EXECUTIVE SUMMARY

Tetra Tech NUS, Inc. (TtNUS) has been authorized by Southern Division, Naval Facilities Engineering Command to prepare a site assessment report (SAR) addendum for the oil/water separator and product line investigation at Naval Air Station (NAS) Whiting Field, in Santa Rosa County, Florida. Site investigations were conducted at NAS Whiting Field at the oil/water separator site near Building 2993 and three JP5 product line sites designated as:

- The product line pump station
- The product line junction
- The product line dispensing facility

This SAR addendum has been prepared for these investigation sites to:

- Address comments included in the technical review letter issued by the Florida Department of Environmental Protection (FDEP) on September 29, 1998, including a summary of the additional work performed by TtNUS and the resulting data.
- Document the remedial actions conducted at the oil/water separator site, the product line pump station, and the product line dispensing facility.
- Provide a summary of the site assessment investigation conducted at the product line junction site, which was not reported in the SAR, and provide the conclusions and recommendations based on the data collected at the site.
- Make recommendations regarding the status of each of the investigation sites, including the need for further investigations or remedial actions at each of the sites.

SITE ASSESSMENT ACTIVITIES

Oil/Water Separator

A site assessment was conducted at the oil/water separator site to determine the extent of soil impact in the vadose zone at the site. As an interim remedial action (IRA), approximately 1,000 cubic yards of soil were excavated from the site in October 1998 for treatment and disposal. Following the IRA, confirmation soil samples, for offsite laboratory analysis, were collected to

verify the soil cleanup target levels (SCTLs) were achieved. One monitoring well was installed at the site and sampled.

Product Line Dispensing Facility

The product line dispensing facility was investigated as part of the product line site assessment. A soil-removal IRA was conducted in January 2000. Samples were collected and analyzed from the stockpiles of soil removed from the excavation. Concentrations of petroleum constituents in the soil samples were below SCTLs and the stockpiled soil was returned to the excavation. One monitoring well was installed at the site and sampled.

Product Line Pump Station

The product line pump station was investigated as part of the product line site assessment. A soil removal IRA was conducted in October 1998 by Public Works Center (PWC) Pensacola, which removed contaminated soil from adjacent to Building 2893, but not from underneath the building. A second IRA, including demolition of Building 2893, was conducted in February 2000 and additional soil was removed from the site.

Product Line Junction

The product line junction was investigated as part of the product line site assessment, but the site was considered for transfer to the Installation Restoration Program (IRP) and the results of the investigation were not presented in the SAR. Two monitoring wells were installed at the site and sampled. Additional soil assessment was conducted at the site following the decision to evaluate site soil under the petroleum storage tank management program and site groundwater as part of the IRP.

RECOMMENDATIONS

The following are the recommended courses of action for each of the sites investigated:

- Oil/Water Separator Site – Soil analytical data collected from the site following the IRA indicate that petroleum constituents in soil remaining at the site are at concentrations below SCTLs. Therefore no further action should be required due to petroleum impact to vadose zone soil at the site. The groundwater cleanup target level (GCTL) exceedance of ethylene dibromide (EDB) in site groundwater should be evaluated under the base wide groundwater investigation conducted under the IRP.

- Product Line Dispensing Facility - Concentrations of petroleum constituents in the soil samples collected from the stockpiles of soil excavated from the site were below SCTLs. The stockpiled soil was returned to the excavation. Petroleum constituents were not detected at concentrations above standard laboratory detection limits in the groundwater sample collected at the site. No further action should be required due to petroleum impact to soil or groundwater at the site.
- Product Line Pump Station - Concentrations of petroleum constituents in the soil samples collected following the IRA were below SCTLs. Therefore no further action should be required due to petroleum impact to vadose zone soil at the site. Depth of vadose zone impact was limited to approximately 13 feet below land surface (bls) and groundwater was not encountered during site assessment investigations. Therefore, evaluation of site groundwater is not recommended at this site.
- Product Line Junction - A remedial action plan (RAP) should be prepared to address petroleum impact to vadose zone soil at this site. Site groundwater should be evaluated under the base-wide groundwater investigation conducted under the IRP.

1.0 INTRODUCTION

Tetra Tech NUS, Inc. (TtNUS), under contract to the Department of Navy, Southern Division, Naval Facilities Engineering Command (SOUTHNAVFACENGCOM), is submitting this Site Assessment Report (SAR) Addendum to document site investigations and remedial actions performed at sites at Naval Air Station (NAS) Whiting Field, located near Milton, Florida. Site activities were conducted at the oil/water separator site near Building 2993 and three JP5 product line sites (Figure 1) designated as:

- The product line pump station
- The product line junction, located near the intersection of Hornet and Saratoga streets, and
- The product line dispensing facility

This SAR Addendum was prepared on behalf of the Navy under contract No. N62467-94-D-0888.

1.1 SITE INVESTIGATION HISTORY

Previously, a contamination assessment report (CAR) had been prepared for the oil/water separator site (W. Grady Swann, Inc., 1995) and a product line closure assessment report had been prepared for the JP5 product line (Jim Stidham and Associates, Inc., 1996). To collect additional data for the SAR, field investigations were conducted at the oil/water separator site and the three product line sites.

In July 1998, the SAR for the oil/water separator and product line investigation (Brown and Root Environmental, 1998) was submitted to the Florida Department of Environmental Protection (FDEP) for review. The SAR discussed the field investigations and results for oil/water separator site, the product line pump station, and the product line dispensing facility. The preliminary data from the product line junction site suggested that the release from this site had co-mingled with the North Field Industrial Area petroleum plume. Therefore, it was determined that further investigation and reporting for the product line junction site should be conducted as part of the Installation Restoration Program (IRP) investigation of the North Field Industrial Area.

A technical review letter was issued by the FDEP on September 29, 1998 that provided comments on the SAR and requested further assessment and additional information. A copy of the letter is provided in Attachment A. Monitoring wells were installed and groundwater samples were collected at the oil/water separator site and the product line dispensing facility. Additional soil evaluation was also conducted at the product line junction.

1.2 INTERIM REMEDIAL ACTIONS

Based on the data collected during the SAR investigation, interim remedial action (IRA) soil removals were conducted at the oil/water separator site and the product line pump station in October 1998 by the Navy's Public Works Center (PWC) Pensacola (Navy Public Works Center Pensacola, 1998a and 1998b). Confirmation soil samples were collected by TtNUS following the IRA at the oil/water separator site.

Soil removal IRAs and confirmation soil sampling were conducted at the product line pump station and the product line dispensing facility by the Navy's remedial action contractor (RAC) during January and February 2000 (CH2M Hill Constructors, Inc., 2000). Stockpiled soil from the product line dispensing facility excavation was sampled by TtNUS to determine the appropriate disposal alternative.

1.3 SITE ASSESSEMENT REPORT ADDENDUM OBJECTIVES

The objectives of this SAR Addendum are:

- To address comments included in the technical review letter issued by the FDEP on September 29, 1998, including a summary of the additional work performed by TtNUS and the resulting data.
- To document the interim remedial actions conducted at the oil/water separator site, the product line pump station, and the product line dispensing facility.
- To provide a summary of the site assessment investigation conducted at the product line junction site, which was not reported in the SAR, and provide the conclusions and recommendations based on the data collected at the site.
- To make recommendations regarding the status of each of the investigation sites, including the need for further investigations or remedial actions at each of the sites.

2.0 RESPONSES TO FDEP COMMENTS

In July 1998, the SAR for the oil/water separator and product line investigation was submitted to the FDEP for review. A technical review letter was issued by the FDEP on September 29, 1998 that provided comments on the SAR and requested further assessment and additional information (Attachment A). Each of the comments is addressed below.

2.1 COMMENT 1

“Please confirm that the “sludge tank” described in Section 1.2.5 was not a waste oil tank, which would necessitate analysis of soil samples for the contaminants in Table II, Chapter 62-770, FAC. What was the nature of the “sludge”?”

Review of the contamination assessment report prepared for the oil/water separator system (W. Grady Swann, Inc., 1995) indicates that the sludge tank was not used for waste oil disposal. Excerpts from the CAR discussing the system are included in Attachment B. The oil/water separator appears to have been part of the storm water collection and treatment system for the parking area to the west. The description of the system suggests that the sludge tank was an underground storage tank (UST) that was also part of the storm-water treatment system, located upstream of the oil/water separator. Furthermore, data in the closure assessment form (Attachment B) filed with the FDEP at the time of tank closure indicate that the system was not a used oil system and that the sludge “tank” may have in fact been a concrete pad. Additional data were not available specifying the exact operation and contents of the sludge tank. An IRA was conducted at the site to remove contaminated soil and is described in Section 3.0.

2.2 COMMENT 2

“It appears that the soil samples were not taken strictly following the guidance in Chapter 62-770, FAC in that samples were not taken from samples in the low, intermediate and high OVA ranges; however, since the proposed IRA is being based on OVA values, this does not appear to pose a problem. The Navy may want to consider additional soil borings and analyticals, which may help reduce the volume of soil that will be removed.”

