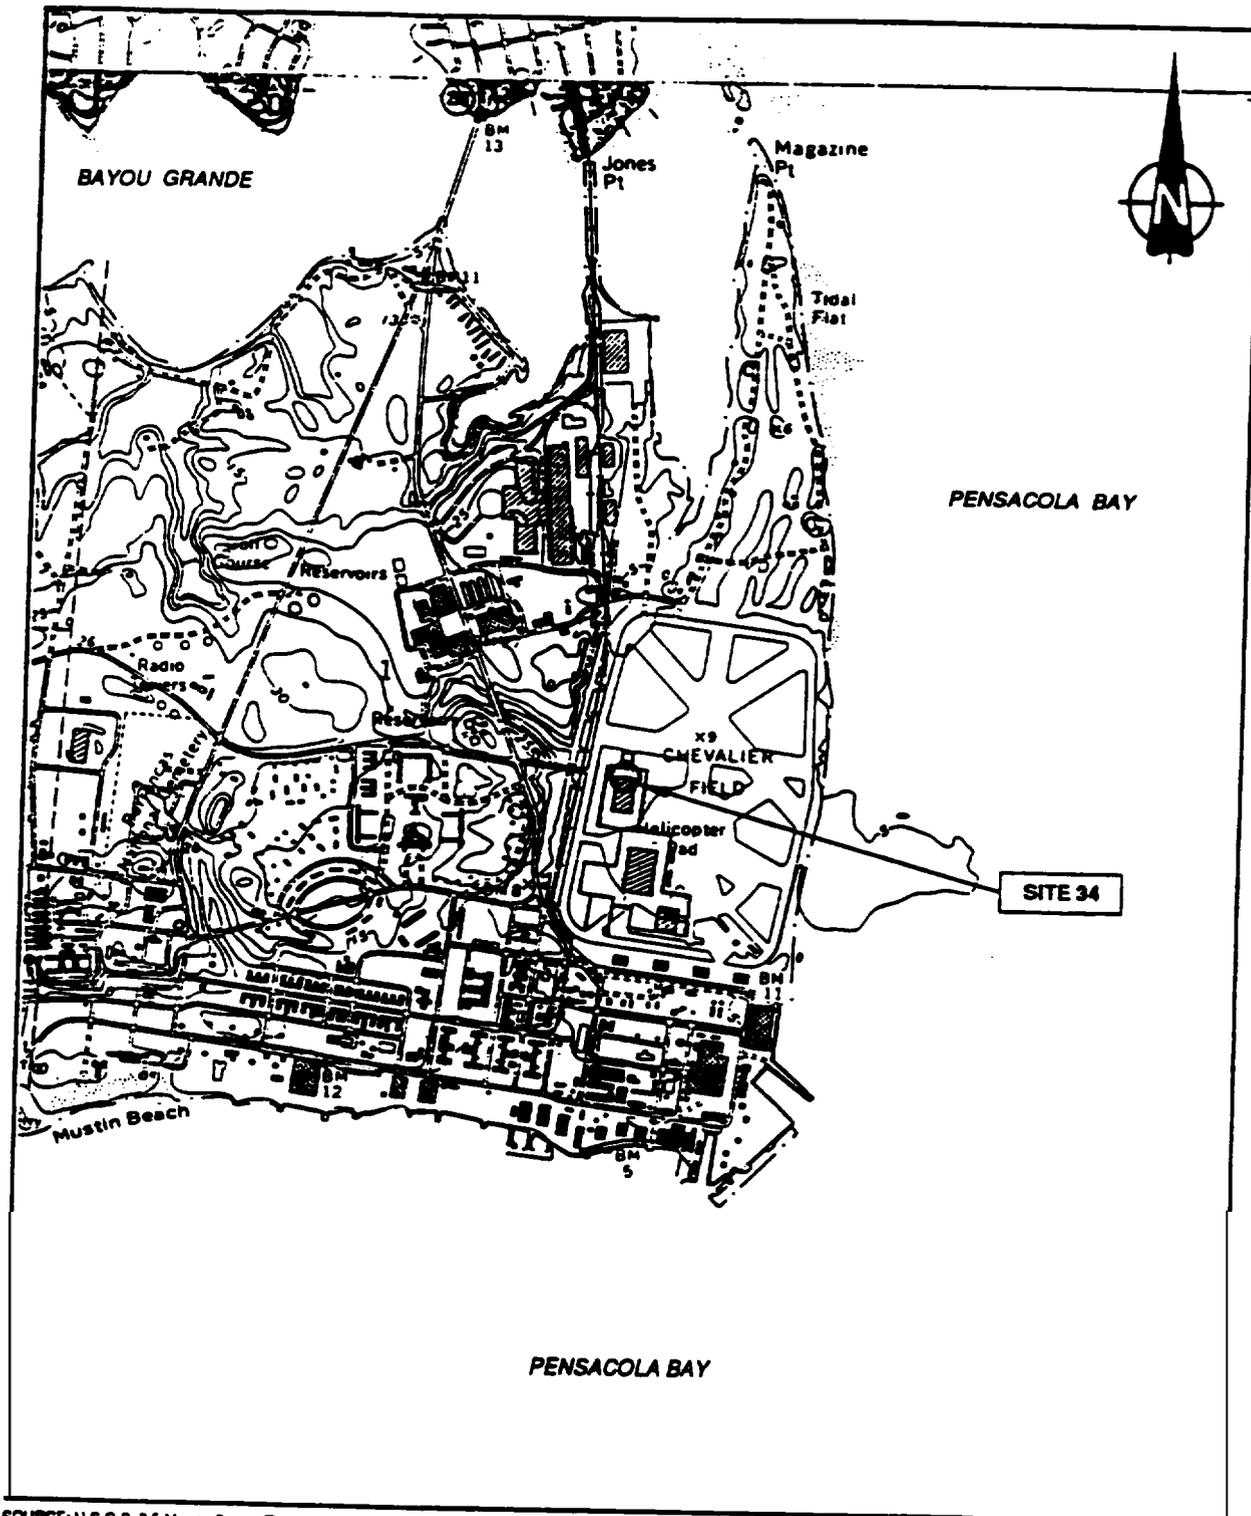

of soil and groundwater samples; and a hydrologic assessment. Soil and groundwater contamination are present on Site 34. Metals, TRPHs, PAHs, and phenols are the primary contaminants. The detected contamination does not appear to be indicative of the descriptions of the detergent/solvent pipe leak that occurred north of Building 3557 in 1974; however, additional sources of contamination, likely including the industrial sewer line (Site 36), **may** be impacting Site 34.

The recommendations for additional work at this site will be incorporated in the revised Group F work plan.

1. INTRODUCTION

This Interim Data Report presents the findings of the Phase I investigation activities performed for Site 34, Solvent North of Building 3557, located at the Naval Air Station (NAS) in Pensacola, Escambia County, Florida. This report has been prepared by Ecology and Environment, Inc., (E & E) for the Southern Division, U.S. Navy, Naval Facilities Engineering Command, under Contract No. N62467-88-C-0200. The information presented in this report is based on information and file documents provided by the Navy and on information gathered during the Phase I fieldwork conducted on the site from April 1991 to July 1991. Because of the proximity of the other four Group F sites (Site 9, Navy Yard Disposal Area; Site 10, Commodore's Pond; Site 23, Chevalier Field Pipe Leak Area; and Site 29, Soil South of Building 3460) and part of Group N Site 36, Industrial Waste Sewer, to Site 34, any information gathered during the corresponding Phase I investigations of these sites that is relevant to understanding Site 34 conditions has been included in this Site 34 interim data report. The Phase I investigation of Site 34 was conducted in accordance with the administrative documents prepared by E & E for this project, which include the June 1990 Project Management Plan, June 1990 Site Management Plan, July 1990 Generic Quality Assurance Project Plan (GQAPP), July 1990 General Health and Safety Plan, and June 1990 Contamination Assessment/Remedial Activities Investigation **Work** Plan--Group F with appended Site-Specific Health and Safety Plan and Site-Specific Quality Assurance Plan. All references to these documents in this report apply only to the 1990 versions.

Site 34 is located at the western edge of Chevalier Field and immediately north of Building 3557 (see figures 1-1, 1-2, and 1-3). The southern portion of the site is covered by the Chevalier Field concrete apron. A tank farm, consisting of seven vertical and one horizontal

aboveground storage tanks on a raised concrete foundation, is located on the site approximately 150 feet north of Building 3557. A drainage ditch crosses the unpaved northern portion of the site, and the asphalt-paved surface of Chevalier Field forms the northern perimeter (see Figure 1-2). A central sump pit is located beneath the northern half of the building. This sump pit is concrete-lined and extends to a depth of 25 feet below land surface (BLS). Because of groundwater infiltration, the sump pit is continuously pumped at a rate of 50,000 to 70,000 gallons per day.

During May 1984, a leak occurred in a pipeline located between the tank farm and Building 3557, The leak reportedly resulted in the loss of 45,000 gallons of a solvent detergent containing 1.7% chlorinated aromatic hydrocarbon solvent, A complete site description and history are presented in the Group F investigation work plan.

The purpose of the Phase I investigation was to identify principal areas and primary contaminants of concern at the site and to provide recommendations for subsequent phases of investigation. The Phase I fieldwork included a site reconnaissance, surface emissions survey and particulate air screening, utilities survey, and the collection and analysis of soil and groundwater samples. In addition, a hydrologic assessment, which included the determination of groundwater elevations, flow direction, and hydraulic gradient, was performed at the site. The recommendations for additional work at this site will be incorporated in the revised Group F work plan.

2. INVESTIGATION METHODOLOGY

2.1 AERIAL PHOTOGRAPH AND EXISTING DATA ANALYSIS

Prior to the initiation of fieldwork, E & E personnel examined all available aerial photographs of NAS Pensacola for past and present conditions, features, and developments that might have had direct relevance to the fieldwork methodology. The aerial photograph analysis task involved assembling and stereoscopically analyzing historical photographic imagery and topographic maps available for the site area. Photographs were scaled to allow analysis of past and present surface conditions, drainage, and land use. The aerial photographs used in the analysis are listed in Table 2-1. The photographs were analyzed to obtain information regarding the evolution of site features that might have affected hydrologic conditions and to aid in the performance of such tasks as field reconnaissance and monitoring well placement.

2.2 SITE RECONNAISSANCE

A field reconnaissance survey was conducted on and around the site. Available aerial photographs and maps were used as guides in locating surface features. Visual inspections were made of surface conditions and surface drainage patterns. These observations of surface conditions on the site were used to update the site map. During the reconnaissance survey, the field team identified areas that presented the most suitable conditions for the establishment of survey grid baselines. The use of a grid system as part of the Phase I field investigation is discussed in the following sections.

The reconnaissance survey team utilized radiation and air monitoring equipment during walkovers of site areas, in accordance with Section 6.1.1 of the GQAPP. Areas with readings above background were located, flagged, and identified on a site map for future reference.

Source: Ecology and Environment, Inc., 1992.

All findings of the physical reconnaissance were mapped in detail and recorded in the field logbook.

2.3 OVA SURFACE EMISSIONS SURVEY AND PARTICULATE AIR SCREENING

Following the establishment of the survey grid network (discussed in Section 2.4), a surface emissions survey was conducted using an organic vapor analyzer (OVA). The survey was conducted in accordance with Section 6.1.1 of the GOAPP. Measurements were made at each established grid point, and readings were recorded in the field logbook. In addition, preliminary air screening was conducted with a particulate monitor to determine if the site represents a source of particulates in the air. The air screening was conducted in accordance with Section 6.1.1 of the GOAPP.

2.4 SURVEY GRID

The survey effort required the initial establishment of a grid system over the study area. To construct the grid, baselines were established along Building 3557. The area was then gridded with spacings based on 100-foot centers. Baseline transects were established using a transit survey instrument and flagged or marked at 50-foot intervals; however, measurements recorded during the surveys were taken at 25-foot intervals. The grid system was completed relative to an arbitrarily established origin point using a Brunton compass and tape measure. Grid points were flagged and numbered as follows:

Grid X, N $n_1 + yy$, E (or W) $n_2 + zz$,

where:

X = Grid letter;

n_1 = Distance in 100-foot increments north (N) from the origin point;

n_2 = Distance in 100-foot increments east (E) or west (W) from the origin point;

yy = Additional distance in feet north from the nearest previously located 100-foot increment from the grid origin; and

zz = Additional distance in feet east or west from the nearest previously located 100-foot increment from the grid origin.

In the case of grid points located at even 100-foot increments from the origin, yy and zz = 00 (e.g., the northeast corner of the grid on Site 34 is N3+00, E3+75). Figure 2-1 shows the location of the survey grid and origin point established on Site 34.

