1.0 INTRODUCTION

Innovative Technical Solutions, Inc. (ITSI) prepared this Data Gap Sampling Investigation Report to describe the results of field activities undertaken to further define subsurface conditions and confirm the northern boundary of the previously identified groundwater plume in the vicinity of Building 20, located within the boundaries of Installation Restoration Site 26 (IR26) at Alameda Point, in Alameda, California (Figure 1). The ultimate goal of these activities is to provide data to support development of a Remedial Design (RD) document for this site. This work is being conducted under the 8(a) Remedial Action Contract (RAC) Number N68711-05-D-6403, Contract Task Order (CTO) 003, for the United States Department of the Navy (Navy), Southwest Division, Naval Facilities Engineering Command, San Diego, California.

In accordance with the Draft Final Workplan (ITSI, 2006), the primary objectives of the Data Gap Investigation were to determine whether the groundwater plume adjacent to Building 20 extended beneath the southern corner of the building and to further evaluate the lithology and depth of contamination within the plume boundaries. The following activities were conducted in September and October 2006:

- Drilling and continuous core sampling of five direct-push borings,
- Collection of multiple discrete-depth (hydropunch) grab groundwater samples,
- Installing seven groundwater monitoring wells,
- Installation of three observation piezometers to be used in upcoming aquifer testing, and
- Conducting one round of initial baseline groundwater sampling in the newly installed monitoring wells.

Documentation of field activities and data evaluations are included in Appendices A through G.

2.0 SITE BACKGROUND

This section briefly summarizes site background information for IR26. The Final Remedial Investigation (RI) and Feasibility Study (FS) Reports contain more details regarding the site (Bechtel Environmental, Inc. [BEI], 2003 and 2005, respectively).

2.1 SITE DESCRIPTION AND HISTORY

The U.S. Army acquired the original base property from the City of Alameda in 1930 and began construction activities in 1931. In 1936, the Navy acquired title to the land from the U.S. Army and began building the Naval Air Station (NAS) Alameda in response to the military buildup in Europe before World War II. Construction of the base included several iterations of filling tidelands, marshlands, and sloughs with dredge materials from San Francisco Bay, Oakland Inner Harbor, and Seaplane Lagoon. The base was operated as an active naval facility from 1940 to 1997. Historically, operations included aircraft, engine, gun, and avionics maintenance; fueling activities; and metal plating, stripping, and painting. The Navy operated two power plants, a transportation shop, and a pesticide shop. The base had a deepwater port capable of berthing aircraft carriers and a fuel-distribution-pipeline network that transported aviation and diesel fuel to various areas on the base (BEI, 2003).

IR26 is an approximately 32-acre site located in the central portion of Alameda Point (Figure 2). IR26 is covered by concrete and asphalt pavement, four former aircraft hangars (Buildings 20 through 23), a paint and finishing building (Building 24), and several ancillary buildings (Figure 3). The buildings are occupied by businesses that are tenants of the Alameda Reuse and Redevelopment Agency. The four former aircraft hangars (Buildings 20-23) are included in the Alameda Point Historic District.

The area of interest for this report is southeast of Building 20 and was historically used as an aircraft washdown area. An oil-water separator (OWS 020) associated with the washdown area was located southeast of Building 20. The groundwater southeast of Building 20 is impacted with volatile organic compounds (VOC) that may be associated with aircraft washdown activities conducted there. The VOCs found in the groundwater are predominantly cis-1,2-dichloroethene

(DCE) and 1,1-dichloroethane (DCA), with lesser concentrations of trichloroethene (TCE), vinyl chloride and related chlorinated hydrocarbon compounds. The previous RI/FS conducted at the site identified that the northern limits of the groundwater plume next to Building 20 were not well-defined and that they might extend beneath the building (BEI, 2003 and 2005).

2.2 PREVIOUS INVESTIGATIONS

The IR26 RI report (BEI, 2003) provides an in-depth discussion of the various investigations that have been conducted at or near Alameda Point's IR26 including:

- A 1983 initial assessment study was conducted by Ecology and Environment, Inc. to identify sites that might pose a threat to human health or the environment.
- An initial Environmental Baseline Survey (EBS), which was implemented in two phases. Phase 1 (conducted by Environmental Resource Management – West in 1994) was conducted to further examine the environmental conditions at the Alameda Point sites identified in the IAS. Phase 2A, 2B, and 2C activities were conducted between October 1994 and December 1998 by International Technology Corporation in 2001 and involved collection of environmental samples targeting potentially contaminated areas.
- A Site-Specific EBS was completed in October 1995 for EBS Parcel 192 (the northernmost parcel within IR26) by Environmental Resource Management – West in 1995.
- A basewide supplemental EBS was completed in August 2002 by Tetra Tech EM, Inc. to update and supplement information contained in the previous EBS reports. For IR26, the supplemental EBS reported that all EBS parcels associated with the site were classified as areas where a release had been confirmed and further actions were required.
- Fuel line investigations, removals, and abandonments, and storm sewer investigations and removals were conducted between 1997 and 2002 and documented in numerous reports.
- An RI and an FS were conducted and documented by Bechtel (BEI, 2003 and 2005).
- A PP is being developed; the Final ROD was issued in August 2006 (Navy, 2006).
- A basewide groundwater monitoring program is also ongoing at Alameda Point.

The previous investigations at IR26 identified that the shallow groundwater southeast of Building 20 is impacted by VOCs, predominantly solvents (1,1-DCA, 1,2-DCA, cis-1,2-DCE, TCE, and vinyl chloride) at concentrations greater than Maximum Concentrations Limits (BEI, 2003 and 2005). The contamination identified at Building 20 and the former washdown area are

both southeast of Building 20, suggesting that former washdown activities in this area may be the source of the groundwater contamination.