We agree that the selection at each site of soil samples for offsite analysis did not adhere exactly to the Chapter 62-770, Florida Administrative Code (FAC) specifications. The preliminary planning for the soil removal IRAs was based on the organic vapor analyzer (OVA) data collected during the SAR investigation. During the performance of the IRAs, soil samples from the excavations were screened in the field and confirmatory soil samples were collected for offsite analysis. Additional soil sampling activities conducted during the IRAs are discussed in Section 3.0. The site investigation activities conducted at the product line junction are discussed in Section 4.0.

2.3 COMMENT 3

“According to Figure 3-3, General Information Report for Whiting Field, January 1998, the geology directly under the site consists of interbedded sands, silts and clays with the presence of clay lenses with the first of two general lenses at about 15-20 feet below land surface (bls). Because of this, lateral migration of petroleum products with downward migration is likely. Accordingly, please install a monitoring well which intersects the water table which is situated at the approximately 90 foot bls depth in the vicinity of OSW-SB-05 at the Oil/Water Separator site. Additionally, please install one monitoring well in the vicinity of PDF-SB-09 at the Product Line Dispensing site. Sample and analyze ground water from these wells for volatile and semivolatile petroleum constituents as specified in Table 1 of Chapter 62-770, F.A.C. Please present the results of the analyses in tabular form. Alternatively, if there are IRP program wells in close proximity, I will consider analyses from them. If you choose to utilize any of these wells, please meet with me so that I can review their suitability.”

Two water table monitoring wells were installed during May 2000: one at the product line dispensing facility (WHF-PDF-1S) and one at the oil/water separator site (WHF-OWS-1S). The locations of the wells are shown on Figures 2 and 3. WHF-PDF-1S was screened from 100 to 115 feet below land surface (bls). WHF-OWS-1S was screened from 89 feet to 104 feet bls. Groundwater samples were collected and analyzed for volatile organic compounds (VOCs), ethylene dibromide (EDB), polynuclear aromatic hydrocarbons (PAHs), total recoverable petroleum hydrocarbons (TPH), and lead. The analytical results are summarized in Table 1. Field data and laboratory analytical reports are included in Attachment C.

Concentrations of petroleum constituents reported from WHF-PDF-1S were below the groundwater cleanup target levels (GCTLs) established in Chapter 62-777 FAC. EDB was detected in the WHF-OWS-1S groundwater sample (OWSGWMW01S001) at a concentration of 0.040 µg/l, exceeding the GCTL of 0.02 µg/l. An additional groundwater sample (OWSGWMW01S002) was collected from WHF-OWS-1S and analyzed for EDB, PAHs, and TPH to verify the analytical results from the first groundwater sample. The EDB concentration had decreased to 0.028 µg/l, which still exceeded the GCTL. Further investigation of the groundwater at this location should be included in the base-wide groundwater investigation currently being conducted under the IRP.

2.4 COMMENT 4

“The product line that was partially investigated as part of this assessment needs further assessment. I suggest that we meet with Mr. Jim Holland and Ms. Linda Martin at the next NAS Whiting Field Partnering meeting and discuss how we may address this. Additionally, I request that we be prepared at the meeting to show where previous investigation activities have occurred along the pipeline so that we can determine the remaining portions of the pipeline that need assessment.”

The length of the JP5 product line was investigated during the product line closure assessment (Jim Stidham and Associates, Inc., 1996). The SAR focused on the areas of the JP5 product line determined to have petroleum impact. Another product line, the AVGAS pipeline, is located in the vicinity of the JP5 product line for part of its length (Figure 4). The AVGAS pipeline has been closed by a certified petroleum storage system

contractor. TtNUS has conducted a closure assessment along the extent of the AVGAS pipeline and prepared a pipeline closure assessment report (TtNUS, 2001).

3.0 INTERIM REMEDIAL ACTIONS

IRA soil removals have been conducted at the oil/water separator site, the product line pump station and product line dispensing facility. Field screening data were used at each site to determine the extent of the excavations. Confirmation soil samples were collected from each of the excavations to verify that remedial goals had been met.

3.1 OIL/WATER SEPARATOR SITE

The oil/water separator, sludge tank, and associated piping were removed from the oil/water separator site in 1996. Tank closure assessment and IRA forms documenting the removal were filed with the FDEP (Brown and Root Environmental, 1998, Appendix C). Approximately 34.45 cubic yards of soil were removed from a 10 feet by 15.5 feet area excavated to a depth of six feet. The excavated soil was transported to a landfill for disposal.

An additional soil removal IRA was conducted at the oil/water separator site by PWC Pensacola in October 1998 (Navy Public Works Center Pensacola, 1998a). Field screening data was collected from 16 soil sampling locations by PWC personnel during the excavation (Figure 5). The extent of the IRA excavation was determined from OVA field screening data. Soils with field screening responses greater than 50 parts per million (ppm) were excavated where feasible and stockpiled for offsite disposal. Approximately 1,000 cubic yards of soil were removed from the excavation and transported to Hudsco, Inc. Thermal Treatment Facility in Pensacola, Florida for disposal (Attachment D). A small area on the east side of Building 2993 and the adjacent paved area, although some of the field screening responses were greater than 50 ppm, was not excavated to avoid structural damage to active facilities. Soil removed from the excavation was stockpiled for future disposal.

Following the soil removal, field screening data was collected from six soil borings advanced at the edges of the IRA excavation (OWS-SB-18, OWS-SB-19, OWS-SB-21, OWS-SB-22, OWS-SB-23, and OWS-SB-24) and one boring located within the excavation boundary (OWS-SB-20). OWS-SB-20 was advanced to a depth below the deepest extent of the IRA excavation. Soil samples from the borings were screened with an OVA following the headspace screening methods specified in the SAR. The results of the soil field screening are shown on Figure 5. The field screening data were used to verify that the remedial goals of the IRA had been met. A summary of the field screening results is provided in Table 2.

A confirmatory soil sample was collected from each soil boring location and submitted to an offsite laboratory for analysis. The confirmatory samples were analyzed for VOCs, PAHs, and TPH (Table 3). The analytical

results for the confirmatory soil analyses are summarized on Figure 6, and the laboratory analytical reports are included in Attachment E. Soil analytical results were evaluated by comparison to the residential direct exposure and leaching soil cleanup target levels (SCTLs) specified in Chapter 62-777 FAC. The reported concentrations of petroleum constituents in the confirmatory soil samples were below SCTLs. Methylene Chloride was reported in four of the confirmatory soil samples at concentrations below the SCTL. These analytical results were flagged by the laboratory as suspected laboratory contamination.

3.2 PRODUCT LINE PUMP STATION

A soil removal IRA was conducted at the product line pump station (Building 2893) by PWC Pensacola during October 1998 (Navy Public Works Center Pensacola, 1998b). Approximately five cubic yards of soil were excavated at the northwest corner of the building and stockpiled for disposal along with the soil from the oil/water separator site. The soil was transported to Hudscos, Inc. Thermal Treatment Facility in Pensacola, Florida for disposal (Attachment D). Field screening data indicated that excessively contaminated soil extended underneath the pump station building. Further excavation was not conducted due to risk of structural damage to the building.

A second IRA, including demolition of Building 2893, was conducted by the RAC at the product line pump station in February, 2000 (CH2M Hill Constructors, Inc., 2000). During this IRA, field screening and confirmation sampling were conducted by the RAC. Approximately 1,600 cubic yards were excavated at the product line pump station. Soil from the excavation was segregated and stockpiled. Clean soil was used to backfill the excavation. Approximately 1,362.41 tons of petroleum contaminated soil were disposed of offsite at Waste Management's Springhill Landfill in Cambellton, Florida. The site map, laboratory data summary, field screening log, and disposal certificates are included in Attachment F.

3.3 PRODUCT LINE DISPENSING FACILITY

During the January, 2000 IRA at the product line dispensing facility (also called the Flightline Fuel Dispensing Area or FFDA), field screening and confirmation sampling were conducted by the RAC (CH2M Hill Constructors, Inc., 2000). Approximately 2,100 cubic yards of soil were excavated at the product line dispensing facility based on the field screening results. Soil from the excavation was stockpiled in two piles, the larger pile was approximately 1,400 cubic yards and the smaller pile was approximately 700 cubic yards. Thirteen confirmation samples were collected from the bottom and the east, south, and west walls of the excavation. Laboratory analytical results indicated that petroleum constituents in the confirmation soil samples were at concentrations below SCTLs. The site map, laboratory data summary, and field screening log prepared by the RAC are included in Attachment F.

Due to the volume of soil generated from the product line dispensing facility excavation, soil samples were collected from the stockpiles for off site laboratory analysis to evaluate disposal alternatives. Soil sample locations were established on the large stockpile at 25-foot intervals measured along the perimeter of the stockpile. Soil samples were collected from the top, middle, and bottom of the stockpile at each stockpile location for offsite analysis. A total of 33 soil samples were collected from the large stockpile. Four soil samples were collected from the small stockpile, one from each quadrant of the stockpile. Laboratory analytical results (Table 4) indicated that petroleum constituents in the stockpile soil samples were at concentrations below SCTLs. The laboratory analytical reports are included in Attachment G.