2.5 UTILITIES SURVEY

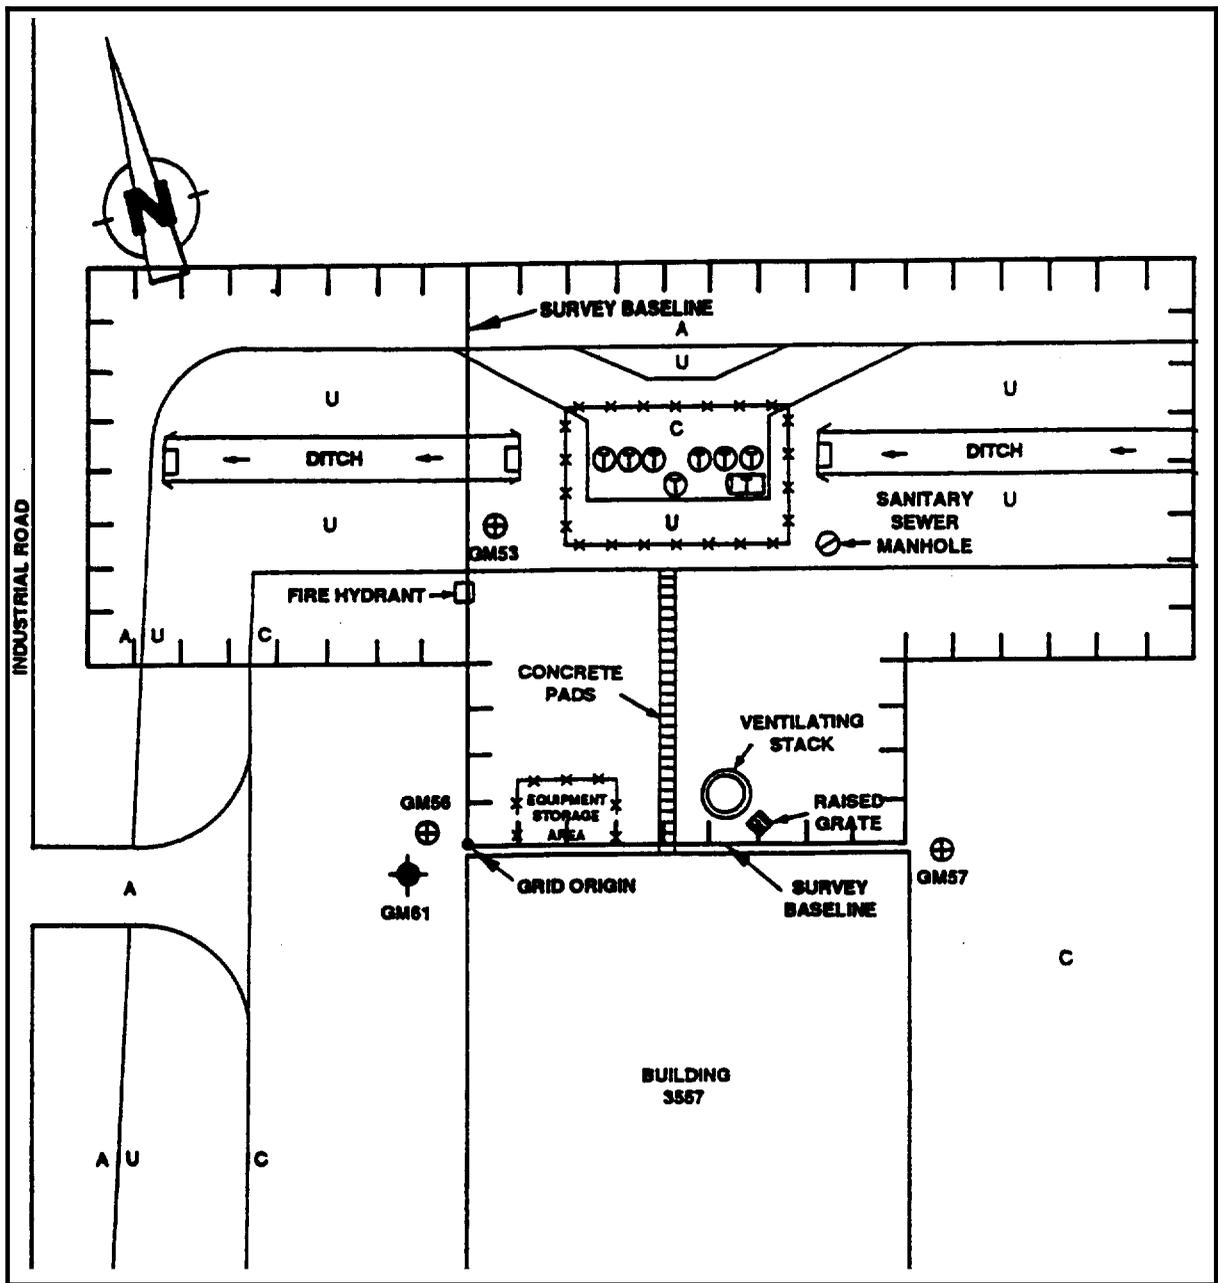

Prior to conducting any augering, boring, or drilling, E & E located all underground cables, pipes, utilities, and other subsurface features that could potentially be damaged, create a safety hazard, or otherwise hinder fieldwork. The appropriate authorities (e.g., NAS Pensacola Public Works and Southern Bell) were contacted to identify the location of all underground utilities in the site area. In addition, E & E examined available maps and documents and conducted a metal detector survey around proposed boring locations to determine the potential presence of any other potentially hazardous subsurface features on site. The locations of all underground utilities and other obstructing features were marked with surveyor flags, fluorescent paint, or by other methods, as appropriate.

2.6 DATA ANALYSIS

Information obtained from the results of the above-described physical surveys was given primary consideration in the development of placement strategies for the Phase I soil borings and temporary monitoring wells. Prior to establishing the Phase I soil boring or temporary monitoring well locations, the results of the aerial photograph analysis, site reconnaissance, surface emissions survey and particulate air screening, and utilities survey were evaluated to identify potential areas of surface or subsurface contamination, leachate seeps, and boundaries of filled areas. The proposed Phase I soil boring and temporary monitoring well locations, shown on Figure 14-2 of the work plan, were then revised, as appropriate upon approval by Southern Division.

2.7 SOIL BORINGS AND TEMPORARY MONITORING WELL INSTALLATION

Figure 2-2 presents soil boring and temporary monitoring well locations at the five Group F sites (9, 10, 23, 29, and 34) and at Site

3400575

36. Figure 2-3 presents the soil boring and temporary monitoring well locations only at Site 34. Twelve soil borings were completed at Site 34 (see figures 2-2 and 2-3). At each Site 34 boring location, samples were collected by compositing soils over 5-foot depth intervals from land surface to the water table. Each 5-foot depth interval was assigned a letter designation as follows: A interval = surface to 5 feet BLS; B interval = 5 to 10 feet BLS; C interval = 10 to 15 feet BLS; and so on to the water table. Samples were collected using either hand-operated bucket augers or a solid-stem auger powered by a drill rig. Lithologic characteristics of the materials encountered in each borehole were recorded in the field logbook. All sampling, compositing, and lithologic logging activities were performed in accordance with Section 6.6 of the GQAPP. Equipment decontamination was performed in accordance with Section 6.10 of the GQAPP.

Temporary, stainless steel monitoring wells were installed in five of the 12 borings (see figures 2-2 and 2-3). Each well was constructed with 5 feet of 0.01-inch slotted screen and installed to a depth that allowed the well screen to bracket the water table. The wells were installed using solid-stem augers powered by a drill rig. Lithologic characteristics of materials encountered during installation of the wells were recorded in the field logbook in accordance with Section 6.6 of the GQAPP. All equipment decontamination activities were performed in accordance with Section 6.10 of the GQAPP.

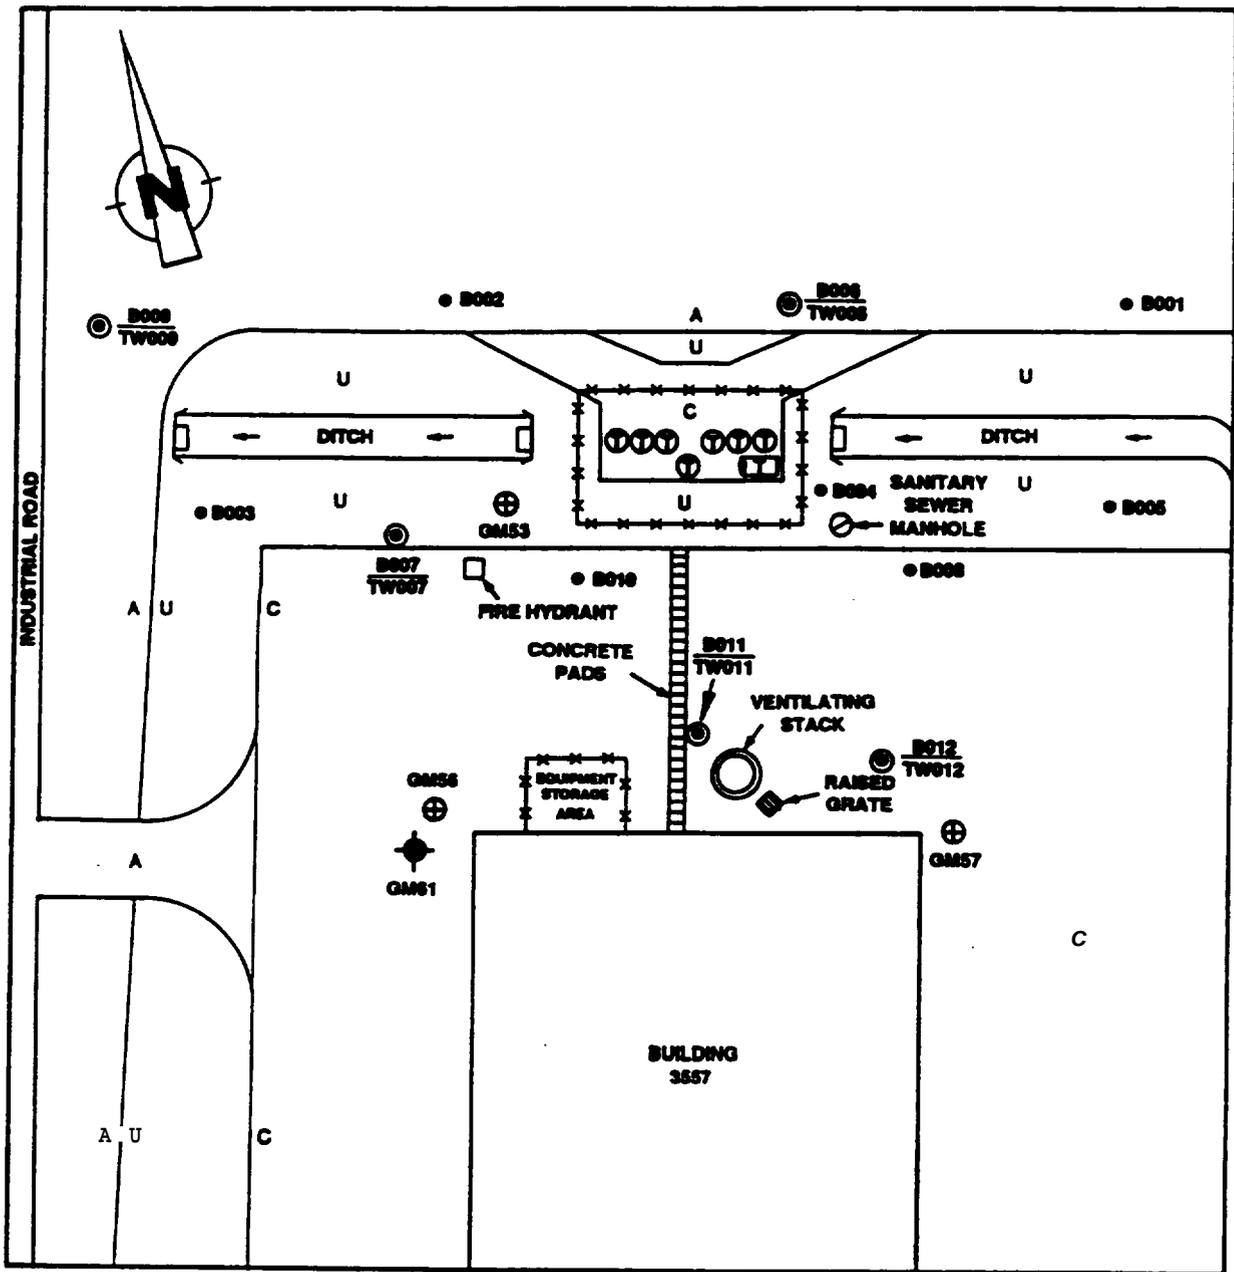

2.8 SOIL SAMPLING

Twelve soil samples, plus one duplicate sample, were collected as described in Section 2.7, in accordance with Section 6.6.2 of the GQAPP. All soil samples were shipped to E & E's Analytical Services Center (ASC) in Buffalo, New York, and analyzed for the screening parameters listed in Table 2-2.

2.9 GROUNDWATER SAMPLING

2.9.1 Temporary Monitoring Wells

Five groundwater samples, plus a duplicate sample, were collected from the five temporary monitoring wells shown on figures 2-2 and 2-3. Weather conditions; water levels; purge volumes; and groundwater pH,

'Analytical suite designation is as follows:

A = Volatile organic compounds (VOCs) including chlorobenzene, polynuclear aromatic hydrocarbons (PAHs), phenols, pesticides and total polychlorinated biphenyls (PCBs), total recoverable petroleum hydrocarbons (TRPHs), and metals (total, unfiltered).

B = Target Compound List (TCL) VOCs (EPA 8240), TCL base/neutral and acid extractable organic compounds (BNAs; EPA 8270), TCL pesticides and PCBs (EPA 8080), TRPHs (EPA 418.1), Target Analyte List (TAL) metals (total [i.e., unfiltered] and dissolved [i.e., millipore-filtered]; EPA 6010/7060/7421/7471/7740/7841), cyanide (EPA 90101, total organic carbon (EPA 415.1), hardness (water only; EPA 130.21, and alkalinity (water only: EPA 310.1).

^bSpecific constituents encompassed by the various chemical groups included within analytical suite A are identified in tables 9-1 through 9-4 of the GQAPP.

^cSpecific constituents encompassed by the various chemical groups included within analytical suite B are identified in tables 9-5 through 9-13 of the GQAPP.

^dGroundwater samples and analyses shown are for temporary wells only.

^oGroundwater samples and analyses shown are for existing permanent wells.

^fTrip blanks analyzed for TCL VOCs only.

^gRinsate blanks analyzed for total and dissolved TAL metals, cyanide, TRPHs, TCL VOCs, TCL BNAs, TCL pesticides and PCBs, and total hardness.

^hPreservative blanks analyzed for TCL VOCs, TRPHs, total TAL metals, and cyanide.

Source: Ecology and Environment, Inc., 1992.

[Bold items enclosed in brackets denote changes to last version of document]

specific conductance, and temperature measurements were recorded in the field logbook prior to sampling. In addition, prior to purging, each well was checked for the presence of floating and/or sinking immiscible hydrocarbons using a Solinst oil-water interface probe. Each groundwater sample was collected immediately following well purging. All well purging and sampling activities were performed in accordance with sections 6.8 and 6.11 of the GQAPP. Equipment decontamination was performed in accordance with Section 6.10 of the GQAPP. All groundwater samples collected from the temporary monitoring wells were shipped to E & E's ASC and analyzed for the screening parameters listed in Table 2-2.