2.2.1 Record of Decision Status

The Final ROD, currently under regulatory review, was developed for IR26 and presents selected remedy of no action for soil and remedial action for groundwater (Navy, 2006). The ROD identified no action for soil because contamination is present at low levels that do not pose an unacceptable risk for current or proposed future site uses. Of the nine remedial alternatives developed and evaluated, Alternate 6 was selected as the preferred remedy for groundwater. Alternate 6 includes the following components:

- *In-situ* chemical oxidation to quickly breakdown source contaminants.
- *In-situ* bioremediation to accelerate natural microbiological processes causing residual contaminant degradation.
- Short-term institutional controls to implement land use and access restrictions to limit exposure of future landowners(s) and/or user(s) of the property to hazardous substances and to maintain the integrity of the remedial action until remediation is complete and the remedial goals have been achieved.
- Groundwater sampling to confirm the achievement of remedial goals for cis-1,2-DCE (6 micrograms per liter ($\mu\text{g/L}$)), TCE (5 $\mu\text{g/L}$), and vinyl chloride (0.5 $\mu\text{g/L}$), which are protective of potential residents and occupational workers.

The Data Gap Investigation focused on evaluating whether the plume boundary delineated in the ROD extends beneath Building 20. This investigation also provided additional vertical and horizontal lithologic and groundwater chemical data to support development of the Remedial Design for the selected remedy identified in ROD.

2.3 SITE GEOLOGY AND HYDROGEOLOGY

This section summarizes the geologic and hydrogeologic settings beneath IR26 as presented in the RI/FS reports (BEI, 2003 and 2005).

The Alameda Island sedimentary deposits consist of five stratigraphic units (from oldest to youngest): the Alameda Formation, lower unit of the San Antonio Formation, upper unit of the

San Antonio Formation, Merritt Sand Formation, and the Bay Sediment Unit (BSU) (upper bay sediment also referred to as the Young Bay Mud) (BEI, 2003 and 2005). The stratigraphy beneath Alameda Point has been characterized from soil borings advanced to depths of 60 to 70 feet below ground surface (bgs) during previous investigations (BEI, 2003). Most of the sedimentary deposits at Alameda Point are overlain by fill that is present at 12 to 18 feet bgs. The BSU, which was encountered below the fill layer at IR26, is composed of upper and lower units (BEI, 2003 and 2005). The upper low-permeability unit consists of an estuarine deposit of stiff, dark, olive-gray clay with discontinuous silty and clayey sand layers, and has been observed to be up to 35 feet thick at Alameda Point. The lower unit consists of estuarine deposits of silty sand with interbedded layers of fine sand. The BSU is underlain by Merritt Sand (a brown, poorly graded, fine-to medium-grained sand) that exists in thicknesses up to 35 feet beneath IR26 (BEI, 2003). The upper BSU is an aquitard that is expected to inhibit vertical migration of chemicals reported in the upper fill soils and groundwater to deeper native material (BEI, 2003 and 2005).

The shallow first water-bearing zone (FWBZ) in the fill material overlying the BSU at IR26 is measured at depths to groundwater of approximately 2 to 6 feet bgs. The shallower groundwater is encountered at the north end of the site, in the vicinity of Building 20. Investigations at IR26 have reported an average horizontal hydraulic gradient of 0.003 in the FWBZ, with groundwater flow direction generally toward the east. Aquifer testing of the FWBZ in the central region of Alameda Point produced hydraulic conductivity value ranges of 6.30×10^{-3} to 1.46×10^{-2} feet/minute (BEI, 2005). Groundwater has been estimated to travel at a velocity of 26 feet per year. The northern boundary of IR26 is approximately 1,000 feet south of Oakland Inner Harbor. Studies at the site indicate that the groundwater is not appreciably tidally influenced (BEI, 2005).

Buildings 20 through 24 were built before 1947 over fill material emplaced in the 1930s and 1940s. Surface runoff in the northern portion of IR 26 (near Buildings 20, 21, 22, and north of Building 23) drains to catch basins that connect to the storm sewer system, which flows to the east and then runs north to Oakland Inner Harbor. This portion of the storm drain system slopes to the north and is approximately 6 feet bgs near Building 20 (BEI, 2003 and 2005).

2.4 GROUNDWATER USE AND POTENTIAL BENEFICIAL USES

This section summarizes the groundwater use and its potential uses beneath IR26. A more detailed discussion is presented in the RI/FS reports (BEI, 2003 and 2005).

Groundwater beneath the central portions of Alameda Point (including IR26) is not currently used for drinking water, irrigation, or industrial supply. Drinking water is supplied to Alameda Point by the East Bay Municipal Utilities District. The California State Water Resources Control Board (SWRCB) classifies the groundwater beneath Alameda Point as potentially suitable for municipal or domestic supply, industrial process water, industrial service water, and agricultural water supply (BEI, 2003). In 2000, the Regional Water Quality Control Board San Francisco Region (RWQCB) proposed that the municipal and domestic supply designation for shallow bay-front groundwater in the artificial fill layer, Young Bay Mud, and the San Antonio/ Merritt Sand Formations in the Oakland shoreline/Alameda Point area (which includes IR26) be de-designated. In 2003, the RWQCB San Francisco Bay Region determined that groundwater meets the municipal and domestic water supply designation exemption criteria in the SWRCB source of drinking water policy Resolution 88-63 and RWQCB Resolution 89-39 for groundwater west of Saratoga Street at Alameda Point (BEI, 2003). This area includes the groundwater beneath IR26.

