Tetra Tech NUS **INTERNAL CORRESPONDENCE**

TO: G. WALKER **DATE:** FEBRUARY 21, 2006

FROM: BERNARD F SPADA III **COPIES:** DV FILE

SUBJECT: ORGANIC DATA VALIDATION- VOC/EDB/SVOC/PAH/PEST/PCB/PRO
CTO 367, NAS PENSACOLA
SDG CTO367-6

SAMPLES: 13/Aqueous

38GW0501	38GW1301	38GW1I01
38GW1S01	38GW3I01	38GW3S01
46GW1701	46GW1701D	46GW1801
46GW1901	46GW2001	46GW2001D
46TB1220		

OVERVIEW

The sample set for CTO 367, NAS Pensacola, SDG CTO367-6 consists of ten (10) environmental aqueous samples, one (1) trip blank, and two (2) field duplicates. All samples were analyzed for volatile organic compounds (VOC). All samples except the trip blank were also analyzed for ethylene dibromide (EDB), semivolatile organic compounds (SVOC), polynuclear aromatic hydrocarbons (PAH), pesticides (PEST), polychlorinated biphenyls (PCB), and petroleum range organics (PRO). The field duplicate pairs included in this SDG are (46GW1701 / 46GW1701D) and (46GW2001 / 46GW2001D).

The samples were collected by Tetra Tech NUS on December 20, 2005 and analyzed by Katahdin Analytical Services. All analyses were conducted in accordance with Naval Facilities Engineering Service Center (NFESC) Quality Assurance/Quality Control (QA/QC) criteria using SW-846 Methods 8260B, 8270C, 8081A, 8082, and 8270SIM, Florida PRO, and EPA Method 504.1 analytical and reporting protocols. The data contained in this SDG were validated with regard to the following parameters:

- Data completeness
- Holding times
- * GC/MS Tuning
- Initial and continuing calibration
- * Blank results
- Surrogate spike recoveries
- Internal standard recoveries
- Blank Spike/Blank Spike Duplicate Results
- Matrix Spike/Matrix Spike Duplicate Results
- * Field Duplicate Precision
- * Compound Quantitation
- * Compound Identification
- * Detection Limits

The symbol (*) indicates that all quality control criteria were met for this parameter. Problems affecting data quality are discussed below; documentation supporting these findings is presented in Appendix C. Qualified Analytical results are presented in Appendix A. Results as reported by the laboratory are included in Appendix B.

Volatile

All initial and continuing calibrations were below the 0.05 relative response factor (RRF) quality control criterion for acetone and 2-butanone. Non-detected results for the aforementioned compounds were rejected (UR) in all samples.

The percent recoveries of bromodichloromethane and styrene exceeded the quality control criterion in the blank spike (WG24290-LCS). No action was taken on this basis because all results for the aforementioned compounds were non-detected.

The percent recovery of styrene exceeded the percent recovery quality control criterion in the blank spike (WG24314-LCS). No action was taken on this basis because all results for styrene were non-detected.

An MS/MSD was not performed with this SDG for all fractions. No action was taken on this basis. This item is noted as a completeness issue.

Positive results below the reporting limit were qualified as estimated (J) due to uncertainty near the detection limit.

EDB

The surrogate tetrachloro-m-xylene was below the percent recovery quality control criterion on both columns in samples 46GW2001 and 46GW2001D. The samples were not re-analyzed. According to the laboratory, the samples were not re-analyzed because of matrix interference. The laboratory identified bubbles in the hexane layer of the extraction as the matrix interference. The non-detected result for 1,2-dibromoethane was qualified as estimated (UJ) in samples 46GW2001 and 46GW2001D.

The surrogate tetrachloro-m-xylene exceeded the percent recovery quality control criterion on both columns in sample 46GW1901. No action was taken on this basis because the result was non-detected.

The surrogate tetrachloro-m-xylene exceeded the percent recovery quality control criterion on one column and was below criterion on the other in sample 38GW3I01. The sample was not re-analyzed. According to the laboratory, the sample was not re-analyzed because of matrix interference. The laboratory identified bubbles in the hexane layer of the extraction as the matrix interference. The non-detected result for 1,2-dibromoethane was qualified as estimated (UJ) in sample 38GW3I01.

An MS/MSD was not performed with this SDG. No action was taken on this basis because an LCS/LCSD was performed.

Semivolatile

The initial calibration performed on January 10, 2006 exceeded the 30% RSD quality control criterion for hexachlorocyclopentadiene. Non-detected results for hexachlorocyclopentadiene were qualified as estimated (UJ) in all samples.

All continuing calibrations exceeded the 25% difference quality control criterion for hexachlorocyclopentadiene. Non-detected results for hexachlorocyclopentadiene were qualified as estimated (UJ) in all samples.

The continuing calibration performed on January 20 at 09:39 exceeded the 25% difference quality control criterion for 4-nitrophenol. Non-detected results for the aforementioned compounds were qualified as estimated (UJ) in samples 46GW1701, 46GW1901, 46GW2001, and 46GW2001D.

The surrogates 2-fluorobiphenyl, and terphenyl-d14 exceeded the percent recovery quality control criterion in sample 38GW1S01. In addition, the internal standards chrysene-d12 and perylene-d12 were below the percent recovery quality control criterion and perylene-d12 was <10%. The sample was re-analyzed. The surrogates 2-fluorobiphenyl and 2,4,6-tribromophenol exceeded the quality control criterion and terphenyl-d14 was not recovered in the re-analysis. In addition, the internal standard acenaphthene-d10 was below recovery criteria and the internal standards chrysene-d12 and perylene-d12 were not recovered in the re-analysis. The sample was not re-extracted. The initial analysis was used for validation. No action was taken based on surrogate recoveries because all results were non-detected. The results for butylbenzyl phthalate, bis(2-ethylhexyl)phthalate, and 3,3'-dichlorobenzidine were qualified as estimated (UJ) and the result for di-n-octylphthalate was rejected (UR) in sample 38GW1S01.

The percent recovery of 2-chloronaphthalene and 3,3'-dichlorobenzidine were below the quality control criterion in the LCS/LCSD (WG24213-LCS / WG24213-LCSD). Non-detected results for the aforementioned compounds were qualified as estimated (UJ) in all samples.

The percent recovery of 2,6-dinitrotoluene and diethylphthalate were below the quality control criteria in the LCS (WG24213-LCS). No action was taken on this basis because the LCSD was compliant.

PAH

Sample 46GW1901 was re-analyzed at a 100X dilution because the concentration of naphthalene and 2-methylnaphthalene exceeded the linear calibration range of the instrument. The result for naphthalene from the diluted analysis was used for validation. The result for 2-methylnaphthalene from the initial analysis was qualified as estimated (J) and used for validation because it was below the reporting limit in the diluted analysis.

All surrogates were not recovered in the 100X dilution of sample 46GW1901. No action was taken on this basis because the surrogates were compliant in the un-diluted sample.

The surrogate fluorene-d10 exceeded the percent recovery quality control criterion and the surrogate pyrene-d10 was not recovered in sample 38GW1S01. The sample was re-analyzed with similar results. The laboratory did not re-extract the sample. The initial analysis was used for validation. Non-detected results were rejected (UR) in sample 38GW1S01.

The internal standards acenaphthene-d10, chrysene-d12, and perylene-d12 were below the percent recovery quality control criterion (and were <10%) in sample 38GW1S01. The sample was re-analyzed with similar results. The laboratory did not re-extract the sample. The initial analysis was used for validation. Non-detected results for all PAHs except 2-methylnaphthalene, anthracene, fluoranthene, and phenanthrene were rejected (UR) in sample 38GW1S01.

Positive results below the reporting limit were qualified as estimated (J) due to uncertainty near the detection limit.

PEST

The continuing calibration performed on January 17 at 05:25 exceeded the 15% difference quality control criterion for delta-BHC, endosulfan sulfate, and methoxychlor on both columns, 4,4'-DDD, 4,4'-DDT, and endrin ketone on the RTX-CLPI column, and heptachlor epoxide on the RTX-CLPII column. Non-detected results for delta-BHC, endosulfan sulfate, and methoxychlor were qualified as estimated (UJ) in all samples. No action was taken for endrin ketone and heptachlor epoxide on this basis because all results for the aforementioned compounds were non-detected.

The continuing calibration performed on January 19 at 13:37 exceeded the 15% difference quality control criterion for alpha-BHC on the RTX-CLPI column. No action was taken on this basis because no samples associated with this calibration were used for validation.

The surrogate decachlorobiphenyl was below the percent recovery quality control criteria in samples 46GW1801, 46GW1901, 46GW2001, 46GW2001D, and 38GW3I01 on both columns. The aforementioned samples were re-extracted >2X outside of holding time and re-analyzed. Re-extracted samples 46GW2001, 46GW2001D, and 38GW3I01 had similar results. Because the holding time non-compliance would cause rejection of results the initial analyses were used for validation of all aforementioned samples. Positive and non-detected results for all pesticides were qualified as estimated (J and UJ) in all aforementioned samples.

The surrogate decachlorobiphenyl was below the percent recovery quality control criteria in sample 38GW1I01 on the RTX-CLPII column. No action was taken on this basis because only one surrogate was non-complaint.

Positive results below the reporting limit were qualified as estimated (J) due to uncertainty near the detection limit.

PCB

The continuing calibration performed on January 11 at 23:31 exceeded the 15% difference quality control criterion for Aroclor 1260 on the RTX-5 column. No action was taken on this basis because the RTX-35 column was compliant and all results were non-detected.

The continuing calibration performed on January 12 at 10:49 exceeded the 15% difference quality control criterion for Aroclor 1260 on the RTX-5 column. No action was taken on this basis because the RTX-35 column was compliant and all results were non-detected.

The continuing calibration performed on January 16 at 18:57 exceeded the 15% difference quality control criterion for Aroclor 1260 on the RTX-5 column. No action was taken on this basis because the RTX-35 column was compliant and all results were non-detected.

The surrogate decachlorobiphenyl was below the percent recovery quality control criterion on both columns in all environmental samples and QC. The environmental samples were re-extracted >2X outside of holding time and re-analyzed. Samples 46GW2001, 46GW2001D, and 38GW3I01 had similar results. The remaining re-extracted samples had improved surrogate recovery. Because the holding time non-compliance would cause rejection of results the initial analyses were used for validation of all aforementioned samples. Positive and non-detected results were qualified as estimated (J and UJ) in all aforementioned samples.

PRO

The surrogate o-terphenyl exceeded the percent recovery quality control criterion in sample 38GW1301. The positive result for PRO was qualified as estimated (J) in sample 38GW1301.

The surrogate o-terphenyl was below the percent recovery quality control criterion in sample 46GW2001D. The positive result for PRO was qualified as estimated (J) in sample 46GW2001D.

The RPD of PRO exceeded the quality control criterion in the LCS/LCSD (WG24194-LCS / WG24194-LCSD). No action was taken on this basis because all percent recoveries were compliant.

EXECUTIVE SUMMARY

Laboratory Performance Issues: Qualifications were made based on calibration non-compliances, surrogate recovery non-compliances, LCS recovery non-compliances and internal standard non-compliances.

Other Factors Affecting Data Quality: An MS/MSD was not performed for any fraction in this SDG.

The data for these analyses were reviewed with reference to the EPA Functional Guidelines for Organic Data Validation (10/99) and the NFESC guidelines. The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC guidelines and the Quality Assurance Project Plan (QAPP)."

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

Sample Receipt

The following samples were received on December 21, 2005 and were logged in under Katahdin Analytical Services work order number WV6788 for a hardcopy due date of January 16, 2006.