Two additional confirmation samples (47SP016 and 47SP017) were collected from the north and northeast walls of the excavation, which had not been previously sampled. Laboratory analytical results (Table 4) indicated that petroleum constituents in these confirmation soil samples were at concentrations below SCTLs. The laboratory analytical reports are included in Attachment G. The stockpiled soil was used to backfill the excavation following evaluation of the laboratory analytical results.

4.0 PRODUCT LINE JUNCTION SITE ASSESSMENT

Previously, a product line closure assessment report had been prepared for the JP5 Product Line (Jim Stidham and Associates, Inc., 1996). To collect additional data for the SAR, field investigations were conducted at the product line junction. The SAR was issued in July 1998 (Brown and Root Environmental, 1998). The preliminary data indicated that petroleum impact had occurred at the site and the site was considered for transfer to the IRP investigation of the North Field Industrial Area. Following review of the SAR for the other product line sites, it was determined that groundwater impact at the product line junction site could be addressed as part of the IRP investigation of the North Field Industrial Area, and that soil impact should be further evaluated under the UST program. Additional soil data were collected at the product line junction site in May 2000 to complete the site assessment. The findings of the product line junction investigations are discussed below.

4.1 SITE HYDROGEOLOGY

The type and distribution of sediments encountered at the product line junction were similar in nature to those previously described in the SAR for the other product line sites. The sediments from near surface to approximately 3 to 5 feet bls consisted of a fine to medium grained quartz sand, light brown to yellowish in color with some silt. Underlying the sand is an alternating sequence of sandy clay, clay and clayey sand, which extends to a depth of approximately 25 feet bls. These sediments have a mottled appearance and range in color from reddish brown to light brown to gray, with a medium stiff density and a slightly plastic consistency. The series is predominantly dry with some zones noted as moist. Below 25 feet the sediments consisted of very fine- to fine-grained sand ranging in color from yellowish orange to red. These sediments were noted as dry. Soil boring logs are included as Attachment H.

Continuous low-permeability horizons acting as perching or confining layers were not reported in the study area. Soils with petroleum odors and/or staining were noted at various depths in several of the borings. Depth to groundwater was approximately 85 to 90 feet bls.

4.2 SOIL QUALITY

Field screening data was collected from 26 soil borings advanced at the site. Soil samples collected from the borings were screened with an OVA following the headspace screening methods specified in the SAR. A plan view of the soil field screening results is shown on Figure 7. Vertical profiles were prepared showing the field screening results from selected soil boring locations (Figure 8). The east/west cross section A-A' (Figure 9) is parallel to the JP5 product line. The two north/south cross sections, B-B' and C-C', are located to the

west (Figure 10) and east (Figure 11) of Saratoga Street. The field screening data were used to determine the extent of the site assessment investigation and to select appropriate samples for offsite confirmatory analyses. A summary of the field screening results is provided in Table 5.

Confirmatory soil samples representing low, medium, and high field screening responses were submitted to offsite laboratories for analysis during the November 1997 and May 2000 field investigations. The samples collected during November 1997 were analyzed for volatile organic aromatics (VOAs), methyl tert butyl ether (MTBE), PAHs and TPH. The samples collected during the May 2000 field investigation were analyzed for VOCs, PAHs and TPH. The analytical results for the soil sampling events are summarized in Table 6, and the laboratory analytical reports are included in Attachment I.

Soil analytical results were evaluated by comparison to the residential direct exposure and leaching SCTLs specified in Chapter 62-777, FAC. The confirmatory soil sample from SB-01 had SCTL exceedances for TPH and benzo(a)pyrene (Figure 12). The soil sample from SB-02 had SCTL exceedances for TPH, ethylbenzene, and xylene. The soil sample from SB-11 had SCTL exceedances for ethylbenzene and xylene.

Comparison of the field screening data and the offsite laboratory analytical results indicate that the samples with field screening responses less than 1,500 ppm had concentrations of petroleum constituents below the laboratory method detection limits. Laboratory analytical results from three of the four samples with field screening responses above 1,500 ppm had concentrations of petroleum constituents exceeding SCTLs.

4.3 GROUNDWATER QUALITY

Two monitoring wells were installed at the product line junction site in January 1998 (Figure 13). Monitoring well MW01 has a total depth of 105 feet and is screened from 90 to 105 feet. Monitoring well MW02 has a total depth of 100 feet and is screened from 85 to 100 feet. Soil boring logs and well installation diagrams are included in Attachment J.

Groundwater samples were collected from these two wells on January 10, 1998, and analyzed for VOCs, semivolatile organic compounds (SVOCs), TPH, and lead. Analytical results from the groundwater sample from MW01 indicate that benzene, ethylbenzene, toluene, and xylene (BTEX); the PAHs naphthalene and 2-methylnaphthalene; and EDB and dichloromethane, were present at concentrations exceeding GCTLs (Figure 13). Analytical results from the groundwater sample from MW02 indicate that BTEX, naphthalene, and total lead were present at concentrations exceeding GCTLs. The analytical results for the groundwater sampling round are summarized in Table 7, and the laboratory analytical report is included in Attachment K.

4.4 CONTAMINANT MASS

An estimate of contaminant mass in the vadose zone soil was calculated using the following assumptions regarding the vertical and horizontal distribution of contaminants in the vadose zone and the concentrations of petroleum constituents reported from offsite laboratory analyses:

- Soil borings with one or more samples exhibiting a field screening response greater than 1,500 ppm were considered to be within the area of impact. The comparison of the field screening data and the offsite laboratory analytical results suggests that this screening level is indicative of soil with petroleum constituent concentrations exceeding SCTLs. Nine soil borings are included in the area of impact (Figure 14).
- The horizontal extent of the area of impact was defined by the locations of the soil borings where field screening results were below 1,500 ppm. The area of impact delineated by this criterion is approximately 150 feet by 60 feet.
- The vertical extent of vadose zone impact at each soil boring location included in the area of impact was considered to begin at the depth of the first field screening result exceeding 1,500 ppm and continue to the water table. A depth to groundwater of 95 feet bls was used to estimate the thickness of the vadose zone. The average contamination thickness for the nine soil borings included in the area of impact is approximately 82 feet.
- The concentration of petroleum hydrocarbons in the area of impact was determined from the arithmetic mean of the positive TPH detections in the soil samples submitted for offsite analyses. The average TPH concentration was 390 mg/kg.

Based on the assumptions presented above, the estimated mass of petroleum contaminants in vadose zone soil at the site is 26,155 pounds. The estimated volume of vadose zone soil impact is 577,268 cubic feet. The volume and mass estimate calculations are included in Attachment L.

4.5 CONCLUSIONS

Petroleum constituents are present in vadose zone soil at concentrations exceeding SCTLs at the product line junction. Area of petroleum impact to the vadose zone soil is approximately 7,069 square feet. Within this area, the vertical extent ranges from five to 25 feet bls to the water table at approximately 85 feet bls. Comparison of the field screening data and offsite laboratory data indicates that field screening responses

exceeding 1,500 ppm are indicative of petroleum constituents at concentrations exceeding SCTLs in site soils. Petroleum constituents were also present at concentrations exceeding GCTLs in groundwater samples collected from the two monitoring wells installed at the site.

4.6 RECOMMENDATIONS

A remedial action plan (RAP) should be prepared for the product line junction site to address the presence of soil in the area of impact exceeding SCTLs for one or more petroleum constituents. Groundwater impact at this site should be evaluated as part of the IRP investigation of the North Field Industrial Area groundwater plume.

5.0 SITE ASSESSMENT SUMMARY

Site investigations were conducted at NAS Whiting Field at the oil/water separator site near Building 2993 and three JP5 product line sites designated as:

- The product line pump station
- The product line junction
- The product line dispensing facility

5.1 SITE ACTIVITIES SUMMARY

A contamination assessment was conducted in 1995 at the oil/water separator site following the detection of free product in a compliance well installed at the oil/water separator (W. Grady Swann, Inc., 1995). Petroleum impact to site soil and a small perched groundwater zone were reported in the CAR. The oil/water separator was removed along with a small amount of contaminated soil in 1996. A site assessment was conducted to determine the extent of soil impact in the vadose zone at the site (Brown and Root Environmental, 1998). Approximately 1,000 cubic yards of soil were removed from the site during a soil removal IRA (PWC Pensacola, 1998a). Following the IRA, confirmation soil samples for offsite laboratory analysis were collected to verify the SCTLs were achieved. One monitoring well was installed and sampled at the site.

The product line dispensing facility was investigated as part of the product line closure assessment conducted in 1996 (J. Stidham and Associates, Inc., 1996). Further assessment of petroleum impact to site soil was conducted during the site assessment (Brown and Root Environmental, 1998). A soil removal IRA was conducted in 2000 (CH2M Hill Constructors, Inc. 2001). Samples were collected and analyzed from the stockpiles of soil removed from the excavation. Concentrations of petroleum constituents in the soil samples were below SCTLs and the stockpiled soil was returned to the excavation. One monitoring well was installed and sampled at the site.