3.0 FIELD ACTIVITIES

The goals of the field activities described herein were to obtain an improved understanding of the lateral extent of the VOC plume near Building 20 and to collect additional information on subsurface lithology and groundwater characteristics in support of the Remedial Design. To achieve this, multiple discrete-depth grab groundwater samples were collected at five locations to further define the extent of contamination and seven monitoring wells were subsequently installed and baseline sampled to provide additional data on plume stability. In addition, three temporary observation piezometers were installed for a planned step drawn-down and 24-hour aquifer pump test to be conducted at the site in order to generate data on site-specific aquifer characteristics.

3.1 HYDROPUNCH INVESTIGATION

On September 5 and 6, 2006, five soil borings (B20-SB-001 through B20-SB-005) were drilled to further investigate the extent of groundwater contaminated with chlorinated hydrocarbons in the area south of Building 20. The locations of these five borings are shown on Figure 4. The objectives of the hydropunch investigation were to 1) provide additional lithologic data to better characterize subsurface conditions in the area of the identified chlorinated hydrocarbon groundwater plume, and 2) close both lateral and vertical data gaps and further delineate the plume boundaries. Groundwater samples collected during this activity were analyzed for VOCs by EPA Method 8260B on a 24-hour turn around basis in order to expedite decisions for placement of step-out locations. No step-out locations were selected after the initial sampling round, based upon review of the analytical results for the hydropunch samples which showed the plume had been adequately delineated by the first round of drilling.

Lithologic data was obtained by driving continuous core samples at each location using a dual tube direct push hydraulic drill rig. The site geologist logged the soil cores in accordance with the American Society for Testing and Materials (ASTM) Procedure D 2488: Standard Practice for Description and Identification of Soils (ASTM, 2000). The geologist used the lithologic information obtained to select three discrete depth sample intervals at each location, and the drill

rig revisited each location to collect groundwater samples using a hydropunch. This two-step process was necessary because continuous core sampling precludes the collection of groundwater samples in the same boring due to the requirement that the hydropunch sampler be driven into previously undisturbed soil. Boring logs are included with the field documentation presented in Appendix A of this report.

Grab groundwater samples were collected using a HydroPunch® sampler at three distinct depth intervals (most were collected at depths of approximately 10, 15, and 20 feet bgs) based on the subsurface lithology. The HydroPunch® sample intervals were selected (based upon a review of the continuous core logs) to screen zones of higher-permeability materials (mainly poorly-graded [SP] sands) overlying clay beds that might act as a barrier to downward vertical migration. The selected sample intervals were intended to target the presumed likely path of contaminant transport (i.e. higher permeability saturated zones) for chlorinated solvents mobilized as a dissolved phase in groundwater. The HydroPunch® sampling methodology used during the investigation is as follows: a sampling tool consisting of an inner stainless-steel screen nested inside of a protective outer drill casing is connected to the steel drive pipe and driven or pushed into undisturbed soil to the desired sampling depth. The sampling tool is designed so that the sample inlet remains closed while the tool is advanced, which precludes any contact of the inner screen with any contaminated soils or fluids. Once the tool is at the selected depth, the outer drive pipe is pulled upward to open the inlet section of the tool, allowing groundwater to flow into the screened sample chamber. The desired sample volume is collected using a disposable bailer and then transferred to appropriate pre-cleaned, laboratory-supplied sample containers for VOC analysis. After the required sample volume is obtained, the borehole is backfilled with bentonite-cement grout.

3.2 MONITORING WELL INSTALLATION, DEVELOPMENT, AND SAMPLING

This section describes the methods that were used to install, develop, and collect samples from the groundwater monitoring wells. Seven groundwater monitoring wells (26MW01 through 26MW07) were installed to provide ongoing groundwater level and chemical data to evaluate the stability of the IR26 groundwater plume and to help document future remedial action

effectiveness. Groundwater monitoring well locations were selected based upon review of the hydropunch data collected during the first round of drilling (described in Section 3.1), but these locations were essentially the same as the proposed well locations that were presented in the *Final Feasibility Study Report, Installation Restoration Program Site 26, Alameda Point* completed by Bechtel (BEI, 2005). Boring logs for the monitoring wells showing well construction details are included with the field documentation presented in Appendix A. Alameda County Water District Well Permits are included in Appendix B.

3.2.1 Monitoring Well Installation

From September 19 through 22, 2006 seven shallow groundwater monitoring wells (26MW01 through 26MW07) were installed to monitor the (shallow) FWBZ aquifer south of Building 20. Groundwater monitoring well locations are shown on Figure 4. The shallow groundwater monitoring wells were designed to screen the entire saturated thickness of the fill materials overlying BSU sediments at the site. The wells were installed with screened intervals set from 3 feet bgs to the total well depths of 15 to 15.5 feet bgs. The wells were screened slightly below the depth of first encountered water, which was generally found as shallow as 2.5 feet bgs in the proposed well locations. This shallow depth to water was considered to be anomalously high, an aftereffect of unusually high precipitation experienced during the preceding rainy season. The tops of the screens were intentionally set at 3 feet bgs to avoid having upper well seals (bentonite plus neat cement) less than 2.5 feet thick. Alameda County monitoring well regulations call for a minimum seal depth of 5 feet bgs *or the maximum depth practicable*.

An eighth deeper well (proposed location 26MW08D) had been proposed to monitor groundwater conditions in the second water-bearing zone beneath the BSU downgradient of the plume, but this well was ultimately not installed after it was discovered that the Merritt Sand and San Antonio Formations (the typical formations that comprise the SWBZ at Alameda) are apparently both absent in this portion of Alameda Point. Low permeability clay with generally high-estimated plasticity (CH), identified as Bay Mud (BSU) by the site geologist, was encountered from approximately 21 feet bgs to a total depth of 101.5 feet bgs. A 9-inch diameter steel conductor casing was installed at this location to seal off the shallow aquifer prior to drilling through the BSU. The bottom of the conductor casing was set at approximately 23 feet

bgs, i.e. approximately 2 feet into the top of a laterally persistent CH clay found at 21 feet bgs. The conductor casing was grouted in place when the boring was abandoned.