KATAHDIN Sample No.	TTNUS Sample Identification
WV6788-1	46GW1901
WV6788-2	46GW2001
WV6788-3	46GW2001D
WV6788-4	46GW1701
WV6788-5	46GW1701D
WV6788-6	46GW1801
WV6788-7	38GW3S01
WV6788-8	38GW1I01
WV6788-9	38GW1S01
WV6788-10	38GW0501
WV6788-11	38GW1301
WV6788-12	38GW3I01
WV6788-13	46TB1220

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Organics Laboratory

The samples of SDG CTO367-6 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA, and/or Method for Determination of Petroleum Range Organics (Method #FL-PRO), Florida Department of Environmental Protection, November 1, 1995 and/or "Methods for the Determination

504.1 Analysis

Sample WV6788-1 had high recoveries for the surrogate TCX on both channels, which were outside of the laboratory established acceptance limits. Since a high recovery would indicate a high bias and the target analyte was not detected above the MDL in the sample, the sample was not reextracted.

Samples WV6788-2 and 3 had low recoveries for the surrogate TCX on both channels, which were outside of the laboratory established acceptance limits. Based on the extraction, as indicated by notations in the extraction prep logbook, the low recoveries are likely due to matrix and were therefore not reextracted.

Sample WV6788-12 had a low recovery on channel A and a high recovery on channel B for the surrogate TCX, which were outside of the laboratory established acceptance limits. Based on the extraction, as indicated by notations in the extraction prep logbook, these recoveries are likely due to matrix and were therefore not reextracted.

The closing CV (file 3WA2043) had a high response for the surrogate TCX on channel B, which resulted in a %D that was outside of the method acceptance limits of 30%. Since the response was within the acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The surrogate for sample WV6788-12 on channel A did not elute within the laboratories established retention time window. The peak was manually assigned which resulted in the retention time of the surrogate to be outside of the retention time window. Therefore, the surrogate is flagged with the qualifier "*" on the form 8. Since the retention time of the surrogate on channel B was acceptable, and there were no target analytes detected above the PQL in the sample, the sample was not reanalyzed.

8270C SIM Analysis

Sample WV6788-9 had a high recovery for one surrogate and no recovery for another surrogate, which were outside the laboratory nominal acceptance limits. The sample also had a low response for one internal standard and no response for two others, which were outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The sample was reanalyzed with similar failures confirming a matrix effect. The results from both analyses are reported.

The calibration verification standard (CV) (file U3510) had a high response for the (CCC) calibration check compound benzo(a)pyrene, which resulted in a %D that was outside the method acceptance limit of 20%D. Since a high response would indicate a high bias and this target analyte was not detected above the MDL, the associated samples were not reanalyzed.

8270C Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten

percent of the spiked analytes (with the exception of the common laboratory phthalate ester contaminants) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

The initial calibration analyzed on 01/10/06 had %RSD values for several analytes that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analyte hexachlorocyclopentadiene failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. This compound was calibrated using the average model. Since this compound was not detected above the MDL for any of the associated samples, the samples were not reanalyzed.

Sample WV6788-9 had high recoveries for two surrogates, which were outside the laboratory established acceptance limits. The sample also had low responses for two internal standards, which were outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The sample was reanalyzed with similar failures confirming a matrix effect. The results from both analyses are reported.

8082 Analysis

The method blank, WG24196-1, the laboratory control sample, WG24196-2, , the laboratory control sample duplicate WG24196-3 and samples WV6788-1 through 12 had low recoveries for the extraction surrogate DCB on one or both channels, which were outside of the laboratory established acceptance limits. The samples were reextracted twenty-two days out of hold time and analyzed. The reextracted samples WV6788-2, 3, 8, and 12, the LCS WG24737-2 and 2RA had low recoveries for the surrogate DCB on one or both channels. The results from both analyses have been reported.

The calibration verification standards (CVs) (files 6WA1128, 6WA1152 and 6WA1188) had low responses for Aroclor 1260 on channel A, which resulted in %Ds that were outside of the method acceptance limits of 15%. Since the responses were acceptable on the confirmation channel, the associated samples were not reanalyzed.

The CV (file 6WA1167) had a high response for Aroclor 1260 on channel A, which resulted in a %D that was outside of the method acceptance limits of 15%. Since the response was acceptable on the confirmation channel, the associated samples were not reanalyzed.

The Form 7 for the CV's (files 6WA1128, 6WA2128, 6WA1167, 6WA2167, 6WA1188, 6WA2188, 6WA3072, 6WA4072, 6WA3110 and 6WA4110) are flagged for the surrogates TCX and/or DCB indicating that the %D is greater than the method acceptance limit of 15%. With the exception of TCX for file 6WA2128, which was high, DCB for file 6WA1167 which was high, DCB for file 6WA2188, which was low and TCX for file 6WA3072, which was low, the %D's are actually within the method acceptance limits and should not be flagged, but due to software limitations the flagging could not be removed.

8081 Analysis

Samples WV6788-1, 2, 3, 6 and 12 had low recoveries for the extraction surrogate DCB on both channels, which were outside of the laboratory established acceptance limits. The samples were reextracted twenty-two days out of hold time and analyzed. The reextracted samples WV6788-2, 3, and 12 had low recoveries for the surrogate DCB on both channels. The results from both analyses have been reported.

Sample WV6788-8 had a low recovery for the extraction surrogates DCB on channel B, which was outside of the laboratory established acceptance limits. Since the recoveries for TCX on both channels and DCB on channel A were acceptable, the sample was not reextracted.

The opening CV (file 8WA1057) had a high response for TCX on channel A, which resulted in a %D that was outside of the method acceptance limits of 15%. Since all of the responses on the confirmation channel were within the acceptance limits, the associated samples were not reanalyzed.

The closing CV (files 8WA1080 and 8WA2080) had low responses for 4,4'-DDT and methoxychlor on both channels, a low response for endrin, endrin aldehyde and endosulfan sulfate on channel A and a high response for TCX on channel A. These responses resulted in %D's that were outside of the method acceptance limits of 15%.

The closing CV (files 8WA3067 and 8WA4067) had a low response for 4,4'-DDT on channel A, high responses for 4,4'DDD and DCB on channel A, high responses for delta-BHC, endrin ketone, methoxychlor and endosulfan sulfate on both channels and a low response for heptachlor epoxide on channel B. These responses resulted in %D's that were outside of the method acceptance limits of 15%.

The closing CV (file 8WA3151) had a low response for alpha-BHC on the A channel, which resulted in a %D that was outside of the method acceptance limits of 15%. Since all responses were within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

Some of the samples and the associated QC were put through a sulfur cleanup according to SW846 method 3660 using the copper powder technique. The cleanup had little or no effect on removing the sulfur. Consequently, some of the samples may have sulfur interference affecting the quantitation of target analytes. Since there was no significant improvement with the sulfur cleanup extracts, the results from the non-sulfur cleanup extracts are reported.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of Katahdin SDG CTO367-6 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Solid Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP) and Inductively-Coupled Plasma Mass Spectrometric Analysis (ICP-MS)

Aqueous-matrix Katahdin Sample Nos. WV6788-(1-12) were digested for ICP and ICP-MS analysis on 01/06/06 (QC Batch WA06ICW0) in accordance with USEPA Method 3010A.

ICP analyses of SDG CTO367-6 sample digestates were performed using a Thermo Jarrell Ash (TJA) ICAP 61E ICP spectrometer. ICP-MS analyses of SDG CTO367-6 sample digestates were performed using an Agilent 7500 ICP-MS spectrometer. All samples were analyzed within holding times and all analytical run QC criteria were met, with the following comments or exceptions:

Some of the results for run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

Aqueous-matrix Katahdin Sample Nos. WV6788-(1-12) were digested for mercury analysis on 01/05/06 (QC Batch WA05HGW1) in accordance with USEPA Method 7470A.

Mercury analyses of Katahdin SDG CTO367-6 sample digestates were performed using a Cetac M6100 automated mercury analyzer. All samples were analyzed within holding times and all analytical run QC criteria were met.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

QC Flag Legend

T - Target compound detected outside RT window.
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

Overview

The sample set for CTO 367, NAS Pensacola, SDG CTO367-6, consists of twelve (12) groundwater environmental samples. Two (2) field duplicate pairs (46GW1701 / 46GW1701D and 46GW2001 / 46GW2001D) are included within this SDG.

All samples were analyzed for target analyte list (TAL) metals. The samples were collected by Tetra Tech NUS on December 20, 2005 and analyzed by Katahdin Analytical Services under Naval Facilities Engineering Service Center (NFESC) Quality Assurance/Quality Control (QA/QC) criteria. Barium, calcium, copper, iron, magnesium, manganese, potassium and sodium analyses were conducted using SW-846 method 6010B. Analyses for aluminum, antimony, arsenic, beryllium, cadmium, chromium, cobalt, lead, nickel, selenium, silver, thallium, vanadium and zinc were conducted using SW-846 method 6020. Mercury analyses were conducted using SW-846 method 7470A.

Barium, calcium, copper, iron, magnesium, manganese, potassium and sodium analyses were conducted using Inductively Coupled Plasma (ICP) instrumentation. Aluminum, antimony, arsenic, beryllium, cadmium, chromium, cobalt, lead, nickel, selenium, silver, thallium, vanadium and zinc analyses were conducted using Inductively Coupled Plasma Mass Spectrometer (ICP-MS) instrumentation. Mercury analyses were conducted using Cold Vapor Atomic Absorption (CVAA) instrumentation.

These data were evaluated based on the following parameters:

* • Data Completeness
* • Holding Times
* • Calibration Verification Results
• Laboratory Blank Analyses
• ICP Interference Check Sample Results
* • Laboratory Control Sample Results
• Field Duplicate Results
* • Sample Quantitation
* • Detection Limits

* - All quality control criteria were met for this parameter.

Laboratory Blank Analyses

The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Aluminum	4.77 µg/L	23.85 µg/L
Antimony[(1)]	0.92 µg/L	4.6 µg/L
Beryllium[(1)]	0.015 µg/L	0.075 µg/L
Cadmium[(1)]	0.02 µg/L	0.10 µg/L
Calcium	103.36 µg/L	516.8 µg/L
Chromium[(1)]	2.257 µg/L	11.285 µg/L
Cobalt	0.01 µg/L	0.05 µg/L
Copper	5.07 µg/L	25.35 µg/L
Iron	38.78 µg /L	193.9 µg/L
Lead[(1)]	0.389 µg /L	1.945 µg/L
Magnesium	113.83 µg/L	569.15 µg/L
Manganese	0.98 µg/L	4.9 µg/L
Potassium	997.82 µg/L	4989.1 µg/L
Selenium[(1)]	0.484 µg/L	2.42 µg/L
Sodium	379.36 µg/L	1896.8 µg/L
Thallium	0.18 µg/L	0.90 µg/L
Vanadium[(1)]	0.428 µg/L	2.14 µg/L
Zinc[(1)]	2.328 µg/L	11.64 µg/L

[(1)] Maximum concentration present in a laboratory preparation blank affecting all samples.

An action level of 5X the maximum concentration has been used to evaluate the sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results, less than the blank action level, were qualified "U" as a result of laboratory blank contamination.

ICP Interference Check Sample Results

The interfering analyte sodium was present in samples 38GW1301, 38GW3S01, 46GW1701, 46GW1701D, 46GW1801 and 46GW1901 at concentrations that were comparable to the level of sodium in the Interference Check Sample (ICS) solution. Several analytes, namely, antimony, chromium, nickel and selenium were present in the ICS solution at a concentration that exceeded the absolute value of the Instrument Detection Limit (IDL). Interference effects exist for nickel in the affected samples. The positive results reported for nickel in these samples were qualified as estimated, "J".

The interfering analyte sodium was present in samples 38GW3I01, 46GW2001 and 46GW2001D at concentrations that were comparable to the level of sodium in the Interference Check Sample (ICS) solution. Several analytes, namely, antimony, chromium, nickel and selenium were present in the ICS solution at a concentration that exceeded the absolute value of the Instrument Detection Limit (IDL). Interference effects exist for chromium, nickel and selenium in the affected samples. The positive results reported for these analytes in these samples were qualified as estimated, "J".

The interfering analytes calcium and sodium were present in sample 38GW1I01 at concentrations that were comparable to the levels of calcium and sodium in the Interference Check Sample (ICS) solution. Several analytes, namely, antimony, chromium, nickel and selenium were present in the ICS solution at a concentration that exceeded the absolute value of the Instrument Detection Limit

(IDL). Interference effects exist for nickel and selenium in the affected sample. The positive results reported for nickel and selenium in this sample was qualified as estimated, "J".