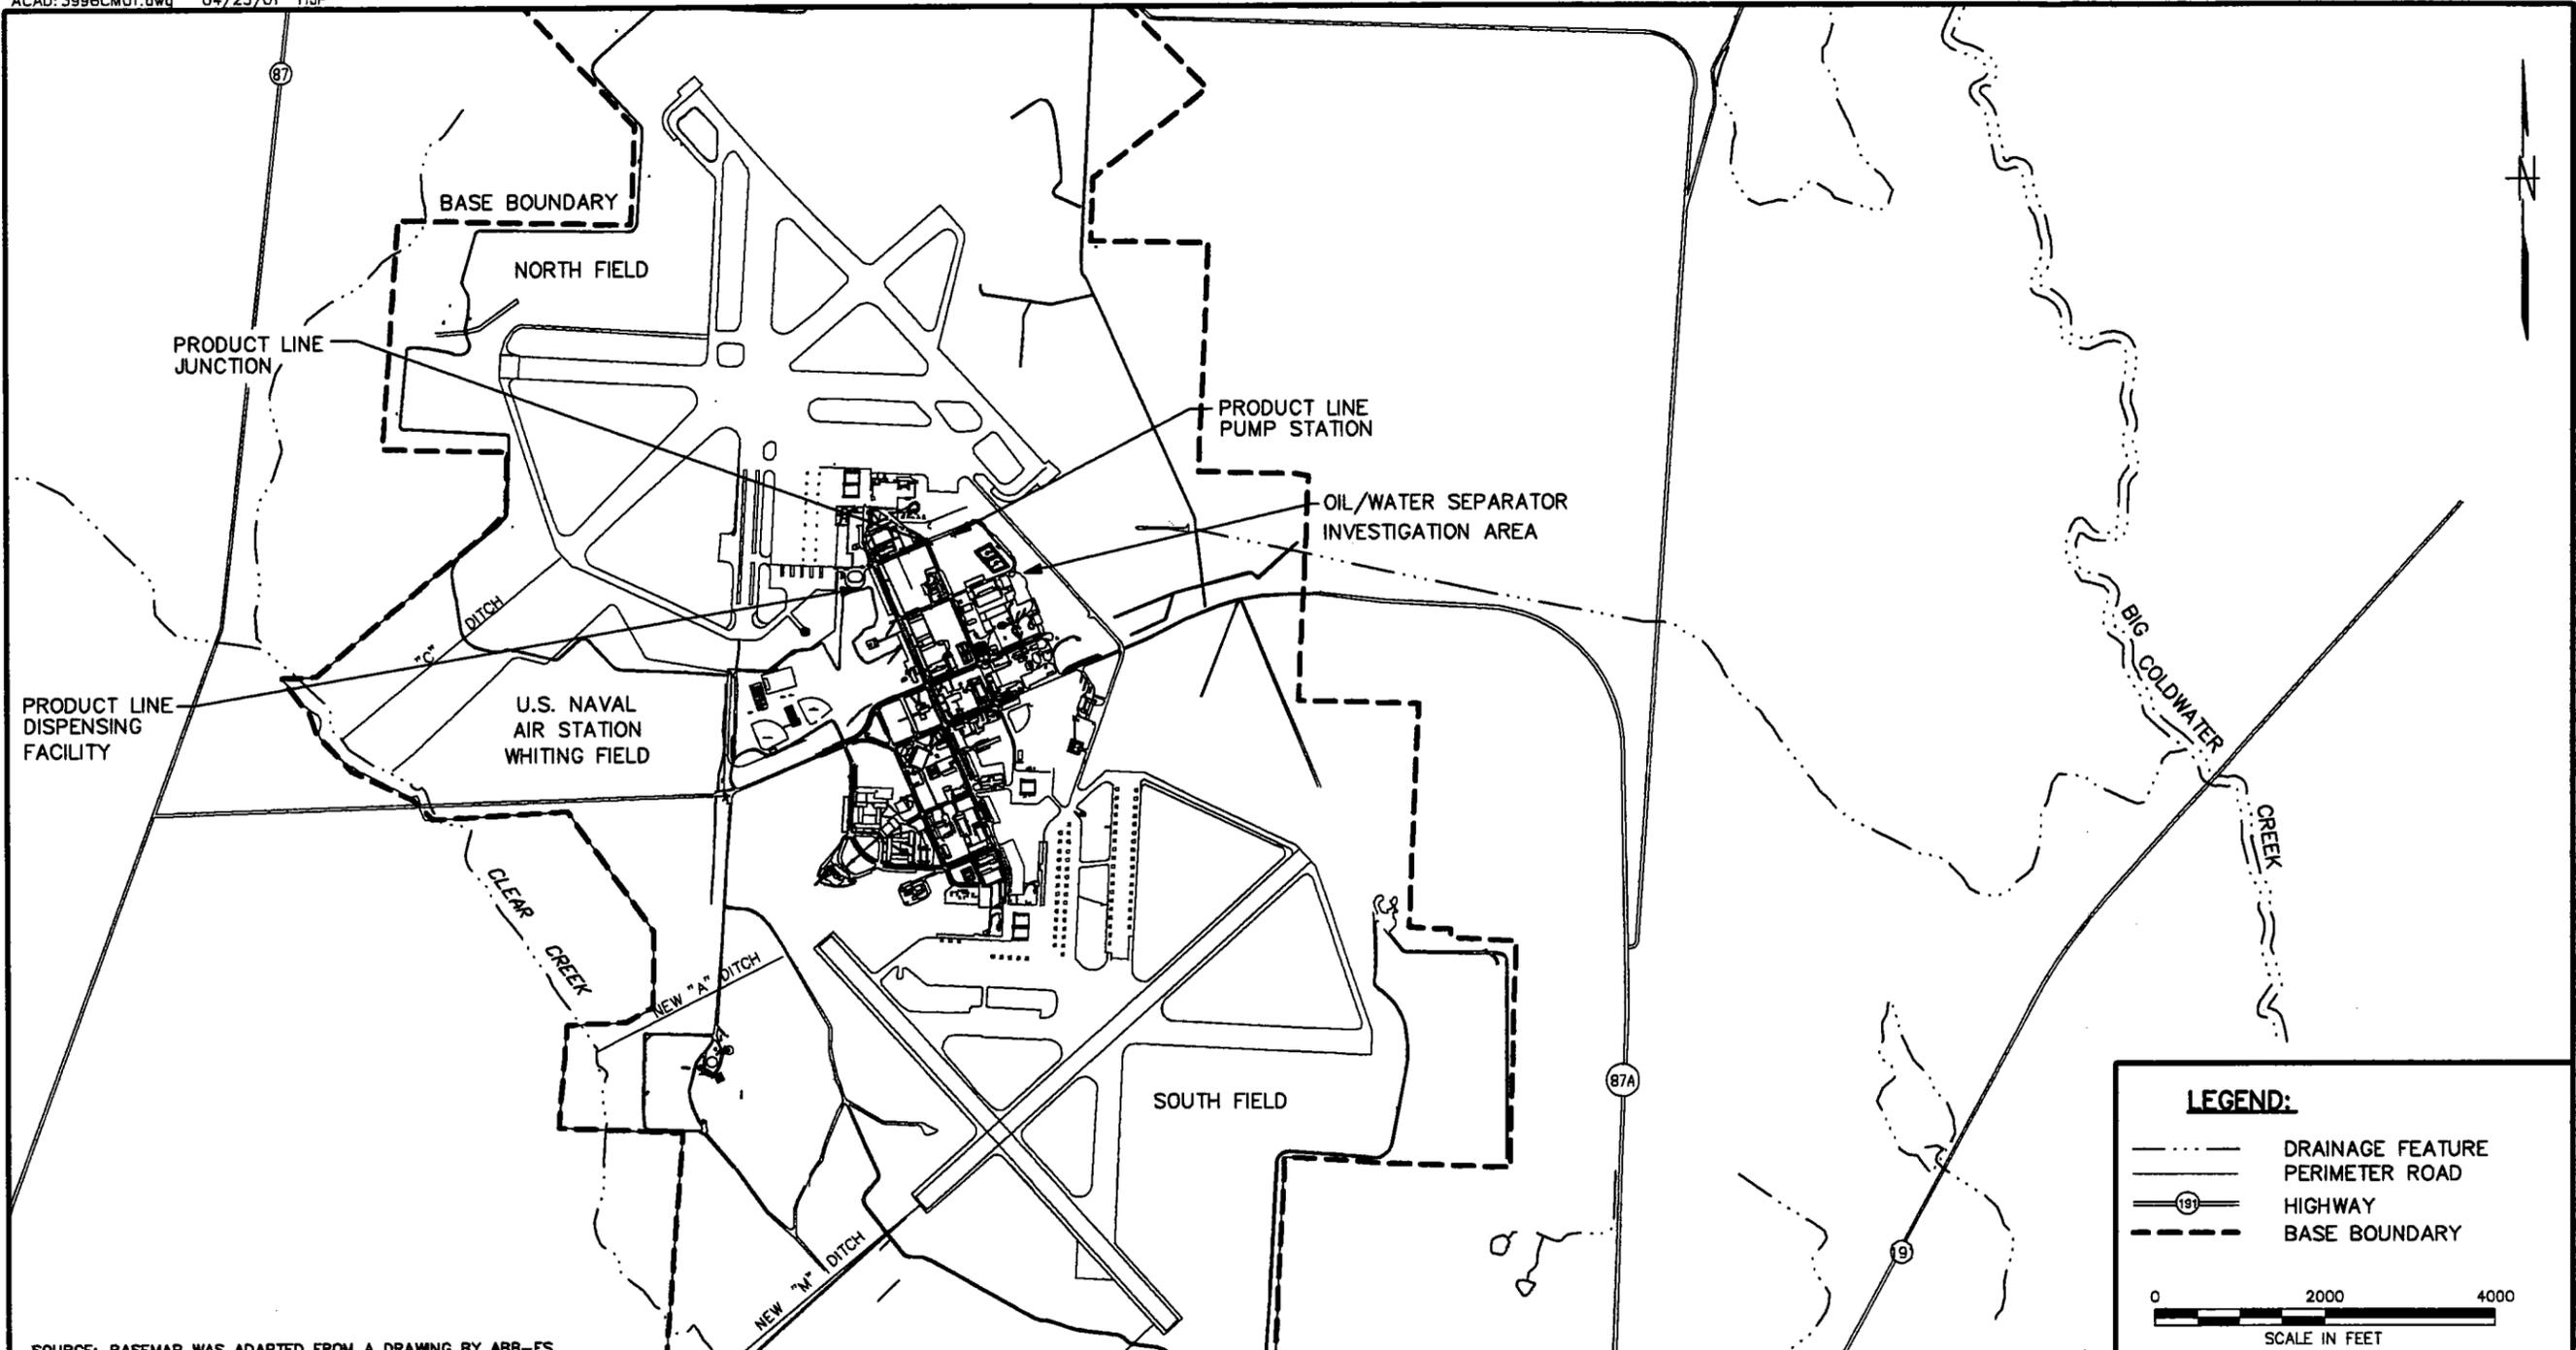

The product line pump station was investigated as part of the product line closure assessment conducted in 1996. Further assessment of petroleum impact to site soil was conducted during the site assessment (Brown and Root Environmental, 1998). A soil removal IRA was conducted in 1998 by PWC Pensacola (PWC Pensacola, 1998b), which removed contaminated soil from adjacent to Building 2893, but not from underneath the building. A second IRA, including demolition of Building 2893, was conducted in 2000 and additional soil was removed from the site (CH2M Hill Constructors, Inc. 2001).

The product line junction was investigated as part of the product line closure assessment conducted in 1996. Further assessment of petroleum impact at the site was conducted during the site assessment (Brown and Root Environmental, 1998), but the site was considered for transfer to the IRP and the results of the investigation were not presented in the SAR. Two monitoring wells were installed and sampled at the site. Additional soil assessment was conducted at the site following the decision to evaluate site soil under the UST program and site groundwater as part of the IRP.

5.2 CONCLUSIONS AND RECOMMENDATIONS

The following are the recommended courses of action for each of the sites investigated:

- Oil/Water Separator Site – Soil analytical data collected from the site following the IRA indicate that petroleum constituents in soil remaining at the site are at concentrations below SCTLs. Therefore, no further action should be required due to petroleum impact to vadose zone soil at the site. The GCTL exceedance of EDB in site groundwater should be evaluated under the base wide groundwater investigation conducted under the IRP.
- Product Line Dispensing Facility - Concentrations of petroleum constituents in the soil samples collected from the stockpiles of soil excavated from the site were below SCTLs. The stockpiled soil was returned to the excavation. Petroleum constituents were not detected at concentrations above standard laboratory detection limits in the groundwater sample collected at the site. No further action should be required due to petroleum impact to soil or groundwater at the site.
- Product Line Pump Station - Concentrations of petroleum constituents in the soil samples collected following the IRA were below SCTLs. Therefore, no further action should be required due to petroleum impact to vadose zone soil at the site. Depth of vadose zone impact was limited to approximately 13 feet bls and groundwater was not encountered during site assessment investigations. Therefore evaluation of site groundwater is not recommended at this site.
- Product Line Junction - A RAP should be prepared to address petroleum impact to vadose zone soil at this site. Site groundwater should be evaluated under the base-wide groundwater investigation conducted under the IRP.

RE: Site Assessment Report for Oil/Water Separator and Product Line Investigation, Naval Air Station Whiting Field, Milton, FL

Dear Mr. Ugolini:

I have reviewed the above document dated July 1998 (received August 7, 1998). The following comments should be adequately addressed by the Navy:

1. Please confirm that the "sludge tank" described in Section 1.2.5 was not a waste oil tank, which would necessitate analysis of soil samples for the contaminants in Table II, Chapter 62-770, FAC. What was the nature of the "sludge?"
2. It appears that the soil samples were not taken strictly following the guidance in Chapter 62-770, FAC in that samples were not taken from samples in the low, intermediate and high OVA ranges; however, since the proposed IRA is being based on OVA values, this does not appear to pose a problem. The Navy may want to consider additional soil borings and analyticals, which may help reduce the volume of soil that will be removed.
