RE: Final Site Inspection Report for the Site 3 Pistol Range, Munitions Response Site (UXO 001), Outlying Landing Field Saufley, Pensacola, Florida.

Dear John:

I have completed my review of Final Site Inspection Report for the Site 3 Pistol Range, Munitions Response Site (UXO 001), Outlying Landing Field Saufley, dated May 2014 (received May 15, 2014), prepared and submitted by Tetra Tech, Inc. The report documents that surface soils at the site have been impacted by past shooting range activities, but not at concentrations that require remediation. Most of the lead detected in surface soils was detected in samples collected from 0 to 0.5 feet below land surface and was attributed to lead bullets and bullet fragments. The calculated exposure concentration, using the average lead concentration, was determined to be less than the Department's residential soil cleanup target level. I have the following comments on the report:

- (1) The groundwater sampling log for the monitoring well installed at Site 3 was not provided in the report. Also, the laboratory analysis sheets and validated data sheets were not provided for the groundwater sample that was collected and analyzed. This data is necessary to verify that inorganic analytes have not migrated to groundwater. Please provide this information.
- (2) Appendix E contains the Field Activities Report for Saufley Field Site 3 Pistol Range. This report describes the work conducted to remove bullets, bullet fragments and casings from the Pistol Range berm. According to the report, approximately 120 cubic yards of soil was excavated and processed through screens to remove bullets, bullet fragments and casings. The amount of bullets, bullet fragments and shell casings sieved from the soil was enough to fill a single 55-gallon drum and weighed approximately 1,295 pounds. Please provide the name of the subcontractor who hauled the material off for recycling and some type of documentation that the material was sent for recycling rather than disposal.