Field Duplicate Results

Field duplicate imprecision (difference > 2X CRDL) was noted for copper in the 46GW2001 / 46GW2001D sample pair. The positive result reported for copper in sample 46GW2001D was qualified as estimated, "J". No validation action was taken for sample 46GW2001 because the copper result in this sample was qualified "U" as a result of laboratory blank contamination.

Notes

All results for all metals analyzed by ICP-MS were analyzed at a 5X dilution.

Barium, calcium, copper, iron, magnesium, manganese, potassium and sodium were analyzed at a 5X dilution in sample 38GW1I01 and at 2X dilutions in samples 38GW3I01, 46GW2001 and 46GW2001D.

The Contract Required Detection Limit (CRDL) percent recovery for mercury was < 80% quality control limit. No validation action was taken based on the CRDL percent recovery.

The Practical Quantitation Limit (PQL) percent recoveries for arsenic, chromium and silver were < 80% quality control limit. No validation action was taken based on the PQL percent recoveries.

The laboratory did not perform laboratory duplicate, matrix spike (MS) or ICP serial dilution analyses for any samples within this SDG; therefore, these quality control parameters could not be evaluated.

Executive Summary

Laboratory Performance: Several analytes were present in the laboratory method/preparation blanks.

Other Factors Affecting Data Quality: Field duplicate imprecision was noted for copper in the 46GW2001 / 46GW2001D sample pair. Several analytes were qualified due to ICS noncompliance.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", July 2002 and the NFESC document entitled "Navy IRCDQM" (September 1999).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC Guidelines and the Quality Assurance Project Plan (QAPP)."

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A
QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

SDG NARRATIVE
KATAHDIN ANALYTICAL SERVICES
TETRA TECH NUS
CASE CTO 367 NAS PENSACOLA
SDG: CTO367-6

Sample Receipt

The following samples were received on December 21, 2005 and were logged in under Katahdin Analytical Services work order number WV6788 for a hardcopy due date of January 16, 2006.

KATAHDIN Sample No.	TTNUS Sample Identification
WV6788-1	46GW1901
WV6788-2	46GW2001
WV6788-3	46GW2001D
WV6788-4	46GW1701
WV6788-5	46GW1701D
WV6788-6	46GW1801
WV6788-7	38GW3S01
WV6788-8	38GW1I01
WV6788-9	38GW1S01
WV6788-10	38GW0501
WV6788-11	38GW1301
WV6788-12	38GW3I01
WV6788-13	46TB1220

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Organics Laboratory

The samples of SDG CTO367-6 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA, and/or Method for Determination of Petroleum Range Organics (Method #FL-PRO), Florida Department of Environmental Protection, November 1, 1995 and/or "Methods for the Determination

8081 Analysis

Samples WV6788-1, 2, 3, 6 and 12 had low recoveries for the extraction surrogate DCB on both channels, which were outside of the laboratory established acceptance limits. The samples were reextracted twenty-two days out of hold time and analyzed. The reextracted samples WV6788-2, 3, and 12 had low recoveries for the surrogate DCB on both channels. The results from both analyses have been reported.

Sample WV6788-8 had a low recovery for the extraction surrogates DCB on channel B, which was outside of the laboratory established acceptance limits. Since the recoveries for TCX on both channels and DCB on channel A were acceptable, the sample was not reextracted.

The opening CV (file 8WA1057) had a high response for TCX on channel A, which resulted in a %D that was outside of the method acceptance limits of 15%. Since all of the responses on the confirmation channel were within the acceptance limits, the associated samples were not reanalyzed.

The closing CV (files 8WA1080 and 8WA2080) had low responses for 4,4'-DDT and methoxychlor on both channels, a low response for endrin, endrin aldehyde and endosulfan sulfate on channel A and a high response for TCX on channel A. These responses resulted in %D's that were outside of the method acceptance limits of 15%.

The closing CV (files 8WA3067 and 8WA4067) had a low response for 4,4'-DDT on channel A, high responses for 4,4'DDD and DCB on channel A, high responses for delta-BHC, endrin ketone, methoxychlor and endosulfan sulfate on both channels and a low response for heptachlor epoxide on channel B. These responses resulted in %D's that were outside of the method acceptance limits of 15%.

The closing CV (file 8WA3151) had a low response for alpha-BHC on the A channel, which resulted in a %D that was outside of the method acceptance limits of 15%. Since all responses were within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

Some of the samples and the associated QC were put through a sulfur cleanup according to SW846 method 3660 using the copper powder technique. The cleanup had little or no effect on removing the sulfur. Consequently, some of the samples may have sulfur interference affecting the quantitation of target analytes. Since there was no significant improvement with the sulfur cleanup extracts, the results from the non-sulfur cleanup extracts are reported.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of Katahdin SDG CTO367-6 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Solid Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP) and Inductively-Coupled Plasma Mass Spectrometric Analysis (ICP-MS)

Aqueous-matrix Katahdin Sample Nos. WV6788-(1-12) were digested for ICP and ICP-MS analysis on 01/06/06 (QC Batch WA06ICW0) in accordance with USEPA Method 3010A.

ICP analyses of SDG CTO367-6 sample digestates were performed using a Thermo Jarrell Ash (TJA) ICAP 61E ICP spectrometer. ICP-MS analyses of SDG CTO367-6 sample digestates were performed using an Agilent 7500 ICP-MS spectrometer. All samples were analyzed within holding times and all analytical run QC criteria were met, with the following comments or exceptions:

Some of the results for run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

Aqueous-matrix Katahdin Sample Nos. WV6788-(1-12) were digested for mercury analysis on 01/05/06 (QC Batch WA05HGW1) in accordance with USEPA Method 7470A.

Mercury analyses of Katahdin SDG CTO367-6 sample digestates were performed using a Cetac M6100 automated mercury analyzer. All samples were analyzed within holding times and all analytical run QC criteria were met.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

Leslie Dimond

COVER PAGE - INORGANIC ANALYSES DATA PACKAGE

Lab Name: Katahdin Analytical Services

SDG Name: CTO367-6 **SOW No.** SW846

Client Field ID	Lab Sample ID
38GW0501	WV6788-010
38GW1301	WV6788-011
38GW1I01	WV6788-008
38GW1S01	WV6788-009
38GW3I01	WV6788-012
38GW3S01	WV6788-007
46GW1701	WV6788-004
46GW1701D	WV6788-005
46GW1801	WV6788-006
46GW1901	WV6788-001
46GW2001	WV6788-002
46GW2001D	WV6788-003

Were ICP interelement corrections applied ?	Yes
Were ICP background corrections applied ?	Yes
If yes - were raw data generated before application of background corrections ?	No

Comments:

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on floppy diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signature.

Signature: Edward A Morgan Name: Edward A. Morgan

Date: January 26, 2006 Title: Senior Chemist

INITIAL AND CONTINUING CALIBRATION VERIFICATION

Overview

The sample set for NAS Pensacola, CTO 367, SDG WV5526, consists of sixteen (16) soil environmental samples.

All samples were analyzed for select metals (aluminum, iron, and lead). The samples were collected by Tetra Tech NUS on October 19, 2005 and analyzed by Katahdin Analytical Services. Metals analyses were conducted using SW-846 method 6010B.

Metals analyses were conducted using Inductively Coupled Plasma (ICP) methodology.

These data were evaluated based on the following parameters:

* • Data Completeness
* • Holding Times
* • Calibration Analyses
• Laboratory Method/Preparation Blank Analyses
* • ICP Interference Analyses
* • Laboratory Duplicate Precision
* • Laboratory Control Sample Analyses
* • Detection Limits
* • Analyte Quantitation

* - All quality control criteria were met for this parameter.

Laboratory Blank Analyses

The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Aluminum	223.05 ug/L	111.55 mg/kg
Iron[(1)]	3.904 mg/kg	19.52 mg/kg

(1) Maximum concentration present in soil preparation blank.

An action level of 5X the maximum concentration was used to evaluate the sample data for blank contamination. Sample aliquot, percent solids, and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the action level for aluminum were qualified as nondetected (U) for laboratory blank contamination. Iron was not qualified for laboratory blank contamination because all results were greater than the action level.

Notes

The interfering analyte aluminum was present in sample PEN46SB1401 at a concentration comparable to the concentration of aluminum in the interference check sample (ICS) solution. Lead was present in the ICS solution at a concentration that exceeded the absolute value of the instrument detection limit (IDL). No interference effects exist for lead in this sample, so no qualification action was taken.

Matrix spike and ICP serial dilution analyses were not conducted for this SDG.

Executive Summary

Laboratory Performance: Aluminum was present in the laboratory method/preparation blanks.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", July 2002 and the NFESC document entitled "Navy IRCDQM" (September 1999).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC Guidelines and the Quality Assurance Project Plan (QAPP)."

2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

WV5526-7	PEN46SB1101
WV5526-8	PEN46SB1102
WV5526-9	PEN46SB1201
WV5526-10	PEN46SB1202
WV5526-11	PEN46SB1401
WV5526-12	PEN46SB1402
WV5526-13	PEN46SB1403
WV5526-14	PEN46SB1301
WV5526-15	PEN46SB1302
WV5526-16	PEN46SB1303

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Metals Analysis

The samples of Katahdin Work Order WV5526 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Aqueous Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP)

Solid-matrix Katahdin Sample Nos. WV5526-(1-16) were digested for ICP analysis on 10/20/05 (QC Batch VJ20ICS1) in accordance with USEPA Method 3050B.

ICP analyses of Work Order WV5526 sample digestates were performed using a Thermo Jarrell Ash (TJA) Trace ICP spectrometer in accordance with USEPA Method 6010B. All samples were analyzed within holding times and all analytical run QC criteria were met.

Wet Chemistry Analysis

The samples of Work Order WV5526 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for total solids were performed according to "U.S. EPA Contract Laboratory Program Statement of Work for Inorganic Analysis", SOW 7/88.

All analyses were performed within analytical holding times, and all quality control criteria were met.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

Overview

The sample set for NAS Pensacola, CTO 367, SDG WV5527, consists of twenty (20) soil environmental samples.

All samples were analyzed for select metals (aluminum, iron, and lead). The samples were collected by Tetra Tech NUS on October 19, 2005 and analyzed by Katahdin Analytical Services. Metals analyses were conducted using SW-846 method 6010B.

Metals analyses were conducted using Inductively Coupled Plasma (ICP) methodology.

These data were evaluated based on the following parameters:

* • Data Completeness
* • Holding Times
* • Calibration Recoveries
• Laboratory Method/Preparation Blank Analyses
* • ICP Interference Analyses
* • Laboratory Duplicate Results
* • Laboratory Control Sample Recoveries
* • Detection Limits
* • Analyte Quantitation

* - All quality control criteria were met for this parameter.

Laboratory Blank Analyses

The following contaminant was detected in the laboratory method/preparation blanks at the following maximum concentration:

Analyte	Maximum Concentration	Action Level
Aluminum	94.99 ug/L	47.50 mg/kg

An action level of 5X the maximum concentration was used to evaluate the sample data for blank contamination. Sample aliquot, percent solids, and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. The positive result less than the action level for aluminum was qualified as nondetected (U) for laboratory blank contamination.

Notes

Matrix spike and ICP serial dilution analyses were not conducted for this SDG.

Executive Summary

Laboratory Performance: Aluminum was present in the laboratory method/preparation blanks.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", July 2002 and the NFESC document entitled "Navy IRCDQM" (September 1999).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC Guidelines and the Quality Assurance Project Plan (QAPP)."

2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

Sample Receipt

The following samples were received on October 20, 2005 and were logged in under Katahdin Analytical Services work order number WV5527 for a hardcopy due date of November 2, 2005.