3. According to Figure 3-3, General Information Report for Whiting Field, January 1998, the geology directly under the site consists of interbedded sands, silts and clays with the presence of clay lenses with the first of two general lenses at about 15-20 feet below land surface (bls). Because of this, lateral migration of petroleum products with downward migration is likely. Accordingly, please install a monitoring well which intersects the water table which is situated at the approximately 90 foot bls depth in the vicinity of OSW-SB-05 at the Oil/Water Separator site. Additionally, please install one monitoring well in the vicinity of PDF-SB-09 at the Product Line Dispensing site. Sample and analyse ground water from these wells for volatile and semivolatile petroleum constituents as specified in Table 1 of Chapter 62-770, F.A.C. Please present the results of the analyses in tabular form. Alternatively, if there are IRP program wells in close proximity, I will consider analyses from them. If you choose to utilize any of these wells, please meet with me so that I can review their suitability.

4. The product line that was partially investigated as part of this assessment needs further assessment. I suggest that we meet with Mr. Jim Holland and Ms. Linda Martin at the next NAS Whiting Field Partnering meeting and discuss how we may address this. Additionally, I request that we be prepared at that meeting to show where previous investigation activities have occurred along the pipeline so that we can determine the remaining portions of the pipeline that need assessment.

Please address these comments in a SAR addendum and please submit an updated recommendation for the sites in this SAR. If you need further clarification or other assistance, please feel free to contact me at (850) 921-4230.

Sincerely,

James H. Cason, P.G.
Remedial Project Manager

CONTAMINATION ASSESSMENT REPORT
N.A.S. WHITING FIELD
SITE 2993A
MILTON, FLORIDA
FDEP FACILITY NO.: 578516386
PROJECT NO.: WGS95-0094

1.0 INTRODUCTION

In September, 1994, during an inspection of the oil-water separator system by the Florida Department of Environmental Protection (FDEP) at N.A.S.-Whiting Field, free product was observed in the northeast compliance well, one of four leak detection wells installed in the vicinity of the oil-water separator unit. A Discharge Reporting Form was filed with the FDEP that same day. In May, 1995, W. Grady Swann, Inc. (WGS) was contracted by Heffernan-Holland Architecture, the prime contractor, to perform a contamination assessment for Tanks System 2993A, the location of the oil-water separator. The contamination assessment was initiated by WGS on May 15, 1995.

2.0 SITE LOCATION AND AREA OF INVESTIGATION

The Site is located on the U.S. Naval Air Station (N.A.S.) Whiting Field, approximately five (5) miles north of Milton, Florida. The Site lies in the northeast quarter of Section 2, Township 2 North, Range 28 West, Santa Rosa County. Figure 2., Topographic Map, shows the Site location relative to the surrounding area. The Site situates on the eastern edge of the developed area of Whiting Field between the North Field and the South Field runways.

The specific Site area is designated as 2993A, being located approximately 200' feet east of Building 2993 in an earthen grassy area which slopes to the east. Structures located in the vicinity of the Site include the aforementioned Building (2993), two (2) 230,000-gallon, aboveground jet fuel storage tanks within concrete containment, and two small storage buildings. An underground oil-water separator is located at the Site under a concrete pad. An underground product holding tank and a sludge tank are situated adjacent to the oil-water separator. The oil-water separator's plumbing has been physically isolated from the product holding tank and the drain line to the Base's sanitary sewer system. The separator unit is still plumbed to the stormwater collection sump in the near-by Fuel Truck Parking area, as evidenced by the repeated presence of water in the tank following periods of rainfall. Figure 1, Site Map, illustrates the tank and compliance well locations, as well as other wells and borings constructed/drilled during the assessment.