2.9.2 Existing Permanent Monitoring Wells

Four groundwater samples, plus one duplicate sample, were collected from the existing permanent monitoring wells located on the site (see Figure 2-2). Weather conditions; water levels; purge volumes; and groundwater pH, specific conductance, and temperature measurements were recorded in the field logbook prior to sampling. Each groundwater sample was collected immediately following well purging. All well purging and sampling activities were performed in accordance with sections 6.8 and 6.11 of the GQAPP. Equipment decontamination was performed in accordance with Section 6.10 of the GQAPP. All groundwater samples collected from the existing wells were analyzed according to U.S. Environmental Protection Agency (EPA) Contract Laboratory Program (CLP) protocol for the Target Analyte List (TAL) and Target Compound List (TCL) and other parameters.

2.10 HYDROLOGIC ASSESSMENT

The hydrologic assessment of the site and surrounding areas included a wellhead elevation survey of the temporary monitoring wells, static water level measurements, and determination of water level elevations in both the existing permanent monitoring wells and the temporary monitoring wells.

Wellhead top-of-casing (TOC) elevations for the temporary monitoring wells were measured relative to the top of a driven reference stake located adjacent to each well using a spirit level and tape

measure. Following groundwater sampling and removal of the temporary monitoring wells, the elevations of the driven reference stakes were surveyed using a transit with reference to permanent monitoring well GM61 (8.91 feet above mean sea level [MSL]; G&M 1986).

Wellhead TOC elevations and static water levels measured in each existing permanent well were referenced directly to the established benchmark. Static water levels in the permanent monitoring wells were measured on May 1, 1991, over a 2-hour period. Static water levels in the temporary monitoring wells were measured on June 20, 1991. The static water level data were used to determine the water table elevation, shallow groundwater flow direction, and horizontal hydraulic gradient for the shallow, surficial zone of the Sand-and-Gravel Aquifer in the site vicinity.

In conjunction with the wellhead survey, the elevations of other nearby features (e.g., ponds, streams, and leachate seeps) were established.

2.11 FIELD QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

All field tasks performed during the investigation were documented in the field logbooks according to the procedures specified in Section 7.2 of the GQAPP.

2.11.1 Field QA/QC Samples

Field QA/QC samples were prepared for all samples collected at the site during the Phase I investigation according to the procedures described in Section 6.12 of the GQAPP. Chain-of-custody was maintained for all samples collected, packaged, and shipped to E & E's ASC for analysis. Sample management was performed as specified in Section 7 of the GQAPP. The collected field QA/QC samples and corresponding analytical parameters are listed in Table 2-2.

2.11.2 Decontamination Procedures

All equipment used during field activities was decontaminated in accordance with Section 6.10 of the GQAPP.

2.12 INVESTIGATION-DERIVED WASTE MANAGEMENT

Excess soil generated during soil boring and temporary monitoring well installation activities was temporarily contained adjacent to the well or boring and then backfilled into the borehole after the auger flights or temporary well casings had been removed following sample collection. Any soil material remaining after completion of borehole backfilling was placed in 55-gallon drums, sealed, labeled, and moved to a central area on the site. Each drum has a painted-on label listing the site number and the type of material contained in the drum.

All water generated during development and purging of the temporary monitoring wells was temporarily contained adjacent to the well and then poured back into the well following collection of samples.

All water generated during purging of the existing permanent monitoring wells was placed in 55-gallon drums, sealed, labeled, and moved to a central area on the site. Each drum has a painted-on label listing the site number and the type of material contained in the drum.

Potentially contaminated, personal protective clothing and disposable materials, wastes generated during decontamination activities, and other potentially contaminated, investigation-derived materials were placed in 55-gallon drums, labeled, and moved to a central area on the site. These drums are sealed and labeled "trash." All drummed investigation-derived materials were subsequently picked up and disposed of by NAS Pensacola.

3. RESULTS

3.1 AERIAL PHOTOGRAPH AND EXISTING DATA ANALYSIS

Review of aerial photographs from 1951 to 1989 indicated that activities and surface features on and in the vicinity of Site 34 evolved considerably during this period. A large building was constructed south of and adjacent to the site; a tank farm and unpaved drainage ditch were constructed in the northern portion of the site; and the southern portion of the site was paved with an extensive concrete pavement .

Review of the January 22, 1951, aerial photograph indicated that the site was covered with low-lying vegetation except for the northern area of the site where a portion of one of the Chevalier Field runways is located. Aircraft were observed nearby on the concrete apron of Chevalier Field in the area west of the site. The site surface is open and flat, and surface drainage is most likely directed toward the west away from Chevalier Field where an extensive paved drainage ditch system is located.

Aircraft were observed in the Chevalier Field area in the January 3, 1958, aerial photograph; however, subsequent aerial photographs from October 12, 1961, to May 4, 1973, indicate that aircraft were no longer present on Chevalier Field. No other changes to the site or site area are apparent during this period.

Review of the April 28, 1976, aerial photograph indicated that construction of Building 3557, located in the southern portion of the site, and the extensive concrete pavement, which covers the southern portion of the site surrounding Building 3557, was occurring at this time. Some construction in the area of the tank farm in the northern portion of the site is also apparent at this time. Although not visible in the photographs, the installation of the underground piping between

Building 3557 and the tank farm and the overlying concrete pads is reported to have occurred at this time.

Construction of Building 3557 and the extensive concrete pavement was apparently completed prior to the time of the March 6, 1981, aerial photograph. The tank farm and an unpaved drainage ditch were also observed in the northern area of the site.

Review of the September 22, 1983, to October 26, 1989, aerial photographs indicated that the site features appear the same as at present .

32 **SITE RECONNAISSANCE**

During the site reconnaissance, visual inspections were conducted around the north side of Building 3557, the area around the tank farm and drainage ditch, and across the site area north of Building 3557 and east of Industrial Road (see Figure 1-3).

The southern portion of Site 34 is entirely paved with concrete. A small fenced area is located adjacent to the northwest corner of Building 3557 and is used for equipment storage. A large, cylindrical, ventilating stack, approximately 10 feet in diameter and 40 feet in height, is located 15 feet north of Building 3557. A steel grate, mounted on a concrete base and raised approximately 1 foot above the paved surface, is located near the base of the tower. An undetermined liquid substance was observed flowing below the open grate away from Building 3557 and toward the area of a sanitary sewer manhole, which is located southeast of the storage tank area (see Figure 1-3).

Eight 55-gallon steel drums were located near the northeast corner of Building 3557. The contents of these drums are not known, and no apparent leaks or spills were observed around the drums.

A series of concrete pads, approximately 1.5 by 3 feet in size, extend north from the north side of Building 3557 to the tank farm area. Piping, which is associated with the tanks, is reported to be in a paved trench located beneath these concrete pads.

The tank farm area is completely fenced and is approximately 75 feet by 100 feet in size (see Figure 1-3). Seven storage tanks are vertically oriented on a concrete platform in the tank farm area. These tanks are labeled: "T101" (epoxy stripper), "T102" (cleaning compound),

"T103" (detergent), "T104" (epoxy stripper), "T105" (detergent), "T106" (stoddard solvent), and "T107" (unknown). A smaller tank, oriented horizontally, is labeled "MEK," which is a common abbreviation for methyl ethyl ketone.

Building 3557 houses maintenance and reconditioning activities for aircraft. Six aircraft cleaning areas are located in the northern portion of the building. Detergents and wash water are directed to a series of floor drains that in turn are all directed to a central sump pit. The central sump pit, located beneath the northern half of the building, is concrete-lined and extends to a depth of 25 feet BLS. The aircraft wash water is pumped from the central sump pit to the industrial waste sewer north of Building 3557. Facility personnel report that groundwater infiltration to the sump pit is substantial, probably due to the lack of seal between clay drain pipes and the concrete sump box. An estimated 50,000 to 70,000 gallons per day (gpd) of infiltrated water are pumped from the sump and into the industrial sewer in order to render the structure effective as a sump. Facility personnel also report that a recent excavation was completed to a depth of 15 feet BLS north and adjacent to Building 3557 and that water table conditions were not encountered. This dry excavation suggests the pumping of the sump is effectively dewatering areas north of the building and is a significant factor to be considered in evaluation of past and present shallow groundwater conditions on Site 34.

Ambient organic vapor readings of 1.0 part per million (ppm) were detected across the site using an HNu during the site reconnaissance, and a reading of 30 ppm was observed at the sanitary sewer manhole located east of the tank farm (see Figure 1-3).

An unpaved, grass-lined, drainage ditch runs east to west across the northern portion of the site and beneath the tank farm. Surface drainage from the site area is presumed to be directed toward this ditch, and water flow in the ditch has been observed to flow west after a rainfall.

The unpaved drainage ditch on Site 34 eventually connects to a paved, drainage ditch system located west of the site area. This paved drainage ditch is located on Site 23, which is currently being studied in conjunction with the Phase I investigations at NAS Pensacola.

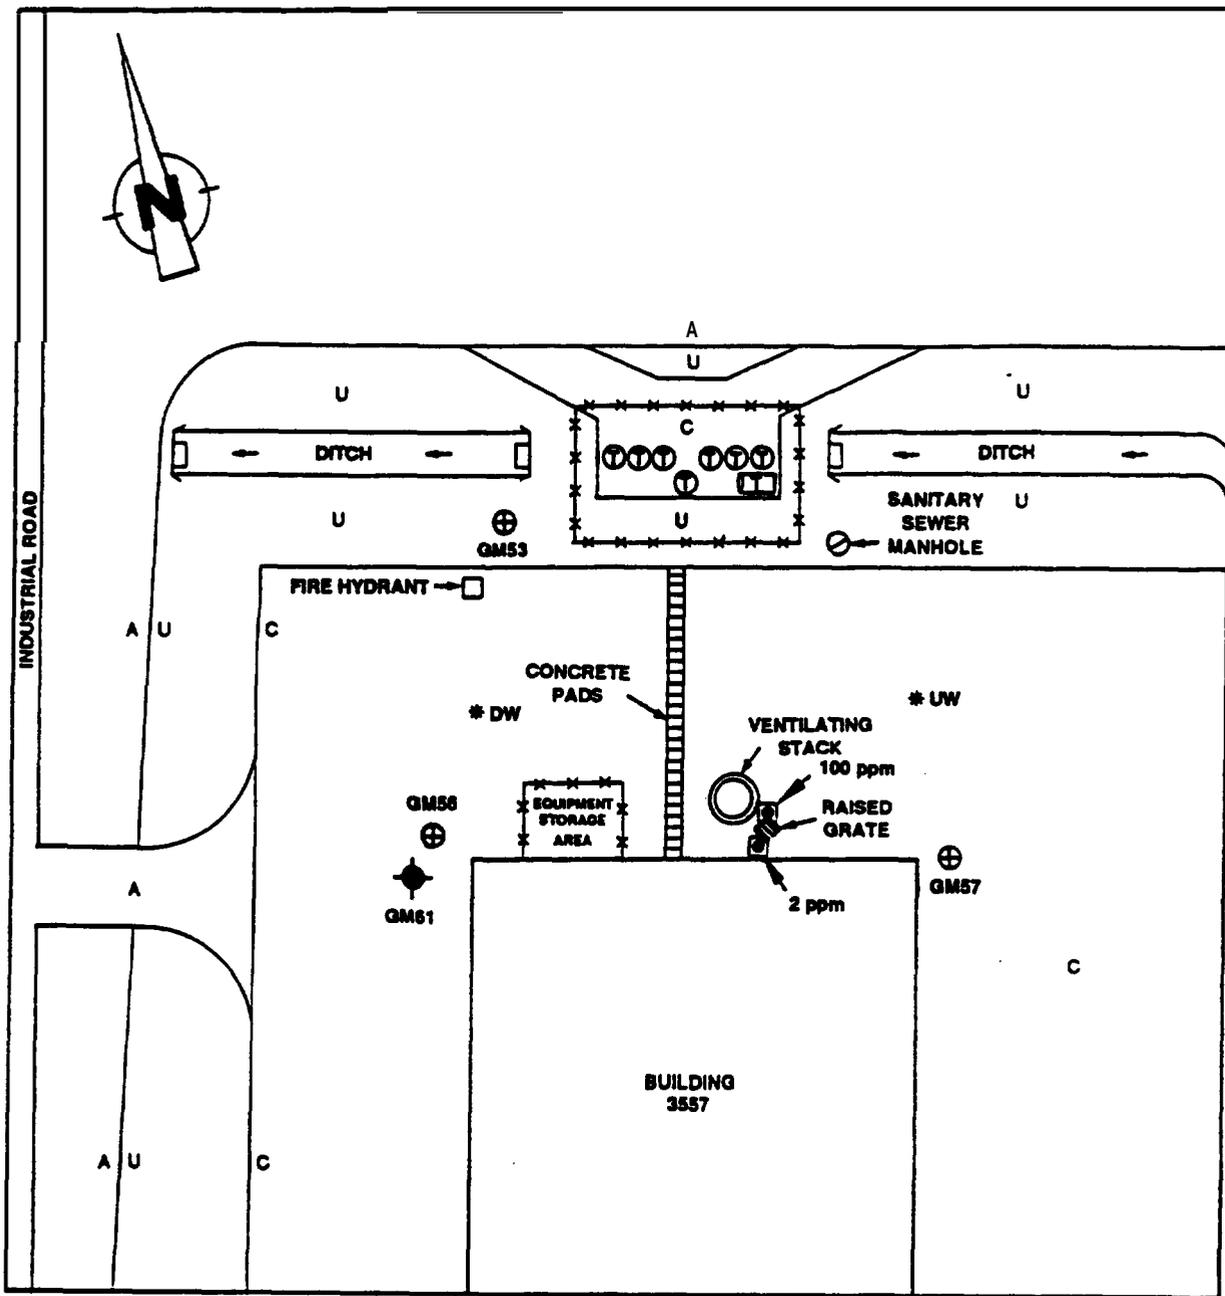

Site 34 is currently being utilized for occasional parking of helicopters that are awaiting maintenance in Building 3557, storage of associated equipment, and the storage and piping of the previously mentioned cleaners and solvents from the tank farm into Building 3557.

[The site is **almost** entirely paved and heavily utilized. No suitable **terrestrial** and aquatic **habitats** or species **were** present on the site.]