KATAHDIN Sample No.	TTNUS Sample Identification
WV5527-1	PEN46SB0101
WV5527-2	PEN46SB0102
WV5527-3	PEN46SB0201
WV5527-4	PEN46SB0202
WV5527-5	PEN46SB0301
WV5527-6	PEN46SB0302
WV5527-7	PEN46SB0401
WV5527-8	PEN46SB0402
WV5527-9	PEN46SB0501
WV5527-10	PEN46SB0502
WV5527-11	PEN46SB0503
WV5527-12	PEN46SB0601
WV5527-13	PEN46SB0602
WV5527-14	PEN46SB0603
WV5527-15	PEN46SB0701
WV5527-16	PEN46SB0702
WV5527-17	PEN46SB0703
WV5527-18	PEN46SB0801
WV5527-19	PEN46SB0802
WV5527-20	PEN46SB0803

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Metals Analysis

The samples of Katahdin Work Order WV5527 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Aqueous Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP)

Solid-matrix Katahdin Sample Nos. WV5527-(1-20) were digested for ICP analysis on 10/20/05 (QC Batch VJ20ICS0) in accordance with USEPA Method 3050B.

ICP analyses of Work Order WV5527 sample digestates were performed using a Thermo Jarrell Ash (TJA) Trace ICP spectrometer in accordance with USEPA Method 6010B. All samples were analyzed within holding times and all analytical run QC criteria were met.

Wet Chemistry Analysis

The samples of Work Order WV5527 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for total solids were performed according to "U.S. EPA Contract Laboratory Program Statement of Work for Inorganic Analysis", SOW 7/88.

All analyses were performed within analytical holding times, and all quality control criteria were met.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

Overview

The sample set for NAS Pensacola, CTO 367, SDG WV5581, consists of twenty-one (21) soil environmental samples.

All samples were analyzed for select metals (aluminum, iron, and lead). The samples were collected by Tetra Tech NUS on October 20, 2005 and analyzed by Katahdin Analytical Services. Metals analyses were conducted using SW-846 method 6010B.

Metals analyses were conducted using Inductively Coupled Plasma (ICP) methodology.

These data were evaluated based on the following parameters:

* • Data Completeness
* • Holding Times
* • Calibration Analyses
• Laboratory Method/Preparation Blank Analyses
* • ICP Interference Analyses
* • Laboratory Duplicate Precision
* • Laboratory Control Sample Analyses
* • Detection Limits
* • Analyte Quantitation

* - All quality control criteria were met for this parameter.

Laboratory Blank Analyses

The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Aluminum	306.4 ug/L	153.2 mg/kg
Iron[(1)]	5.054 mg/kg	25.27 mg/kg
Iron[(2)]	2.831 mg/kg	14.16 mg/kg

(1) Maximum concentration present in preparation blank from batch VJ21ICS0, affecting all samples except PEN46SB2003.
(2) Maximum concentration present in preparation blank from batch VJ21ICS1, affecting sample PEN46SB2003 only.

An action level of 5X the maximum concentration was used to evaluate the sample data for blank contamination. Sample aliquot, percent solids, and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the action level for aluminum were qualified as nondetected (U) for laboratory blank contamination. Iron was not qualified for laboratory blank contamination because the results were greater than the action levels.

Notes

Matrix spike and ICP serial dilution analyses were not conducted for this SDG.

Executive Summary

Laboratory Performance: Aluminum was present in the laboratory method/preparation blanks.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", July 2002 and the NFESC document entitled "Navy IRCDQM" (September 1999).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC Guidelines and the Quality Assurance Project Plan (QAPP)."

2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

Sample Receipt

The following samples were received on October 21, 2005 and were logged in under Katahdin Analytical Services work order number WV5581 for a hardcopy due date of November 3, 2005.

KATAHDIN Sample No.	TTNUS Sample Identification
WV5581-1	PEN46SB1501
WV5581-2	PEN46SB1502
WV5581-3	PEN46SB1503
WV5581-4	PEN46SB1601
WV5581-5	PEN46SB1602
WV5581-6	PEN46SB1603
WV5581-7	PEN46SB1701
WV5581-8	PEN46SB1702
WV5581-9	PEN46SB1703
WV5581-10	PEN46SB1801
WV5581-11	PEN46SB1802
WV5581-12	PEN46SB1803
WV5581-13	PEN46SB1901
WV5581-14	PEN46SB1902
WV5581-15	PEN46SB1903
WV5581-16	PEN46SB2101
WV5581-17	PEN46SB2102
WV5581-18	PEN46SB2103
WV5581-19	PEN46SB2001
WV5581-20	PEN46SB2002
WV5581-21	PEN46SB2003

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Metals Analysis

The samples of Katahdin Work Order WV5581 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Aqueous Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP)

Solid-matrix Katahdin Sample Nos. WV5581-(1-20) were digested for ICP analysis on 10/21/05 (QC Batch VJ21ICS0) in accordance with USEPA Method 3050B. Duplicate laboratory control samples were prepared in this batch.

Solid-matrix Katahdin Sample No. WV5581-21 was digested for ICP analysis on 10/21/05 (QC Batch VJ21ICS1) in accordance with USEPA Method 3050B. Duplicate laboratory control samples were prepared in this batch.

ICP analyses of Work Order WV5581 sample digestates were performed using a Thermo Jarrell Ash (TJA) Trace ICP spectrometer in accordance with USEPA Method 6010B. All samples were analyzed within holding times and all analytical run QC criteria were met.

Wet Chemistry Analysis

The samples of Work Order WV5581 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for total solids were performed according to "U.S. EPA Contract Laboratory Program Statement of Work for Inorganic Analysis", SOW 7/88.

All analyses were performed within analytical holding times, and all quality control criteria were met.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

Overview

The sample set for NAS Pensacola, CTO 367, SDG WV5582, consists of seventeen (17) soil environmental samples.

All samples were analyzed for select metals (aluminum, iron, and lead). The samples were collected by Tetra Tech NUS on October 20, 2005 and analyzed by Katahdin Analytical Services. Metals analyses were conducted using SW-846 method 6010B.

Metals analyses were conducted using Inductively Coupled Plasma (ICP) methodology.

These data were evaluated based on the following parameters:

* • Data Completeness
* • Holding Times
* • Calibration analyses
  • Laboratory Method/Preparation Blank Analyses
* • ICP Interference Analyses
* • Laboratory Duplicate Precision
* • Laboratory Control Sample Analyses
* • Detection Limits
* • Analyte Quantitation

* - All quality control criteria were met for this parameter.

Laboratory Blank Analyses

The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Aluminum	306.4 ug/L	153.2 mg/kg
Iron[(1)]	2.831 mg/kg	14.16 mg/kg

[(1)] Maximum concentration present in soil preparation blank.

An action level of 5X the maximum concentration was used to evaluate the sample data for blank contamination. Sample aliquot, percent solids, and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the action level for aluminum were qualified as nondetected (U) for laboratory blank contamination. Iron was not qualified for laboratory blank contamination because the results were greater than the action level.

Notes

Matrix spike and ICP serial dilution analyses were not conducted for this SDG.

Executive Summary

Laboratory Performance: Aluminum was present in the laboratory method/preparation blanks.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", July 2002 and the NFESC document entitled "Navy IRCDQM" (September 1999).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC Guidelines and the Quality Assurance Project Plan (QAPP)."

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

WV5582-10	PEN46SB2501
WV5582-11	PEN46SB2502
WV5582-12	PEN46SB2503
WV5582-13	PEN46SB2201
WV5582-14	PEN46SB2202
WV5582-15	PEN46SB2203
WV5582-16	PEN46SB2801
WV5582-17	PEN46SB2802

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Metals Analysis

The samples of Katahdin Work Order WV5582 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Aqueous Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP)

Solid-matrix Katahdin Sample Nos. WV5582-(1-17) were digested for ICP analysis on 10/21/05 (QC Batch VJ21ICS1) in accordance with USEPA Method 3050B. Duplicate laboratory control samples were prepared in this batch.

ICP analyses of Work Order WV5582 sample digestates were performed using a Thermo Jarrell Ash (TJA) Trace ICP spectrometer in accordance with USEPA Method 6010B. All samples were analyzed within holding times and all analytical run QC criteria were met.

Wet Chemistry Analysis

The samples of Work Order WV5582 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for total solids were performed according to "U.S. EPA Contract Laboratory Program Statement of Work for Inorganic Analysis", SOW 7/88.

All analyses were performed within analytical holding times, and all quality control criteria were met.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

Overview

The sample set for CTO 367, NAS Pensacola, SDGs CTO367-2 & CTO333-4, consists of fifteen (15) soil environmental samples, seven (7) aqueous environmental samples and one (1) aqueous rinsate blank, PEN46RB1202. One (1) field duplicate pair (PEN46SB3001 / PEN46SB3001D) is included within this SDG.

All soil samples and the rinsate blank sample were analyzed for target analyte list (TAL) metals, with the exception of samples PEN45SB2601 and PEN45SB2701, which were analyzed for aluminum, arsenic and iron only. In addition, all of the soil samples except PEN45SB2601 and PEN45SB2701 were leached according to the Synthetic Precipitate Leachate Procedure (SPLP) and analyzed for TAL metals. The aqueous samples were analyzed for iron only. The samples were collected by Tetra Tech NUS on December 2, 16, 17, 18 and 20, 2005 and analyzed by Katahdin Analytical Services under Naval Facilities Engineering Service Center (NFESC) Quality Assurance/Quality Control (QA/QC) criteria. Metals analyses, with the exception of aluminum, iron, sodium and zinc in several samples and antimony, arsenic, chromium, lead, mercury, selenium and thallium in all samples were conducted using SW-846 method 6010B. Mercury analyses were conducted using SW-846 methods 7470A and 7471A. Analyses for aluminum, iron, sodium and zinc in several samples and antimony, arsenic, chromium, lead, selenium and thallium in all samples were conducted using SW-846 method 6020.

Metals analyses, with the exception of aluminum, iron, sodium and zinc in several samples and antimony, arsenic, chromium, lead, mercury, selenium and thallium in all samples, were conducted using Inductively Coupled Plasma (ICP) instrumentation. Analyses for aluminum, iron, sodium and zinc in several samples and antimony, arsenic, chromium, lead, selenium and thallium in all samples were conducted using Inductively Coupled Plasma Mass Spectrometry

(ICP-MS) instrumentation. Mercury analyses were conducted using Cold Vapor Atomic Absorption (CVAA) instrumentation.

These data were evaluated based on the following parameters:

* • Data Completeness
* • Holding Times
* • Calibration Verification Results
• Laboratory Blank Analyses
• ICP Interference Check Sample Results
* • Laboratory Control Sample Results
• Field Duplicate Results
* • Sample Quantitation
* • Detection Limits

* - All quality control criteria were met for this parameter.

Laboratory Blank Analyses

The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Aluminum	69.7 µg/L	34.85 mg/kg
Antimony[1]	0.031 mg/kg	0.155 mg/kg
Barium	1.98 µg/L	0.99 mg/kg
Beryllium	1.07 µg/L	0.535 mg/kg
Calcium	76.66 µg/L	38.33 mg/kg
Chromium[1]	0.36 mg/kg	1.8 mg/kg
Iron[1]	7.365 mg/kg	36.825 mg/kg
Lead[1]	0.084 mg/kg	0.42 mg/kg
Magnesium	79.57 µg/L	39.785 mg/kg
Manganese[1]	0.178 mg/kg	0.89 mg/kg
Mercury	0.07 µg/L	0.058 mg/kg
Nickel[1]	0.089 mg/kg	0.445 mg/kg
Potassium	953.98 µg/L	476.99 mg/kg
Selenium	0.60 µg/L	0.30 mg/kg
Silver	12.86 µg/L	6.43 mg/kg
Sodium	82.36 µg/L	41.18 mg/kg
Thallium	0.13 µg/L	0.065 mg/kg
Vanadium[1]	0.045 mg/kg	0.225 mg/kg
Zinc[1]	0.604 mg/kg	3.02 mg/kg

Samples affected: All soil samples.

[1] Maximum concentration present in laboratory preparation blank affecting all soil samples.