The land surrounding the Site is all part of Whiting Field. Immediately west of the Site is an asphalt covered parking area extending approximately 200-feet west to Building 2993, the Fuel Contractor's Office. Approximately 400-feet to the northwest of the Site beyond the asphalt parking lot are the two (2) aforementioned jet fuel storage tanks.

To the north of the Site is an earthen grassy area which extends approximately 1,000-feet to the North Field runways. To the east and southeast of the Site for over 1/4 mile is earthen, grassy vacant land. Immediately adjacent to the Site to the south-southwest is a curbed concrete drain area (Fuel Truck Parking area) for the oil-water separator and a 500-gallon aboveground tank containing contaminated jet fuel.

3.0 INITIAL REMEDIAL ACTION

Initial Remedial Action consisted of bailing approximately four (4) gallons of free product from the northeast compliance well (NE/CW) immediately upon discovery of the release, September 21, 1994. The removal of excessively contaminated soils is recommended herein.

4.0 PREVIOUS INVESTIGATIONS

No previous investigations have been conducted at the Site.

5.0 REGIONAL TOPOGRAPHY

The Site is located with respect to regional topography near a dividing line of two physiographic provinces, "The Coastal Lowlands" to the south and "The Western Highlands" to the north. Collectively these two provinces comprise the coastal plain. The dividing line is generally considered to be Interstate Highway 10 (I-10), located approximately eight (8) miles southeast of the Site. "The Western Highlands", where the Site locates, are characterized by a gentle to strong sloping area, a well developed branching drainage pattern and "V" shaped valleys. Along larger tributaries, slopes are long and steep and ridge tops are narrow while along smaller streams the slopes are short and mild and ridge tops are broad and level. Surface elevations range from approximately 100 feet to 280 feet above mean sea level.

6.0 REGIONAL GEOLOGY

The principal near surface stratigraphic units in this area, from the surface in descending order, are the undifferentiated terrace marine and fluvial deposits of Pleistocene age, the Citronelle formation of Pliocene age and the Alum Bluff Group and Choctowhatchee formation of Miocene age.

The Site and general area is underlain, at land surface, by a permeable geologic unit comprised principally of quartz sand and gravel interbedded with numerous thin discontinuous clay and silt layers. This section is the undifferentiated terrace marine and fluvial deposits.

10. CONCLUSIONS AND RECOMMENDATIONS (CONTINUED)

4. The source of contamination to the perched aquifer system and the dry soils underlying the perched aquifer system appear to be stormwater discharges from the Fuel Truck Parking area to the leaky oil-water separator unit, and, the four (4) near-by compliance wells; and,

5. Based on the soil quality data collected from the deep borings drilled below the semi-confining hardpan unit, and the fact that 75 to 90-feet of "clean" soil exists between the water table of the primary surficial aquifer and the vertical extent of soil contamination at the source, it is unlikely that the groundwaters of the primary aquifer system are contaminated with petroleum contaminants above State standards; and,

