WV6482-31	PEN45SB2503

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

0000002

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Organics Laboratory

The samples of SDG CTO367-2 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA, and/or Method for Determination of Petroleum Range Organics (Method #FL-PRO), Florida Department of Environmental Protection, November 1, 1995 and/or "Methods for the Determination of Organic Compounds in Drinking Water", U.S. EPA, Environmental Monitoring and Support Laboratory - Cincinnati (September 1995), for the specific methods listed below or on the Report of Analysis. Some manual integrations may have been performed due to split peaks and/or corrected baselines. All have been flagged with an "M" (software-generated) on the pertinent quantitation reports.

SW8260B Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory contaminants acetone and methylene chloride) in the LCS are outside of the QC limits. If the associated MS/MSD has greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

One or more target analytes may have been detected above the MDL in some method blanks. Any of these analytes that were also detected in any of the associated samples were flagged with a "V" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

The SPLP blanks WG24016-3, 4 and 5 had the target analytes acetone, chloroform, and m+p-xylene detected above the MDL. The analyte o-xylene was also detected in the SPLP blank WG24016-5. The SPLP blank WG24050-3 had the target analytes acetone, m+p-xylene, and methylene chloride detected above the MDL. The laboratory has since replaced many of the o-rings in the ZHE systems in the attempt to remove any laboratory contaminants.

The LCS's WG23726-1, WG24016-1 and WG24050-1 had greater than ten percent of the spiked analytes with recoveries that were high and outside of the laboratory established acceptance limits.

340 County Road, No. 5 • P.O. Box 720, Westbrook, ME 04098 • Tel: (207) 874-2400 • Fax: (207) 775-4029 • www.katahdinlab.com

Since a high recovery would indicate a high bias and these affected analytes were not detected in the samples associated with these LCS's, the samples were not reanalyzed.

The initial calibration analyzed on the M instrument on 12/14/05 had a %RSD value for acetone that exceeded the method acceptance limit of 15%. Even though the %RSD is greater than 15%, acetone was calibrated with the average model since this calibration model is more accurate for this analyte at concentrations near the PQL than either the linear or quadratic calibration models.

The calibration verification standard (CV) (file Z8866) had no response for the analyte bromoform. This CV affected the samples WV6482-8RA2, 9RA2, 11RA, and 13RA. These samples were also analyzed previously in a sequence with an acceptable response for bromoform.

Samples WV6482-15, 25, 27, 28, 29, 30 and WG23738-1 and 2, and WG24050-3 had high recoveries for the surrogate 1,2-dichloroethane-d4, which were outside of the laboratory established acceptance limits. For those samples that had no target analytes detected above the PQL, since a high recovery would indicate a high bias the associated samples were not reanalyzed. For those samples that had target analytes detected above the PQL, since the recoveries of the second surrogate dibromofluoromethane, which is associated with the same internal standard as the surrogate 1,2-dichloroethane-d4, were acceptable, these samples were not reanalyzed.

The initial analysis of samples WV6482-1, 2 and 8 had low recoveries for one surrogate, which was outside of the laboratory established acceptance limits. The reanalysis also had low surrogate recoveries, indicating a matrix effect. The results from both analyses are reported.

The initial analysis of sample WV6482-11 had low recoveries for three surrogates, which were outside of the laboratory established acceptance limits. The sample was reanalyzed and had low recoveries for two surrogates, indicating a matrix effect. The results from both analyses are reported.

The initial analysis of sample WV6482-9 had a recovery for one surrogate that was outside of the laboratory established acceptance limit. The reanalysis, labeled "RA", also had a low surrogate recovery. The sample was reanalyzed a third time and is labeled with the suffix "RA2". The reanalyses labeled "RA" and "RA2" are reported.

The initial analysis of sample WV6482-10 had a recovery for one or more surrogates that were outside of the laboratory established acceptance limit. The reanalysis of this sample is labeled with the suffix "RA". The reanalysis was analyzed within hold time and met all QC acceptance limits. Therefore, only the reanalysis is reported.

The initial analysis of sample WV6482-12 had recoveries for three surrogates that were outside of the laboratory established acceptance limit and had responses for four internal standards that resulted in %D's which were outside the laboratory acceptance limit of -50% to +100% of the response of the internal standard of the daily calibration verification standard. The reanalysis of this sample, labeled "RA", had recoveries for two surrogates that were outside of the laboratory established acceptance limit. The reanalysis of this sample is labeled with the suffix "RA2". The reanalysis was analyzed within hold time and met all QC acceptance limits. Therefore, only the reanalysis "RA2" is reported.

340 County Road, No. 5 • P.O. Box 720, Westbrook, ME 04098 • Tel: (207) 874-2400 • Fax: (207) 775-4029 • www.katahdinlab.com

The initial analysis of sample WV6482-13 had recoveries for two surrogates that were outside of the laboratory established acceptance limit and had responses for four internal standards that resulted in %D's which were outside the laboratory acceptance limit of -50% to +100% of the response of the internal standard of the daily calibration verification standard. The reanalysis of this sample is labeled with the suffix "RA". The reanalysis was analyzed within hold time and met all QC acceptance limits. Therefore, only the reanalysis is reported.

8015M-FLPRO Analysis

The method blank WG23845-1 and sample WV6482-3 and had high recoveries for the extraction surrogates o-terphenyl and n-triacontane-D_{62}, which were outside of the method acceptance limits. Since high recoveries would indicate a high bias and PRO was not detected above the PQL in the method blank or sample, the associated samples were not reextracted.

The LCS WG23845-2 had high recoveries for the extraction surrogates o-terphenyl and n-triacontane-D_{62}, which were outside of the method acceptance limits. Since the recovery for PRO was within the acceptance limits, the associated samples were not reextracted.

Samples WV6482-1, 2 and 4 had high recoveries for the extraction surrogate o-terphenyl, which were outside of the method acceptance limits. Since the recoveries for the second surrogate, n-triacontane-D_{62}, were within the acceptance limits, the samples were not reextracted.

The LCS WG23712-2 and LCSD's WG23712-3 and WG23845-3 had high recoveries for the extraction surrogate o-terphenyl, which were outside of the method acceptance limits. Since the recovery for the second surrogate, n-triacontane-D_{62}, as well as the recovery for PRO were within the acceptance limits, the associated sample was not reextracted.

PRO was detected in the laboratory method blank, WG23845-1, above the MDL. The associated samples were flagged with a "V" qualifier indicating that the analyte PRO was detected in the laboratory method blank analyzed concurrently with the sample.

The CV standard (file CWA2016) had high responses for some of the individual hydrocarbons, which resulted in %Ds that were outside of the method acceptance limits of 25%. Since the method requirement applies to only the PRO range response, which was acceptable, the associated samples were not reanalyzed.

The CV standard (file CWA2120) had high responses for some of the individual hydrocarbons C_{24} and C_{34}, which resulted in %Ds that were outside of the method acceptance limits of 25%. Since the method requirement applies to only the PRO range response, which was acceptable, the associated samples were not reanalyzed.

504.1 Analysis

The method blank WG23818-1, the laboratory control sample (LCS) WG23818-2 and the laboratory control sample duplicate (LCSD) WG23818-3 had high recoveries for the surrogate TCX on both channels. These recoveries were outside of the laboratory established acceptance limits. Since a high recovery would indicate a high bias and the target analyte was not detected above the PQL in any of the associated sample, the sample was not reextracted.

340 County Road, No. 5 • P.O. Box 720, Westbrook, ME 04098 • Tel: (207) 874-2400 • Fax: (207) 775-4029 • www.katahdinlab.com

The calibration verification standard (CV) (file 3VL1077) had a high response for 1,2-dibromoethane on channel A, which resulted in a %D that was outside of the method acceptance limits of 15%. Since the response was within the acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The LCS and LCSD WG23818-2 and 3 had high recoveries for the spiked analyte 1,2-dibromoethane which were outside of the method acceptance limits. Since a high recovery would indicate a high bias and the target analyte was not detected above the PQL in any of the associated samples, the samples were not reextracted.

8270C SIM Analysis

There were no protocol deviations or observations for this method noted by the organics laboratory staff.

8270C SCAN Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory phthalate ester contaminants) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

The LCSD WG23940-3 had greater than ten percent of the spiked analytes with recoveries that were low and outside of the laboratory established acceptance limits. Since the associated LCS WG23940-2 had acceptable recoveries for the spiked analytes, the associated samples were not reextracted.

The initial calibration analyzed on 12/06/05 had %RSD values for several analytes that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analytes N-nitroso-di-n-propylamine and hexachlorocyclopentadiene failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model. Since these analytes were not detected above the PQL in the associated samples, the samples were not reanalyzed.

The initial calibration analyzed on 01/05/06 had %RSD values for several analytes that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analytes 2-methylphenol, 2,2'-oxybis(1-chloropropane), 4-methylphenol, dibenzofuran, di-n-butylphthalate and the surrogate 2-fluorobiphenyl failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model.

340 County Road, No. 5 • P.O. Box 720, Westbrook, ME 04098 • Tel: (207) 874-2400 • Fax: (207) 775-4029 • www.katahdinlab.com

The initial calibration analyzed on 01/10/06 had %RSD values for several analytes that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analyte hexachlorocyclopentadiene failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model.

The calibration verification standard (CV) (file K1068) had a low response for the (CCC) calibration check compound hexachlorobutadiene, which resulted in a %D that was outside the method acceptance limit of 20%.

The calibration verification standards (CVs) (file K1179 and K1201) had low responses for the (CCC) calibration check compound di-n-octylphthalate, which resulted in %D's that were outside the method acceptance limit of 20%.

The calibration verification standards (CVs) (file K1248 and K1268) had high responses for the (CCC) calibration check compound di-n-octylphthalate, which resulted in %D's that were outside the method acceptance limit of 20%.

Samples WV6482-11 and 12 had low responses for one internal standard, which were outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The samples were reanalyzed with similar failures confirming a matrix effect. The results from both analyses are reported.

Samples WV6482-1, 2 and 10 had low recoveries for two surrogates, which were outside the laboratory established acceptance limits. These samples were reextracted twenty-six days out of hold time and analyzed. Samples WV6482-1RE and 10RE had low responses for one or more internal standards, which were outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. Samples WV6482-1RE and 2RE had low recoveries for one or more surrogates and sample WV6842-1RE had a high recovery for one surrogate. Sample WV6842-10RE also had high recoveries for three surrogates. Since the reextracts confirm a matrix effect, no further action was taken. The results for both extractions are included in the report.

Sample WV6482-3 had a low recovery for one surrogate, which was outside the laboratory established acceptance limits. Since the other five surrogates were acceptable and the surrogate is outside of the acceptance limit by 1%, the sample was not reextracted.

Samples WV6482-4, 5, 7, 11, 11RA, 12, 12RA and 13 had high recoveries for one or more surrogates, which were outside the laboratory established acceptance limits. Since a high recovery would indicate a high bias and there were no target analytes (with the exception of the common laboratory phthalate ester contaminants) detected above the PQL in the aforementioned samples, the samples were not reextracted.