Analyte	Maximum Concentration	Action Level
Aluminum	69.7 µg/L	348.5 µg/L
Antimony[2]	0.319 µg/L	1.595 µg/L
Antimony[3]	0.574 µg/L	2.87 µg/L
Arsenic[2]	0.915 µg/L	4.575 µg/L
Arsenic[4]	0.003 mg/L	15.0 µg/L

Barium	1.98 µg/L	9.9 µg/L
Beryllium	1.07 µg/L	5.35 µg/L
Calcium	76.66 µg/L	383.3 µg/L
Chromium[(2)]	2.195 µg/L	10.975 µg/L
Chromium[(3)]	2.352 mg/L	11.76 µg/L
Chromium[(4)]	0.0044 mg/L	22.0 µg/L
Iron	36.76 µg/L	183.8 µg/L
Lead[(2)]	0.329 µg/L	1.645 µg/L
Lead[(3)]	0.251 µg/L	1.255 µg/L
Lead[(4)]	0.002 mg/L	10.0 µg/L
Magnesium	79.57 µg/L	397.85 µg/L
Manganese	1.18 µg/L	5.9 µg/L
Mercury	0.07 µg/L	0.35 µg/L
Potassium	953.98 µg/L	4769.9 µg/L
Selenium	0.60 µg/L	3.0 µg/L
Selenium[(3)]	0.741 µg/L	3.705 µg/L
Selenium[(4)]	0.004 mg/L	20.0 µg/L
Silver	12.86 µg/L	64.3 µg/L
Sodium	82.36 µg/L	411.8 µg/L
Thallium	0.13 µg/L	0.65 µg/L
Thallium[(3)]	0.322 µg/L	1.6 µg/L
Thallium[(4)]	0.0005 mg/L	2.5 µg/L
Zinc	3.12 µg/L	15.6 µg/L

Samples affected: All SPLP samples.

[(2)] Maximum concentration present in a laboratory preparation blank from preparation batch VL28ICW0, affecting samples PEN46SB2901, PEN46SB2902, PEN46SB2903 and PEN46SB3001.
[(3)] Maximum concentration present in a laboratory preparation blank from preparation batch VL29ICW1, affecting all samples except PEN46SB2901, PEN46SB2902, PEN46SB2903 and PEN46SB3001.
[(4)] Maximum concentration present in SPLP extraction blank PBT697A, affecting samples PEN45SB2501, PEN45SB2502, PEN45SB2503, PEN46SB3003, PEN46SB3101, PEN46SB3102 and PEN46SB3103.

Analyte	Maximum Concentration	Action Level
Iron	36.69 µg/L	183.45 µg/L

Samples affected: All aqueous samples.

An action level of 5X the maximum concentration has been used to evaluate the sample data for blank contamination. Sample aliquot, percent solids and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results, less than the blank action level, were qualified "U" as a result of laboratory blank contamination.

ICP Interference Check Sample Results

The interfering analytes calcium and iron were present in the soil analysis of sample PEN45SB2501 at concentrations that were comparable to the levels of calcium and iron in the Interference Check Sample (ICS) solution. Several analytes, namely, antimony, beryllium, chromium, cobalt, copper, lead, manganese, nickel, potassium, selenium, silver, sodium, vanadium and zinc were present in the ICS solution at concentrations which exceeded the absolute value of the Instrument Detection Limit (IDL). Interference effects exist for antimony,

cobalt and sodium in the affected sample. The positive results reported for antimony, cobalt and sodium were qualified as estimated, "J".

Field Duplicate Results

Field duplicate imprecision (RPD > 50%) was noted for iron and manganese, affecting the soil matrix. Positive results reported for these analytes in the soil matrix were qualified as estimated, "J".

Field duplicate imprecision (RPD > 50%) was noted for barium and zinc, affecting the SPLP matrix. Positive results reported for these analytes in the SPLP matrix were qualified as estimated, "J".

Notes

The laboratory only performed matrix spike (MS) and matrix spike duplicate (MSD) analyses for mercury. The MS and MSD percent recoveries for mercury were outside of the 75-125% quality control limits, however, no validation action was required because the concentration of mercury in the unspiked sample was greater than four times the concentration of mercury in the spiking solution.

The laboratory did not perform ICP serial dilution analyses for any samples within this SDG; therefore, this quality control parameter could not be evaluated.

The Contract Required Detection Limit (CRDL) percent recovery for cadmium on 12/18/05 at 16:00 was > 120% quality control limit. The CRDL percent recoveries for silver on 12/30/05 at 00:55 and 03:41 were > 120% quality control limit. The CRDL percent recovery for cadmium on 12/30/05 at 15:43 was > 120% quality control limit. The CRDL percent recoveries for silver on 12/30/05 at 15:43 and 19:15 were > 120% quality control limit. No validation action was taken based on the CRDL percent recoveries.

The Practical Quantitation Limit (PQL) percent recoveries for barium, calcium and manganese on 12/18/05 at 12:15 were > 120% quality control limit. The PQL percent recovery for potassium on 12/18/05 at 12:15 was < 80% quality control limit. The PQL percent recoveries for cadmium, calcium and silver on 12/29/05 at 18:31 were > 120% quality control limit. The PQL percent recovery for calcium on 12/30/05 at 11:23 was > 120% quality control limit. The PQL percent recovery for thallium on 12/30/05 at 13:09 was < 80% quality control limit. The PQL percent recovery for silver on 1/5/06 at 12:37 was < 80% quality control limit. The PQL percent recoveries for calcium and magnesium on 1/5/06 at 12:40 were > 120% quality control limit. No validation action was taken based on the PQL percent recoveries.

The rinsate blank sample was not used to establish blank action levels and was not qualified due to laboratory blank contamination.

All results for antimony, arsenic, chromium, lead, selenium and thallium were analyzed by ICP-MS and were analyzed at a 5X dilution, with the exception of lead in the soil analyses of samples PEN45SB2501 and PEN45SB2502, which were analyzed at 25X dilutions.

Aluminum and iron were analyzed by ICP-MS at 20X and 5X dilutions, respectively, in samples PEN45SB2601 and PEN45SB2701.

Zinc was analyzed by ICP-MS at a 5X dilution in the soil analysis of sample PEN45SB2501. Several samples were analyzed for sodium by ICP-MS at 5X dilutions.

The extraction fluid blank, PBT697A, was not summarized on the analytical run log (Form XIV). The blank was summarized on the instrument run log and it was noted that the blank was analyzed at a 25X dilution. The dilution was greater than the level that most SPLP samples were analyzed. No action was taken; however, the dilution factor adjustment could not be used when evaluating SPLP samples.

Executive Summary

Laboratory Performance: Several analytes were present in the laboratory method/preparation blanks.

Other Factors Affecting Data Quality: Antimony, cobalt and sodium were qualified due to ICS noncompliance, affecting the soil analysis of sample PEN45SB2501. Field duplicate imprecision was noted for iron and manganese, affecting the soil matrix. Field duplicate imprecision was noted for barium and zinc, affecting the SPLP matrix.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", July 2002 and the NFESC document entitled "Navy IRCDQM" (September 1999).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC Guidelines and the Quality Assurance Project Plan (QAPP)."

2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A
QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

CASE CTO 367 NAS PENSACOLA
SDG: CTO367-2

Sample Receipt

The following samples were received on December 3, 2005 and were logged in under Katahdin Analytical Services work order number WV6482 for a hardcopy due date of December 30, 2005.

KATAHDIN Sample No.	TTNUS Sample Identification
WV6482-1	PEN46SB2901
WV6482-2	PEN46SB2902
WV6482-3	PEN46SB2903
WV6482-4	PEN46SB3001
WV6482-5	PEN46SB3001D
WV6482-6	PEN46SB3002
WV6482-7	PEN46SB3003
WV6482-8	PEN46SB3101
WV6482-9	PEN46SB3102
WV6482-10	PEN46SB3103
WV6482-11	PEN45SB2501
WV6482-12	PEN45SB2502
WV6482-13	PEN45SB2503
WV6482-14	PEN46RB1202
WV6482-15	PEN46TB1202
WV6482-16	PEN45SB2601
WV6482-17	PEN45SB2701
WV6482-19	PEN46SB2901

WV6482-29	PEN45SB2501
WV6482-30	PEN45SB2502
WV6482-31	PEN45SB2503

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

340 County Road, No. 5 • P.O. Box 720, Westbrook, ME 04098 • Tel: (207) 874-2400 • Fax: (207) 775-4029 • www.katahdinlab.com

Sample WV6482-11 had a high recovery for the extraction surrogate DCB on channel B, which was outside of the laboratory established acceptance limits. Since the recoveries for TCX on both channels and DCB on channel A were acceptable, the sample was not reextracted.

The closing calibration verification standards (CV's) (files 6VL3097 and 6VL4097) had low responses for DCB on both channels and Aroclor 1016, Aroclor 1260 and TCX on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses were acceptable in the opening CV's, the associated samples were not reanalyzed.

The closing calibration verification standards (CV's) (files 6VL3175 and 6VL4175) had low responses for DCB on both channels and Aroclor 1260 on channel A, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses were acceptable in the opening CV's and the low responses could be attributable to sample(s) that were analyzed prior to the CV's, the associated samples were not reanalyzed.

The Form 7 for the CV's (files 6VL3097, 6VL3128, 6VL4128, 6VL3175 and 6VL4175) are flagged for the surrogates TCX and/or DCB indicating that the %D is greater than the method acceptance limit of 15%. With the exception of DCB for files 6VL3097, 6VL13175 and 6VL4175, which were low, the %D's are actually within the method acceptance limits and should not be flagged, but due to software limitations the flagging could not be removed.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of Katahdin SDG CTO367-2 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Solid Waste", SW-846, November 1986, Third Edition.

Synthetic Precipitation Leaching Procedure (SPLP) by USEPA Method 1312

Katahdin Sample Nos. WV6482-(19-31) are SPLP extracts of solid samples. The extraction dates, the extraction fluid used, and the associated SPLP fluid blank identification numbers for these samples are summarized in the following table.

Katahdin Sample Numbers	SPLP Extraction Start Date	Extraction Finish/Filter Date	SPLP Fluid Used	Associated SPLP Fluid Blank ID
WV6482-(19-22)	12/27/05	12/28/05	1	PBT693A
WV6482-(23, 24)	12/28/05	12/29/05	1	PBT693A
WV6482-(25-31)	12/28/05	12/29/05	1	PBT697A

Analyte concentrations that were measured in the SPLP Fluid Blanks are listed in the Extraction Fluid Blank reports that follow Form 3P in the accompanying data package.

0000009

Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP) and Inductively-Coupled Plasma Mass Spectrometric Analysis (ICP-MS)

Aqueous-matrix Katahdin Sample No. WV6482-14 was digested for ICP and ICP-MS analysis on 12/15/05 (QC Batch VL15ICW1) in accordance with USEPA Method 3050B.

Soil-matrix Katahdin Sample Nos. WV6482-(1-13, 16, and 17) were digested for ICP and ICP-MS analysis on 12/27/05 (QC Batch VL27ICS0) in accordance with USEPA Method 3050B. Duplicate laboratory control samples were prepared in this digestion batch.

The SPLP extracts of Katahdin Sample Nos. WV6482-(19-31) were digested for ICP and ICP-MS analysis on 12/28/05 (QC Batch VL28ICW0) and 12/29/05 (QC Batch VL29ICW1) in accordance with USEPA Method 3010A.

ICP analyses of SDG CTO367-2 sample digestates were performed using a Thermo Jarrell Ash (TJA) Trace ICP spectrometer and a TJA 61E ICP spectrometer. ICP-MS analyses of SDG CTO367-2 sample digestates were performed using an Agilent 7500 ICP-MS spectrometer. All samples were analyzed within holding times and all analytical run QC criteria were met, with the following comments or exceptions:

Some of the results for run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

Soil-matrix Katahdin Sample Nos. WV6482-(1-13) were digested for mercury analysis on 12/28/05 (QC Batch VL28HGS0) in accordance with USEPA Method 7471A. Katahdin Sample No. WV6482-13 was prepared with duplicate matrix-spiked aliquots in this batch.