6. Free-product is no longer present in any of the compliance or monitor wells; and,

7. There are no domestic or base supply wells located within a 1/2 mile radius of the Site.

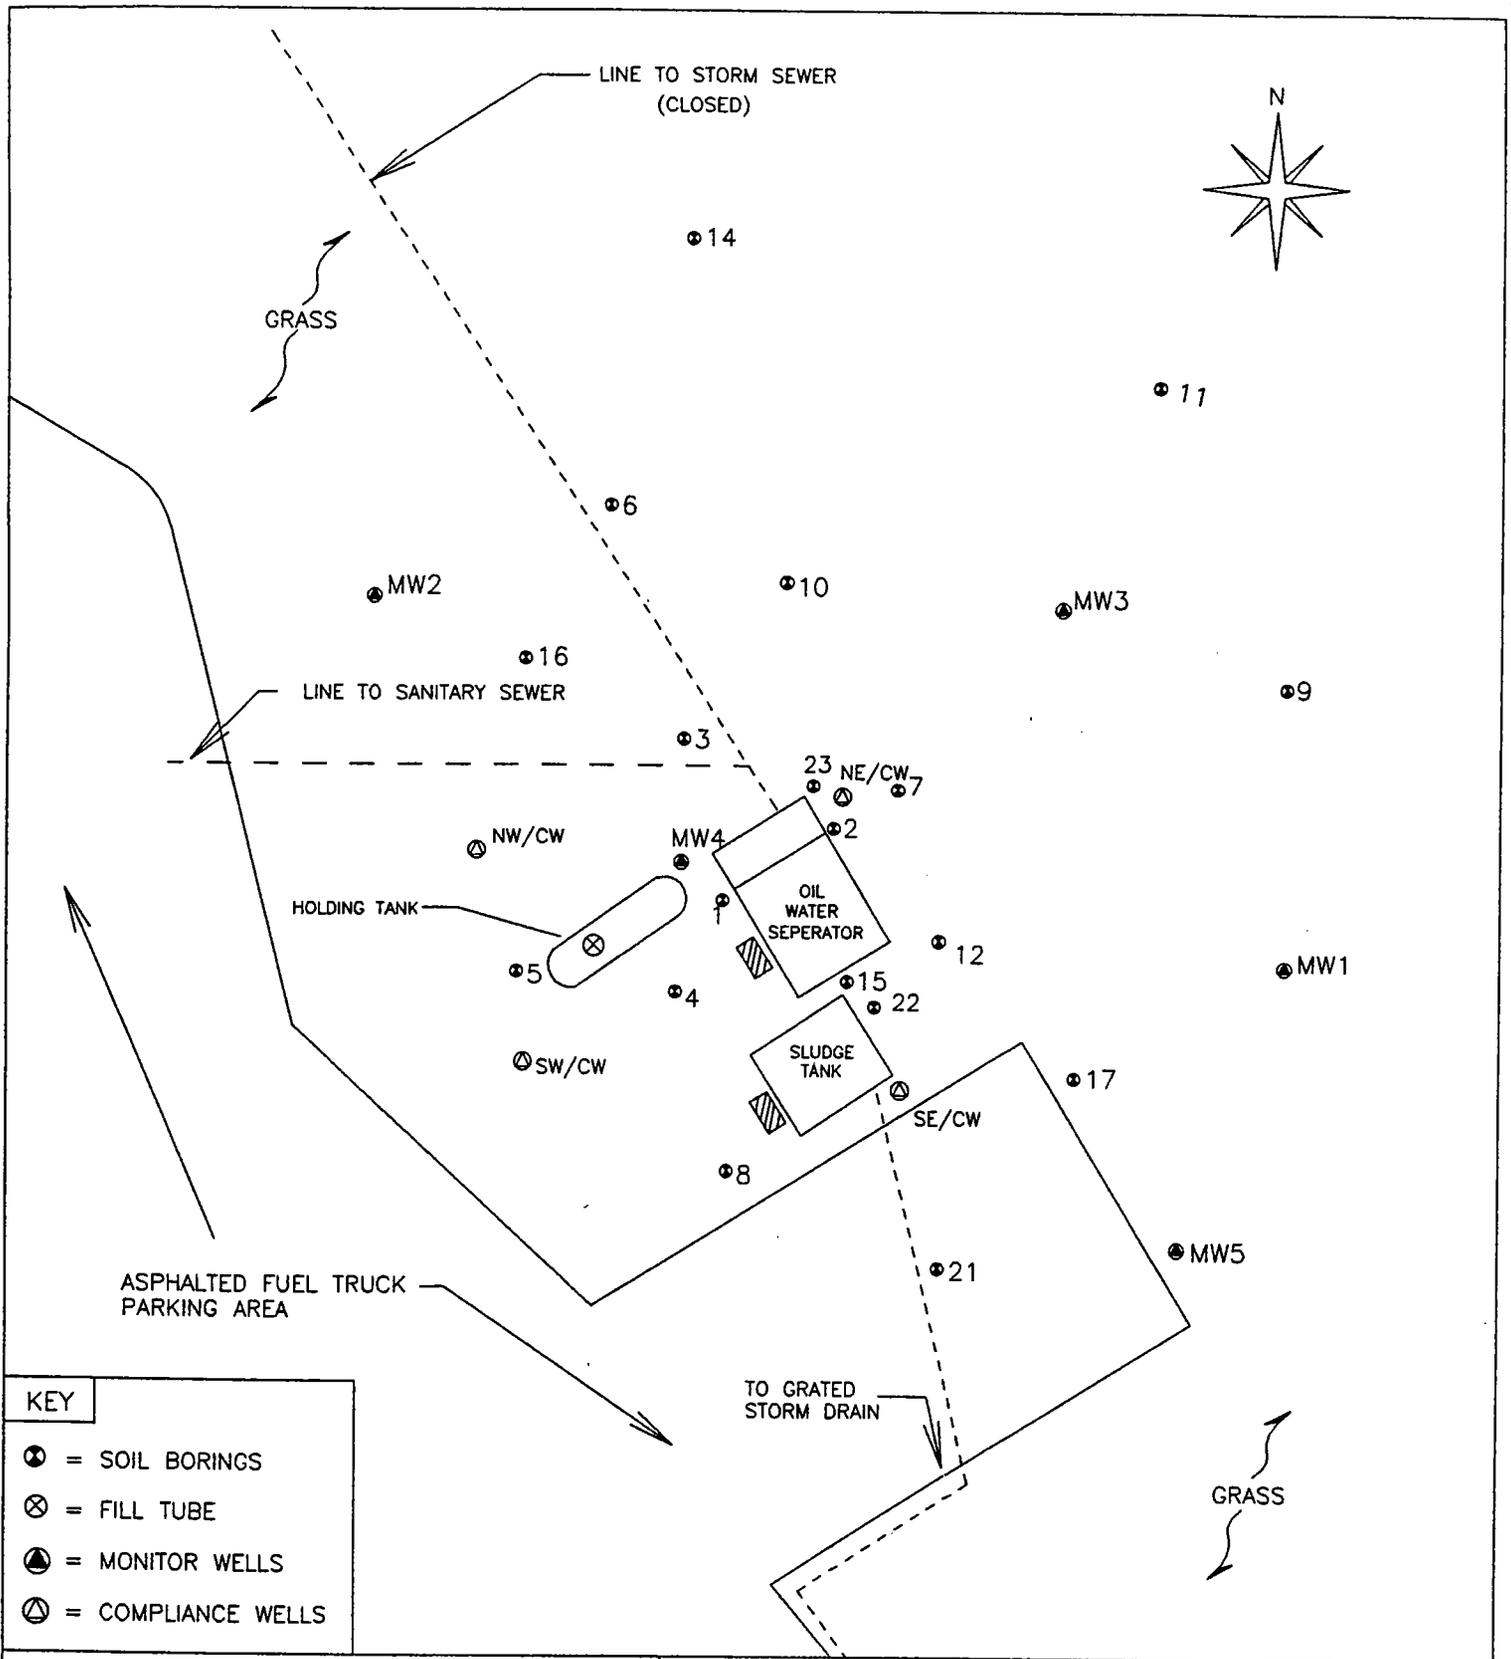

W. Grady Swann, Inc. recommends in the following order that: *incorrect*

1. The collection sump in the Fuel Truck Parking area and piping to the sludge tank and oil-water separator should be physically isolated from one another to ensure that stormwater is not discharged to the Site; and,

2. The four compliance wells should be pulled, overdrilled, and the resulting boreholes grouted with neat cement from bottom to top; and,

3. Water levels should be measured in all monitor wells which were found to be dry on or after the groundwater sampling event, or, where sufficient water was not present in the well to complete the analyses of those compounds belonging to the kerosene analytical group which were detected at MW-4. In other words, water samples should be collected from MWs 2 and 3 and analyzed for the total VOCs (BETX + MTBE), PAHs, and TRPHs. Waters from MWs 1 and 5 should be analyzed for the PAHs and TRPHs; and,

4. The excessively contaminated soils above the perching hardpan unit should be removed and properly disposed/treated. Care should be taken not to damage the hardpan unit. Following the removal of soil and any free-liquid which accumulates in the open hole, if the wells mentioned in paragraph 3, above are dry or water quality at those locations meets State standards, the excessively contaminated soil existing below the hardpan unit, based on a soil headspace reading of 50 ppm OVA-FID, should be excavated and properly disposed/treated.

From: Resident Officer in Charge of Construction, Pensacola Region, NASWF Detachment, Naval Air Station Whiting Field, Milton, FL

To: Public Works Officer, Naval Air Station Whiting Field, Milton, FL (ATTN: Jim Holland, Code 183AH)

Subj.: CONTRACT N62467-99-Q-3137; Transportation and Disposal of Contaminated Soil, Naval Air Station Whiting Field, Milton, FL

Encl.: (1) EFDSouth Customer Comment Form

1. Please help us improve our service by answering the questions On Enclosure (1) and return it to Southern Division, NAVFAC.
2. Non-Hazardous Waste Manifest Numbers 2445 through 2507, dated June 1, 2, 3 and 4, 1999 are attached. These manifests document that 1493.47 tons of contaminated soil were removed from NASWF and disposed of in accordance with the subject contract. A certificate of Disposal prepared by Hudsko, Inc., dated June 16, 1999 attesting to the proper disposal is also attached.
3. Our point of contact is the undersigned, (850) 623-7246,19.

John A. Nicholls
Project Manager

HUDSCO, INC.

**8810 PAUL STARR DRIVE
PENSACOLA, FL 32514**

Certificate of Disposal

Hudsko, Inc. hereby certifies that 1,493.47 tons of petroleum impacted soil generated by:

NAVFAC FIELD OFFICE, ROICC
520 TURNER STREET
NAS PENSACOLA, FL 32508-5225

and originating at the site address:

NAS WHITING FIELD
BUILDING 2993
MILTON, FL

have been received for thermal treatment and disposal at 8810 Paul Starr Drive, Pensacola, FL 32514 in compliance with all applicable rules and regulations set forth by Local, State and Federal authorities and strictly in accordance with Permit Nos. AO17-217356 and AC17-237356.

HUDSCO, INC.

Confirmation of Profile

MARCH 21, 2000

ATTN: LISA SCHWAN
CH2M HILL
115 PERIMETER CENTER PLACE
SUITE 700
ATLANTA, GA 30346

Your waste material has been approved for disposal at SPRINGHILL landfill, CAMBELLTON, FL subject to the terms of the agreement between the companies. The following information is based on the volume profiled and analytical data you have provided:

- Profile Number:** WM-CP-6255 (WHITING FIELD PULIC WORKS)
- Waste Type:** NON-HAZ. PETRO CONT'D SOIL
- Profile Expiration Date:** 07/01/2000
- Disposal & Hauling Rate:** \$25.50/ A TON (22 ton minimum)
- Demurrage:** \$60.00/ after 2 hours
- Special Conditions:** This price is based on making 2 loads per truck, per day.

Note that disposal pricing is based on the information from your profile and analytical previously submitted. The actual invoice produced is determined on the actual volume received.

The confirmation letter must be reviewed for accuracy, signed by your designated representative and faxed back to the Customer Service Center at 205/652-8289. We will then notify the landfill prior to the arrival of your waste.

Waste Priced as Profiled - Invoiced as Received

Thank you for the opportunity to be of service to you.

Title Contracts Administration Manager

Date 3/23/2000

CCI anticipates the estimated quantity of work expected to be performed at NAS Whiting Field (CTO 22), for this project to be approximately 1800 to 5000 tons total. However, all work to be performed by CCI is subject to funding availability and approval by SoDiv (USNAVY). The estimated quantities represent the best and most accurate information available as of the request for bid issuance date. These estimates shall not be construed as a guarantee of quantities to Waste Management. Unit prices submitted and quoted by Waste Management for this project shall be applied to actual quantities of work performed and form the basis of payment.

BOC300148.
Thanks, Ny

Severn Trent Laboratories completed the purchase of Quanterra, Inc. on January 31, 2000. This purchase created the largest and most geographically widespread laboratory company that has ever existed in the Industry.

Our commitment and dedication to providing high quality and client service is unchanged.

Paul Calligan – Task Order Manager

Tetra Tech NUS, Inc.

1401 Oven Park Drive

Suite 1002

Tallahassee, FL 32312

Dear Paul Calligan,

This report contains the analytical results for the three samples received under chain of custody by STL on April 12, 2000. These samples are associated with your Whiting Field project.

All applicable quality control procedures met method-specified acceptance criteria.

If you have any questions, please feel free to call me at 813-621-0784.

SAMPLE SUMMARY

B0D120149

<u>WO #</u>	<u>SAMPLE#</u>	<u>CLIENT SAMPLE ID</u>	<u>DATE</u>	<u>TIME</u>
DAR8Q	001	47SP016	04/11/00	14:52
DAR94	002	47SP017	04/11/00	15:13
DAR96	003	TRIP BLANK	04/11/00	

NOTE (S) :

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Other Information:

Any "NO" responses or discrepancies should be explained in the "Comments" section below. If an NCM was initiated, write the NCM number in the appropriate space.