8081 Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. Katahdin standard operating procedure is

340 County Road, No. 5 • P.O. Box 720, Westbrook, ME 04098 • Tel: (207) 874-2400 • Fax: (207) 775-4029 • www.katahdinlab.com

not to take corrective action until greater than ten percent of the spiked analytes in the LCS are outside of the QC limits.

The method blank WG23714-1 and sample WV6482-14 had low recoveries for the extraction surrogate DCB on both channels which were outside of the laboratory established acceptance limits. Since the recoveries for TCX were acceptable on both channels and the associated LCS was acceptable for the spiked target analytes, the sample was not reextracted.

The method blank WG23876-1 and laboratory control sample duplicate WG23876-3 had low recoveries for the extraction surrogate TCX on one or both channels, which were outside of the laboratory established acceptance limits. Since the recoveries for DCB were acceptable on both channels, the associated samples were not reextracted.

The closing CV (files 8VK3131 and 8VK4131) had low responses for 4,4'-DDT and methoxychlor on both channels, as well as low responses for seven additional analytes and TCX on channel A. These responses resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses were acceptable in the opening CV's, the associated samples were not reanalyzed.

The opening CV (file 8WA1057) had a high response for TCX on the A channel, which resulted in a %D that was outside of the method acceptance limits of 15%. Since TCX was within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The closing CV (files 8WA1080 and 8WA2080) had low responses for endrin, 4,4'-DDT, endrin aldehyde, endosulfan sulfate, methoxychlor and a high response for TCX on channel A and low responses for 4,4'-DDT and methoxychlor on the B channel. These responses resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses were acceptable in the opening CV's (with the exception of TCX on channel A), the associated samples were not reanalyzed.

The opening CV (file 8WA1109) had high responses for twelve analytes and TCX on the A channel, which resulted in %Ds that were outside of the method acceptance limits of 15%. Since all responses were within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The closing CV (files 8WA1132 and 8WA2132) had low responses for endosulfan sulfate on both channels, as well as low responses for 4,4'-DDT and methoxychlor and a high response for TCX on channel A. These responses resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses were acceptable in the opening CV's, the associated samples were not reanalyzed.

<u>8082 Analysis</u>

The method blank, WG23715-1, the laboratory control sample, WG23715-2 and sample WV6482-14 had low recoveries for the extraction surrogate DCB on both channels, which were outside of the laboratory established acceptance limits. Since the recoveries for TCX were acceptable on both channels, the sample was not reextracted.

0000008

Sample WV6482-11 had a high recovery for the extraction surrogate DCB on channel B, which was outside of the laboratory established acceptance limits. Since the recoveries for TCX on both channels and DCB on channel A were acceptable, the sample was not reextracted.

The closing calibration verification standards (CV's) (files 6VL3097 and 6VL4097) had low responses for DCB on both channels and Aroclor 1016, Aroclor 1260 and TCX on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses were acceptable in the opening CV's, the associated samples were not reanalyzed.

The closing calibration verification standards (CV's) (files 6VL3175 and 6VL4175) had low responses for DCB on both channels and Aroclor 1260 on channel A, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses were acceptable in the opening CV's and the low responses could be attributable to sample(s) that were analyzed prior to the CV's, the associated samples were not reanalyzed.

The Form 7 for the CV's (files 6VL3097, 6VL3128, 6VL4128, 6VL3175 and 6VL4175) are flagged for the surrogates TCX and/or DCB indicating that the %D is greater than the method acceptance limit of 15%. With the exception of DCB for files 6VL3097, 6VL13175 and 6VL4175, which were low, the %D's are actually within the method acceptance limits and should not be flagged, but due to software limitations the flagging could not be removed.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of Katahdin SDG CTO367-2 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Solid Waste", SW-846, November 1986, Third Edition.

Synthetic Precipitation Leaching Procedure (SPLP) by USEPA Method 1312

Katahdin Sample Nos. WV6482-(19-31) are SPLP extracts of solid samples. The extraction dates, the extraction fluid used, and the associated SPLP fluid blank identification numbers for these samples are summarized in the following table.

Katahdin Sample Numbers	SPLP Extraction Start Date	Extraction Finish/Filter Date	SPLP Fluid Used	Associated SPLP Fluid Blank ID
WV6482-(19-22)	12/27/05	12/28/05	1	PBT693A
WV6482-(23, 24)	12/28/05	12/29/05	1	PBT693A
WV6482-(25-31)	12/28/05	12/29/05	1	PBT697A

Analyte concentrations that were measured in the SPLP Fluid Blanks are listed in the Extraction Fluid Blank reports that follow Form 3P in the accompanying data package.

0000009

Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP) and Inductively-Coupled Plasma Mass Spectrometric Analysis (ICP-MS)

Aqueous-matrix Katahdin Sample No. WV6482-14 was digested for ICP and ICP-MS analysis on 12/15/05 (QC Batch VL15ICW1) in accordance with USEPA Method 3050B.

Soil-matrix Katahdin Sample Nos. WV6482-(1-13, 16, and 17) were digested for ICP and ICP-MS analysis on 12/27/05 (QC Batch VL27ICS0) in accordance with USEPA Method 3050B. Duplicate laboratory control samples were prepared in this digestion batch.

The SPLP extracts of Katahdin Sample Nos. WV6482-(19-31) were digested for ICP and ICP-MS analysis on 12/28/05 (QC Batch VL28ICW0) and 12/29/05 (QC Batch VL29ICW1) in accordance with USEPA Method 3010A.

ICP analyses of SDG CTO367-2 sample digestates were performed using a Thermo Jarrell Ash (TJA) Trace ICP spectrometer and a TJA 61E ICP spectrometer. ICP-MS analyses of SDG CTO367-2 sample digestates were performed using an Agilent 7500 ICP-MS spectrometer. All samples were analyzed within holding times and all analytical run QC criteria were met, with the following comments or exceptions:

Some of the results for run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

Soil-matrix Katahdin Sample Nos. WV6482-(1-13) were digested for mercury analysis on 12/28/05 (QC Batch VL28HGS0) in accordance with USEPA Method 7471A. Katahdin Sample No. WV6482-13 was prepared with duplicate matrix-spiked aliquots in this batch.

The SPLP extracts of Katahdin Sample Nos. WV6482-(19-31) were digested for mercury analysis on 01/03/06 (QC Batch WA03HGW0) in accordance with USEPA Method 7470A.

Aqueous-matrix Katahdin Sample No. WV6482-14 was digested for mercury analysis on 01/03/06 (QC Batch WA03HGW1) in accordance with USEPA Method 7470A. .

Mercury analyses of Katahdin SDG CTO367-2 sample digestates were performed using a Cetac M6100 automated mercury analyzer. All samples were analyzed within holding times and all analytical run QC criteria were met.

Matrix QC Summary

The mercury recoveries in the matrix-spiked aliquots of Katahdin Sample Nos. WV6482-13 are within the laboratory's acceptance limits (75% - 125% recovery of the added element, if the native concentration is less than four times the amount added).

340 County Road, No. 5 • P.O. Box 720, Westbrook, ME 04098 • Tel: (207) 874-2400 • Fax: (207) 775-4029 • www.katahdinlab.com

Wet Chemistry Analysis

The samples of Katahdin SDG CTO367-2 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for total solids were performed according to "U.S. EPA Contract Laboratory Program Statement of Work for Inorganic Analysis", SOW 7/88.

All analyses were performed within analytical holding times, and all quality control criteria were met.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

44TB1213	44TB1214	

OVERVIEW

The sample set for CTO 367, NAS Pensacola, SDG CTO367-3 consists of sixteen (16) environmental aqueous samples, two (2) trip blanks, and two (2) field duplicates. All samples were analyzed for volatile organic compounds (VOC). All samples except the trip blanks were also analyzed for ethylene dibromide (EDB), semivolatile organic compounds (SVOC), polynuclear aromatic hydrocarbons (PAH), pesticides (PEST), polychlorinated biphenyls (PCB), and petroleum range organics (PRO). The field duplicate pairs included in this SDG are (3221GW1001 / 3221GW1001D) and (44GW1501 / 44GW1501D).

The samples were collected by Tetra Tech NUS on December 13 and 14, 2005 and analyzed by Katahdin Analytical Services. All analyses were conducted in accordance with Naval Facilities Engineering Service Center (NFESC) Quality Assurance/Quality Control (QA/QC) criteria using SW-846 Methods 8260B, 8270C, 8081A, 8082, Florida PRO, and 8270SIM and EPA Method 504.1 analytical and reporting protocols. The data contained in this SDG were validated with regard to the following parameters:

- Data completeness
- Holding times
- * GC/MS Tuning
- Initial and continuing calibration
- Blank results
- Surrogate spike recoveries
- Internal standard recoveries
- Blank Spike/Blank Spike Duplicate Results
- Matrix Spike/Matrix Spike Duplicate Results
- * Compound Quantitation
- * Compound Identification
- * Detection Limits

The symbol (*) indicates that all quality control criteria were met for this parameter. Problems affecting data quality are discussed below; documentation supporting these findings is presented in Appendix C. Qualified Analytical results are presented in Appendix A. Results as reported by the laboratory are included in Appendix B.

Volatile

All initial and continuing calibrations were below the 0.05 relative response factor (RRF) quality control criterion for acetone and 2-butanone. Non-detected results for the aforementioned compounds were rejected (UR) in all samples.

The continuing calibration performed on December 23 at 09:49 exceeded the 25% difference quality control criterion for bromomethane and acetone. No action was taken for acetone on this basis because all results were rejected for RRF non-compliance. Non-detected results for bromomethane were qualified as estimated (UJ) in samples 3221GW0401, 3221GW0701, 3221GW0901, 3221GW1001, 44TB1213, and 3221GW1001D.

The following compounds were detected in a method blank:

Compound	Maximum Concentration	Blank Action Level
Acetone	5.0 µg/L	50 µg/L
Methylene chloride	1.0 µg/L	10 µg/L

Sample aliquot and dilution factors were taken into consideration when applying the blank action levels. No action was taken on this basis because all results for the aforementioned compounds were non-detected.

The surrogate toluene-d8 exceeded the percent recovery quality control criterion in sample 44GW1401. Positive results were qualified as estimated (J) in sample 44GW1401.

All surrogates were below the percent recovery quality control criterion in the MS performed on sample 44GW0901. No action was taken on this basis because all surrogates were compliant in the un-spiked sample and the MSD.

The percent recovery of 2-butanone exceeded the quality control criterion in the blank spikes (WG24148-LCS and WG24176-LCS). No action was taken on this basis because all results for 2-butanone were rejected for RRF non-compliance.

The relative percent difference (RPD) of all compounds exceeded the quality control criterion in the MS/MSD performed on sample 44GW0901. In addition, all percent recoveries except for chloromethane, vinyl chloride, bromomethane, chloroethane, acetone, carbon disulfide, 2-butanone, and 4-methyl-2-pentanone were below the quality control criterion in the MS. No action was taken on this basis because the RPD and percent recovery non-compliances are attributed to the poor surrogate recovery in the MS and was isolated to only the MS.