The SPLP extracts of Katahdin Sample Nos. WV6482-(19-31) were digested for mercury analysis on 01/03/06 (QC Batch WA03HGW0) in accordance with USEPA Method 7470A.

Aqueous-matrix Katahdin Sample No. WV6482-14 was digested for mercury analysis on 01/03/06 (QC Batch WA03HGW1) in accordance with USEPA Method 7470A. .

Mercury analyses of Katahdin SDG CTO367-2 sample digestates were performed using a Cetac M6100 automated mercury analyzer. All samples were analyzed within holding times and all analytical run QC criteria were met.

Matrix QC Summary

The mercury recoveries in the matrix-spiked aliquots of Katahdin Sample Nos. WV6482-13 are within the laboratory's acceptance limits (75% - 125% recovery of the added element, if the native concentration is less than four times the amount added).

000010

Wet Chemistry Analysis

The samples of Katahdin SDG CTO367-2 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for total solids were performed according to "U.S. EPA Contract Laboratory Program Statement of Work for Inorganic Analysis", SOW 7/88.

All analyses were performed within analytical holding times, and all quality control criteria were met.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

Sample Receipt

The following samples were received on December 20 and 21, 2005 and were logged in under Katahdin Analytical Services work order numbers WV6770 and WV6789 for a hardcopy due date of January 16, 2006.

KATAHDIN Sample No.	TTNUS Sample Identification
WV6770-1	PEN-OU1-PZ01-07
WV6770-2	PEN-OU1-MW02A-07
WV6770-3	PEN-OU1-MW02-07
WV6789-1	PEN-OU1-PZ10-07
WV6789-2	PEN-OU1-W01-07
WV6789-3	PEN-OU1-W02-07
WV6789-4	PEN-OU1-PZ07B-07

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Metals Analysis

The samples of Katahdin SDG CTO333-4 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Solid Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP)

Aqueous-matrix Katahdin Sample Nos. WV6770-(1-3) and WV6789-(1-4) were digested for ICP analysis on 01/04/06 (QC Batch WA04ICW0) in accordance with USEPA Method 3010A.

0000002

ICP analyses of SDG CTO333-4 sample digestates were performed using a Thermo Jarrell Ash (TJA) ICAP 61E ICP spectrometer. All samples were analyzed within holding times and all analytical run QC criteria were met.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

Sample QC Report

Data File:	C:\ICPCHEM\1\DATA\FWA05A.B\046SMPL.D\046SMPL.D#
Date Acquired:	Jan 5 2006 04:36 pm
Acq. Method:	K2008.M
Operator:	EAM
Sample Name:	WV6462-011 PEN45SB250i EmF 4/30/06
Misc Info:	DILUTION - 0.4/10
Vial Number:	2206
Current Method:	C:\ICPCHEM\1\METHODS\K2008.M
Calibration File:	C:\ICPCHEM\1\CALIB\K2008.C
Last Cal. Update:	Jan 05 2006 00:08 pm
Sample Type:	Sample
Dilution Factor:	25.00
Autodil Factor:	Undiluted
Final Dil Factor:	25.00

1 - Tap Water Preliminary Remediation Goal (PRG) (USEPA Region 9, October 2004, Updated December 28, 2004).

2 - NA - Not applicable. The USEPA has not established a cancer slope factor (CSF) or noncarcinogenic reference dose (RfD) for this chemical.

3 - The PRG for naphthalene is used as a surrogate for 2-methylnaphthalene.

APPENDIX D.2

EXAMPLE CALCULATIONS OF ALTERNATE SOIL CLEANUP TARGET LEVELS (SCTLS)

CALCULATION WORKSHEET

CLIENT: NAVAL AIR STATION, PENSACOLA		**JOB NUMBER:** 0007
SUBJECT: CALCULATION OF ALTERNATE SOIL CLEANUP TARGET LEVELS (SCTLS) FOR CARCINOGENS CONSTRUCTION WORKERS		
BASED ON: TECHNICAL REPORT: DEVELOPMENT OF SOIL CLEANUP TARGET LEVELS FOR CHAPTER 62-777, F.A.C., FDEP, FEBRUARY 2005		
BY: T. JACKMAN	**CHECKED BY:**	**DATE:** 11/27/2006

PURPOSE: To calculate an alternative soil cleanup level for consturction workers exposed to soil.

RELEVANT EQUATIONS:

$$SCTL = \frac{TR \times BW \times AT}{EF \times ED \times FC \times [Intake_{Ing} + Intake_{Der} + Intake_{Inh}]}$$

$$Intake_{Ing} = CSFo \times IRo \times 10^{-6}\ kg/mg$$

$$Intake_{Der} = CSFd \times SA \times AF \times DA \times 10^{-6}\ kg/mg$$

$$Intake_{Inh} = CSFi \times IRi \times (1/VF + 1/PEF)$$

Where:

Chemical	=	Benzo(a)pyrene (cPAHs)	
SCTL	=		Soil Cleanup Target Level (mg/kg)
TR	=	1.0E-06	Target Cancer Risk (unitless)
BW	=	70	Body weight (kg)
AT	=	25550	Averaging time (days)
EF	=	250	Exposure frequency (days/year)
ED	=	1	Exposure duration (years)
FC	=	1	Fraction from contaminated source (unitless)
IRo	=	330	Ingestion rate, oral (mg/day)
SA	=	3300	Surface area of skin exposed (cm^2/day)
AF	=	0.3	Adherence factor (mg/cm^2)
DA	=	0.13	Dermal absorption (unitless)
IRi	=	20	Inhalation rate (m^3/day)
VF	=	2.72E+07	Volatilization factor (m^3/kg)
PEF	=	2.43E+06	Particulate emission factor (m^3/kg)
CSFo	=	7.30E+00	Oral cancer slope factor $(mg/kg/day)^{-1}$
CSFd	=	7.30E+00	Dermal cancer slope factor $(mg/kg/day)^{-1}$
CSFi	=	3.10E+00	Inhalation cancer slope factor $(mg/kg/day)^{-1}$

CLIENT: NAVAL AIR STATION, PENSACOLA		**JOB NUMBER:** 0007
SUBJECT: CALCULATION OF ALTERNATE SOIL CLEANUP TARGET LEVELS (SCTLS) FOR CARCINOGENS CONSTRUCTION WORKERS		
BASED ON: TECHNICAL REPORT: DEVELOPMENT OF SOIL CLEANUP TARGET LEVELS FOR CHAPTER 62-777, F.A.C., FDEP, FEBRUARY 2005		
BY: T. JACKMAN	**CHECKED BY:**	**DATE:** 11/27/2006

EXAMPLE CALCULATION

$Intake_{Ing}$ = 7.30E+00 (mg/kg-day)-1 x 330 mg/day x 1E-06 kg/mg

$Intake_{Ing}$ = 2.41E-03 kg-kg/mg

$Intake_{Der}$ = 7.30E+00 (mg/kg-day)-1 x 3300 cm2/day x 0.3 mg/cm2 x 0.13 x 1E-06 kg/mg

$Intake_{Der}$ = 9.40E-04 kg-kg/mg

$Intake_{Inh}$ = 3.10E+00 (mg/kg-day)-1 x 20 m3/day x (1/2.72E+07 m3/kg + 1/2.43E+06 m3/kg)

$Intake_{Inh}$ = 2.78E-05 kg-kg/mg

$$SCTL = \frac{1.E\text{-}06 \times 70\ kg \times 25550\ days}{250\ days/yr \times 1\ yrs \times 1 \times [2.41E\text{-}03\ kg\text{-}kg/mg + 9.40E\text{-}04\ kg\text{-}kg/mg + 2.78E\text{-}05\ kg\text{-}kg/mg]}$$

SCTL = 2.12E+00 mg/kg

CALCULATION WORKSHEET

BASED ON: TECHNICAL REPORT: DEVELOPMENT OF SOIL CLEANUP TARGET LEVELS FOR CHAPTER 62-777, F.A.C., FDEP, FEBRUARY 2005		
BY: T. JACKMAN	**CHECKED BY:**	**DATE:** 11/27/2006

PURPOSE: To calculate an alternative soil cleanup level for consturction workers exposed to soil.

RELEVANT EQUATIONS:

$$SCTL = \frac{THI \times BW \times AT}{EF \times ED \times FC \times [Intake_{Ing} + Intake_{Der} + Intake_{Inh}]}$$

$$Intake_{Ing} = 1/RfDo \times IRo \times 10^{-6} \text{ kg/mg}$$

$$Intake_{Der} = 1/RfDd \times SA \times AF \times DA \times 10^{-6} \text{ kg/mg}$$

$$Intake_{Inh} = 1/RfDi \times IRi \times (1/VF + 1/PEF)$$

Where:

Chemical	=	Arsenic	
SCTL	=		Soil Cleanup Target Level (mg/kg)
THI	=	1	Target Hazard Index (unitless)
BW	=	70	Body weight (kg)
AT	=	365	Averaging time (days)
EF	=	250	Exposure frequency (days/year)
ED	=	1	Exposure duration (years)
FC	=	1	Fraction from contaminated source (unitless)
IRo	=	330	Ingestion rate, oral (mg/day)
SA	=	3300	Surface area of skin exposed (cm^2/day)
AF	=	0.3	Adherence factor (mg/cm^2)
DA	=	0.03	Dermal absorption (unitless)
IRi	=	20	Inhalation rate (m^3/day)
VF	=	1.00E+99	Volatilization factor (m^3/kg)
PEF	=	2.43E+06	Particulate emission factor (m^3/kg)
RfDo	=	3.0E-04	Oral reference dose (mg/kg/day)
RfDd	=	3.0E-04	Dermal reference dose (mg/kg/day)
RfDi	=	3.0E-04	Inhalation reference dose (mg/kg/day)

CLIENT: NAVAL AIR STATION, PENSACOLA		**JOB NUMBER:** 4821
SUBJECT: CALCULATION OF ALTERNATE SOIL CLEANUP TARGET LEVELS (SCTLS) FOR NONCARCINOGENS - CONSTRUCTION WORKERS		
BASED ON: TECHNICAL REPORT: DEVELOPMENT OF SOIL CLEANUP TARGET LEVELS FOR CHAPTER 62-777, F.A.C., FDEP, FEBRUARY 2005		
BY: T. JACKMAN	**CHECKED BY:**	**DATE:** 11/27/2006

EXAMPLE CALCULATION

$Intake_{Ing}$ = 1/3.0E-04 mg/kg-day x 330 mg/day x 1E-06 kg/mg

$Intake_{Ing}$ = 1.10E+00 kg-kg/mg

$Intake_{Der}$ = 1/3.0E-04 mg/kg-day x 3300 cm2/day x 0.3 mg/cm2 x 0.03 x 1E-06 kg/mg

$Intake_{Der}$ = 9.90E-02 kg-kg/mg

$Intake_{Inh}$ = 1/3.0E-04 mg/kg-day x 20 m3/day x (1/1.00E+99 m3/kg + 1/2.43E+06 m3/kg)

$Intake_{Inh}$ = 2.74E-02 kg-kg/mg

$$SCTL = \frac{1 \times 70 \text{ kg} \times 365 \text{ days}}{250 \text{ days/yr} \times 1 \text{ yrs} \times 1 \times [1.10E+00 \text{ kg-kg/mg} + 9.90E-02 \text{ kg-kg/mg} + 2.74E-02 \text{ kg-kg/mg}]}$$

SCTL = 8.33E+01 mg/kg

APPENDIX D.3

IEUBK CHILD LEAD MODEL
AND
TRW ADULT LEAD MODEL RESULTS

LEAD MODEL FOR WINDOWS Version 1.0

Model Version: 1.0 Build 263 (Page 1 of 3)
Location: Naval Air Station Pensacola, Florida
Site Name: Site 46
Date: 11/29/2006
Run Mode: Site Risk Assessment

Soil/Dust Data
Average concentration of lead in surface soil = 73 mg/kg.
Water Data
Average concentration of lead in groundwater = 4.34 ug/L.

The time step used in this model run: 1 - Every 4 Hours (6 times a day).