3.3 SURFACE EMISSIONS SURVEY AND PARTICULATE AIR SCREENING

An OVA was used to monitor surface emissions across the site. Figure 2-1 shows the grid layout of the site. The background OVA reading during the surface emissions survey at Site 34 **was** 0.5 ppa. Appendix A presents the grid coordinates and corresponding emissions readings. Only two measurements (2 ppm and 100 ppm) of organic vapors above background readings were observed during the surface emissions survey. These measurements were taken in the area of and above the grate north of Building 3557 (see Figure 3-1). Liquid, having a slight solvent odor, was observed flowing below the open grate during the survey (see Section 3.2).

On June 5, 1991, a Hini-Ram particulate air monitoring device was used to determine if Site 34 represents a source of particulates in the air. Figure 3-1 shows the particulate air screening locations on Site 34. Appendix B presents the particulate air screening data. During the test, the wind was blowing from the east at approximately 3 to 5 miles per hour (mph). The Hini-Ram was placed upwind (UW) at a grid location of N0+75, E2+25 in the eastern portion of the site (see Figure 3-1). After 15 minutes, the time weighted average (TWA) of particulates was 0.11 milligram per cubic meter (mg/m^3). The Mini-Ram was then placed directly downwind (DW) and approximately 225 feet west of the upwind station (see Figure 3-1). After 15 minutes, the TWA was recorded as 0.12 mg/m^3 . Based on these results (a difference in the two readings of 0.01 mg/m^3 during light winds), the central area of the site appears to be a potential source of low levels of particulates.

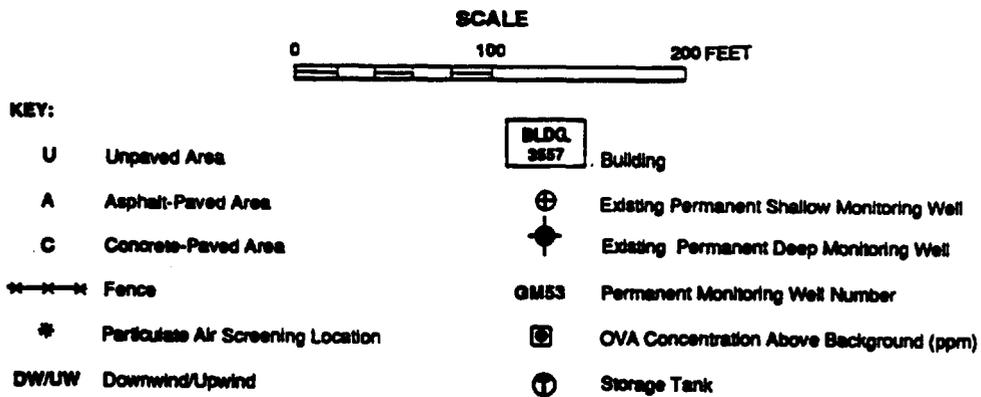

Figure 3-1 SURFACE EMISSIONS SURVEY AND PARTICULATE AIR SCREENING LOCATIONS MAP — NAS PENSACOLA SITE 34

34 HYDROLOGIC ASSESSMENT

3.4.1 Shallow Subsurface Lithology

Based on information collected during completion of the 12 borings at Site 34, the shallow subsurface lithology beneath Site 34 can be generally characterized as a dark brown to red, fine- to medium-grained quartz sand that generally becomes a tan to white, medium-grained quartz sand at the water table. At two borings (B002 and B003) in the northwestern portion of the site, a brown- or black-stained, fine- to medium-grained quartz sand saturated with a thick liquid substance was encountered in the A interval (0 to 5 feet BLS). During the installation of temporary well TW011, a gray to dark gray, medium-grained sand was encountered in the B interval (5 to 10 feet BLS), which was within the water table, in boring B011. Appendix C presents the lithologic logs for the 12 soil borings completed at Site 34. OVA readings taken in the open borehole during drilling ranged from 0 to 0.4 ppm. The OVA readings for the boreholes are also presented in Appendix C.

3.4.2 Water Levels and Groundwater Flow

Table 3-1 presents the water level elevations measured in the temporary monitoring wells at Site 34, and Table 3-2 presents the water level elevations measured in the permanent monitoring wells at Site 34. Based on the measurements obtained from water levels observed in the monitoring wells, the depth to the water table across the site ranges from 0.45 feet BLS (GM53) to 6.98 feet (TW011).

Figure 3-2 illustrates the water level elevations and the groundwater flow direction in the upper portion of the surficial zone of the Sand-and-Gravel Aquifer at Site 34, based on the temporary monitoring well data. Based on these groundwater elevations, the direction of shallow groundwater flow is generally to the west. The horizontal hydraulic gradient is approximately 0.0030. The temporary monitoring well data presented on Figure 3-2 suggest that the horizontal gradient may be as high as 0.01 in the area of temporary monitoring wells TW011 and TW012. The flow directions and horizontal hydraulic gradient appear to have been influenced during the sampling interval due to pumping of water from the central sump pit located beneath Building 3557.

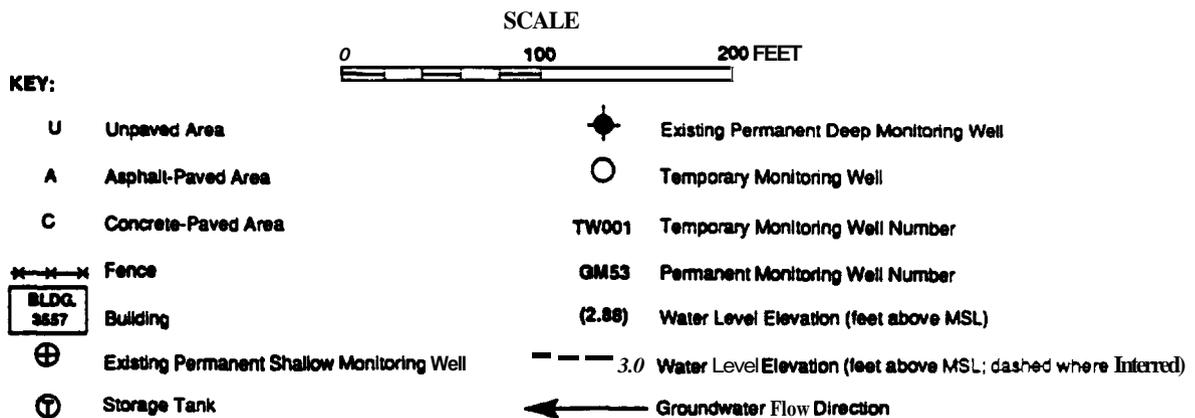

Figure 3-2 SURFICIAL ZONE WATER LEVEL ELEVATIONS FOR TEMPORARY MONITORING WELLS — NAS PENSACOLA SITE 34

Figure 3-3 illustrates the water level elevations and the groundwater flow direction, based on the temporary monitoring well data, in the upper portion of the surficial zone of the Sand-and-Gravel Aquifer in the area of sites 34, 9, 10, 23, and 29. Based on these groundwater elevations, the direction of shallow groundwater flow is generally to the west over Site 34, toward an area on Site 23 west of Industrial Road. However, the pumping of the central sump pit may serve to greatly affect flow directions and gradients in the Site 34 vicinity and, in effect, capture and divert a substantial amount of flow into the industrial waste sewer system.

Figure 3-4 illustrates the water level elevations and the groundwater flow direction based on the permanent monitoring well data and the temporary monitoring well data collected in the upper portion of the surficial zone of the Sand-and-Gravel Aquifer at and in the vicinity of Site 34. Based on these groundwater elevations, the direction of shallow groundwater flow is to the south; however, it appears that the central sump pump may not have been in operation during the time these measurements were made.

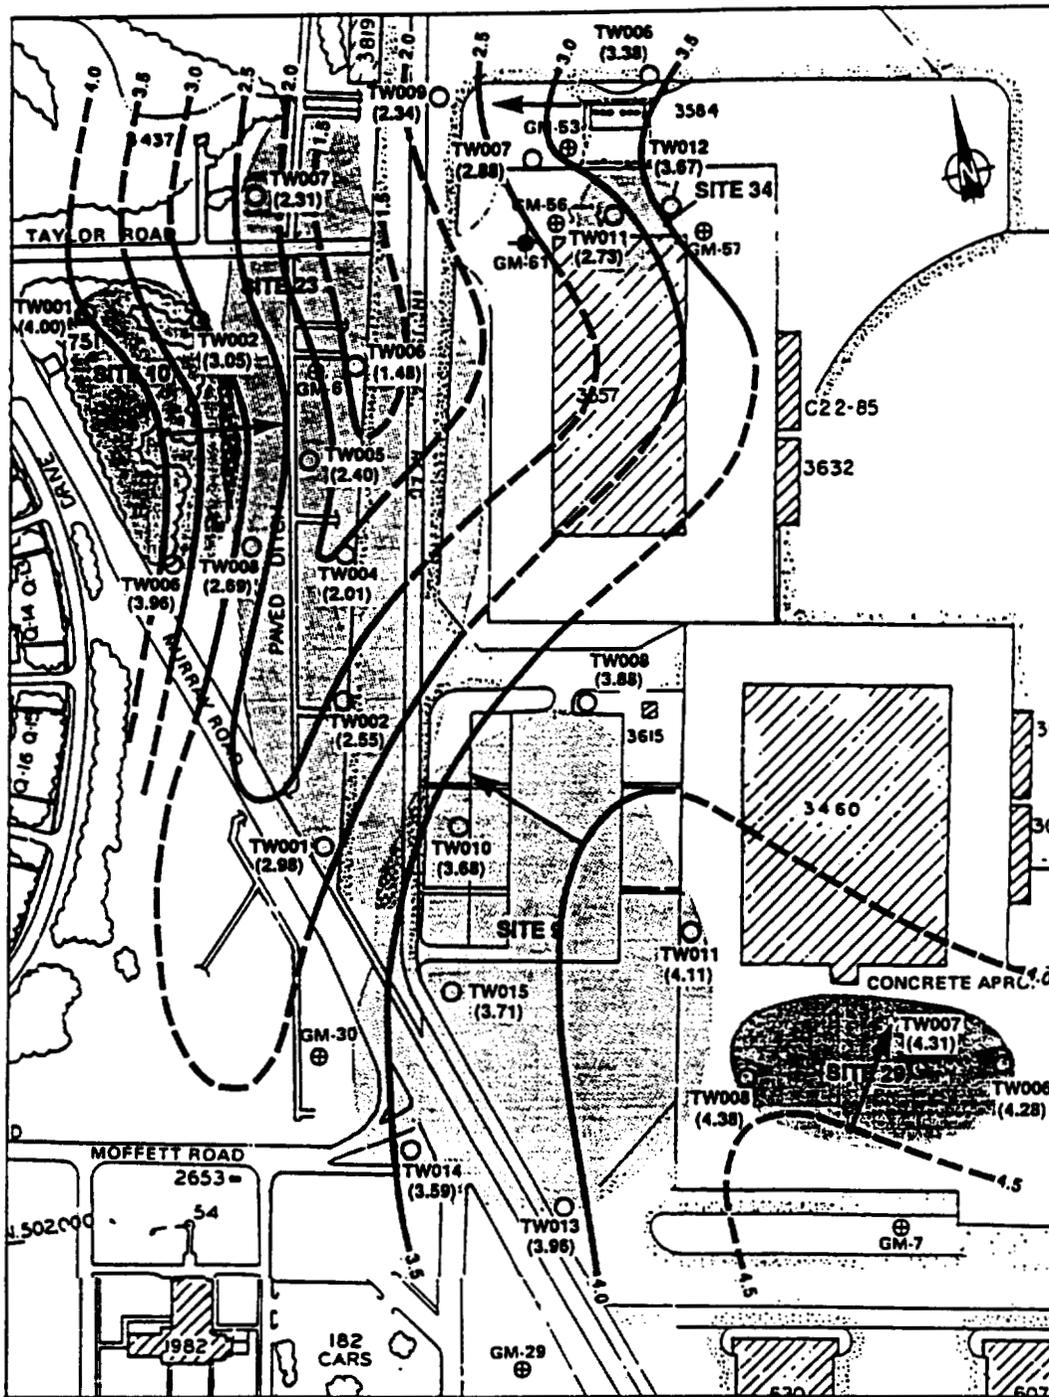

Permanent deep monitoring well GM61 is located on Site 34 near permanent shallow monitoring well GM56. The water level elevation in GM61 is 3.16 feet above HSL; whereas, the water level elevation in shallow monitoring well GM56 is 3.27 feet above MSL (see Table 3-2). These data indicate that GM61 is screened within a deeper, possibly confined or semi-confined flow system and that a downward hydraulic gradient exists; however, these measurements appear to have been taken during a time period when the sump pump was not in operation.

3.5 CHEMICAL ANALYSIS

The following section presents the results of the laboratory analyses of the Site 34 soil and groundwater samples. The specific analytical parameters and parameter groups are listed or referenced in Table 2-2.

RCRA PCAL = Resource Conservation and Recovery Act Proposed Corrective Action Level.

Dash (--) indicates compound not detected.

Source: Ecology and Environment, Inc., 1992.

[Bold items enclosed in brackets denote
changes to last version of document]

Recovery Act (RCRA) Proposed Corrective Action Levels (PCALs) for soil contamination (EPA 1990). Figure 2-3 indicates the soil boring locations on Site 34. The complete analytical screening results for soil samples are presented in Appendix D.