Positive results below the reporting limit were qualified as estimated (J) due to uncertainty near the detection limit.

EDB

The continuing calibration performed on December 21 at 14:08 exceeded the 30% difference quality control criterion for 1,2-dibromoethane on both columns. Non-detected results for 1,2-dibromoethane were qualified as estimated (UJ) in all samples.

The surrogate tetrachloro-m-xylene was below the percent recovery quality control criterion on both columns in sample 44GW1501D and the MS performed on sample 44GW0901. Sample 44GW1501D was re-analyzed with similar results. The original analysis was used for validation. The MS was not re-

analyzed because the surrogate recoveries were compliant in the un-spiked sample and associated MSD. The non-detected result for 1,2-dibromoethane was qualified as estimated (UJ) in sample 44GW1501D.

The percent recovery of 1,2-dibromoethane was below the quality control criterion in the LCS (WG24076-LCS). No action was taken on this basis because the LCSD was compliant.

The percent recovery of 1,2-dibromoethane was below the quality control criterion in the MS/MSD performed on sample 44GW0901. The non-detected result for 1,2-dibromoethane was qualified as estimated (UJ) in the un-spiked sample.

Semivolatile

The initial calibration performed on January 10, 2006 exceeded the 30% RSD quality control criterion for hexachlorocyclopentadiene. Non-detected results for hexachlorocyclopentadiene were qualified as estimated (UJ) in all samples.

The continuing calibration performed on January 12 at 13:17 exceeded the 25% difference quality control criterion for hexachlorocyclopentadiene and di-n-octylphthalate. No action was taken on this basis because only QC samples were associated with this calibration.

The continuing calibration performed on January 13 at 14:18 exceeded the 25% difference quality control criterion for 4-chloroaniline and hexachlorocyclopentadiene. Non-detected results for 4-chloroaniline and hexachlorocyclopentadiene were qualified as estimated (UJ) in samples 3221GW0401, 3221GW0501, 3221GW0701, 3221GW0801, 3221GW0901, 3221GW1001, 3221GW1001D, 44GW1001, 44GW0901, 44GW1101, 44GW1401, and 44GW1901.

The continuing calibration performed on January 14 at 10:17 exceeded the 25% difference quality control criterion for bis(2-chloroethyl)ether and hexachlorocyclopentadiene. Non-detected results for bis(2-chloroethyl)ether and hexachlorocyclopentadiene were qualified as estimated (UJ) in samples 3221GW0601, 44GW1201, 44GW1301, 44GW1501, 44GW1501D, and 44GW1801.

The surrogates nitrobenzene-d5, 2-fluorobiphenyl, and terphenyl-d14 were below the percent recovery quality control criterion in the MSD performed on sample 44GW0901. No action was taken on this basis because the surrogates were compliant in the un-spiked sample and the MS.

The percent recovery of hexachlorocyclopentadiene exceeded the quality control criterion in the LCS/LCSD (WG23885-LCS / WG23885-LCSD). No action was taken on this basis because all results for hexachlorocyclopentadiene were non-detected.

The RPD of 2,2'-oxybis(1-chloropropane) exceeded the quality control criterion in the LCS/LCSD (WG23885-LCS / WG23885-LCSD). No action was taken on this basis because both percent recoveries were compliant.

The percent recovery of 3,3'-dichlorobenzidine was below the quality control criterion in the LCSD (WG23885-LCSD). No action was taken on this basis because the LCS was compliant.

The percent recovery of 3,3'-dichlorobenzidine was below the quality control criterion In the LCS (WG23949-LCS).

The relative percent difference (RPD) of all compounds exceeded the quality control criterion in the MS/MSD performed on sample 44GW0901. In addition, all percent recoveries except for phenol, 2-nitrophenol, hexachlorocyclopentadiene, 3-nitroaniline, 4-nitrophenol, and pentachlorophenol were below the quality control criterion in the MSD. No action was taken on this basis because the RPD and percent recovery non-compliances are attributed to the poor surrogate recovery in the MSD and was isolated to only the MSD.

PAH

The continuing calibration performed on January 6 at 15:36 exceeded the 25% difference quality control criterion for benzo(b)fluoranthene. Non-detected results for benzo(a)anthracene were qualified as estimated (UJ) in samples 3221GW0501, 3221GW0701, 3221GW0801, 3221GW0901, 3221GW1001, 3221GW1001D, 44GW1001, and 44GW1101.

The continuing calibration performed on January 7 at 09:16 exceeded the 25% difference quality control criterion for indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene. Non-detected results for benzo(b)fluoranthene were qualified as estimated (UJ) in samples 3221GW0401, 44GW1401, 3221GW0601, 44GW0901, 44GW1201, 44GW1301, 44GW1501, 44GW1501D, 44GW1801, and 44GW1901.

Positive results below the reporting limit were qualified as estimated (J) due to uncertainty near the detection limit.

PEST

The continuing calibration performed on January 6 at 05:19 exceeded the 15% difference quality control criterion for endrin, endrin aldehyde, 4,4'-DDT, endosulfan sulfate, and methoxychlor on the RTX-CLPI column and for 4,4'-DDT and methoxychlor on the RTX-CLPII column. No action was taken on this basis because only QC samples were associated with this calibration.

The continuing calibration performed on January 9 at 10:43 exceeded the 15% difference quality control criterion for gamma-BHC, heptachlor, beta-BHC, delta-BHC, heptachlor epoxide, endosulfan I, 4,4'-DDE, dieldrin, endrin, 4,4'-DDT, endrin aldehyde, alpha-chlordane, and gamma-chlordane on the RTX-CLPI column. No action was taken on this basis because the RTX-CLPII column was compliant and all results were non-detected.

The continuing calibration performed on January 9 at 21:18 exceeded the 15% difference quality control criterion for 4,4'-DDT, endosulfan sulfate, and methoxychlor on the RTX-CLPI column and for endosulfan sulfate on the RTX-CLPII column. Non-detected results for endosulfan sulfate were qualified as estimated (UJ) in samples 3221GW0401, 3221GW0701, 3221GW0801, 3221GW0901, 3221GW1001, 3221GW1001D, 44GW1001, 44GW0901, 44GW1101, 44GW1301, 44GW1401, 44GW1801, and 44GW1901. No further qualifications were made on this basis because one column was compliant for the remaining compounds and all results were non-detected.

The continuing calibration performed on January 10 at 11:15 exceeded the 15% difference quality control criterion for gamma-BHC, heptachlor, and beta-BHC on the RTX-CLPI column. No action was taken on this basis because the RTX-CLPII column was compliant and all results were non-detected.

The continuing calibration performed on January 10 at 21:50 exceeded the 15% difference quality control criterion for gamma-BHC, heptachlor, beta-BHC, aldrin, heptachlor epoxide, endosulfan I, dieldrin, endrin, endosulfan II, endrin aldehyde, endosulfan sulfate, alpha-chlordane, gamma-chlordane, and endrin ketone on the RTX-CLPI column. No action was taken on this basis because the RTX-CLPII column was compliant and all results were non-detected.

The surrogate decachlorobiphenyl was below the percent recovery quality control criteria in sample 44GW1501D and the MS performed on sample 44GW0901 on the RTX-CLPII column. No action was taken on this basis because the RTX-CLPI column was compliant.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC guidelines and the Quality Assurance Project Plan (QAPP)."

2. Appendix B - Results as Reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

SDG NARRATIVE
KATAHDIN ANALYTICAL SERVICES
TETRA TECH NUS
CASE CTO 367 NAS PENSACOLA
SDG: CTO367-3

Sample Receipt

The following samples were received on December 14 and 15, 2005 and were logged in under Katahdin Analytical Services work order numbers WV6662 and WV6687 for a hardcopy due date of January 10, 2006.

KATAHDIN Sample No.	TTNUS Sample Identification
WV6662-1	3221GW0401
WV6662-2	3221GW0501
WV6662-3	3221GW0801
WV6662-4	3221GW0701
WV6662-5	44TB1213
WV6662-6	3221GW0901
WV6662-7	3221GW1001
WV6662-8	3221GW1001D
WV6687-1	44GW1401
WV6687-2	44GW1101
WV6687-3	44GW1001
WV6687-4	44GW0901
WV6687-5	44GW1901
WV6687-6	44TB1214
WV6687-7	44GW1801
WV6687-8	44GW1301
WV6687-9	44GW1501
WV6687-10	44GW1201
WV6687-11	3221GW0601
WV6687-12	44GW1501D

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Organics Laboratory

The samples of SDG CTO367-3 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA, and/or Method for Determination of Petroleum Range Organics (Method #FL-PRO), Florida Department of Environmental Protection, November 1, 1995 and/or "Methods for the Determination of Organic Compounds in Drinking Water", U.S. EPA, Environmental Monitoring and Support Laboratory - Cincinnati (September 1995), for the specific methods listed below or on the Report of Analysis. Sample WV6687-4 was used for a matrix spike (MS) and matrix spike duplicate sample (MSD), as per client's request. Some manual integrations may have been performed due to split peaks and/or corrected baselines. All have been flagged with an "M" (software-generated) on the pertinent quantitation reports.

8260B Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory contaminants acetone and methylene chloride) in the LCS are outside of the QC limits. If the associated MS/MSD has greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

The initial calibrations analyzed on the F and M instruments had %RSD values for acetone that exceeded the method acceptance limit of 15%. Even though the %RSD is greater than 15%, acetone was calibrated with the average model since this calibration model is more accurate for this analyte at concentrations near the PQL than either the linear or quadratic calibration models.

One or more target analytes may have been detected above the MDL in some method blanks. Any of these analytes that were also detected in any of the associated samples were flagged with a "V" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

Sample WV6687-1 had a high recovery for the surrogate toluene-d8, which was outside of the laboratory established acceptance limits. Since the recovery of the second surrogate p-bromofluorobenzene, which is associated with the same internal standard as the surrogate toluene-d8, was acceptable, the sample was not reanalyzed.

The MS WG24178-3 had most spiked analytes with recoveries that were low and outside of the laboratory established acceptance limits. The MS also had low recoveries for all four surrogates, which were outside of the laboratory established acceptance limits. Since the MSD had acceptable spike and surrogate recoveries, the MS was not reanalyzed. This resulted in RPD's for the matrix spike sample duplicates that were above the acceptance limit of 20%.

8015M-FLPRO Analysis

Due to a laboratory accident, sample WV6687-5 was lost during the concentration stage of the extraction process. The sample was reextracted fifteen days out of hold time and analyzed.

Samples WV6687-11 and the LCSD WG24365-3 had low recoveries for the extraction surrogate o-terphenyl, which were outside of the method acceptance limits. Since the recoveries for the second surrogate, n-triacontane-D_{62}, were within the acceptance limits, the associated samples were not reextracted.