Well borings were drilled using a truck-mounted hollow stem auger drill rig (CME 75). Boreholes were lithologically logged based on soil cores driven every 5 feet and depth to first encountered groundwater was noted on the logs. After completion of the boreholes, the well screens and casings were placed in the borehole through the hollow-stem augers. The monitoring wells were constructed of 4-inch diameter Schedule 40 flush-threaded polyvinyl chloride (PVC) casing and flush-threaded slotted PVC well screen with 0.010-inch slots. The annulus for each well was backfilled through the augers with Number 2/16 Monterey filter pack sand from the bottom of the borehole to approximately 0.5 foot above the top of the screened interval. A transition seal consisting of approximately 1.5 feet of bentonite chips was placed above the filter sand, and the bentonite chips were hydrated and allowed to swell prior to grouting. Neat cement/bentonite grout was placed above the transition seal to ground surface. The wellheads were all capped with locking expanding plugs and completed with flush-mounted, traffic-rated well vaults set in concrete to match the surrounding ground surface. Well construction details are summarized in Table 1.

3.2.2 Monitoring Well Development

From September 27 through 29, 2006, the monitoring wells were developed to remove fine sand, silt, and clay materials from the screened interval and the surrounding filter pack. The monitoring wells were developed using alternate "surge and bail" techniques. The column of water inside the monitoring well casing was gently agitated using a vented surge block, and then pumped or bailed down. During development, the field crew periodically measured standard water quality parameters (temperature, pH, conductivity, turbidity, dissolved oxygen [DO], and oxidation-reduction potential [ORP]) using properly calibrated portable field instruments. Water quality parameters were measured and recorded at least once per well volume or once every five minutes. The flow rate during purging, total gallons pumped, and drawdown measurements were also recorded. Monitoring wells were developed until the purge water was relatively free of fine sediments and water quality parameters stabilized. Stabilization was deemed complete after three consecutive readings fell within plus or minus 0.1 pH units, plus or minus 1.0 degree

centigrade, and conductivity values varied by less than 10 percent. Well development logs are included in the field documentation presented in Appendix A.

3.2.3 Monitoring Well Sampling

The monitoring wells were sampled October 2 through 4, 2006. [Two wells were resampled for VOCs only on October 17, 2006 due to the analytical lab missing the holding times for the wells' first round of groundwater samples.] Groundwater samples were collected with a peristaltic pump and dedicated sample tubing utilizing "low-flow" sampling techniques. The field crew measured standard water quality parameters (temperature, pH, conductivity, turbidity, DO, and ORP) and initiated sample collection when the water quality parameters stabilized. Stabilization was considered complete after three consecutive readings were within plus or minus 0.1 pH units, plus or minus 1.0 degree centigrade, and conductivity values varied by less than 10 percent. Groundwater samples were analyzed for VOCs by EPA Method 8260B and Dissolved Metals by EPA Method 6010B/6020/7470A. Well purge and sample logs are included in the field documentation presented in Appendix A.

3.3 TEMPORARY OBSERVATION PIEZOMETER INSTALLATION

Three temporary observation piezometers (26PZ01 through 26PZ03) were drilled and installed on September 20 and 21, 2006 using a truck-mounted hollow stem auger drill rig or suitable alternative. The piezometers were screened to match the screened interval of the monitoring wells. The piezometers were installed with screened intervals set from 3 feet bgs to the total depths of 15 to 15.5 feet bgs. The piezometers were constructed with 2-inch-diameter Schedule 40 flush-threaded PVC casing and flush-threaded slotted PVC well screen with 0.010-inch slots. The annulus was backfilled with #2/16 Monterey filter pack sand from the bottom of the borehole to approximately 0.5 feet above the top of the screen. A transition seal consisting of bentonite chips was placed above the filter sand, hydrated and allowed to swell prior to grouting. Neat cement/bentonite grout was placed above the transition seal to ground surface. Boring logs for the piezometers showing construction details are included with the field documentation presented in Appendix A. The piezometers will be used as observation wells during the aquifer tests described in Section 6 and during implementation of the future Remedial Action.

3.4 SITE SURVEY

The locations of the monitoring wells and borings were surveyed to within 0.1 foot horizontal accuracy using the State Plane Coordinate System. The survey provided the elevation of the top of the casing of each monitoring well to 0.01 feet accuracy. Elevations were based on the National Geodetic Vertical Datum of 1929 as adjusted by the National Geodetic Survey in June 1991 and converted to NGVD27. Vertical coordinates are reported as feet above Mean Seal Level (MSL). The survey data will be merged with existing survey data in the Alameda Point database. Survey results are posted in Table 1 and are included with the field documentation in Appendix A.

3.5 WASTE CHARACTERIZATION AND DISPOSAL

Wastes generated during the Data Gap Investigation were temporarily stored on-site in a designated staging area and labeled as non-hazardous pending analysis for waste characterization, profiling, and final off-site disposal. The selection and approval of the staging area were coordinated with the Navy Caretaker Site Office (CSO) representative. The Navy provided the appropriate EPA identification number, sign all required documentation, and perform other related functions required of a hazardous waste generator.

Approximately 8,000 gallons of purged groundwater and decontamination rinsate, contained in a Baker Tank and generated from well installation, development, and sampling, and the aquifer tests, were accepted and disposed of at the Oakland EBMUD Treatment Facility under the Alameda Point Basewide Program's Trucked Non-Hazardous Waste Permit # INTE3000-001 on December 14, 2006. Soil IDW, contained in 55-gallon drums and generated during well installation, was transported and disposed of at the Forward Landfill in Manteca California on December 15, 2006. Disposal of both liquid and soil were coordinated through the Resident Officer in Charge of Construction (ROICC). Copies of disposal manifest documentation are provided in Appendix G.