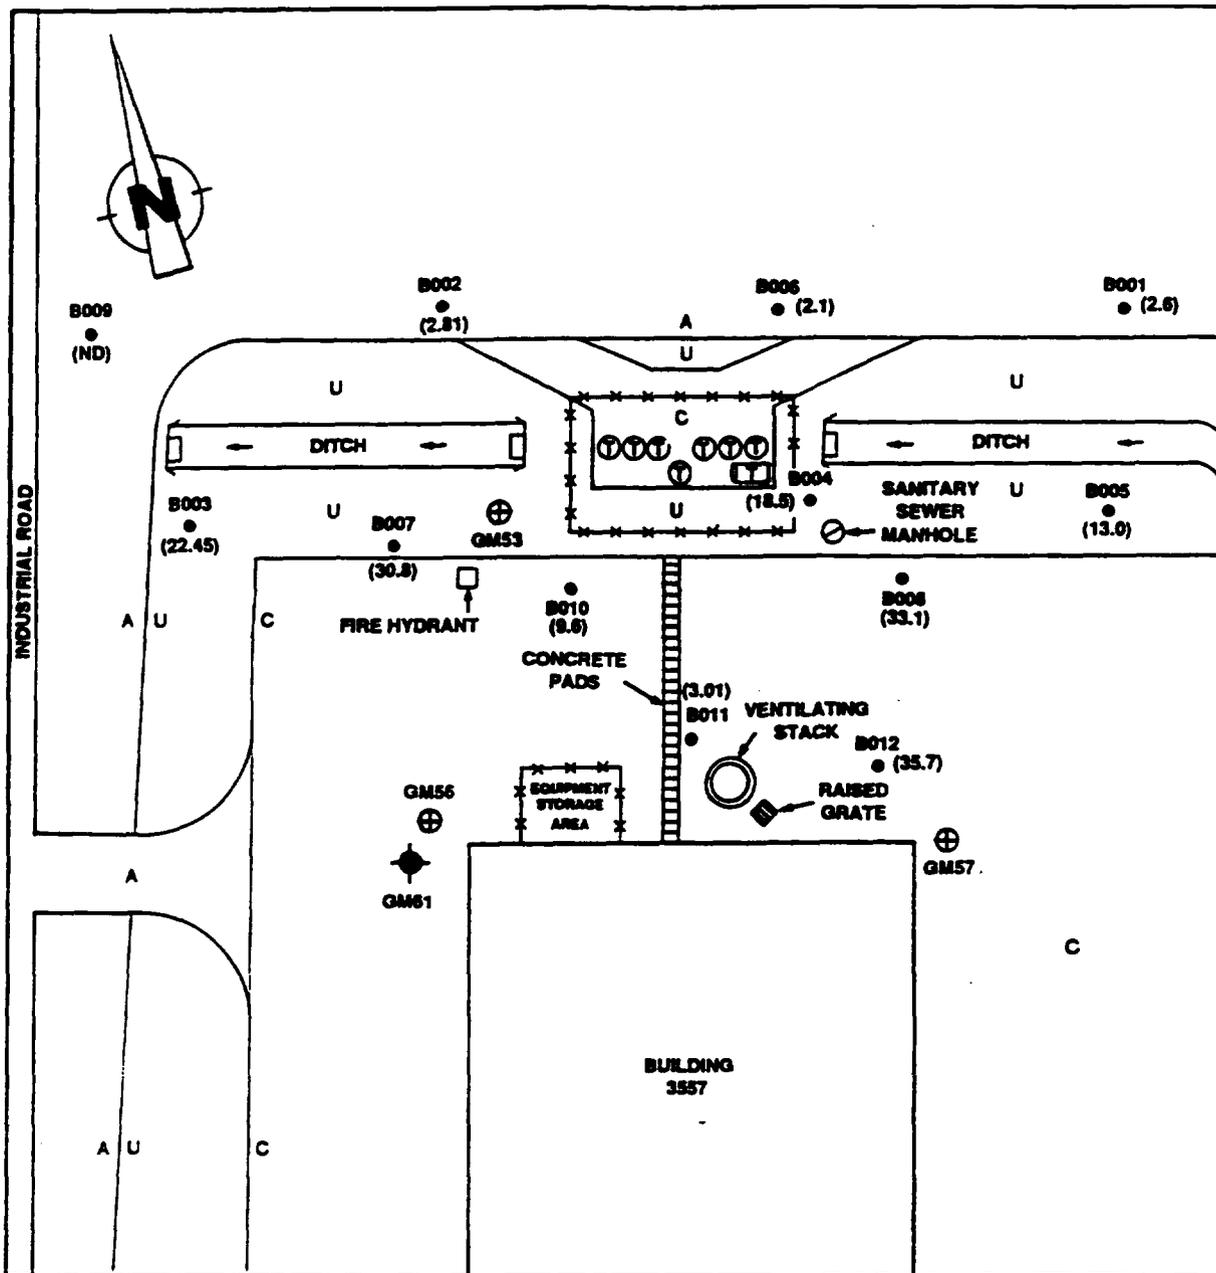

Due to the depth to the water table across Site 34 (0.45 feet to 6.98 feet BLS), soil samples were collected from the A interval only, except at boring **B011** where soil samples were collected from the A and B intervals only. Soil sample numbers correspond to the number of the soil boring from which the sample was collected.

In general, metals concentrations were detected slightly above metal detection limits in soil samples across the site. Total recoverable petroleum hydrocarbons (TRPHs) were detected only in sample **S011B**. No volatile organic compounds (VOCs), base/neutral and acid extractable organic compounds (BNAs), polynuclear aromatic hydrocarbons (PAHs), phenols, pesticides, or polychlorinated biphenyls (PCBs) were detected in samples collected on Site 34.

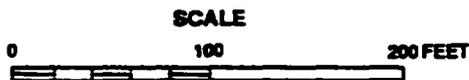

Metals

The metals chromium, lead, zinc, and cadmium were detected at concentrations slightly above method detection limits in almost all of the soil samples recovered from the site. Figure 3-5 shows total metals concentrations for each A-interval soil sample collected from each of the Site 34 borings. Sample **S009A**, collected from a boring located in the northwest corner of the site (see Table 3-3 and Figure 3-5), was the only sample that did not exhibit any of the above metals at a concentration above the method detection limit.

The metals concentrations reported were generally low and ranged from: chromium, 1.0 to 7.8 milligrams per kilogram (mg/kg); zinc, 2.1 to 20.0 mg/kg; lead, 5.4 to 24.0 mg/kg; and cadmium, 0.51 to 0.55 mg/kg. Although the concentrations detected were elevated with respect to the reported concentrations in outlying sample S009A, the slight difference may be caused by general variations in the soil. In fact, all of the reported metals concentrations detected in the soil samples are within the trace chemical element content of natural soils (EPA 1983). Of the four metals detected in soil samples collected on Site 34, chromium (VI), zinc, and cadmium have RCRA PCALs of 400 mg/kg, 16,000 mg/kg, and

40 mg/kg, respectively. The total chromium, zinc, and cadmium concentrations detected were well below these levels (see Table 3-3).

The single B-interval sample (S011B) collected at the site exhibited chromium and zinc concentrations similar to the concentrations present in the A-interval samples collected throughout the site. A significant increase or decrease in the chromium and zinc concentrations compared with S011A was not noted.

TRPHs

Sample S011B exhibited a TRPB concentration of 7.7 mg/kg. This concentration is only slightly elevated above the analytical method detection limit of 5.0 mg/kg.

3.5.2 Groundwater

3.5.2.1 Field Parameters

Table 3-4 lists the groundwater temperature, pH, and specific conductance values measured in the groundwater samples collected from the temporary monitoring wells (June 20, 1991) and the existing permanent monitoring wells (May 1, 1991). Appendix C presents the temporary monitoring well installation information.

Several noticeable trends are evident based on the data supplied in Table 3-4. Reported temperatures of the temporary well groundwater samples averaged 11.25°C higher than the values reported for the existing permanent monitoring wells. The temperatures reported for the permanent well samples are within the reported range of values for ambient groundwater in Escambia County (Clemens *et al.* 1989), but the values reported for the temporary well samples are much higher.

The cause of these elevated temperatures is probably summer heating effects, given that the permanent well samples were collected on May 1, 1991, and that the temporary well samples were collected on June 20, 1991, during an excessive heatwave.

The pH values recorded from groundwater samples at the site ranged from 6.05 units to 7.8 units. Only the sample from temporary well TW006 with a pH value of 6.05 units was found to be outside the range (6.5 to 8.5 units) of Florida Secondary Drinking Water Standards (FSDWSs). In

Table 3-4

GROUNDWATER FIELD PARAMETERS
NAS FERRACOLA SITE 34

Well Number	Temperature (°C)	pH (units)	Specific Conductance (µmhos/cm)	Date Measured
TW006	34	6.05	82.5	6/20/91
TW007	35	6.7	203	6/20/91
TW009	36	6.65	8.26	6/20/91

[Bold items enclosed in brackets denote changes to last version of document]

3400587

general, the pH values recorded at Site 34 were well within the range of values for ambient shallow groundwater in Escambia County (Clemens *et al.* 1989).

The specific conductance values reported at the site ranged from 8.26 micromhos per centimeter ($\mu\text{mhos/cm}$) to 780 $\mu\text{mhos/cm}$. The specific conductance value reported in temporary well TW009 was the only single digit value. In general, the values exceed the reported range of values for ambient groundwater in Escambia County (30 to 200 $\mu\text{mhos/cm}$; Clemens *et al.*). Only reported values from wells TW006, TW009, and GM53 were found to be within the reported range. Well GM61 is a deep well, and the value of specific conductance (780 $\mu\text{mhos/cm}$) is only slightly above the reported range of values for deeper wells in Escambia County (28 to 747 $\mu\text{mhos/cm}$; Clemens *et al.* 1989).

No floating and/or sinking immiscible hydrocarbons were observed in any of the wells. The temporary well information, including field parameter and groundwater elevation data, is presented in Appendix C.

3.5.2.2 Analytical Screening Parameters

Table 3-5 summarizes the analytical screening results for the groundwater samples collected from the five temporary wells installed on Site 34. Figure 2-3 shows the temporary monitoring well locations at Site 34. The complete analytical screening results for the temporary monitoring well groundwater samples are presented in Appendix E.

The groundwater samples collected from the five temporary monitoring wells at Site 34 exhibited low concentrations of zinc above method detection limits. Sporadic occurrences of chromium and lead were also reported. TRPHs and total PAHs were detected in only one of the temporary wells (TW011), and phenols were detected in two of the temporary wells (TW007 and TW011).

No VOCs, pesticides, or PCBs were detected in any of the temporary monitoring wells at Site 34.

Metals

Zinc concentrations were present above method detection limits in all five of the temporary monitoring well samples collected at Site 34. Zinc concentrations ranged from 55 micrograms per liter ($\mu\text{g/L}$; GW007) to

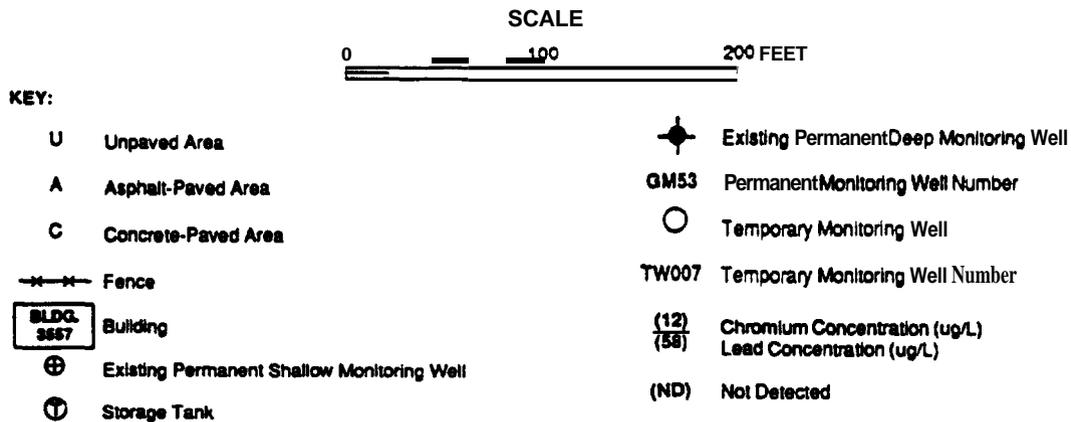

Figure 3-6 TOTAL CHROMIUM AND LEAD CONCENTRATIONS DETECTED IN SHALLOW GROUNDWATER SAMPLES — NAS PENSACOLA SITE 34

290 µg/L (GW012). All of the reported zinc concentrations are below the maximum limit of 5,000 µg/L established by the FSDWS (Chapter 17-550, Florida Administrative Code [FAC]).

Figure 3-6 shows the distribution of chromium and lead concentrations detected in groundwater samples from Site 34. Chromium concentrations were present above method detection limits in three of the temporary well samples (see Table 3-5 and Figure 3-6). Samples from temporary wells TW007, TW011, and TW012 exhibited total chromium concentrations of 15 µg/L, 12 µg/L, and 37 µg/L, respectively. All chromium concentrations are within the Florida Primary Drinking Water Standard (FPDVS) of 50 µg/L (Chapter 17-550, FAC).

Lead was detected in only one of the temporary well samples collected at Site 34 (see Table 3-5 and Figure 3-6). The lead concentration detected in sample GW011 (58 µg/L) exceeds the FPDVS of 50 µg/L.

The samples collected from temporary wells were unfiltered and turbid. The results, although generally low, may yet reflect the effect of acid preservative leaching or dissolution of aquifer matrix sediments entrained in these unfiltered samples, rather than actual groundwater contamination. Therefore, the concentrations detected may be somewhat higher than the actual dissolved concentrations represented in the aquifer.