****** Air ******

Indoor Air Pb Concentration: 30.000 percent of outdoor.
Other Air Parameters:

APPENDIX F

RESPONSE TO REGULATORS COMMENTS

Responses to Florida Department of Environmental Protection Comments dated February 22, 2007 on the Draft Remedial Investigation Report for Site 46 (Former Building 72), Naval Air Station Pensacola, Florida

Comment 1 (Page 4-45, Section 4.4, Surface Water and Sediments, 1st paragraph, 1st sentence) - The following sentence states, "Surface water and sediment samples were not collected for the site characterization investigation at Site 46 because no surface water bodies are present at the site." In the next sentence Pensacola Bay is referred to and Pensacola Bay is a marine surface water body and it is located downgradient from the site on the Southern boundary. Please clarify.

Response - Pensacola Bay is adjacent to the southern edge of Site 46, the boundary between the sites was established at the concrete seawall. This part of Pensacola Bay was previously investigated as Installation Restoration (IR) Site 2 because past waste disposal practices in this area of the base included disposal of untreated waste streams directly into the bay from industrial facilities, including the operations at Site 46.

An extensive surface water, sediment, and biological analytical program was conducted for Site 2 during the RI and focused feasibility study (FS). The proposed plan (July, 2005) and the final record of decision (signed September 2005) recommended no action (NA) based on the results of this investigation. The text of the Site 46 RI report will be edited to clarify the spatial relationship between the two sites and the NA status of Site 2.

Comment 2 (Chapters 6 and 7) - The Department supports and concurs with the attached comments on Chapter 6 "Human Health Risk Assessment" and Chapter 7 "Screening Level Ecological and Risk Assessment" which were reviewed by the University of Florida.

Response - Please see attached responses for the University of Florida review comments.

Comment 3 (Page 8-3, Section 8.3, Groundwater Assessment, 2nd paragraph) - This paragraph discusses groundwater analytical results for pesticides, PCBs and TRPH and says lab analyses for those analytes had results that were below the laboratory detection limits. Please explain whether the "laboratory detection limits" cited are method detection limits (MDLs) or Practical Quantitation Limits (PQLs). Also, it should be stated whether those "laboratory detection limits" are below the applicable groundwater cleanup target levels (GCTLs) or below the concentrations listed in Table C, in the guidance document entitled, "Guidance for the Selection of Analytical Methods and for the Evaluation of Practical Quantitation Limits". If the "laboratory detection limit" for a particular analyte exceeds the GCTL for that analyte, and the PQL in the guidance document for that analyte, it may be required to have groundwater reanalyzed by a different EPA Method or by another laboratory in order to get data verifying the absence of that analyte.

Response - The text will be modified to clearly indicate that the "laboratory detection limits" for these analytes were less than the GCTLs or the target PQLs listed in Table C.

Comment 4 (Page 8-4, Figure 8-2, Extent of Impact to Site Groundwater Site 46) - What does the shading in this figure indicate? Please clarify and make the necessary changes to the figure.

Response - The figure will be edited to clearly denote the meaning of the shading. The area was shaded in the summary figure to indicate the estimated areal extent of the CVOC plume in groundwater.

Comment 5 (Section 8.3, Groundwater Assessment) - Contaminants of Concern (COC) detected in the groundwater and their impact on the Pensacola Bay surface water body are discussed in this section. The COCs that exceed Marine Surface Water Cleanup Target Levels (MWSWCTLs) are listed below:

- Vinyl Chloride
- Bis(2-Ethylhexyl)phthalate
- Naphthalene
- Beryllium
- Nickel

The COCs listed above have been detected in concentrations that exceed MWSWCTL in sentry monitoring wells located adjacent to the Pensacola Bay. This contamination is a violation per Chapter 62-780, F.A.C. The Department recommends the following to determine if groundwater is contaminating Pensacola Bay:

- Install additional sentry monitoring wells closer to Pensacola Bay to determine if the groundwater contamination is affecting Pensacola Bay or
- conduct a Trident probe study to determine the same thing.

Response - Bis(2-ethylhexyl)phthalate was detected at a concentration greater than the GCTL in one groundwater sample, the field duplicate collected at PEN-46-14 (Section 4.3.1.2 of the RI report). The reported concentration in 46GW1401D was 64 ug/L, greater than the GCTL of 6 ug/L. The bis(2-ethylhexyl)phthalate concentration for the corresponding groundwater sample (46GW1401) was less than 7 ug/L. PEN-46-14 was resampled in May 2006 and the bis(2-ethylhexyl)phthalate result from that sampling event was less than 5.1 ug/L. The result of the May 2006 re-sampling has been added to Table 4-9. Although the detection limit in the May 2006 sample, 5.1 ug/L, was greater than the MWSWCTL of 2.2 ug/L, the target PQL for bis(2-ethylhexyl)phthalate in groundwater is 10 ug/L.

Beryllium concentrations in groundwater samples collected for the Site 46 RI ranged from less than 0.05 μg/L to 0.74 μg/L. Although beryllium concentrations in two groundwater samples were greater than the MWSWCTL of 0.13 μg/L, all were less than the NAS Pensacola reference concentration of 1.1 μg/L (Table 4-10).

Nickel concentrations in groundwater samples collected for the Site 46 RI ranged from 0.87 ug/L to 17.8 ug/L. Although the nickel concentration in one groundwater sample (46GW1401 collected from PEN-46-14) was greater than the MWSWCTL of 8.3 ug/L, all were less than the NAS Pensacola reference concentration of 40 ug/L (Table 4-10).

Vinyl chloride and naphthalene were detected in one or more of the wells close to Pensacola Bay at concentrations greater than MWSWCTLs. Installation of sentinel wells closer to the Bay was not feasible due to reconstruction along the sea wall following Hurricane Ivan. Additional sampling in Pensacola Bay (trident probe) is not considered necessary because the area of Pensacola Bay adjacent to Site 46 was investigated as IR Site 2. Please see response to comment 1 regarding IR Site 2. Site 2 has been approved for NFA, because the impact of releases from Site 46 and the adjacent industrial areas, including Site 38, appear to be minimal.

Comment 6 (Section 8.8 “Conclusions”) - In this section, the proposed remedy for this site is Monitored Natural Attenuation. The Department will consider this option after the issues explained in the previous comments have been addressed. In addition, an explanation on how the inorganic groundwater contamination naturally attenuates needs to be included when discussing this remedy.

Response - Site 38, located to the immediate east of Site 46, has been investigated and the final ROD was issued in 2005, which selected LUCs and MNA as the remedy for Site 38 groundwater contamination. Similar contaminants, including CVOCs and metals, were found at Site 38 and Site 46. Evaluation of the site conditions led to the selection of MNA as the remedial option for Site 38 groundwater contamination. Because of the proximity and similarity of the two sites, MNA is considered as an appropriate remedial option for groundwater at Site 46. A full evaluation of remedial options will conducted during the Feasibility Study for Site 46.

Responses to University of Florida Comments
dated September 25, 2007
on the
Draft Remedial Investigation Report for Site 46 (Former Building 72),
Naval Air Station Pensacola, Florida

Comment 1. - Bromodichloromethane and chlorodibromomethane were detected in groundwater samples (PEN-46-01 and PEN-46-14) at concentrations greater than their GCTLs. They are subsequently dropped as COPCs for groundwater without explanation. Bromodichloromethane and chlorodibromomethane should remain as COPCs.

Response - Bromodichloromethane and chlorodibromomethane were identified as COPCs for groundwater and were quantitatively evaluated in the risk assessment as shown in Table 6-5, 6-14, and page 6-67. Both chemical compounds were evaluated in the risk assessment.

Comment 2. –The report describes surface soil as soil from zero to six inches below land surface (bls) and subsurface soil as greater than six inches bls. Chapter 62-780 FAC defines surface soil as soil located from zero to two feet bls and subsurface soil as soil greater than two feet bls.

Response - The Navy concurs. The definitions of surface and subsurface soil specified by Chapter 62-780 will be added to the text. Please note that use of the Chapter 62-780 definitions will not change the results and conclusions of the risk assessment because risks were evaluated using maximum concentrations in surface and subsurface soil, as shown in Tables 6-6 through 6-13. Therefore, it will not be necessary to revise these tables.

Comment 3. –Page 6-6 of the report states that screening levels for sodium are not available in the FDEP CTL tables. This is incorrect for groundwater. Sodium has a GCTL of 160,000 ug/L (a secondary standard) (Chapter 62-777, FAC) and should be identified as a COPC for groundwater.

Response – The Navy concurs. Sodium and its CTL (160,000 ug/L) will be added to Table 6-14.

Comment 4. –We recommend adding the incidental ingestion of groundwater to the construction worker scenario due to the likely exposure to shallow groundwater during construction activities.

Response - Although possible, exposure to groundwater by a construction worker would be regarded as negligible relative to direct exposure to soil. The text will be modified to reflect that this exposure pathway is possible, but its contribution to overall risk would be insignificant.

The following revisions will be made to the text in Section 6.3.1, page 6-20:

- Construction/Excavation Worker – A plausible on-site receptor under future land use if major construction activities were to occur. This receptor could be exposed to surface and subsurface soils by incidental ingestion, dermal contact, and inhalation (i.e., airborne particulates/vapors). The construction worker is assumed to be exposed to soil for 250 days per year (USEPA, 2002b) assuming a Reasonable Maximum Exposure (RME) scenario. Although possible, direct exposure to groundwater by a construction worker is not quantitatively evaluated in the risk assessment. This scenario is considered to be unlikely and risks from exposure to groundwater (via incidental ingestion of small amounts of water) are regarded as negligible relative to direct exposure to soil. In addition, evaluation of exposure of construction workers to groundwater is not specified or recommended in Rule 62-777 FAC.

Comment 5. –An exposure frequency of 30 d/y for the site maintenance worker (based on professional judgment) seems low given the Pensacola area climate. Some documentation from NAS Pensacola regarding the expected frequency of groundskeeping and maintenance events for this part of the base will be important in helping to justify this exposure assumption.

Response - The EF of 30 days/year is recognized as professional judgment for evaluating risk at the site. A EF of 30 days/year for the maintenance worker has been used in human health risk assessments performed at various Navy facilities in Florida for at least 10 years (e.g., Naval Training Center, Orlando (June 1999) and NAS Whiting Field (January 1998) for reasonable maximum exposure (RME) scenarios. This exposure frequency has also been used in previous risk assessments at NAS Pensacola, (e.g., Site 43). It should be recognized that this provides a point of reference to the industrial worker who is assumed to have an EF of 250 days/year and for whom risks have also been calculated.

Comment 6. –Adult and adolescent recreational users and trespassers were assumed to be exposed to on-site soil for 45 d/y based on professional judgment. Although 45 d/y may be an appropriate exposure frequency for a trespasser, it is low for recreational users. We recommend using an exposure of 200 d/y for the recreational scenario. This value has been used by the FDEP for recreational scenarios at other sites.

Response - As stated, the exposure frequency for recreational users and trespassers is based on professional judgment. The 45 days per year is based on an estimate for swimming frequency in the southeast; this estimate is stated in EPA Region 4 guidance (Supplemental Guidance to RAGS: Human Health Risk Assessment Bulletins, EPA Region 4). Although the recreational user or trespasser at this site is not equivalent to a swimmer, it helps to predict the frequency that one may trespass or recreate, which may be similar to going to a lake or pond to swim. The Navy believes that the swimming frequency of 45 days per year was sufficiently conservative with regards to evaluating a reasonably maximum exposed individual. We believe that it is unlikely that a recreational user or trespasser would be at the site for an average of 4 days per week. Increasing the exposure frequency to 200 days per year renders these receptors essentially equivalent to an industrial worker. It is unlikely that the Navy would tolerate trespassers on the property with a frequency of 200 days per year.

In addition, a recreational EF of 45 days/year has been used in human health risk assessments performed at other Navy facilities in Florida (e.g., Naval Training Center, Orlando (June 1999) and NAS Whiting Field (January 1998) for reasonable maximum exposure (RME) scenarios. This exposure frequency has also been used in previous risk assessments at NAS Pensacola, (e.g., Site 43).