The %RPD for PRO between the LCS WG24365-2 and LCSD WG24365-3 was outside of the method acceptance limit of 30%. Since the PRO recoveries in both the LCS and LCSD were within the method acceptance limits, the associated samples were not reextracted.

The LCS associated with WG24053 was lost during the concentration stage of the extraction process. Since the PRO recoveries for the associated MS and MSD, WG24053-3 and 4, were within the acceptance limits, the associated samples were not reextracted.

PRO was detected above the MDL in the laboratory method blank WG24088-1. The associated samples were flagged with a "V" qualifier indicating that the analyte PRO was detected in the laboratory method blank analyzed concurrently with the sample.

The CV standard (file CWA2094) had a high response for the individual hydrocarbon C_{10}, which resulted in a %D that was outside of the method acceptance limits of 20%. Since the method requirement applies to only the PRO range response, which was acceptable, the associated samples were not reanalyzed.

The CV standard (file CWA2107) had a low response for the individual hydrocarbon C_{40}, which resulted in a %D that was outside of the method acceptance limits of 20%. Since the method requirement applies to only the PRO range response, which was acceptable, the associated samples were not reanalyzed.

The CV standard (file CWA2120) had high responses for the individual hydrocarbons C_{24} and C_{34}, which resulted in %Ds that were outside of the method acceptance limits of 20%. Since the method requirement applies to only the PRO range response, which was acceptable, the associated samples were not reanalyzed.

504.1 Analysis

The method blank WG24076-1 had a high recovery for the surrogate TCX on channel B, which was outside of the laboratory established acceptance limits. Since the recovery for TCX was acceptable on channel A, the samples were not reextracted.

Sample WV6687-12 had low recoveries for the surrogate TCX on both channels, which were outside of the laboratory established acceptance limits. The sample was reextracted with similar results indicating a matrix effect. The results from both analyses are reported.

The matrix spike sample WG24076-4 had low recoveries for the surrogate TCX on both channels, which were outside of the laboratory established acceptance limits. The MS and MSD WG24076-4 and WG24076-5 had low recoveries for the spiked analyte 1,2-dibromoethane, which were outside of the method acceptance limits. The MS and MSD were reextracted with similar results indicating a matrix effect. The results from the first extraction are reported.

The calibration verification standard (CV) (file 3VL1126) had a low response for 1,2-dibromoethane on channel A, which resulted in a %D that was outside of the method acceptance limits of 30%. Since the response was within the acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The LCS WG24076-2 had a low recovery for the spiked analyte 1,2-dibromoethane which was outside of the method acceptance limits. Since the LCSD WG24076-3 had an acceptable spike recovery, the samples were not reextracted.

8270C Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory phthalate ester contaminants) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

The initial calibration analyzed on 12/17/05 had %RSD values for several analytes that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. Several target analytes failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model. Since these analytes were not detected above the PQL in the associated method blank and the LCS and LCSD were acceptable, these samples were not reanalyzed.

The initial calibration analyzed on 01/10/06 had %RSD values for several analytes that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analyte hexachlorocyclopentadiene failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. This compound was calibrated using the average model. Since this analyte was not detected above the PQL in the associated sample, this sample was not reanalyzed.

The CV (file K1268) had a high response for the CCC di-n-octylphthalate, which resulted in a %D that was outside the method acceptance limit of 20%. Since a high response would indicate a high bias and this target analyte was not detected above the PQL, the associated samples were not reanalyzed.

The CV (file K1284) had a low response for the CCC 2,4,6-trichlorophenol, which resulted in a %D that was outside the method acceptance limit of 20%.

The MS WG23949-4 had greater than ten percent of the spiked analytes with recoveries that were low and outside of the laboratory established acceptance limits. This sample also had low recoveries for three surrogates, which were outside the laboratory established acceptance limits. This was the result of a laboratory accident where a significant quantity of the extract was lost during the concentration stage of the extraction process. Consequently, the %RPD's for many of the spiked analytes are outside of the laboratory acceptance limits. Since the associated LCS and the MS were acceptable, no corrective action was taken.

8270C SIM Analysis

The CV (file U3084) had a high response for the CCC fluoranthene, which resulted in a %D that was outside the method acceptance limit of 20%. Since a high response would indicate a high bias and this target analyte was not detected above the PQL in the associated method blank, the method blank was not reanalyzed. The associated LCS and LCSD may be biased accordingly.

8082 Analysis

The method blank, WG23986-1, the laboratory control sample, WG23986-2, samples WV6662-6, 8, WV6687-4, 8 through 10 and 12, and the matrix spike duplicate pair, WG23986-3 and 4, had low recoveries for the extraction surrogate DCB on one or both channels, which were outside of the laboratory established acceptance limits. Per the client's request the samples and matrix spike duplicates were reextracted 26 or 27 days out of hold time and analyzed. All of the recoveries for the surrogate DCB in the reextracted sample (with the exception of WV6662-8) were also low. The results from both extractions are included in the report.

Samples WV6662-1 and WV6687-1 had low recoveries for the extraction surrogate DCB on channel B, which were outside of the laboratory established acceptance limits. Since the recoveries were within the acceptance limits for DCB on channel A and TCX on both channels, the samples were not reextracted.

The method blank, WG24698-1, laboratory control sample WG24698-2 and laboratory control sample duplicate WG24698-3 had low recoveries for the extraction surrogate DCB on both channels, which were outside of the laboratory established acceptance limits. Since these samples were associated with reextracted samples, no further corrective action was taken.

The calibration verification standard (CV) (files 6WA2002) had a low response for DCB on channel B, which resulted in a %D that was outside of the method acceptance limits of 15%. Since the response was acceptable on the confirmation channel, the associated samples were not reanalyzed.

The Form 7 for the CV's (files 6WA1027 and 6WA2027) are flagged for the surrogates TCX and DCB indicating that the %D is greater than the method acceptance limit of 15%. The %D's are actually within the method acceptance limits and should not be flagged, but due to software limitations the flagging could not be removed.

8081 Analysis

Sample WV6687-12 and the matrix spike sample WG23985-3 had low recoveries for the extraction surrogate DCB on channel B, which were outside of the laboratory established acceptance limits. Since the recoveries were within the acceptance limits for DCB on channel A and TCX on both channels, the samples were not reextracted.

The opening CV (file 8WA1057) had high responses for the surrogate TCX on the A channel, which resulted in a %D that was outside of the method acceptance limits of 15%. Since TCX was within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The closing CV (files 8WA1080 and 8WA2080) had high responses for the surrogate TCX and low responses for endrin, 4,4'DDT, endrin aldehyde, endosulfan sulfate and methoxychlor on the A channel and low responses for 4,4'DDT and methoxychlor on channel B. These responses resulted in %D's that were outside of the method acceptance limits of 15%.

The opening/closing CV (file 8WA1109) had high responses for most target analytes on the A channel, which resulted in %D's that were outside of the method acceptance limits of 15%. Since these analytes were within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The closing CV (files 8WA1132 and 8WA2132) had low responses for 4,4'-DDT, endosulfan sulfate and methoxychlor and high responses for TCX on channel A and a low response for endosulfan sulfate on the B channel. These responses resulted in %D's that were outside of the method acceptance limits of 15%.

The opening CV (file 8WA1136) had high responses for gamma-BHC, heptachlor, beta-BHC and TCX on the A channel, which resulted in %D's that were outside of the method acceptance limits of 15%. Since these analytes were within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The closing CV (file 8WA1159) had high responses for most target analytes on the A channel, which resulted in %D's that were outside of the method acceptance limits of 15%. Since these analytes were within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of SDG CTO367-3 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Solid Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma (ICP) Atomic Emission Spectroscopic Analysis

The aqueous-matrix samples of SDG CTO367-3 were digested for ICP analyses on 12/22/05 (QC Batch VL22ICW1) and 01/03/06 (QC Batch WA03ICW1) in accordance with USEPA Method 3010A. Katahdin Sample Nos. WV6662-4 and WV6687-4 were prepared with duplicate matrix-spiked aliquots.

ICP analyses of SDG CTO367-3 sample digestates were performed using a Thermo Jarrell Ash (TJA) Trace ICP spectrometer and a TJA ICAP 61E ICP spectrometer. All samples were analyzed within holding times and all analytical run QC criteria were met, with the following comments or exceptions:

Some of the results for run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

The aqueous-matrix samples of SDG CTO367-3 were digested for mercury analysis on 01/03/06 (QC Batches WA03HGW1 and WA03HGW2) in accordance with USEPA Method 7470A. Katahdin Sample No. WV6687-4 was prepared with duplicate matrix-spiked aliquots.

Mercury analyses of SDG CTO367-3 sample digestates were performed using a Cetac M6100 automated mercury analyzer. All samples were analyzed within holding times and all analytical run QC criteria were met.

Matrix QC Summary

Analyte recoveries in the matrix-spiked aliquots of Katahdin Sample Nos. WV6662-4 are within the laboratory's acceptance limits (75% - 125% recovery of the added element, if the native concentration is less than four times the amount added) for all measured analytes.

The recoveries of aluminum (141.4%) and iron (129.1%) in the matrix spike aliquot of Katahdin Sample No. WV6687-4 are outside the laboratory's acceptance limits. The recovery of aluminum (128.3%) in the matrix spike duplicate aliquot of Katahdin Sample No. WV6687-4 is outside the laboratory's acceptance limits.

The matrix spike duplicate analyses of Katahdin Sample Nos. WV6662-4 and WV6687-4 are within the laboratory's acceptance limit (<20% relative difference between duplicate matrix-spiked aliquots) for all measured analytes.

The serial dilution analysis of Katahdin Sample No. WV6687-4 is within the laboratory's acceptance limit (<10% relative percent difference, if the concentration in the original sample is greater than 50 times the IDL) for all measured analytes.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

Overview

The sample set for CTO 367, NAS Pensacola, SDG CTO367-3, consists of eighteen (18) groundwater environmental samples. Two (2) field duplicate pairs (3221GW1001 / 3221GW1001D and 44GW1501 / 44GW1501D) are included within this SDG.

All samples were analyzed for target analyte list (TAL) metals. The samples were collected by Tetra Tech NUS on December 13 and 14, 2005 and analyzed by Katahdin Analytical Services under Naval Facilities Engineering Service Center (NFESC) Quality Assurance/Quality Control (QA/QC) criteria. Metals analyses, with the exception of mercury, were conducted using SW-846 method 6010B. Mercury analyses were conducted using SW-846 method 7470A.

These data were evaluated based on the following parameters:

* • Data Completeness
* • Holding Times
* • Calibration Verification Results
• Laboratory Blank Analyses
* • ICP Interference Check Sample Results
• Matrix Spike/Matrix Spike Duplicate Results
* • Laboratory Control Sample Results
* • Field Duplicate Results
* • Sample Quantitation
* • Detection Limits

* - All quality control criteria were met for this parameter.