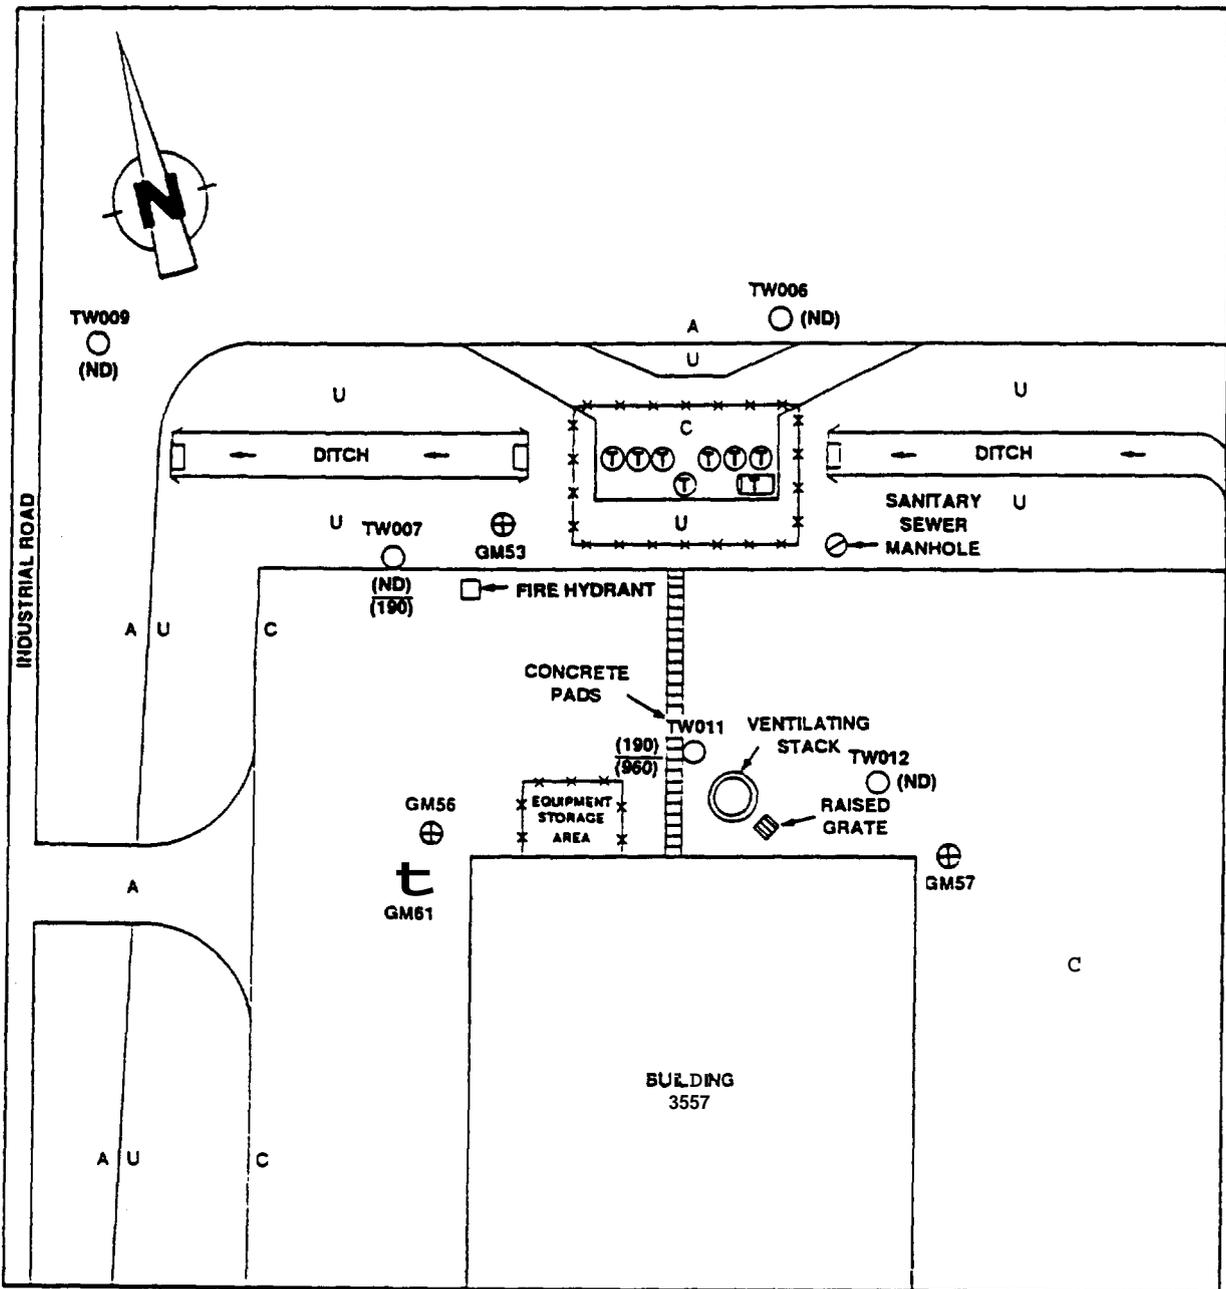

TRPHs and PAHs

TRPHs and total PAHs were detected only in sample GW011. The TRPH concentration detected (1.2 µg/L) was only slightly above the analytical method detection limit of 1.0 µg/L, and, similarly, the total PAH concentration (190 µg/L) was less than 2 times the analytical method detection limit of 100 µg/L (see Table 3-5 and Figure 3-7).

It should be noted that PAHs were reported as benzo-a-pyrene for laboratory reporting purposes; however, PAHs other than benzo-a-pyrene may be present in the samples.

Phenols

Phenol concentrations were detected above method detection limits in samples from temporary monitoring wells TW007 and TW011. The concentration detected in GW007 (190 µg/L) was only slightly elevated

SOURCE: U.S. Naval Air Station Pensacola, Pensacola, Florida, 1990; Ecology and Environment: 1991

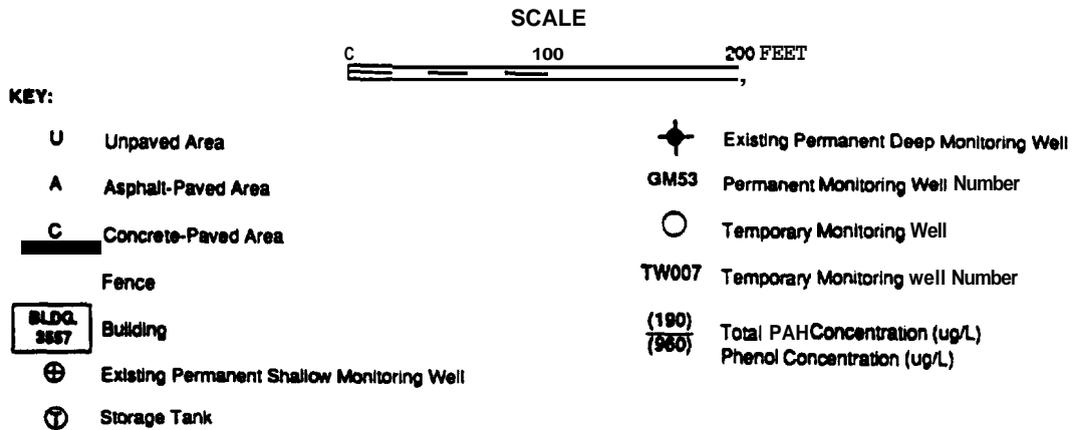

Figure 3-7 TOTAL PAH AND PHENOL CONCENTRATIONS DETECTED IN SHALLOW GROUNDWATER SAMPLES FROM TEMPORARY MONITORING WELLS — NAS PENSACOLA SITE 34

above the method detection limit of 100 µg/L; however, the concentration detected in GW011 (960 µg/L) is clearly above the method detection limit (see Table 3-5 and Figure 3-7).

It should be noted that phenols were reported as trichlorophenol for laboratory reporting purposes; however, phenols other than trichlorophenol may be present in the samples.

3.5.2.3 TAL/TCL Parameters

Table 3-6 summarizes the analytical results for the groundwater samples collected from the permanent monitoring wells on Site 34. These samples were analyzed for the TAL/TCL parameter groups, TRPHs, total alkalinity, total hardness, and total organic carbon. Figure 1-3 illustrates the existing permanent monitoring well locations at Site 34. The complete TAL/TCL analytical results for these groundwater samples are presented in Appendix F.

In general, a variety of metals were detected in each of the four permanent monitoring well samples at Site 34. The dissolved (filtered) metals detected and concentrations reported were similar to those reported for the total (unfiltered) metals analysis. Several VOCs and BNAs were also detected at low levels. TRPHs, cyanide, phenols, pesticides, and PCBs were not detected in any of the groundwater samples from the permanent monitoring wells.

Metals

Table 3-6 summarizes the analytical results for TAL metals in the permanent monitoring well groundwater samples. In comparison, the total and dissolved metals concentrations present in the permanent monitoring well samples are, in general, very similar. The similar concentrations between total (unfiltered) and dissolved (filtered) metals analyses indicate that these developed and purged wells yield few suspended sediments. The total and dissolved samples are in turn similar to duplicate samples as well, and the slight differences in concentrations can be attributed to natural variations in the water column.

In contrast to the other metals concentrations detected, the total aluminum concentrations present in samples W056 and W057, the total iron concentration present in W057, and the total chromium concentration

Table 3-6 (Cont.)

14[NASP]UH8018:t0358/699/7

Note: The number within parentheses preceding the listed concentration value represents the number of tentatively identified compounds (TICs) in this parameter group. The listed Concentration represents the sum of the individual group-member concentrations.

Key:

FPDWS = Florida Primary Drinking Water Standard.
FSDWS = Florida Secondary Drinking Water Standard.

NA = Analyses not performed.
Dash (—) indicates compound not detected.

*Duplicate analysis not within control limits.
**Values for TICs are estimated. Detection limits for TICs were not established.

Qualifiers:

- (B) = Reported value was obtained from a reading that was less than the Contract Required Detection Limit but greater than or equal to the Instrument Detection Limit.
- (B^a) = Present in method blank.
- (J) = For non-TICs, estimated value; compound present but below stated method detection limit. Also indicates that TIC concentrations are estimated because no detection limits were established for TICs.
- (S) = The reported value was determined by the method of standard additions.
- (W) = Post digestion spike for furnace M analysis is out of control limits (85-115%), while sample absorbance is less than 50% of spike absorbance.

present in W053 were significantly higher than the dissolved concentrations. The detected concentrations suggest that the elevated total metals concentrations probably reflect the effect of acid preservative leaching or dissolution of aquifer matrix sediments entrained in these unfiltered samples, rather than actual groundwater contamination.

Although numerous metal compounds were detected in the groundwater samples from permanent monitoring wells at Site 34, only three of the metals, chromium, iron, and manganese, were detected at concentrations exceeding FPDWSs and FSDWSs. Total and dissolved iron and manganese concentrations in excess of the FSDWSs of 300 µg/L and 50 µg/L, respectively, were detected in samples from monitoring wells GM53, GM56, and GM61. The iron concentrations ranged from 4,070 µg/L to 6,590 µg/L, and manganese concentrations ranged from 54 µg/L to 607 µg/L. In addition, the total iron concentration (2,600 µg/L) present in sample W057 also exceeded the FSDWS. The total chromium concentration of 52.9 µg/L detected in sample W053 was the only other metal concentration reported above the FSDWS of 50 µg/L.

A number of the metals detected at elevated concentrations do not currently have state or federal standards for concentrations in groundwater. These metals and the range of total concentrations detected are as follows: aluminum, 279 µg/L to 1,650 µg/L; antimony, <33 µg/L to 39.1 µg/L; calcium, 15,700 µg/L to 60,000 µg/L; cobalt, 5.8 µg/L to 7.6 µg/L; magnesium, 3,380 µg/L to 6,330 µg/L; potassium, 1,460 µg/L to 3,800 µg/L; and vanadium, <4 µg/L to 7.1 µg/L.

VOCs

Table 3-6 also summarizes the analytical results for the TCL parameters in the permanent monitoring well groundwater samples. Methylene chloride and acetone were detected in all the permanent monitoring well groundwater samples. Given that these compounds were also detected in the associated laboratory method blanks at approximately the same values, the presence of these compounds in the groundwater samples is likely attributed to laboratory-derived contamination.

Carbon disulfide was detected in two samples (W056 and W061) at concentrations of 9 µg/L and 13 µg/L, respectively. Although carbon

disulfide was not detected in the analytical method blanks, the compound is believed to laboratory-derived.

Sample W056 exhibited detectable concentrations of chlorobenzene (3 $\mu\text{g/L}$), 1,3-dichlorobenzene (1 $\mu\text{g/L}$), and 1,4-dichlorobenzene (2 $\mu\text{g/L}$). All three reported values were estimated, because the compound was present below method detection limits. Of the three compounds, only 1,4-dichlorobenzene has an FPDWS (75 $\mu\text{g/L}$). The 1,4-dichlorobenzene detected in W056 is far below this standard.

BNAs

Naphthalene and 2-methylnaphthalene were detected in groundwater samples from permanent monitoring wells GM53 and GM56. Bis(2-ethylhexyl)phthalate was detected in all the permanent monitoring well groundwater samples, as well as in the associated laboratory method blanks; therefore, the presence of this compound can be attributed to laboratory-derived Contamination.

Tentatively Identified Compounds (TICs)

A number of VOC and BNA TICs were detected in the permanent groundwater samples (see Table 3-6). Six TICs (a diethyl benzene isomer, a dihydro methyl 1H indene isomer, an ethyl dimethyl benzene isomer, methyl methylethyl benzene, 1 methyl-naphthalene, and a tetramethyl benzene isomer) were detected in samples W053 and W056. Miscellaneous unknown hydrocarbons and other unknown compounds were detected in all four groundwater samples from the site. The fact that a portion of the unknown hydrocarbons and other unknown compounds were also detected in the analytical method blanks may indicate that at least *some* of these compounds may be attributable to laboratory-derived contamination.

Remediation Parameters

The permanent well groundwater samples were also analyzed for total alkalinity, total hardness, and total organic carbon to support subsequent groundwater remediation design activities at Site 34, if required. Table 3-6 presents the analytical results for these remediation parameters. With respect to the four permanent monitoring

wells sampled at Site 34, total alkalinity ranged from 46 milligrams per liter (mg/L) to 165 mg/L; total hardness ranged from 50 mg/L to 160 µg/L; and total organic carbon ranged from <1 mg/L to 9.0 mg/L.

For comparative purposes, regional (i.e., within southern Escambia County) values of these same parameters in the Sand-and-Gravel Aquifer are as follows: alkalinity (as mg/L of CaCO₃) values range from <1.00 mg/L to 129.97 mg/L (Clemens et al. 1989); total hardness values range from 1.00 mg/L to 326.00 mg/L, with the majority being less than 50 mg/L (Johnson 1991); and total organic carbon values range from 2.88 mg/L to 24.41 mg/L (Clemens et al. 1989). The majority of Site 34 groundwater samples exhibited values of alkalinity, hardness, and total organic carbon well within the reported ranges of regional values.

3.6 CONTAMINATION DISTRIBUTION/SOURCE DISCUSSION

Soil samples from Site 34 yielded only very low concentrations of metals across the site and TRPHs at only one subsurface location. Groundwater samples collected on and in the vicinity of Site 34 were found to exhibit metals, TRPHs, VOCs, PAHs, and phenols. The detected contamination in soil and groundwater does not appear to be indicative of the descriptions of the former pipe leak reported on Site 34; however, the Phase I results indicate the presence of other potential contaminant sources impacting Site 34.