4.0 RESULTS OF DATA GAP INVESTIGATION

Project activities conducted during the Data Gap Investigation included:

- Drilling and continuous core sampling of five direct-push borings,
- Collection of multiple discrete-depth (hydropunch) grab groundwater samples,
- Installing seven groundwater monitoring wells,
- Installation of three observation piezometers to be used in upcoming aquifer testing, and
- Conducting one round of initial baseline groundwater sampling in the newly installed monitoring wells.

This section describes the results of above field activities.

4.1 SUBSURFACE GEOLOGY AND HYDROGEOLOGY

The subsurface geology in the vicinity of the groundwater plume south of Building 20 (IR 26) consists of fill materials overlying in-place sediments of the BSU. The top of the BSU was encountered at depths of 15 to 15.5 feet bgs in the area of investigation. The transition from fill to BSU sediments was characterized by a change in color from olive browns to dark grayish green (gley color), an increase in the amount of fine-grained sediments and clays (especially high plasticity clays), and an increase in the size and abundance of shell fragments in the soil samples. Within the plume area boundaries, color was considered a less reliable indicator, since hydrocarbon-stained soils can approximate the color of unimpacted BSU sediments. In some portions of the site, the transition between locally-derived hydraulic fill materials (SP sands) and higher permeability BSU sediments (SP sands interbedded with clays) is indistinct. Within the plume area boundaries, the top of the BSU coincides with a laterally persistent clay layer that may have helped retard vertical migration of contaminants from the fill materials into underlying BSU sediments. The subsurface geology of the site is shown in cross section on Figure 5.

Fill materials at the site are predominantly olive colored poorly graded sands (SP), with subordinate amounts of silty sand (SM), clayey sand (SC) and both low-plasticity and high-plasticity clays (CL and CH). The poorly graded sands that comprise the bulk of the fill contain

little to no fines (generally < 5%) and minor quantities of very small shell fragments, typical of locally-derived hydraulic fill.

Beneath the fill materials, the upper 5 feet of the BSU (from approximately 15 to 21 feet bgs) consists of interbedded clays and sand layers (possibly representing channel sands in a near-shore slough environment). The clays in the upper portion of the BSU are dark grayish green with high-estimated plasticity and contain shell fragments. The shell fragments in the BSU are generally more abundant and larger in size than in the overlying fill materials. Sands in the upper BSU are generally poorly graded (SP), "clean" sands (about 5 to 10% fines) darker in color than the SP sands in the overlying fill (dark grayish green instead of olive).

Most of the soil borings drilled during the Data Gap Investigation were terminated in a laterally persistent clay layer encountered at a depth of approximately 21 feet bgs within the area of investigation. This clay layer is very dark greenish gray (gley color) with generally high-estimated plasticity (CH) and contains abundant shell fragments, including intact shells. This clay layer was investigated at boring location 26MW08D by hollow-stem auger drilling after a conductor casing was installed to seal off the shallow water-bearing zone. Soil samples collected for lithologic logging purposes every 5 feet indicated that this clay layer persists from 21 feet bgs to the bottom of the boring, which was terminated at a depth of 101.5 feet bgs (Figure 5).

4.2 ANALYTICAL RESULTS FOR HYDROPUNCH SAMPLES

Grab groundwater samples were collected from three depth-discrete intervals in each of the five initial Hydropunch borings (B20-SB-001 through B20-SB-005) drilled on September 5-6, 2006. Analytical results for Hydropunch samples are summarized in Table 2, and posted on Figure 4.

The highest concentrations of chlorinated hydrocarbons were detected in the grab groundwater sample collected by hydropunch screened at 9.5 to 12 feet bgs in boring B20-SB-001. This sample contained 310 µg/L 1,2-DCE, 32 µg/L TCE, 2.2 µg/L (J-flagged; estimated) tetrachloroethene (PCE), 2.0 µg/L (J-flagged; estimated) vinyl chloride and trace amounts (equal to or less than 0.6 µg/L) 1,1-DCE and 1,1-DCA. The sample collected from deeper in this same boring, from a hydropunch screened at 18.5 to 21 feet bgs, contained only 1.3 µg/L 1,2-DCE, 0.5

$\mu\text{g/L}$ PCE and trace ($0.2 \text{ J } \mu\text{g/L}$) TCE. Boring B20-SB-001 was drilled near the center of the previously delineated area of VOC contamination (Figure 4).

Minor concentrations of 1,2-DCE ($2.4 \mu\text{g/L}$; $2.5 \mu\text{g/L}$ in duplicate) were detected in grab groundwater samples collected by hydropunch screened at 7.5 to 10 feet bgs in boring B20-SB-004. No other significant concentrations of chlorinated hydrocarbons (other than trace) were detected in the grab groundwater samples collected by hydropunch (Table 2).

4.3 ANALYTICAL RESULTS FOR GROUNDWATER MONITORING WELLS

Groundwater samples were collected by low-flow sampling technique from each of the seven groundwater monitoring wells (26MW01 through 26MW07) installed on September 19-22, 2006. Analytical results for groundwater monitoring well samples are summarized in Table 3 (VOCs) and Table 4 (Metals). Analytical results for VOCs are posted on Figure 4.