Laboratory Blank Analyses

The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Aluminum	181.87 µg/L	909.35 µg/L
Barium	1.98 µg/L	9.9 µg/L
Beryllium	0.45 µg/L	2.25 µg/L
Calcium	64.17 µg/L	320.85 µg/L
Iron	24.21 µg /L	121.05 µg/L
Magnesium	65.65 µg/L	328.25 µg/L
Mercury	0.05 µg/L	0.25 µg/L
Potassium	953.98 µg/L	4769.9 µg/L
Selenium[(1)]	3.67 µg/L	18.35 µg/L
Silver	7.8 µg/L	39.0 µg/L
Sodium	427.1 µg/L	2135.5 µg/L
Thallium	7.38 µg/L	36.9 µg/L
Zinc	4.45 µg/L	22.25 µg/L

[(1)] Maximum concentration present in a laboratory preparation blank from preparation batch WA03ICW0, affecting sample 44GW0901 only.

An action level of 5X the maximum concentration has been used to evaluate the sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results, less than the blank action level, were qualified "U" as a result of laboratory blank contamination.

Matrix Spike/Matrix Spike Duplicate Results

The matrix spike (MS) and matrix spike duplicate (MSD) percent recoveries for aluminum in sample 44GW0901 were > 125% quality control limit. The positive result reported for aluminum in this sample was qualified as estimated, "J". The MS and MSD percent recoveries for aluminum in sample 3221GW0701 were within acceptable quality control limits.

The MS percent recovery for iron in sample 44GW0901 was > 125% quality control limit. The positive result reported for iron in this sample was qualified as estimated, "J". The MS and MSD percent recoveries for iron in sample 3221GW0701 were within acceptable quality control limits.

Notes

The Contract Required Detection Limit (CRDL) percent recoveries for selenium on 1/5/06 at 23:27 and 1/6/06 at 03:01 were > 120% quality control limit. The CRDL percent recovery for cadmium on 12/30/05 at 15:43 was > 120% quality control limit. The CRDL percent recoveries for silver on 1/3/06 at 19:37 and 23:10 were > 120% quality control limit. No validation action was taken based on the CRDL percent recoveries.

The Practical Quantitation Limit (PQL) percent recoveries for calcium, magnesium and selenium on 1/5/06 at 13:06 were > 120% quality control limit. The PQL percent recovery for antimony on 1/5/06 at 13:06 was < 80% quality control limit. The PQL percent recovery for calcium on 12/30/05 at 11:23 was > 120% quality control limit. The PQL percent recoveries for calcium and sodium on 1/3/06 at 11:42 were > 120% quality control limit. The PQL percent recovery for aluminum on 1/4/06 at 10:39 was < 80% quality control limit. No validation action was taken based on the PQL percent recoveries.

The MS percent recoveries for calcium in samples 3221GW0701 and 44GW0901 were > 125% quality control limit. No validation action was required because the concentration of calcium in the original samples was greater than four times the concentration in the spiking solution.

Executive Summary

Laboratory Performance: Several analytes were present in the laboratory method/preparation blanks.

Other Factors Affecting Data Quality: Aluminum and iron were qualified due to MS noncompliance in sample 44GW0901.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", July 2002 and the NFESC document entitled "Navy IRCDQM" (September 1999).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC Guidelines and the Quality Assurance Project Plan (QAPP)."

2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A
QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

SDG NARRATIVE
KATAHDIN ANALYTICAL SERVICES
TETRA TECH NUS
CASE CTO 367 NAS PENSACOLA
SDG: CTO367-3

Sample Receipt

The following samples were received on December 14 and 15, 2005 and were logged in under Katahdin Analytical Services work order numbers WV6662 and WV6687 for a hardcopy due date of January 10, 2006.

KATAHDIN Sample No.	TTNUS Sample Identification
WV6662-1	3221GW0401
WV6662-2	3221GW0501
WV6662-3	3221GW0801
WV6662-4	3221GW0701
WV6662-5	44TB1213
WV6662-6	3221GW0901
WV6662-7	3221GW1001
WV6662-8	3221GW1001D
WV6687-1	44GW1401
WV6687-2	44GW1101
WV6687-3	44GW1001
WV6687-4	44GW0901
WV6687-5	44GW1901
WV6687-6	44TB1214
WV6687-7	44GW1801
WV6687-8	44GW1301
WV6687-9	44GW1501
WV6687-10	44GW1201
WV6687-11	3221GW0601
WV6687-12	44GW1501D

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

8081 Analysis

Sample WV6687-12 and the matrix spike sample WG23985-3 had low recoveries for the extraction surrogate DCB on channel B, which were outside of the laboratory established acceptance limits. Since the recoveries were within the acceptance limits for DCB on channel A and TCX on both channels, the samples were not reextracted.

The opening CV (file 8WA1057) had high responses for the surrogate TCX on the A channel, which resulted in a %D that was outside of the method acceptance limits of 15%. Since TCX was within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The closing CV (files 8WA1080 and 8WA2080) had high responses for the surrogate TCX and low responses for endrin, 4,4'DDT, endrin aldehyde, endosulfan sulfate and methoxychlor on the A channel and low responses for 4,4'DDT and methoxychlor on channel B. These responses resulted in %D's that were outside of the method acceptance limits of 15%.

The opening/closing CV (file 8WA1109) had high responses for most target analytes on the A channel, which resulted in %D's that were outside of the method acceptance limits of 15%. Since these analytes were within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The closing CV (files 8WA1132 and 8WA2132) had low responses for 4,4'-DDT, endosulfan sulfate and methoxychlor and high responses for TCX on channel A and a low response for endosulfan sulfate on the B channel. These responses resulted in %D's that were outside of the method acceptance limits of 15%.

The opening CV (file 8WA1136) had high responses for gamma-BHC, heptachlor, beta-BHC and TCX on the A channel, which resulted in %D's that were outside of the method acceptance limits of 15%. Since these analytes were within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The closing CV (file 8WA1159) had high responses for most target analytes on the A channel, which resulted in %D's that were outside of the method acceptance limits of 15%. Since these analytes were within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of SDG CTO367-3 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Solid Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma (ICP) Atomic Emission Spectroscopic Analysis

The aqueous-matrix samples of SDG CTO367-3 were digested for ICP analyses on 12/22/05 (QC Batch VL22ICW1) and 01/03/06 (QC Batch WA03ICW1) in accordance with USEPA Method 3010A. Katahdin Sample Nos. WV6662-4 and WV6687-4 were prepared with duplicate matrix-spiked aliquots.

ICP analyses of SDG CTO367-3 sample digestates were performed using a Thermo Jarrell Ash (TJA) Trace ICP spectrometer and a TJA ICAP 61E ICP spectrometer. All samples were analyzed within holding times and all analytical run QC criteria were met, with the following comments or exceptions:

Some of the results for run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

The aqueous-matrix samples of SDG CTO367-3 were digested for mercury analysis on 01/03/06 (QC Batches WA03HGW1 and WA03HGW2) in accordance with USEPA Method 7470A. Katahdin Sample No. WV6687-4 was prepared with duplicate matrix-spiked aliquots.

Mercury analyses of SDG CTO367-3 sample digestates were performed using a Cetac M6100 automated mercury analyzer. All samples were analyzed within holding times and all analytical run QC criteria were met.

Matrix QC Summary

Analyte recoveries in the matrix-spiked aliquots of Katahdin Sample Nos. WV6662-4 are within the laboratory's acceptance limits (75% - 125% recovery of the added element, if the native concentration is less than four times the amount added) for all measured analytes.

The recoveries of aluminum (141.4%) and iron (129.1%) in the matrix spike aliquot of Katahdin Sample No. WV6687-4 are outside the laboratory's acceptance limits. The recovery of aluminum (128.3%) in the matrix spike duplicate aliquot of Katahdin Sample No. WV6687-4 is outside the laboratory's acceptance limits.

The matrix spike duplicate analyses of Katahdin Sample Nos. WV6662-4 and WV6687-4 are within the laboratory's acceptance limit (<20% relative difference between duplicate matrix-spiked aliquots) for all measured analytes.

The serial dilution analysis of Katahdin Sample No. WV6687-4 is within the laboratory's acceptance limit (<10% relative percent difference, if the concentration in the original sample is greater than 50 times the IDL) for all measured analytes.

46RB1217		

Overview

The sample set for NAS Pensacola, CTO 367, SDG CTO367-4, consists of seventeen (17) aqueous environmental samples and two (2) rinse blanks. One (1) field duplicate pair (46GW1401D / 46GW1401) is included in this SDG.

All samples were analyzed for target analyte list (TAL) metals. The samples were collected by Tetra Tech NUS on December 14, 17, and 18, 2005 and analyzed by Katahdin Analytical Services. Metals analyses were conducted using SW-846 method 6010B. Mercury analyses were conducted using SW-846 method 7470A.

Metals analyses except mercury were conducted using Inductively Coupled Plasma (ICP) methodologies. Mercury analyses were conducted using Cold Vapor Atomic Absorption (CVAA) methodology.

These data were evaluated based on the following parameters:

* • Data Completeness
* • Holding Times
• Calibration Analyses
• Laboratory Method/Preparation Blank Analyses
* • ICP Interference Analyses
* • Matrix Spike Analyses
* • Laboratory Duplicate Precision
* • Laboratory Control Sample Analyses
• ICP Serial Dilution Analyses
* • Field Duplicate Precision
* • Detection Limits
* • Analyte Quantitation

* - All quality control criteria were met for this parameter.

Calibration Analyses

The contract required detection limit (CRDL) run on 1/4/06 at 14:01 had a percent recovery (%R) >130% for mercury. The positive result reported for mercury <2X the CRDL in sample 46RB1217 was qualified as estimated (J).

Laboratory Blank Analyses

The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Aluminum	145.06 ug/L	725.30 ug/L
Barium	1.82 ug/L	9.1 ug/L
Beryllium	0.67 ug/L	3.35 ug/L
Calcium	92.99 ug/L	464.95 ug/L
Cobalt	3.81 ug/L	19.05 ug/L
Copper	4.03 ug/L	20.15 ug/L
Iron	36.69 ug/L	183.45 ug/L
Magnesium	66.15 ug/L	330.75 ug/L
Manganese	1.72 ug/L	8.60 ug/L
Mercury	0.13 ug/L	0.65 ug/L
Potassium	750.31 ug/L	3751.55 ug/L
Sodium	305.6 ug/L	1528 ug/L
Vanadium	6.55 ug/L	32.75 ug/L
Zinc	12.33 ug/L	61.65 ug/L

An action level of 5X the maximum concentration was used to evaluate the sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results reported less than the action level for aluminum, barium, beryllium, cobalt, copper, iron, manganese, mercury, potassium, vanadium, and zinc were qualified as nondetected (U) due to laboratory blank contamination. The remaining analytes were not qualified because the results were greater than the action level. It should be noted that the rinse blanks were not qualified for laboratory blank contamination.

ICP Serial Dilution

The ICP serial dilution had a percent difference (%D) >10% and an initial sample concentration >50X the instrument detection limit (IDL) for aluminum. Positive results reported for aluminum were qualified as estimated (J).

Notes

The continuing calibration verification (CCV) standard run on 1/5/06 at 21:17 had a %R >110% for zinc. No qualification action was required because no samples were associated with this standard.