3.6.1 Soil

Low concentrations of the metals chromium, zinc, lead, and cadmium were detected in the samples from soil borings at Site 34.

Total detected metals concentrations were lowest in samples from the four borings (B001, B002, B006, and B009) located along the northern perimeter of the site where chromium and lead were not detected.

Only slightly higher concentrations of metals were found in the remaining soil borings, all located between the on-site drainage ditch and Building 3557. Low levels of lead, chromium, nickel, and cadmium are apparently widespread in soils throughout this area south of the ditch. Soil samples collected along the Site 36 industrial waste sewer line where it crosses Site 34 confirmed the above trend in that only very low concentrations of the same metals were detected in soils. The

data does not suggest the existence of "hot spots" or significant sources of metals contamination in soil affecting groundwater.

TRPHs were detected in only one Site 34 soil sample (S011B) at a low concentration (7.7 mg/kg) in the southern portion of the site; however, TRPHs were detected in three of the four soil borings (P36B103, P36B105, and P36B106) located along the industrial sewer line (Site 36) at higher concentrations (22 to 93 mg/kg), indicating that the sewer may be a potential source of TRPHs in this area.

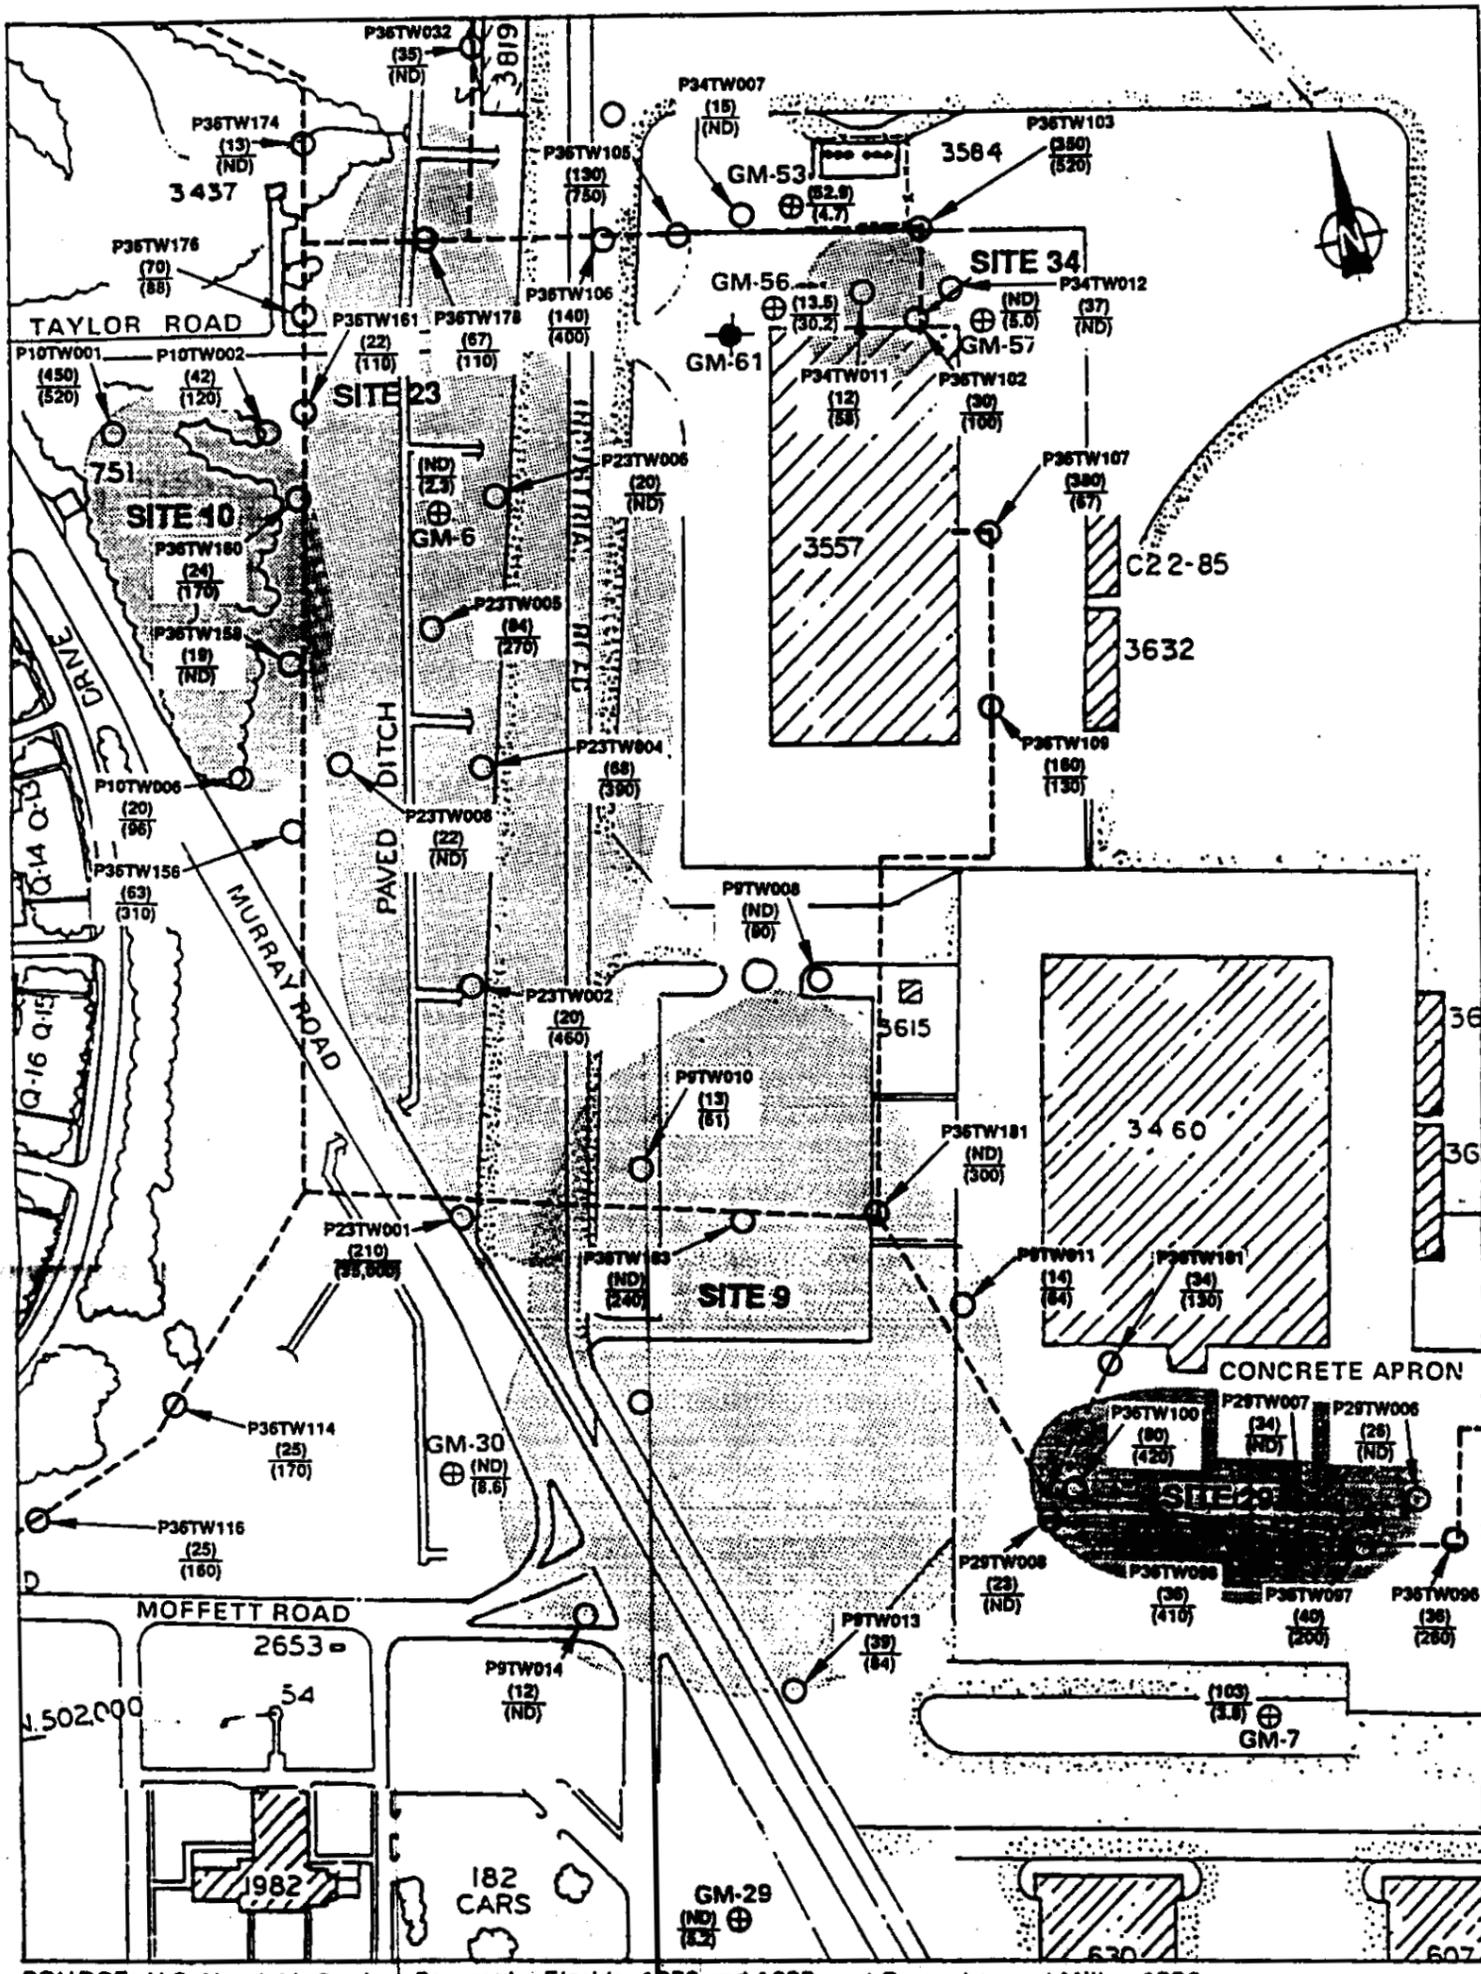

Although PAHs were not detected in any Site 34 soil samples, two samples (P36S102B and P36S105B) associated with the industrial sewer line (Site 36) exhibited low levels of total PAHs below the instrument detection limits of 1,000 micrograms per kilogram ($\mu\text{g}/\text{kg}$), adding to the possibility that the sewer may be a source of hydrocarbon contamination to the subsurface.

3.6.2 Groundwater

Numerous metals were detected in Site 34 groundwater samples at low to high Concentrations. TRPHs, VOCs, BNAs, PAHs, and phenols were also detected, but at few locations.

A comparison of metals concentrations detected in on-site soil samples to elevated metals concentrations detected in the groundwater samples indicates a slight correlation in that only zinc was detected in groundwater samples collected north of the drainage ditch and that the greater variety and concentrations of metals were present in samples collected between the ditch and Building 3557. There is no apparent correlation between the lead concentrations in soil and the lead concentrations in groundwater samples at boring and temporary well locations B/TW007, B/TW011, and B/TW012. Similarly, there is no correlation between soil and groundwater samples for zinc, which was detected in the groundwater sample collected from temporary well TW009.

The presence of metals in the samples from temporary and permanent monitoring wells does not seem to indicate any trend in distribution except in consideration of the results for groundwater samples collected from temporary wells along the industrial waste sewer line (Site 36; see Figure 3-8). Figure 3-8 presents chromium and lead concentrations detected in groundwater samples collected on sites 9, 10, 23, 29, 34,

Figure 3-8 CHROMIUM AND LEAD CONCENTRATIONS WHERE DETECTED IN GROUNDWATER SAMPLES - NAS PENSACOLA SITES 9, 10, 23, 29, 34, AND 36

and 36 in the southwest area of Chevalier Field. Lead and chromium are widely distributed in the groundwater over this area and may be of concern because many of the Concentrations detected in the groundwater samples exceed the FPDWS of 50 µg/L for each metal. Samples collected from Site 36 shallow monitoring wells TW103, TW105, and TW106 yielded chromium, lead, and zinc concentrations generally a magnitude higher than the surrounding Site 34 well samples. These elevated levels of metals along the industrial sewer suggest that the sewer is a source of groundwater contamination. The limited area of these high concentrations may be an indication that metals contamination which emanated from the sewer line has to an extent accumulated in the nearby sediments. The unfiltered and turbid groundwater samples collected from these Site 36 wells may at least partially reflect the dissolution of aquifer matrix materials through acid preservation of the sample.

The groundwater samples recovered from temporary wells TW007 and TW011 were the only temporary well samples found to contain elevated concentrations of organic contaminants (i.e., TRPHs, PAHs, and phenols). The highest concentrations were detected in temporary well TW011, with lesser concentrations detected in temporary well TW007. The proximity of the wells to the industrial waste sewer line suggests that the sewer is a possible contaminant source (see Figure 3-9). Figure 3-9 presents TRPH and phenol concentrations detected in groundwater samples collected on sites 9, 10, 23, 29, 34, and 36 in the southwest area of Chevalier Field.

Elevated concentrations of several VOCs (chlorobenzene, 3 µg/L; 1,3-dichlorobenzene, 1 µg/L; and 1,4-dichlorobenzene, 2 µg/L) and the BNA compounds naphthalene (15 µg/L) and 2-methylnaphthalene (60 µg/L) were detected in the sample from permanent monitoring well GH56 which, according to both the temporary and the permanent monitoring well data, is downgradient from temporary well TW011. Lesser concentrations of naphthalene (4 µg/L) and 2-methylnaphthalene (4 µg/L) were also detected in permanent monitoring well GM53, which is located in cross-gradient flow directions from temporary well TW011.