Comment 7. –The IEUBK Model for lead was used to assess exposure to lead in children from groundwater. The average groundwater lead concentration was used as the exposure point concentration in the model. Receptors are usually exposed to groundwater from only one well. Averaging contaminant concentrations across wells would not accurately represent potential exposure scenarios. The exposure point concentration for lead in groundwater should be the maximum detected concentration.

Response - Average lead concentrations were used for the IEUBK Model evaluation because current USEPA guidance indicates that average lead concentrations should be used for both the IEUBK (http://www.epa.gov/superfund/lead/ieubkfaq.htm#mean) and ALM (http://www.epa.gov/superfund/lead/almfaq.htm#equation) models. Please note that if the maximum lead concentration in groundwater (23.7 ug/L) were used in the IEUBK Model, the results would still be acceptable. The predicted geometric mean child blood lead level would be 3.7 ug/dL and the probability of exceeding the USEPA goal of 10 ug/dL would be 1.8 per cent. This estimate is less than USEPA's goal of limiting exposure to lead so that no more than 5 percent of the exposed children have an estimated blood-lead level greater than the established level of concern (i.e., 10 ug/dL).

Comment 8. –It is assumed that the grounds maintenance worker will spend at least part of the day outdoors. Therefore, we recommend using the US EPA default outdoor worker soil ingestion rate of 100 mg/d for this scenario (US EPA, 2002).

Response - The Navy disagrees with increasing the soil ingestion rate from 50 to mg/kg to 100 mg/kg. The soil ingestion rate is consistent with FDEP's exposure assumption for an industrial worker, which forms the basis for the derivation of the industrial SCTLs.

Comment 9. –Future adult recreational users/trespassers under the same conditions as the adolescents (95^{th} percentile value for soccer players in moist conditions) have a skin adherence factor of 0.08 mg/cm^2 (US EPA, 2004). We recommend changing the adult skin adherence factor to reflect the same conditions as the adolescent.

Response - Changing the skin adherence factor from 0.07 mg/cm^2 to 0.08 mg/cm^2 will pose a negligible change to the overall risk, and would have no significant impact on any risk management decisions. The adherence factor of 0.07 mg/cm^2 is taken from Exhibit 3-5 in EPA's Risk Assessment Guidance for Superfund, Volume I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment) (EPA, July 2004). It is consistent with residential exposure conditions. The value of 0.08 mg/cm^2 is the 95^{th} percentile adherence factor for an adult soccer player in moist conditions. This value is also presented in the referenced guidance (EPA, July 2004).

Comment 10. –The list of COPCs in surface soil is incomplete. Phenol (Table 6-9), aluminum (Table 4-4), lead (Table 4-4), and methylene chloride (Table 4-6) exceed their SCTLs for leachability to groundwater.

Response – The Navy concurs with regard to aluminum, lead, and phenol. These analytes will be added to the list of COPCs for leachability to groundwater in Section 6.6.3.1. Methylene chloride was not positively detected in any surface soil samples (see Response to Comment 2).

<u>Comparison of Chemicals in Surface Soil with Leachability SCTLs</u>

Table 6-9 presents comparisons of maximum detected concentrations in surface soil with Florida criteria based on leachability to groundwater. As shown in the table, the following constituents had maximum concentrations which exceeded the leachability criteria:

- Acetone
- Chloromethane
- PCE
- TCE
- Phenol
- Aluminum
- Lead

Comment 11. –The list of COPCs in subsurface soil is incomplete. Methylene chloride (Table 6-13) and lead (Table 4-4) remain of concern for leachability to groundwater.

Response – The Navy concurs. These constituents will be added to the list of COPCs for leachability to groundwater in Section 6.6.3.2, as indicated below.

- Chloromethane
- Cis-1,2-DCE
- Chloroform
- Methylene Chloride
- PCE
- TCE
- Lead

The addition of methylene chloride and lead to the above table does not affect the conclusions of the risk assessment as the exceedances were correctly indicated in Table 6-13.

Comment 12. –The list of COPCs for groundwater is incomplete. Arsenic (Table 6-14) and sodium (Table 4-8) exceed their GCTLs.

Response – The Navy concurs. These constituents will be added to the list of COPCs for groundwater in Section 6.6.3.3. The list of COCs on page 6-67 will be revised as follows:

FLORIDA GROUNDWATER EVALUATION

Potential COCs for Groundwater
Bromodichloromethane
Chlorodibromomethane
TCE
Vinyl chloride
Bis(2-ethylhexyl)phthalate
Naphthalene
Aluminum
Arsenic
Barium
Cadmium
Chromium
Iron
Lead
Manganese
Sodium
Vanadium

The addition of these constituents to this table does not affect the results and conclusions of the risk assessment because arsenic was specified as a COC in both the USEPA (Table 6-5) and Florida (Table 6-14) risk assessments. The addition of sodium should not affect the conclusions because the elevated levels of sodium in groundwater (maximum = 2,020,000 ug/L) indicate that the water is likely not potable.

Comment 13. –Page 6-60 states that the 95% UCL is "..a representation of the upper limit that potential receptors would be exposed to over the entire exposure period". The 95% UCL is an upper limit on the mean concentration receptors would be exposed to, not the upper limit of the exposure concentration.

Response – The Navy concurs. The text and definition of the 95% UCL on page 6-60 will be revised as specified in the comment:

Exposure Point Concentrations

EPCs for soil were calculated using the Florida UCL Calculator (Version 1.0). Uncertainty is associated with the use of the 95 percent UCL on the mean concentration as the EPC. As a result of using the 95 percent UCL, the estimations of potential risk for the RME scenario were most likely overstated because this is ~~**a representation of**~~ the upper limit **on the mean concentration** that potential receptors would be exposed to over the entire exposure period. In some cases, the maximum concentration was used as the EPC. Use of the maximum concentration as the EPC tends to overestimate potential risks because receptors are assumed to be exposed continuously to the maximum concentration for the entire exposure period. Uncertainty was also introduced when the nondetects results were assigned a value of one-half the nondetect quantitation limit in the calculation of the EPC. This may either overstate or understate the risks to potential receptors.

Comment 14. –Section 8.0 Summary and Conclusions is incomplete:

a. Based on Table 4-6, chloromethane, methylene chloride, PCE, and cis-1,2 dichloroethene were detected above their SCTLs for leachability to groundwater. These chemicals should be added as COPCs.
b. Based on Table 4-7, chlorodibromomethane and bromodichloromethane were detected in wells above their GCTLs. In Table 4-8, sodium was detected above its GCTL. These constituents should be added as COPCs for groundwater.

Response – The Navy concurs. Section 8.0 is a summary of the previous sections of the report. These constituents were identified as COPCs in Sections 6.6.3.1, 6.6.3.2, and 6.6.3.3 and were included in both the USEPA and FDEP risk assessments. Sodium will be added as a COPC for groundwater as per the response to Comment 12. The report will be updated to include summary discussion of all the COPCs found at the site.

Comment 15. –In Table 4-5 the SCTL for TRPH leachability to groundwater should be 340 mg/kg.

Response – The Navy concurs. The SCTL for TRPH leachability to groundwater will be changed from 340,000 mg/kg to 340 mg/kg in Table 4-5.

Comment 16. – In Table 6-8 the simple apportionment for the recreational scenario was performed incorrectly. TCE, Aroclor-1260, and arsenic are carcinogens and had a maximum concentration greater than $1/10^{th}$ their non-apportioned SCTLs. Therefore, the SCTLs for these chemicals would be divided by

three and the SCTL for TCE would be 40,000 ug/kg. The TCE exposure point concentration of 38,000 ug/kg is below the correctly apportioned SCTL for direct contact.

Response – The Navy concurs. TCE, Aroclor-1260, and arsenic will be apportioned as specified in the comment. The table will be revised to show that the exposure point concentration for TCE exceeds the simple apportioned SCTL.

Comment 17. –Comments concerning Table 7-1:

Comment 17a. – The minimum detected PCE concentration was compared to the US EPA Region 4 soil screening values. The maximum concentration should be used for comparison and PCE should remain a COPEC.

Response – The Navy concurs. The maximum concentration will be used and PCE will be added as an initial COPC. Table 7-1 will be modified to reflect the change. The following modifications to the text were made to address this change:

Section 7.5.1 – The text was changed from "In surface soil, four VOCs (1,2-dichlorobenzene, 1,4-dichlorobenzene, chloromethane, and TCE) were retained as COPCs because their maximum concentrations exceeded screening values (Table 7-1)." to "In surface soil, **five** VOCs (1,2-dichlorobenzene, 1,4-dichlorobenzene, chloromethane, **PCE**, and TCE) were retained as COPCs because their maximum concentrations exceeded screening values (Table 7-1)."

Section 7.6.1.1 – The following text was added, "PCE was detected in 2 of 15 soil samples at or above its ESV (0.1 mg/kg). Sample location 46SB3401 had the highest concentration of 0.1 mg/kg while sample 46SB3101 had the lowest reported detected concentration of 0.006 mg/kg. The detected PCE concentrations were compared to the following toxicity guidelines to further evaluate risks to plants and invertebrates.

- Canadian Soil Quality Guideline (SQG): 3.8 mg/kg agricultural use (CCME, 1999a)
- Dutch Target Value 0.002 mg/kg, Intervention Value 4 mg/kg (MVROM, 2000)

The Canadian SQG of 3.8 mg/kg for PCE is the 25^{th} percentile of effects and no effects data distribution for plants and invertebrates (CCME, 1999a). The maximum detected concentration of PCE at Site 46 is well below the Canadian Soil Quality Guideline for agricultural use, and for residential parkland use (3.8 mg/kg). Both of the detected concentrations exceed the Dutch Target Value. The intermediate value, as describe previously, for PCE is 2.001 mg/kg. Both detected concentrations are well below this benchmark. Therefore, because the detected concentrations are below these benchmarks, risk to plants and soil invertebrates from TCE are expected to be minimal."

Comment 17b. – An ecological soil screening level was developed for total PAHs in June 2007. This new value (1.1 mg/kg) is based on protection of mammals exposed to high molecular weight PAHs and is very similar to the US EPA Region 4 screening value of 1 mg/kg.

Response - Comment noted. However, this Report was submitted for review in March 2007, prior to the Ecological Soil Screening Level document for PAHs becoming available in June 2007. Future documents will include the new screening level. Because the Region IV screening value (1.0 mg/kg) is more conservative than the Eco-SSL value (1.1 mg/kg), no changes to the document will be made to address this comment.

Comment 17c. – An ecological soil screening level was derived for manganese (220 mg/kg for the protection of plants) in April 2007. This value should be added to the Table. The conclusion that manganese is not a COPEC at this site remains valid.

Response - Comment noted. However, this Report was submitted for review in March 2007, prior to the Ecological Soil Screening Level document for manganese becoming available in April 2007. Future documents will include the new screening level. Because the Region IV screening value (100 mg/kg) is more conservative than the Eco-SSL value (220 mg/kg), no changes to the document will be made to address this comment.

Comment 17d. – The Canadian Soil Quality Guidelines (2006) recommends using a soil screening value of 0.1 mg/kg for benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene for the protection of the environment and human health. This value is the same as the US EPA Region 4 surface soil screening value for benzo(a)pyrene. Based on site concentrations, these constituents can be excluded as COPECs.

Response – The Navy concurs. The text was modified using the Canadian Soil Quality Guideline of 0.1 mg/kg in the Step 3A refinement for benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene). Consequently, these individual PAHs will be eliminated as COPCs for plants and invertebrates. The following modification to the text will be made to address this change:

Section 7.6.1.2 – The following text was added, "The Canadian SQG recommends individual soil screening values of 0.1 mg/kg for benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene) for the protection of the environment and human health. The maximum detected concentrations of these PAHs are all below the Canadian SQG screening benchmarks (see Table 7-1). Therefore, risks to plants and soil invertebrates from. benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene) are expected to be negligible."

Comment 18. – In Section 4.3.2.4 the word "cadmium" should be changed to "chromium" for all occurrences.

Response – The Navy concurs. The text will be revised as indicated.