The CCV standard run on 1/6/06 at 17:21 had a %R >110% for calcium. No qualification action was required because no samples that were associated with this standard were analyzed for calcium.

The matrix spike had %Rs >125% for calcium and sodium. No qualification action was required because the initial sample concentration was >4X the spike added.

Executive Summary

Laboratory Performance: Mercury was qualified due to calibration noncompliance. Several analytes were present in the laboratory method/preparation blanks.

Other Factors Affecting Data Quality: Aluminum was qualified due to ICP serial dilution noncompliance.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", July 2002 and the NFESC document entitled "Navy IRCDQM" (September 1999).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC Guidelines and the Quality Assurance Project Plan (QAPP)."

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

Sample Receipt

The following samples were received on December 15, 19 and 20, 2005 and were logged in under Katahdin Analytical Services work order numbers WV6688, WV6701 and WV6766 for a hardcopy due date of January 15, 2006.

KATAHDIN Sample No.	TTNUS Sample Identification
WV6688-1	3221GW0201
WV6688-2	44RB1214
WV6688-3	3221GW0301
WV6688-4	3221GW0101
WV6701-1	46GW1101
WV6701-2	46GW1201
WV6701-3	46GW0901
WV6701-4	46GW1001
WV6701-5	46RB1217
WV6701-6	46TB1217
WV6701-7	46GW1301
WV6701-8	46GW1401
WV6701-9	46GW1401D
WV6701-10	46GW1501
WV6701-11	46GW1601
WV6766-1	46GW0101
WV6766-2	46GW0201
WV6766-3	46GW0801
WV6766-4	46GW0701
WV6766-5	46GW0301

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Organics Laboratory

The samples of SDG CTO367-4 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA, and/or Method for Determination of Petroleum Range Organics (Method #FL-PRO), Florida Department of Environmental Protection, November 1, 1995 and/or "Methods for the Determination of Organic Compounds in Drinking Water", U.S. EPA, Environmental Monitoring and Support Laboratory - Cincinnati (September 1995), for the specific methods listed below or on the Report of Analysis. Sample WV6688-4 was used for a matrix spike (MS) and matrix spike duplicate sample (MSD), as per client's request. Some manual integrations may have been performed due to split peaks and/or corrected baselines. All have been flagged with an "M" (software-generated) on the pertinent quantitation reports.

8260B Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory contaminants acetone and methylene chloride) in the LCS are outside of the QC limits. If the associated MS/MSD has greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

The initial calibrations analyzed on the F instrument on 12/21/05 and on the M instrument on 12/22/05 had %RSD values for acetone that exceeded the method acceptance limit of 15%. Even though the %RSD is greater than 15%, acetone was calibrated with the average model since this calibration model is more accurate for this analyte at concentrations near the PQL than either the linear or quadratic calibration models.

Samples WV6688-2, 3, 4 and WV6766-1 and 2 had high recoveries for the surrogate 1,2-dichloroethane-d4, which were outside of the laboratory established acceptance limits. For those samples that had no target analytes detected above the PQL, since a high recovery would indicate a high bias the associated samples were not reanalyzed. For those samples that had target analytes detected above the PQL, since the recoveries of the second surrogate dibromofluoromethane, which is associated with the same internal standard as the surrogate 1,2-dichloroethane-d4, were acceptable, these samples were not reanalyzed. The laboratory is conducting a long-term corrective action plan to investigate the high recoveries of this surrogate.

Samples WV6701-3, 4, and 11 were analyzed at a dilution based on sample history. Consequently, the sample's PQLs were elevated accordingly.

8015M-FLPRO Analysis

Samples WV6688-3, WV6701-8 and 9 and WV6766-2 and -3 had low recoveries for the extraction surrogate o-terphenyl, which were outside of the method acceptance limits. Since the recoveries for

the second surrogate, n-triacontane-D_{62}, were within the acceptance limits, the samples were not reextracted.

Samples WV6701-2, 4 and 11 had low recoveries for the extraction surrogates o-terphenyl and n-triacontane-D_{62}, which were outside of the method acceptance limits. The samples were reextracted twenty days out of hold time and reanalyzed. The reextracted samples WV6701-2RE, 4RE and 11RE also had low recoveries for OTP. The results for both analyses are included in the report.

The target range PRO may have been detected above the MDL but below the MDL in some method blanks. Any PRO that was also detected in any of the associated samples was flagged with a "V" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

The matrix spike sample, WG24127-3, had a high PRO recovery, which was outside of the method acceptance limits. Since the recoveries were acceptable in the associated LCS and MSD, WG24127-2 and 4, respectively, the associated samples were not reextracted.

The CV standards (files CWA2120, CWA2132, CWA2145, CWA2158, CWA2162 and CWA2176) had low and/or high responses for one or more of the individual hydrocarbons, which resulted in %D's that were outside of the method acceptance limits of 25%. Since the method requirement applies to only the PRO range response, which was acceptable in all CV's, the associated samples were not reanalyzed.

504.1 Analysis

Samples WV6688-1, 2, WV6701-8 and 9 had low recoveries for the surrogate TCX on channel A, which were outside of the laboratory established acceptance limits. Since the recoveries for TCX were acceptable on channel B, the samples were not reextracted.

Sample WV6766-3 had low recoveries for the surrogate TCX on both channels, which were outside of the laboratory established acceptance limits. The sample was reextracted and analyzed with similar results indicating a matrix effect. The results from both extractions are included in the report.

Sample WV6701-7 had high recoveries for the surrogate TCX on both channels, which were outside of the laboratory established acceptance limits. Since a high recovery would indicate a high bias and the sample did not detect 1,2-dibromoethane above the PQL, the sample was not reextracted.

Samples WV6701-2, 4 and 11 had low recoveries for the surrogate TCX on both channels, which were outside of the laboratory established acceptance limits. Based on the appearance of the extracts after completing the extraction process, the low recoveries are likely due to a matrix effect and were therefore not reextracted.

Sample WV6701-11 was extracted within the 14 day holding time. The sample was deliberately not analyzed until all of the other samples were analyzed in order to avoid a possible instrument problem. This resulted in this sample being analyzed 4 days out of hold time. Also, the surrogate for sample WV6701-11 on channel A did not elute within the laboratories established retention time

window. Therefore, the peak was manually assigned and is flagged with the qualifier "*" on the form 8. The retention time on channel B was acceptable.

The opening calibration verification standard (CV) (file 3VL1212) had a low response for the surrogate TCX on channel A, which resulted in a %D that was outside of the method acceptance limits of 15%. Since the response was within the acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The closing CV (files 3VL1236 and 3VL2236) had low responses for the surrogate TCX on both channels, which resulted in %D's that were outside of the method acceptance limits of 30%.

The closing CV (file 3WA2043) had a high response for the surrogate TCX on channel B, which resulted in a %D that was outside of the method acceptance limits of 30%. Since the response was within the acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

8270C SIM Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are nominal limits for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory phthalate ester contaminants) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

8270C Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory phthalate ester contaminants) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

The initial calibration analyzed on 01/10/06 had %RSD values for several analytes that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analyte hexachlorocyclopentadiene failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. This compound was calibrated using the average model. Since this analyte was not detected above the MDL in the associated samples, the samples were not reanalyzed.

The calibration verification standards (CV) (file K1268 and K1329) had high responses for the calibration check compound (CCC) di-n-octylphthalate, which resulted in %D's that were outside

the method acceptance limit of 20%. Since a high response would indicate a high bias and this target analyte was not detected above the PQL, the associated samples were not reanalyzed.

8082 Analysis

The method blank, WG23986-1, the laboratory control sample, WG23986-2, samples WV6688-1, 3, 4, WV6701-8, 9, 10, 11, WV6766-1 through 3, and 5 had low recoveries for the extraction surrogate DCB on both channels, which were outside of the laboratory established acceptance limits. Per the client's request the samples were reextracted 23, 24 or 27 days out of hold time and analyzed. All of the recoveries for the surrogate DCB in the reextracted samples (with the exception of WV6766-1 and 5) were also low. Samples WV6701-2RE and 4RE also had low recoveries for the extraction surrogate TCX on both channels. The results from both extractions are included in the report.

The method blank, WG24714-1, laboratory control sample WG24714-2 and laboratory control sample duplicate WG24698-3 had low recoveries for the extraction surrogate DCB on both channels, which were outside of the laboratory established acceptance limits. Since these samples were associated with reextracted samples, no further corrective action was taken.

The closing calibration verification standards (CV's) (files 6VL3097 and 6VL4097) had low responses for DCB on both channels and low responses for Aroclor 1016, Aroclor 1260 and TCX on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses were acceptable in the opening CV's, the associated samples were not reanalyzed.

The calibration verification standard (CV) (files 6WA2002) had a low response for DCB on channel B, which resulted in a %D that was outside of the method acceptance limits of 15%. Since the response was acceptable on the confirmation channel, the associated samples were not reanalyzed.

The Form 7 for the CV's (files 6VL3097, 6WA1027, 6WA2027, 6WA1084, 6WA2084, 6WA3072, 6WA4072, 6WA3110 and 6WA4110) are flagged for the surrogates TCX and/or DCB indicating that the %D is greater than the method acceptance limit of 15%. With the exception of DCB for file 6VL3097 and TCX for file 6WA3072, which were low, the %D's are actually within the method acceptance limits and should not be flagged, but due to software limitations the flagging could not be removed.

8081 Analysis

Samples WV6688-1, WV6701-2, 4, 8, 9 and 11 and WV6766-2 and 3 had low recoveries for the extraction surrogate DCB on both channels, which were outside of the laboratory established acceptance limits. Per the client's request the samples were reextracted 24, 25 or 28 days out of hold time and analyzed. All of the recoveries for the surrogate DCB in the reextracted samples were also low. Samples WV6701-2RE and 4RE also had low recoveries for the extraction surrogate TCX on both channels. The results from both extractions are included in the report.

The method blank, WG23986-1, the laboratory control sample, WG23986-2, samples WV6688-1, 3, 4, WV6701-8, 9, 10, 11, WV6766-1 through 3, and 5 had low recoveries for the extraction surrogate DCB on both channels, which were outside of the laboratory established acceptance limits. Per the client's request the samples were reextracted 23, 24 or 27 days out of hold time and analyzed. All of the recoveries for the surrogate DCB in the reextracted samples (with the exception of WV6766-1

and 5) were also low. Samples WV6701-2RE and 4RE also had low recoveries for the extraction surrogate TCX on both channels. The results from both extractions are included in the report.

The opening CV (file 8WA1136) had high responses for gamma-BHC, heptachlor, beta-BHC and TCX on the A channel, which resulted in %D's that were outside of the method acceptance limits of 15%. Since these analytes were within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The closing CV (file 8WA1159) had high responses for most target analytes on the A channel, which resulted in %D's that were outside of the method acceptance limits of 15%. Since these analytes were within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The opening CV (file 8WA1057) had a high response for TCX on channel A, which resulted in a %D that was outside of the method acceptance limits of 15%. Since all of the responses on the confirmation channel were within the acceptance limits, the associated samples were not reanalyzed.