These detected VOCs may be representative of residual contamination from the reported 1984 solvent leak on the site. The almost continuous operation of the pump in the central sump pit beneath Building 3557

might have served as a recovery point for the detergent/solvent mixture. Any recovered contamination would have been directed to the industrial sewer.

Monitoring well GM61, completed to a depth of 85.66 feet BLS, was not reported to contain any organic contaminant concentrations that could not be attributed to laboratory-derived contamination.

3.7 QA/QC

3.7.1 Field QA/QC

Analytical Screening Samples

One soil field duplicate sample and one groundwater field duplicate sample were collected for the Site 34 screening samples. The analytical results for the duplicate samples are presented in the summary screening result tables for soil and groundwater (see tables 3-3 and 3-5, respectively). The results for the soil duplicate sample (SOOSAD) and groundwater duplicate sample (GW009D) were in agreement with the results for the corresponding samples.

TAL/TCL Samples

One field duplicate sample, one bottle trip blank, one field blank, one sampling equipment rinsate blank, and one preservative blank were collected for the four Site 34 TAL/TCL groundwater samples. The analytical results for these QA/QC samples are presented in the summary results table for the groundwater field QA/QC samples (see Table 3-7).

Aluminum, antimony, calcium, cobalt, iron, lead, manganese, nickel, sodium, and zinc were the only metals detected in the QA/QC sample blanks. All reported metal concentrations were obtained from a reading less than the contract required detection limit but greater than or equal to the instrument detection limit. The values reported are therefore not significant.

The analytical results for groundwater duplicate sample W056D were in agreement with the results of corresponding sample W056.

Methylene chloride, acetone, and carbon disulfide were detected in the trip blank sample (analyzed for VOCs only) and the field blank. Methylene chloride and carbon disulfide were also detected in the rinsate blank and the preservative blank. Bis(2-ethylhexyl)phthalate

Table 3-7 (Cont.)

14[HASP]UH8018:T0358/701/0

Note: The number within parentheses preceding the listed concentration value represents the number of tentatively identified compounds (TICs) in this parameter group. The listed concentration represents the sum of the individual group-member concentrations.

Key:

FPDWS = Florida Primary Drinking Water Standard.
FSDWS = Florida Secondary Drinking Water Standard.

NA = Analyses not performed.
Dash (—) indicates compound not detected.

*Duplicate analysis not within control limits.
**Value for TICs are estimated. Detection limits for TICs were not established.

^aDuplicate of sample P34W056.
^bAnalyzed for VOCs only.
^cAnalyzed for total metals, dissolved metals, TRPHs, cyanide, VOCs, BRAs, pesticides, PCBs, and total hardness only.
^dAnalyzed for total metals, TRPHs, cyanide, and VOCs only.

Qualifiers:

- (B) = Reported value was obtained from a reading that was less than the Contract Required Detection Limit but greater than or equal to the Instrument Detection Limit.
- (B^a) = Present in wthod blank.
- (J) = For non-TICs, estimated value; compound present but below detection limit. Also indicates that TIC concentrations were estimated because no detection limits were established for TICs.
- (S) = The reported value was determined by the wthod of standard additions.
- (W) = Post digestion spike for furnace M analysis is out of control limits (85-115%), while sample absorbance is less than 502 of spike absorbance.

4. CONCLUSIONS

Soil and groundwater contamination are present on Site 34. Metals, TRPHs, PAHs, and phenols are the primary contaminants. The detected contamination does not appear to be indicative of the descriptions of the detergent/solvent pipe leak that occurred north of Building 3557 in 1984; however, additional sources of contamination, likely including the industrial sewer line (Site 36), may be impacting Site 34.

Low levels of metals contamination, including chromium, lead, zinc, and cadmium, was detected from land surface to the water table in the soil samples collected south of the on-site drainage ditch.

Limited areas of TRPH contamination were detected in soils in the southern portion of Site 34, near the pipeline from the tank farm to Building 3557 and also along the industrial sewer line. Very low levels of PAHs were also detected in soils in two areas along the industrial sewer line.

Slightly elevated metals concentrations were detected in groundwater samples from the Site 34 temporary and permanent monitoring wells. Three metals, chromium, iron, and manganese, were detected in samples collected from the permanent monitoring wells at concentrations exceeding the FPDWS or FSDWS. A comparison of the total versus dissolved metal concentrations indicated similar concentrations indicative of developed monitoring wells with few suspended sediments.

The highest metals concentrations on Site 34 occurred in samples from temporary monitoring wells located along the industrial sewer line (Site 36) during the corresponding Site 36 Phase I investigation, indicating a potential source of metals contamination in this area. The limited extent of the high metals concentrations suggests the

PARTICULATE AIR SCREENING DATA

SITE 34

PARTICULATE AIR SCREENING DATA

Date: June 5, 1991

Wind Direction: East

Wind Velocity: 3 to 5 miles per hour

Upwind Location: Grid coordinate N0+75, E2+25

Measurement Duration: 15 minutes

Time Weighted Average Particulate Concentration: 0.11 mg/m³

Downwind Location: 225 feet west of upwind location

Measurement Duration: 15 minutes

Time Weighted Average Particulate Concentration: 0.12 mg/m³

Upwind/Downwind Difference: 0.01 mg/m³

APPENDIX C

TEMPORARY MONITORING WELL, SOIL BORING,
AND LITHOLOGIC INFORMATION

SOIL BORING/TEMPORARY MONITORING WELL INFORMATION

- 1) Site no.: 34
- 2) Boring no./Well no.: P34B001
- 3) Drilling firm: Griner Drilling Service
- 4) Drilling method: SSA
- 5) Date drilled/installed: 06/18/91
- 6) Geologist: JOE FUGITT
- 7) Depth of boring (BLS): 5
- 8) Depth to water in borehole (BLS): 4
- 9) Highest open-borehole OVA/HNu reading (ppm): 0
- 10) Depth of well (BLS): NA
- 11) Length of well screen: NA
- 12) Length of casing (BLS): NA
- 13) Approx. height of casing above land surface: NA
- 14) Depth to water in well (BTOC): NA
- 15) Elevation of TOC: NA
- 16) Water level elevation: NA
- 17) Date groundwater sampled:
- 18) pH (units): NA
- 19) Temperature (degrees C): NA
- 20) Specific conductance (umhos/cm): NA
- 21) Borehole/Well abandonment method: Backfill with cuttings.
- 22) Comments:

BOREHOLE LITHOLOGIC LOG

Sample Depth (BLS)	Sample Description
0- 1.0	Dark brown sand with orange-red sand, fine to medium grained.
1.0- 5.0	White sand, medium grained. Water at 4 ft.

Notes: All depths, lengths, heights, and elevations are measured in feet. All boreholes are 4 inches in diameter. All well casings and screens are 2-inch-diameter; well screen slot sizes are .010 inches. No annular material (i.e. filter pack, seal or grout) was used in well installation. Unless otherwise noted, all sand grains are quartz.

NA = not applicable
 SSA = solid stem auger
 HA = hand auger

BLS = below land surface
 TOC = top of casing
 BTOC = below top of casing

SOIL BORING/TEMPORARY MONITORING WELL INFORMATION

- 1) Site no.: 34
- 2) Boring no./Well no.: P34B002
- 3) Drilling firm: Griner Drilling Service
- 4) Drilling method: SSA
- 5) Date drilled/installed: 06/18/91
- 6) Geologist: JOE FUGITT
- 7) Depth of boring (BLS): 5
- 8) Depth to water in borehole (BLS): 4
- 9) Highest open-borehole OVA/HNu reading (ppm): 0.2
- 10) Depth of well (BLS): NA
- 11) Length of well screen: NA
- 12) Length of casing (BLS): NA
- 13) Approx. height of casing above land surface: NA
- 14) Depth to water in well (BTOC): NA
- 15) Elevation of TOC: NA
- 16) Water level elevation: NA
- 17) Date groundwater sampled:
- 18) pH (units): NA
- 19) Temperature (degrees C): NA
- 20) Specific conductance (umhos/cm): NA
- 21) Borehole/Well abandonment method: Backfilled with cuttings.
- 22) Comments: Black ooze in sand at 3-4 ft. No odors.

BOREHOLE LITHOLOGIC LOG

<u>sample</u> <u>Depth (BLS)</u>	<u>Sample</u> <u>Description</u>
0- 1.0	Dark brown to red sand, fine to medium grained.
1.0- 3.0	White sand, medium grained.
3.0- 4.0	Black stained sand with black goo. No odor noted.
4.0- 5.0	Grey stained sand. Wet at 4 ft.

Notes: All depths, lengths, heights, and elevations are measured in feet. All boreholes are 4 inches in diameter. All well casings and screens are 2-inch-diameter; well screen slot sizes are .010 inches. No annular material (i.e. filter pack, seal or grout) was used in well installation. Unless otherwise noted, all sand grains are quartz.

APPENDIX D

SOIL SAMPLING ANALYTICAL SCREENING RESULTS

MEMORANDUM

TO: John Barksdale
FROM: Gary Hahn *G. Hahn / jk*
DATE: July 2, 1991
SUBJECT: **UH-8000** Pensacola Report
RE: 9101.449
CC: Lab File

Attached is the laboratory report of the analysis conducted on eight samples received at the Analytical Services Center on June 21, 1991. Analysis was performed according to the screening procedures set forth in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", **SW-846**, Third Edition, U.S. EPA, 1986.

The following samples were not preserved to proper pH: #14058, #14059, #14060, #14061, #14062, and #14063.

All samples on which this report is based will be retained by E & E for a period of 30 days from the date of this report unless otherwise instructed by the client. If additional storage of samples is requested by the client, a storage fee of **\$1.00** per sample container per month will be charged for each sample, with such charges accruing until destruction of the samples is authorized by the client.

FROM: Gary Hahn *Gary Hahn kr*
DATE: July 8, 1991
SUBJECT: UH-8000 Pensacola Report
RE: 9101.436
CC: Lab File

Attached is the laboratory report of the analysis conducted on twelve samples received at the Analytical Services Center on June 20, 1991. Analysis was performed according to the screening procedures set forth in "Generic Quality Assurance Project Plan, Contamination Assessments and Remedial Activities, Naval Air Station Pensacola, Pensacola, Florida," July 1990.

Sample P34-S005A was destroyed upon receipt as per Brian Caldwell.

Samples #14001 through 814012 were reanalyzed on 6/29/91 for phenols.

All samples on which this report is based will be retained by E 6 E for a period of 30 days from the date of this report unless otherwise instructed by the client. If additional storage of samples is requested by the client, a storage fee of \$1.00 per sample container per month will be charged for each sample, with such charges accruing until destruction of the samples is authorized by the client.

ANALYTICAL REFERENCE SUMMARY

9101.449

<u>PARAMETER</u>	<u>METHOD</u>
Chromium Zinc Cadmium Nickel Copper Silver	Method 6010 - "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", SW-846, Third Edition, U.S. EPA, 1986.
Arsenic	Method 7060 - "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", SW-846, Third Edition, U.S. EPA, 1986.
Lead	Method 7421 - "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", SW-846, Third Edition, U.S. EPA, 1986.
Polynuclear Aromatic Hydrocarbons	Method 8310 - "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", SW-846, Third Edition, U.S. EPA, 1986.
Purgeable Aromatics	Method 8020 - "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", SW-846, Third Edition, U.S. EPA, 1986.
Pesticides	Method 8080 - "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", SW-846, Third Edition, U.S. EPA, 1986.
Total Phenols	Method 420.1 - "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", SW-846, Third Edition, U.S. EPA, 1986.
T. Petroleum Hydrocarbons	Method 418.1 - "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", SW-846, Third Edition, U.S. EPA, 1986.

**TEMPORARY MONITORING WELL GROUNDWATER SAMPLING
ANALYTICAL SCREENING RESULTS**

MEMORANDUM

TO : John Barksdale
FROM: Gary Eahn *GH/EPK*
DATE : July 2, 1991
SUBJECT: UH-8000 Pensacola Report
RE: 9101.449
CC: Lab File

Attached is the laboratory report of the analysis conducted on eight samples received at the Analytical Services Center on June 21, 1991. Analysis was performed according to the screening procedures set forth in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", SW-846, Third Edition, U.S. EPA, 1986.

The following samples were not preserved to proper pH: #14058, #14059, #14060, #14061, #14062, and #14063.

All samples on which this report is based will be retained by E & E for a period of 30 days from the date of this report unless otherwise instructed by the client. If additional storage of samples is requested by the client, a storage fee of \$1.00 per sample container per month will be charged for each sample, with such charges accruing until destruction of the samples is authorized by the client.

EXISTING PERMANENT MONITORING WELL GROUNDWATER
SAMPLING ANALYTICAL RESULTS

M E M O R A N D U M

TO : John Barksdale

FROM : Gary Hahn G. Hahn / TB

DATE: June 18, 1991

SUBJECT : NASP Well Resampling (Site 34)

REF : 9101.044

CC : Lab File

Attached is the laboratory report of the analysis conducted on nine samples received at the Analytical Services Center on May 03, 1991. Analysis **was** performed according to the "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," SW-846, USEPA, Third Edition, 1986 and USEPA Contract Laboratory Program, Statement of Work for Organic Analysis, 2/88 and Statement of Work for Inorganic Analysis, 7/88.

All samples on which this report is based will be retained by E & E for a period of 30 days from the date of this report, unless otherwise instructed by the client. If additional storage of samples is requested by the client, a storage fee of \$1.00 per sample container per month will be charged for each sample, with such charges accruing until destruction of the samples is authorized by the client.

GH/bjh
enclosure

Based on the amount of mass spectral information available, the GC/MS computer is not always able to supply three matches for the unknown.

Carbon disulfide was detected in several of the volatile samples. This compound is believed to be laboratory introduced and is not native to the samples.

The pesticide EVALB standard analyzed at 17:23 on 05/22/91 contained carryover. This standard was immediately reanalyzed.

A pesticide spiked method blank was not extracted with samples included in this data pack. Blank spike analysis was performed with and is reported in other data packs associated with this project.

The order which the 05/15/91 ICP analytical sequence was performed did not precisely follow the Statement of Work. The initial calibration blank contained carryover and was reanalyzed later in the sequence with acceptable results. We do not believe this oversight to affect the data validity.

Times reported for mercury and cyanide analysis on Form 14 are not real. The instruments utilized are not capable of recording time of analysis.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.