Concentrations of TCE ($25 \mu\text{g/L}$; $24 \mu\text{g/L}$ in duplicate) and vinyl chloride ($5.6 \mu\text{g/L}$; $5.2 \mu\text{g/L}$ in duplicate) were detected in well 26MW03, installed near the center of the previously delineated chlorinated VOC plume. These concentrations were much lower than those found in Hydropunch samples collected from nearby location B20-SB-001. The apparent discrepancy between the two sample points is likely due to the differences in methodology between Hydropunch sampling and low-flow groundwater sampling techniques. Hydropunch samples typically carry a higher suspended sediment load that may contribute to higher detected contaminant concentrations when compared to samples obtained from a properly installed and developed groundwater monitoring well. Another factor contributing to the apparent discrepancy may be the difference in the length of screened intervals; the Hydropunch sampling device employed in this project uses a 2.5-foot long screened sample chamber while the monitoring wells were constructed to screen the entire upper saturated zone, with screened lengths of approximately 12 to 13 feet. Even using low-flow sampling to minimize drawdown it is to be expected that samples collected from groundwater monitoring wells screened across the entire saturated zone are representative of a larger portion of the saturated zone than grab Hydropunch samples targeted to screen individual 2.5-foot sections within the shallow groundwater zone. It should be noted that BOTH

types of samples are still representative of site conditions as long as the corresponding screened intervals and possible biases or limitations of the sampling methodology are taken into account.

Groundwater collected from monitoring well 26MW04, installed along the expected southern perimeter of the plume, showed 10 µg/L TCE, 4.2 µg/L 1,2-DCE, and trace (0.7 µg/L) vinyl chloride (Figure 4). The remaining wells contained only trace to non-detect concentrations of VOCs (Table 3).

Several of the wells showed concentrations of arsenic and barium above Alameda background values, including some arsenic levels exceeding the MCL of 10 µg/L (Table 4). The metals results were otherwise unremarkable.

The newly installed monitoring wells were surveyed on October 20, 2006 and the top-of-casing elevations were used to determine the groundwater flow direction and gradient for the site. Previously, groundwater flow direction was estimated based on the information obtained from hydropunch borings during the RI and from offsite wells. Figure 6 is a potentiometric surface map of the shallow groundwater in the vicinity of the Building 20 chlorinated hydrocarbon plume, based on depth-to-water measurements taken on October 26, 2006. This newer data confirmed the previous interpretation of groundwater flow direction, which is slightly north of due east. The calculated groundwater gradient based on the potentiometric surface map is approximately 0.0025 feet per foot.

4.4 CONTAMINANT DISTRIBUTION IN GROUNDWATER

Groundwater analytical data collected during the Data Gap Investigation in the area south of Building 20 were consistent with previous interpretations of the lateral limits of the groundwater VOC plume as depicted in the relevant RI/FS documents for the site (BEI, 2005 & BEI, 2006). There were some differences from the previous interpretation of the lateral extent, notably low concentrations of DCE in Hydropunch® boring B20-SB-004 and TCE concentrations detected in monitoring well 26MW04 indicate that plume boundaries appear to extend a little farther to the northeast and to the south than the previous data indicated.. Figure 7 is a comparison of the area of groundwater contamination exceeding Remedial Goals based on the previous data only versus

the newly drawn area (as shown in Figure 4) which is based on a “best-fit” of both the new and the older data.

Groundwater samples collected from boring B20-SB-003 (inside Building 20) and monitoring wells 26MW02 and 26 MW07 show that significant groundwater contamination does not appear to extend northward underneath the building.

Depth-discrete grab groundwater samples collected from the Hydropunch® borings provided groundwater chemical data needed to evaluate the vertical extent of contamination. Previous subsurface investigations did not extend below 12 feet bgs, and most of the groundwater samples were collected from depths of 9 feet or less. Grab groundwater samples collected from boring B20-SB-001, drilled in the center of the chlorinated hydrocarbon plume, showed high concentrations at a screened depth of 9.5 to 12 feet bgs, but only trace concentrations (less than 2 micrograms per liter) of VOCs in the 18.5 to 21 foot sample. A clay layer located at the top of the BSU (15 to 15.5 feet bgs) in the area underlying fill materials contaminated with chlorinated hydrocarbons appears to have limited vertical migration of contaminants (Figure 5).

The lowermost sample in each Hydropunch® boring was targeted for permeable sediments (SP sands of the BSU) immediately above the persistent clay layer that was encountered at approximately 21 feet bgs across most of the site. Except for the minor VOCs in the sample collected from directly below the plume center in boring B20-SB-001, groundwater samples collected from hydropunches screened in BSU sediments were clean.

5.0 DATA QUALITY CONTROL SUMMARY REPORT

A Data Quality Control Summary Report (QCSR) was prepared for the groundwater results collected from the monitoring wells and is included as Appendix E.

The QCSR concluded that the analytical methods used for this project were selected to provide quality data sufficient to meet project data quality objectives and project sensitivity requirements. No major quality control issues were identified. The data generated in support of the project are usable with appropriate qualifications and meet project objectives.

6.0 AQUIFER TESTING

Aquifer testing was conducted in order to establish a radius of influence for the aquifer and provide site-specific hydraulic conductivity data in the preparation and development of the RD. The information will be used to estimate the extent of lateral influence and to model the distribution and effects of the chemical oxidation process on the groundwater plume in order to design the spacing of injection points and quantity of material needed for effective treatment in implementing the RD.