The closing/opening CV (files 8WA1198 and 8WA2198) had high responses for 4,4'-DDD, endrin aldehyde and DCB on channel A, a low response for 4,4'-DDT on channel A, a low response for heptachlor epoxide on channel B, and high responses for endrin ketone on both channels. These responses resulted in %D's that were outside of the method acceptance limits of 15%. Since these analytes were within the method acceptance limits on the confirmation channel, with the exception of endrin ketone, and endrin ketone was not detected in any samples above the MDL, the associated samples were not reanalyzed.

The closing CV (files 8WA1222 and 8WA2222) had a high response endosulfan sulfate on channel A and high responses for endrin aldehyde and endrin ketone on both channels. These responses resulted in %D's that were outside of the method acceptance limits of 15%.

The opening CV (file 8WA3151) had a low response for alpha-BHC on the A channel, which resulted in a %D that was outside of the method acceptance limits of 15%. Since all responses were within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The closing CV (files 8WA3172 and 8WA4172) had low responses gamma-BHC, heptachlor, delta-BHC and methoxychlor on channel A and low responses for alpha-BHC on both channels. These responses resulted in %D's that were outside of the method acceptance limits of 15%.

Some of the samples and the associated QC were put through a sulfur cleanup according to SW846 method 3660 using the copper powder technique. The cleanup had little or no effect on removing the sulfur. Consequently, some of the samples may have sulfur interference affecting the quantitation of target analytes. The results of the first analysis have been reported.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of SDG CTO367-4 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Solid Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma (ICP) Atomic Emission Spectroscopic Analysis

The aqueous-matrix samples of SDG CTO367-4 were digested for ICP analyses on 12/30/05 (QC Batch VL30ICW1) in accordance with USEPA Method 3010A. Katahdin Sample No. WV6766-5 was prepared with duplicate matrix-spiked aliquots.

ICP analyses of SDG CTO367-4 sample digestates were performed using a Thermo Jarrell Ash (TJA) Trace ICP spectrometer and a TJA ICAP 61E ICP spectrometer. All samples were analyzed within holding times and all analytical run QC criteria were met, with the following comments or exceptions:

Some of the results for run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

The CCB analyzed at 20:12 in ICP analysis sequence BWA05A, failed high for magnesium. All associated samples contained magnesium at concentrations greater than ten times that of the CCB, therefore, no corrective action was necessary.

In ICP analysis sequence BWA09A, no final CCV/CCB pair was analyzed. Data was only accepted up to the CCV analyzed at 20:37. The ICSA, analyzed at 21:36, was used for data validation.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

The aqueous-matrix samples of SDG CTO367-4 were digested for mercury analysis on 01/03/06 (QC Batch WA03HGW1) and 01/04/06 (QC Batch WA04HGW0) in accordance with USEPA Method 7470A. Katahdin Sample Nos. WV6688-4 and WV6766-5 were prepared with duplicate matrix-spiked aliquots.

Mercury analyses of SDG CTO367-4 sample digestates were performed using a Cetac M6100 automated mercury analyzer. All samples were analyzed within holding times and all analytical run QC criteria were met.

During data package review, it was discovered that the closing CCB in analysis sequence HWA05A was analyzed 14 hours after the closing CCV. The associated samples (Katahdin Sample No. WV6688-4 and its matrix-spiked aliquots) were redigested and reanalyzed out of holding time. Reanalysis results confirmed the results from sequence HWA05A.

Matrix QC Summary

Analyte recoveries in the matrix-spiked aliquots of Katahdin Sample Nos. WV6688-4 and WV6766-5 are within the laboratory's acceptance limits (75% - 125% recovery of the added element, if the

native concentration is less than four times the amount added) for all measured analytes.

The matrix spike duplicate analyses of Katahdin Sample Nos. WV6688-4 and WV6766-5 are within the laboratory's acceptance limit (<20% relative difference between duplicate matrix-spiked aliquots) for all measured analytes.

The serial dilution analysis of Katahdin Sample No. WV6766-5 is outside the laboratory's acceptance limit (<10% relative percent difference, if the concentration in the original sample is greater than 50 times the IDL) for aluminum and zinc.

Overview

The sample set for NAS Pensacola, CTO 367, SDG CTO367-5, consists of sixteen (16) aqueous environmental samples and one (1) rinse blank. One (1) field duplicate pair (45GW0801D / 45GW0801) is included in this SDG.

All samples were analyzed for target analyte list (TAL) metals. The samples were collected by Tetra Tech NUS on December 18-19, 2005 and analyzed by Katahdin Analytical Services. Metals analyses were conducted using SW-846 method 6010B. Mercury analyses were conducted using SW-846 method 7470A.

Metals analyses except mercury were conducted using Inductively Coupled Plasma (ICP) methodologies. Mercury analyses were conducted using Cold Vapor Atomic Absorption (CVAA) methodology.

These data were evaluated based on the following parameters:

* • Data Completeness
* • Holding Times
• Calibration Analyses
• Laboratory Method/Preparation Blank Analyses
* • ICP Interference Analyses

Calibration Analyses

The contract required detection limit (CRDL) run on 1/5/06 at 12:19 had a percent recovery (%R) >130% for mercury. The positive result reported for mercury <2X the CRDL in sample 45RB1219 was qualified as estimated (J).

Laboratory Blank Analyses

The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Aluminum	181.87 ug/L	909.35 ug/L
Beryllium	0.66 ug/L	3.3 ug/L
Calcium	103.36 ug/L	516.80 ug/L
Cobalt	3.81 ug/L	19.1 ug/L
Copper	4.03 ug/L	20.2 ug/L
Iron	38.78 ug/L	193.9 ug/L
Magnesium	113.83 ug/L	569.15 ug/L
Manganese	1.72 ug/L	8.60 ug/L
Mercury[(1)]	0.172 ug/L	0.860 ug/L
Potassium	750.31 ug/L	3751.6 ug/L
Selenium	6.44 ug/L	32.2 ug/L
Sodium	379.36 ug/L	1896.8 ug/L
Thallium	7.38 ug/L	36.9 ug/L
Vanadium	6.55 ug/L	32.8 ug/L
Zinc	2.43 ug/L	12.2 ug/L

[(1)] Maximum concentration present in laboratory preparation blank.

An action level of 5X the maximum concentration was used to evaluate the sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results reported less than the action level for aluminum, beryllium, copper, iron, manganese, mercury, potassium, selenium, vanadium, and zinc were qualified as nondetected (U) due to laboratory blank contamination. The remaining analytes were not qualified because the results were either greater than the action level or they were nondetects. It should be noted that the rinse blank was not qualified for laboratory blank contamination.

Notes

The continuing calibration verification (CCV) standard run on 1/24/06 at 20:23 had a %R <90% for aluminum. No qualification action was required because no samples were associated with this standard.

The CRDL standards run on 1/5/06 at 16:54 and 23:27 had %Rs >130% for selenium. No qualification action was required because no samples were associated with these standards.

The matrix spike matrix spike duplicate had %Rs >125% for calcium and sodium. No qualification action was required because the initial sample concentrations were >4X the spike added.

A 3X dilution was performed for sodium in sample 45GW0701 because the concentration was above the linear range of the instrument.

Executive Summary

Laboratory Performance: Mercury was qualified due to calibration noncompliance. Several analytes were present in the laboratory method/preparation blanks.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review", July 2002 and the NFESC document entitled "Navy IRCDQM" (September 1999).

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC Guidelines and the Quality Assurance Project Plan (QAPP)."

2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$ / ICP PDS Recovery Noncompliance
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

Sample Receipt

The following samples were received on December 20, 2005 and were logged in under Katahdin Analytical Services work order number WV6767 for a hardcopy due date of January 15, 2006.

KATAHDIN Sample No.	TTNUS Sample Identification
WV6767-1	46GW0401
WV6767-2	46GW0501
WV6767-3	46GW0601
WV6767-4	46TB1218
WV6767-5	45GW0401
WV6767-6	45TB1219
WV6767-7	45GW0501
WV6767-8	18GW0201
WV6767-9	45RB1219
WV6767-10	45GW0601
WV6767-11	45GW0701
WV6767-12	45GW1201
WV6767-13	45GW1301
WV6767-14	45GW1001
WV6767-15	45GW1101
WV6767-16	18GW0401
WV6767-17	45GW0801
WV6767-18	45GW0801D
WV6767-19	45GW0901

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Organics Laboratory

The samples of SDG CTO367-5 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA, and/or Method for Determination of Petroleum Range Organics (Method #FL-PRO), Florida Department of Environmental Protection, November 1, 1995 and/or "Methods for the Determination of Organic Compounds in Drinking Water", U.S. EPA, Environmental Monitoring and Support Laboratory - Cincinnati (September 1995), for the specific methods listed below or on the Report of Analysis. Sample WV6767-5 was used for a matrix spike (MS) and matrix spike duplicate sample (MSD), as per client's request. Some manual integrations may have been performed due to split peaks and/or corrected baselines. All have been flagged with an "M" (software-generated) on the pertinent quantitation reports.

8260B Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory contaminants acetone and methylene chloride) in the LCS are outside of the QC limits. If the associated MS/MSD has greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

One or more target analytes may have been detected above the MDL in some method blanks. Any of these analytes that were also detected in any of the associated samples were flagged with a "V" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

The initial calibration analyzed on the F instrument on 12/21/05 and on the M instrument on 12/22/05 had a %RSD value for acetone that exceeded the method acceptance limit of 15%. Even though the %RSD is greater than 15%, acetone was calibrated with the average model since this calibration model is more accurate for this analyte at concentrations near the PQL than either the linear or quadratic calibration models.

Samples WV6767-1, 2, 3, and 4 had a high recovery for one surrogate, which were outside of the laboratory established acceptance limits. Since a high recovery would indicate a high bias and there were no target analytes detected above the PQL in the aforementioned samples, the samples were not reanalyzed.

The MS/MSD WG24315-4 and WG24315-5 had a low recovery for one surrogate, which was outside of the laboratory established acceptance limits. Since the associated LCS was acceptable, the MS/MSD was not reanalyzed.

8015M-FLPRO Analysis

Sample WV6767-3 had a high recovery for the extraction surrogate o-terphenyl, which was outside of the method acceptance limits. Since the recovery for the second surrogate, n-triacontane-D_{62}, was within the acceptance limits, the sample was not reextracted.

Samples WV6767-1, 5, 7, 11 and 15 had low recoveries for the extraction surrogate o-terphenyl, which were outside of the method acceptance limits. Since the recoveries for the second surrogate, n-triacontane-D_{62}, were within the acceptance limits, the samples were not reextracted.

The CV standard (files CWA2145, CWA2158, CWA2161, CWA2176, CWA2189 and CWA2202) had high and/or low responses for one or more of the individual hydrocarbons, which resulted in %D's that were outside of the method acceptance limits of 25%. Since the method requirement applies to only the PRO range response, which was acceptable in all CV's, the associated samples were not reanalyzed.