CHECKLIST

	YES	NO	NA	NCM #
1. Were custody seals on shipping container(s) intact? Check "NA" if hand delivered. If "Yes," check one: <input checked="" type="checkbox"/> CUSTODY SEAL SAVED <input type="checkbox"/> UNABLE TO SAVE CUSTODY SEAL	X			
2. Were custody papers properly included with samples?	X			
3. Were custody papers properly filled out (ink, signed, match labels)?	X			
4. Did all bottles arrive in good condition (unbroken)?	X			
5. Were all bottle labels complete (sample #, date, signed, analysis, preservatives)?	/			
6. Were correct bottles used for the tests indicated?	/			
7. Were proper sample preservation techniques indicated?	/			
8. Were samples received within holding times? If "No," NCM required.	/			
9. Were all VOA bottles checked for the presence of air bubbles? If air bubbles were found, indicate in comment section.	/			
10. Were samples in direct contact with wet ice? If "No," check one: <input type="checkbox"/> NO ICE <input type="checkbox"/> BLUE ICE	/			
11. Were the samples received with a temperature blank? RECORD TEMPERATURE ABOVE If "No," check one: <input type="checkbox"/> Unable to determine temp <input type="checkbox"/> Taken from ice/water near samples	/			
12. Was the cooler temperature less than 6°C?	/			
13. Were sample pHs checked and recorded by Sample control? NOTE: VOA samples are checked by laboratory analysts.			/	
14. Were samples accepted into the laboratory?	/

NOTE (S) :

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Cooler/Shipping Information:

Type: Cooler Box Other

Cooler ID/Track #				
Temp (Celsius)	40			
Cooler ID/Track #				
Temp (Celsius)				

Any "NO" responses or discrepancies should be explained in the "Comments" section below.

CHECKLIST

	YES	NO	NA
1. Were custody seals on shipping container(s) intact? Check "NA" if hand delivered. If "Yes," check one: CUSTODY SEAL SAVED <input type="checkbox"/> UNABLE TO SAVE CUSTODY SEAL <input checked="" type="checkbox"/>	X		
2. Were custody papers properly included with samples?	X		
3. Were custody papers properly filled out (ink, signed, match labels)?	X		
4. Did all bottles arrive in good condition (unbroken)?	X		
5. Were all bottle labels complete (sample #, date, signed, analysis, preservatives)?	X		
6. Were correct bottles used for the tests indicated?	X		
7. Were proper sample preservation techniques indicated?	X		
8. Were samples received within holding times? If "No," NCM required.	X		
9. Were all VOA bottles checked for the presence of air bubbles? If air bubbles were found, indicate in comment section.	X		
10. Were samples in direct contact with wet ice? If "No," check one: NO ICE <input type="checkbox"/> BLUE ICE <input type="checkbox"/>	X		
11. Were the samples received with a temperature blank? RECORD TEMPERATURE ABOVE If "No," check one: UNABLE TO DETERMINE TEMP <input type="checkbox"/> TEMP TAKEN FROM ICE/WATER NEAR SAMPLES <input type="checkbox"/>	X		
12. Were sample pHs checked and recorded by S.R. (see back for Page 2 - Sample pH)? NOTE: TOC and VOA samples are checked by laboratory analysts. If response is "Not Inspected," then a pH check is not required/performed by Sample Receiving and Page 2 is not applicable.	X		Not inspected - Page 2 not completed <input type="checkbox"/>
13. Were samples accepted into the laboratory?	X

CASE NARRATIVE

LABORATORY ID NUMBER: B8B110133

ORGANICS -INORGANICS

The Method blank associated with batch numbers 8049184 and 8049187 for method 601 and 602 had several compounds flagged with the "J" value which indicates estimated results below the reporting limit.

The recovery and RPD for FL-Pro, associated with QC batch number 8043180 in the matrix spike/matrix spike duplicate was not calculated because the sample amount was greater than four times the spike amount. This is flagged with MSB.

Due to suspected matrix interference and or dissimilar nature of the sample aliquots, several metals in the matrix spike/matrix spike duplicate associated with QC batch numbers 8044177 and 8044182 were outside the laboratory established control limits. The Laboratory Control Sample indicated acceptable method performance for each batch.

Due to suspected matrix interference and or dissimilar nature of the sample aliquots, Methylene chloride in the matrix spike/matrix spike duplicate associated with QC batch number 8049184 was outside the laboratory established control limits. The Laboratory Control Sample indicated acceptable method performance for the batch.

Due to suspected matrix interference and or dissimilar nature of the sample aliquots, EDB and TPH in the matrix spike duplicate associated with QC batch numbers 8043146 and 8043188 were outside the laboratory established control limits. The Laboratory Control Sample indicated acceptable method performance for each batch.

Due to suspected matrix interference and or dissimilar nature of the sample aliquots, several compounds in the matrix spike/matrix spike duplicate associated with QC batch number 8043186 was outside the laboratory established control limits. The Laboratory Control Sample indicated acceptable method performance for the batch.

CFA1L	004	WHF-GW-MW02B	02/10/98	10:15

NOTE (S) :

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Cooler ID/Track #				
Temp (Celsius)	2°	3°		
Cooler ID/Track #				
Temp (Celsius)	2°			

Any "NO" responses or discrepancies should be explained in the "Comments" section below.

CHECKLIST

	YES	NO	NA
1. Were custody seals on shipping container(s) intact? Check "NA" if hand delivered. If "Yes," check one: CUSTODY SEAL SAVED <input type="checkbox"/> UNABLE TO SAVE CUSTODY SEAL <input checked="" type="checkbox"/>	X		
2. Were custody papers properly included with samples?	X		
3. Were custody papers properly filled out (ink, signed, match labels)?	X		
4. Did all bottles arrive in good condition (unbroken)?	X		
5. Were all bottle labels complete (sample #, date, signed, analysis, preservatives)?	X		
6. Were correct bottles used for the tests indicated?	X		
7. Were proper sample preservation techniques indicated?	X		
8. Were samples received within holding times? If "No," NCM required.	X		
9. Were all VOA bottles checked for the presence of air bubbles? If air bubbles were found, indicate in comment section.	X		
10. Were samples in direct contact with wet ice? If "No," check one: NO ICE <input type="checkbox"/> BLUE ICE <input type="checkbox"/>	X		
11. Were the samples received with a temperature blank? RECORD TEMPERATURE ABOVE If "No," check one: UNABLE TO DETERMINE TEMP <input type="checkbox"/> TEMP TAKEN FROM ICE/WATER NEAR SAMPLES <input type="checkbox"/>	X		
12. Were sample pHs checked and recorded by S.R. (see back for Page 2 - Sample pH)? NOTE: TOC and VOA samples are checked by laboratory analysts. If response is "Not Inspected," then a pH check is not required/performed by Sample Receiving and Page 2 is not applicable.	X		Not inspected - Page 2 not completed <input type="checkbox"/>
13. Were samples accepted into the laboratory?	X		

Comments:

pic Client MS/MSD is for mwo2 (ph for metals = < 2 + Fe - Ph < 2)
trip blank rec'd not on coc

**PRODUCT LINE JUNCTION
CONTAMINANT MASS ESTIMATE**

ESTIMATED MASS OF CONTAMINANTS IN VADOSE ZONE SOIL MATRIX

SITE INFORMATION:

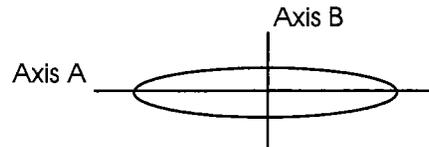

Site:	PRODUCT LINE JUNCTION
Location:	NAS WHITING FIELD, MILTON, FLORIDA
Client:	SOUTH DIV

ASSUMPTIONS:

ESTIMATED AREA OF IMPACT:

Area = $\pi (rA)(rB)$

Axis A = 150 ft
Axis B = 60 ft

Estimated Area = sq ft

ESTIMATED VERTICAL EXTENT OF IMPACT:

Average Thickness = $(T1+T2+...Tn)/n$

T1	SB-01	85 ft
T2	SB-02	90 ft
T3	SB-03	70 ft
T4	SB-05	75 ft
T5	SB-10	85 ft
T6	SB-11	85 ft
T7	SB-12	90 ft
T8	SB-14	75 ft
T9	SB-17	80 ft

Average Thickness = ft

ESTIMATED VOLUME OF IMPACT:

Volume = Area x Thickness

Area = 7069 sq ft
Thickness = 82 ft

Estimated Volume = cu ft

AVERAGE CONCENTRATION OF IMPACT:

Average Concentration = $(C1+C2+...Cn)/n$

C1	SB-01	630 mg/kg
C2	SB-02	900 mg/kg
C3	SB-10	13.3 mg/kg
C4	SB-11	17.0 mg/kg

Average Concentration = mg/kg

ESTIMATED MASS OF CONTAMINANTS IN VADOSE ZONE SOIL MATRIX

SITE INFORMATION:

Site:	PRODUCT LINE JUNCTION
Location:	NAS WHITING FIELD, MILTON, FLORIDA
Client:	SOUTH DIV

INPUT:

Estimated Impacted Area	sq ft	7,069
Estimated Average Impacted Thickness	ft	82
Estimated Impacted Volume	cu ft	577,268
Average Total TPH Concentration	mg/kg	390

CALCULATIONS:

Estimated mass of hydrocarbons in soil:

$$565,487 \text{ ft}^3 \times 1 \text{ yd}^3 / 27 \text{ ft}^3 \times 1.4 \text{ tons} / 1 \text{ yd}^3 \times 1016 \text{ kg} / \text{ton} \times 390 \text{ mg} / \text{kg} \text{ TPH} \times (1.0 \times 10^{-6}) \text{ kg} / \text{mg} \times 2.204623 \text{ lb} / \text{kg}$$

lbs 26,155