Aquifer tests for IR26 consisted of a step test (to determine an optimal pumping rate), a 24-hour pump and recovery test. These tests were conducted in accordance with the procedures presented in the Draft Final Workplan (ITSI, 2006) on October 31 through November 2, 2006. Aquifer testing data evaluation is attached in Appendix F. A summary of calculated aquifer parameters is presented in Table 5

APPENDIX B
WELL PERMITS

Alameda County Public Works Agency - Water Resources Well Permit

399 Elmhurst Street
Hayward, CA 94544-1395
Telephone: (510)670-6633 Fax:(510)782-1939

Application Approved on: 09/18/2006 By jamesy

Permit Numbers: W2006-0798 to W2006-0808
Permits Valid from 09/19/2006 to 09/22/2006

Application Id: 1158621579229
Site Location: Building 20 - Alameda Point (IR Site 26), 2701 Monarch St, Alameda, CA
Project Start Date: 09/19/2006

City of Project Site: Alameda
Completion Date: 09/22/2006

Applicant: Innovative Technical Solutions - Ken Leonard
2730 Shadelands Dr #100, Walnut Creek, CA 94598

Phone: 925-946-3100

Property Owner: US Dept. of the Navy - SWPIV
1230 Columbia St, #1100, San Diego, CA 92101

Phone: 510-749-5940

Client: ** same as Property Owner **

Specific Work Permit Conditions

1. Permittee shall assume entire responsibility for all activities and uses under this permit and shall indemnify, defend and save the Alameda County Public Works Agency, its officers, agents, and employees free and harmless from any and all expense, cost, liability in connection with or resulting from the exercise of this Permit including, but not limited to, properly damage, personal injury and wrongful death.

2. Permitte, permittee's contractors, consultants or agents shall be responsible to assure that all material or waters generated during drilling, boring destruction, and/or other activities associated with this Permit will be safely handled, properly managed, and disposed of according to all applicable federal, state, and local statutes regulating such. In no case shall these materials and/or waters be allowed to enter, or potentially enter, on or off-site storm sewers, dry wells, or waterways or be allowed to move off the property where work is being completed.

Alameda County Public Works Agency - Water Resources Well Permit

3. Prior to any drilling activities, it shall be the applicant's responsibility to contact and coordinate an Underground Service Alert (USA), obtain encroachment permit(s), excavation permit(s) or any other permits or agreements required for that Federal, State, County or City, and follow all City or County Ordinances. No work shall begin until all the permits and requirements have been approved or obtained.
 4. Compliance with the well-sealing specifications shall not exempt the well-sealing contractor from complying with appropriate State reporting-requirements related to well destruction (Sections 13750 through 13755 (Division 7, Chapter 10, Article 3) of the California Water Code). Contractor must complete State DWR Form 188 and mail original to the Alameda County Public Works Agency, Water Resources Section, within 60 days. Including permit number and site map.
 5. Wells shall have a Christy box or similar structure with a locking cap or cover. Well(s) shall be kept locked at all times. Well(s) that become damaged by traffic or construction shall be repaired in a timely manner or destroyed immediately (through permit process). No well(s) shall be left in a manner to act as a conduit at any time.
 6. Minimum surface seal thickness is two inches of cement grout placed by tremie
 7. Minimum seal depth for monitoring wells is 5 feet below ground surface(BGS) or the maximum depth practicable or 20 feet.
 8. Copy of approved drilling permit must be on site at all times. Failure to present or show proof of the approved permit application on site shall result in a fine of \$500.00.
 9. No Inspector Assigned to this site.
- Applicant shall contact this office by email at wells@acpwa.org and certify in writing that work was completed and according to County Standards within 5 working days after the completion of work.

Well Construction-Piezometer-Seismic Monitoring-Seismic Monitoring - 3 Wells

Driller: RSI Drilling - Lic #: 802334 - Method: auger

8. Copy of approved drilling permit must be on site at all times. Failure to present or show proof of the approved permit application on site shall result in a fine of \$500.00.

9. No Inspector Assigned to this site.

Applicant shall contact this office by email at wells@acpwa.org and certify in writing that work was completed and according to County Standards within 5 working days after the completion of work.

PROGRAMS AND SERVICES

Well Standards Program

The Alameda County Public Works Agency, Water Resources is located at:

399 Elmhurst Street

Hayward, CA 94544

For Driving Directions or General Info, Please Contact 510-670-5480 or wells@acpwa.org

For Drilling Permit information and process contact James Yoo at

Phone: 510-670-6633

FAX: 510-782-1939

Email: Jamesy@acpwa.org

Alameda County Public Works is the administering agency of General Ordinance Code, Chapter 6.88 . The purpose of this chapter is to provide for the regulation of groundwater wells and exploratory holes as required by California Water Code. The provisions of these laws are administered and enforced by Alameda County Public Works Agency through its Well Standards Program.

Drilling Permit Jurisdictions in Alameda County: There are four jurisdictions in Alameda County.

Location: Agency with Jurisdiction Contact Number

Berkeley City of Berkeley Ph: 510-981-7460

Fax: 510-540-5672

Fremont, Newark, Union City Alameda County Water District Ph: 510-668-4460

Fax: 510-651-1760

Pleasanton, Dublin, Livermore, Sunol Zone 7 Water Agency Ph: 925-454-5000

Fax: 510-454-5728

The Alameda County Public Works Agency, Water Resources has the responsibility and authority to issue drilling permits and to enforce the County Water Well Ordinance 73-68. This jurisdiction covers the western Alameda County area of **Oakland, Alameda, Piedmont, Emeryville, Albany, San Leandro, San Lorenzo, Castro Valley, and Hayward** . The purpose of the drilling permits are to ensure that any new well or the destruction of wells, including geotechnical investigations and environmental sampling within the above jurisdiction and within Alameda County will not cause pollution or contamination of ground water or otherwise jeopardize the health, safety or welfare of the people of Alameda County.

Permits are required for all work pertaining to wells and exploratory holes at any depth within the jurisdiction of the Well Standards Program. A completed permit application (30 Kb)* , along with a site map, should be submitted at least **ten (10) working days prior to the planned start of work**. Submittals should be sent to the address or fax number provided on the application form. When submitting an application via fax, please use a high resolution scan to retain legibility.