504.1 Analysis

Samples WV6767-19RA had a high recovery for the surrogate TCX on channel B, which was outside of the laboratory established acceptance limits. Since the recovery for TCX was acceptable on channel A, the sample was not reextracted.

Samples WV6767-7, 11 and 13 had low recoveries for the surrogate TCX on both channels, which were outside of the laboratory established acceptance limits. Based on the extraction, as indicated by notations in the extraction prep logbook, the low recoveries are likely due to matrix and were therefore not reextracted.

Sample WV6767-1 and 15 had low recoveries for the surrogate TCX on both channels, which were outside of the laboratory established acceptance limits. The samples were reextracted three and two days out of hold time, respectively, with similar results indicating a matrix effect. The results from both analyses are reported.

The initial analysis of samples WV6767-1, 5, 7, 10 through 12, and 14 through 19 and the matrix spike WG24230-4 and matrix spike duplicate WG24230-5 had recoveries for the surrogate TCX that were outside of the laboratory established acceptance limit. The reanalysis of these samples are labeled with the suffix "RA". The reanalyses were analyzed within hold time and met all QC acceptance limits. Therefore, only the reanalyses are reported.

The opening calibration verification standard (CV) (file 3VL1212) had a low response for the surrogate TCX on channel A, which resulted in a %D that was outside of the method acceptance limits of 30%. Since the response was within the acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The closing CV (files 3VL1236 and 3VL2236) had low responses for the surrogate TCX on both channels, which resulted in %D's that were outside of the method acceptance limits of 30%.

The closing CV (file 3WA2043) had a high response for the surrogate TCX on channel B, which resulted in a %D that was outside of the method acceptance limits of 30%. Since the response was

within the acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The opening CV (file 3WA1075) had a low response for the surrogate TCX on channel A, which resulted in a %D that was outside of the method acceptance limits of 30%. Since the response was within the acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The closing CV (file 3WA1083) had a low response for the surrogate TCX on channel A, which resulted in a %D that was outside of the method acceptance limits of 30%. Since the response was within the acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

8270C SIM Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are nominal limits for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory phthalate ester contaminants) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

Sample WV6767-12 had a high response for one internal standard, which was outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The sample WV6767-12RA was reanalyzed and had a high recovery for one surrogate, which was outside the laboratory established acceptance limits. This indicated a likely matrix effect. The results from both analyses are included in the report.

8270C Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory phthalate ester contaminants) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

The LCS WG24953-2 had greater than ten percent of the spiked analytes with recoveries that were low and/or high and outside of the laboratory established acceptance limits. Since this LCS is associated with the two reextracted samples, no further action was taken.

The initial calibration analyzed on 01/10/06 had %RSD values for several analytes that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analyte hexachlorocyclopentadiene

failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. This compound was calibrated using the average model. Since this analyte was not detected above the PQL in any of the associated samples, the samples were not reanalyzed.

The calibration verification standard (CV) (file K1429) had high responses for the (CCC) calibration check compounds 2,4-dichlorophenol and di-n-octylphthalate, which resulted in %D's that were outside the method acceptance limit of 20%. Since a high response would indicate a high bias and these analytes were not detected above the PQL in the associated samples, the samples were not reanalyzed.

The CV (file K1444) had a high response for the CCC 2,4-dichlorophenol and a low response for 2,4,6-trichlorophenol, which resulted in %D's that were outside the method acceptance limit of 20%.

Sample WV6767-10 had a low recovery for one surrogate, which was outside the laboratory established acceptance limits. Sample WV6767-10 also had a low response for one internal standard, which was outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The sample was reanalyzed with similar failures. Sample WV6767-16 had a low recovery for one surrogate, which was outside the laboratory established acceptance limits. The client was contacted and requested reextraction of this sample. The samples were reextracted thirty-one days out of hold time and then analyzed. The recoveries of the surrogates for the reextracted samples were acceptable. The results from both extractions are included in the report.

8082 Analysis

Samples WV6767-1, 5, 7, 8, 10, 11, 13, 15, 17, 19, the matrix spike WG24121-3 and matrix spike duplicate WG24121-4 had low recoveries for the extraction surrogate DCB on both channels (with the exception of WV6767-17 which was low only on channel A), which were outside of the laboratory established acceptance limits. Per the client's request the samples were reextracted 22 or 23 days out of hold time and analyzed. All of the recoveries for the surrogate DCB in the reextracted samples were also low. The results from both extractions are included in the report.

The method blank, WG24714-1, laboratory control sample WG24714-2 and laboratory control sample WG24737-2 had low recoveries for the extraction surrogate DCB on both channels, which were outside of the laboratory established acceptance limits. Since these samples were associated with reextracted samples, no further corrective action was taken.

Sample WV6767-5 and the reextracted sample WV6767-5RE contained some peaks that had the same retention times as those from peaks of the Aroclor 1260 standard. However, there were several peaks in the standard that were not present in the sample. Also, many of the peaks in the sample were disproportional to those from the Aroclor 1260 standard. Therefore, this sample was not identified for this aroclor.

The closing calibration verification standards (CV's) (files 6VL3097 and 6VL4097) had low responses for DCB on both channels and low responses for Aroclor 1016, Aroclor 1260 and TCX on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses were acceptable in the opening CV's, the associated samples were not reanalyzed.

The calibration verification standards (CV's) (files 6WA1128 and 6WA2128) had low responses for Aroclor 1260 on channel A and a high response for TCX on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses were acceptable on the confirmation channel, the associated samples were not reanalyzed.

The calibration verification standard (CV) (file 6WA1152) had a low response for Aroclor 1260 on channel A, which resulted in a %D that was outside of the method acceptance limits of 15%. Since the response was acceptable on the confirmation channel, the associated samples were not reanalyzed.

The calibration verification standard (CV) (file 6WA4130) had a high response for Aroclor 1016 on channel B, which resulted in a %D that was outside of the method acceptance limits of 15%. Since the response was acceptable on the confirmation channel, the associated samples were not reanalyzed.

The Form 7 for the CV's (files 6VL3097, 6WA1084, 6WA2084, 6WA1128, 6WA2128, 6WA3072, 6WA4072, 6WA3110, 6WA4110, 6WA3130 and 6WA4130) are flagged for the surrogates TCX and/or DCB indicating that the %D is greater than the method acceptance limit of 15%. With the exception of DCB for file 6VL3097 and TCX for files 6WA2128 and 6WA3072, which were low or high, the %D's are actually within the method acceptance limits and should not be flagged, but due to software limitations the flagging could not be removed.

8081 Analysis

Samples WV6767-7, 10, 11, 13, 15 and 19 had low recoveries for the extraction surrogate DCB on both channels, which were outside of the laboratory established acceptance limits. The samples were reextracted twenty-two days out of hold time and analyzed. The results from both analyses have been reported.

Sample WV6767-1 had low recoveries for the extraction surrogate DCB on both channels, which were outside of the laboratory established acceptance limits. Since this sample was used for the matrix spike and matrix spike duplicate samples, which had acceptable recoveries for DCB on both channels, WV6767-1 was not reextracted.

The closing/opening CV (files 8WA1198 and 8WA2198) had high responses for 4,4'-DDD, endrin aldehyde and DCB on channel A, a low response for 4,4'-DDT on channel A, a low response for heptachlor epoxide on channel B, and high responses for endrin ketone on both channels. These responses resulted in %D's that were outside of the method acceptance limits of 15%. Since these analytes were within the method acceptance limits on the confirmation channel, with the exception of endrin ketone, and endrin ketone was not detected in any of the associated samples above the MDL, the associated samples were not reanalyzed.

The closing CV (files 8WA1222 and 8WA2222) had a high response endosulfan sulfate on channel A and high responses for endrin aldehyde and endrin ketone on both channels and a high response for DCB on channel B. These responses resulted in %D's that were outside of the method acceptance limits of 15%.

The closing CV's (files 8WA3028 and 8WA4028) had high responses for most target analytes on both channels, which resulted in %D's that were outside of the method acceptance limits of 15%. Since these analytes were within the method acceptance limits in the opening CV's, the associated samples were not reanalyzed.

The opening CV (file 8WA3151) had a low response for alpha-BHC on the A channel, which resulted in a %D that was outside of the method acceptance limits of 15%. Since all responses were within the method acceptance limits on the confirmation channel, the associated samples were not reanalyzed.

The closing CV (files 8WA3172 and 8WA4172) had low responses gamma-BHC, heptachlor, delta-BHC and methoxychlor on channel A and low responses for alpha-BHC on both channels. These responses resulted in %D's that were outside of the method acceptance limits of 15%.

Some of the samples and the associated QC were put through a sulfur cleanup according to SW846 method 3660 using the copper powder technique. The cleanup had little or no effect on removing the sulfur. Consequently, some of the samples may have sulfur interference affecting the quantitation of target analytes. Since there was no significant improvement with the sulfur cleanup extracts, the results from the non-sulfur cleanup extracts are reported.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of SDG CTO367-5 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Solid Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma (ICP) Atomic Emission Spectroscopic Analysis

The aqueous-matrix samples of SDG CTO367-5 were digested for ICP analyses on 01/03/06 (QC Batch WA03ICW0) in accordance with USEPA Method 3010A. Katahdin Sample No. WV6767-5 was prepared with duplicate matrix-spiked aliquots.

ICP analyses of SDG CTO367-5 sample digestates were performed using a Thermo Jarrell Ash (TJA) Trace ICP spectrometer and a TJA ICAP 61E ICP spectrometer. All samples were analyzed within holding times and all analytical run QC criteria were met, with the following comments or exceptions:

Some of the results for run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

Some CCBs analyzed analysis sequence BWA05A, failed high for calcium or magnesium. All associated samples contained calcium and magnesium at concentrations less than the PQL or greater than ten times that of the CCB, therefore, no corrective action was necessary.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

The aqueous-matrix samples of SDG CTO367-5 were digested for mercury analysis on 01/05/06 (QC Batch WA05HGW0) in accordance with USEPA Method 7470A. Katahdin Sample No. WV6767-5 was prepared with duplicate matrix-spiked aliquots.

Mercury analyses of SDG CTO367-5 sample digestates were performed using a Cetac M6100 automated mercury analyzer. All samples were analyzed within holding times and all analytical run QC criteria were met.

Matrix QC Summary

Analyte recoveries in the matrix-spiked aliquots of Katahdin Sample No. WV6767-5 are within the laboratory's acceptance limits (75% - 125% recovery of the added element, if the native concentration is less than four times the amount added) for all measured analytes.

The matrix spike duplicate analysis of Katahdin Sample No. WV6767-5 is within the laboratory's acceptance limit (<20% relative difference between duplicate matrix-spiked aliquots) for all measured analytes.

The serial dilution analysis of Katahdin Sample No. WV6767-5 is within the laboratory's acceptance limit (<10% relative percent difference, if the concentration in the original sample is greater than 50 times the IDL) for all analytes.