Fees

Beginning April 11, 2005 , the following fees shall apply:

A permit to construct, rehabilitate, or destroy wells, including cathodic protection wells, but excluding dewatering wells (*Horizontal hillside dewatering and dewatering for construction period only), shall cost \$300.00 per well.

A permit to bore exploratory holes, including temporary test wells, shall cost \$200 per site. A site includes the project parcel as well as any adjoining parcels.

Please make checks payable to: **Treasurer, County of Alameda**

Permit Fees are exempt to State & Federal Projects

Applicants shall submit a letter from the agency requesting the fee exemption.

Scheduling Work/Inspections:

Alameda County Public Works Agency (ACPWA), Water Resources Section requires scheduling and inspection of permitted work. All drilling activities must be scheduled in advance. Availability of inspections will vary from week to week and will come on a first come, first served bases. To ensure inspection availability on your desired or driller scheduled date, the following procedures are required:

Please contact **James Yoo at 510-670-6633** to schedule the inspection date and time (You must have drilling permit approved prior to scheduling).

Schedule the work as far in advance as possible (at least 5 days in advance); and confirm the scheduled drilling date(s) at least 24 hours prior to drilling.

Once the work has been scheduled, an ACPWA Inspector will coordinate the inspection requirements as well as how the Inspector can be reached if they are not at the site when Inspection is required. Expect for special circumstances given, all work will require the inspection to be conducted during the working hours of 8:30am to 2:30pm., Monday to Friday, excluding holidays.

Request for Permit Extension:

Permits are only valid from the start date to the completion date as stated on the drilling permit application and Conditions of Approval. To request an extension of a drilling permit application, applicants must request in writing prior to the completion date as set forth in the Conditions of Approval of the drilling permit application. Please send fax or email to Water Resources Section, Fax 510-782-1939 or email at wells@acpwa.org. There are no additional fees for permit extensions or for re-scheduling inspection dates. You may not extend your drilling permit dates beyond 90 days from the approval date of the permit application. **NO refunds** shall be given back after 90 days and the permit shall be deemed voided.

Cancel a Drilling Permit:

Applicants may cancel a drilling permit only in writing by mail, fax or email to Water Resources Section, Fax 510-782-1939 or email at wells@acpwa.org. If you do not cancel your drilling permit application before the drilling completion date or notify in writing within 90 days, Alameda County Public Works Agency, Water Resources Section may void the permit and No refunds may be given back.

Refunds/Service Charge:

A service charge of \$25.00 dollars for the first check returned and \$35.00 dollars for each subsequent check returned.

Applicants who cancel a drilling permit application **before** we issue the approved permit(s), will receive a **FULL** refund (at any amount) and will be mailed back within two weeks.

Applicants who cancel a drilling permit application **after** a permit has been issued will then be charged a service fee of \$50.00 (fifty Dollars).

To collect the remaining funds will be determined by the amount of the refund to be refunded (see process below).

Board of Supervisors Minute Order, File No. 9763, dated January 9, 1996, gives blanket authority to the Auditor-Controller to process claims, from all County departments for the refund of fees which do not exceed \$500 (Five Hundred Dollars)(with the exception of the County Clerk whose limit is \$1,500).

Refunds over the amounts must be authorized by the Board of Supervisors Minute Order, File No. 9763 require specific approval by the Board of Supervisors. The forms to request for refunds under \$500.00 (Five Hundred Dollars) are available at this office or any County Offices. If the amount is exceeded, a Board letter and Minute Order must accompany the claim. Applicant shall fill out the request form and the County Fiscal department will process the request.

Enforcement

Penalty. Any person who does any work for which a permit is required by this chapter and who fails to obtain a permit shall be guilty of a misdemeanor punishable by fine not exceeding Five Hundred Dollars (\$500.00) or by imprisonment not exceeding six months, or by both such fine and imprisonment, and such person shall be deemed guilty of a separate offense for each and every day or portion thereof during which any such

violation is committed, continued, or permitted, and shall be subject to the same punishment as for the original offense. (Prior gen. code §3-160.6)

Enforcement actions will be determined by this office on a case-by-case basis

Drilling without a permit shall be the cost of the permit(s) and a fine of \$500.00 (Five Hundred Dollars).

Well Completion Reports (State DWR-188 forms) must be filed with the Well Standards Program within 60 days of completing work. Staff will review the report, assign a state well number, and then forward it to the California Department of Water Resources (DWR). Drillers should not send completed reports to DWR directly. Failure to file a Well Completion Report or deliberate falsification of the information is a misdemeanor; it is also grounds for disciplinary action by the Contractors' State License Board. Also note that filed Well Completion Reports are considered private record protected by state law and can only be released to the well owner or those specifically authorized by government agencies.

See our website (www.acgov.org/pwa/wells/index.shtml) for links to additional forms.

APPENDIX D
PHOTO LOG

Photographic Documentation

Photograph No. 1

Date:
9-19-06

Description:

Well location 26MW06 prior to drilling (the hole cut in asphalt). Location near where drillers are standing is B20-SB-005. White marking at bottom of photo was proposed location for 26MW08D.

Photograph No. 2

Date:
9-19-06

Description:

5'-6.5' and 10'-11.5' samples (left to right) at 26MW05. Soil is mainly SP sand, probably locally-derived hydraulic fill.

Photographic Documentation

Photograph No. 3

Date:
9-19-06

Description:
SP sand color comparison; SP sand from above 15 ft bgs on the left, SP sand from below 15 ft on the right. SP sand from above 15 ft has an olive brown tint.

Photograph No. 4

Date:
9-19-06

Description:
SP sand from below 15 ft has a gley tint. Color change was subtle but consistent and was interpreted as the transition from locally-derived hydraulic fill to in-place sediments of the BSU.

Photographic Documentation

Photograph No. 5

Date:
9-20-06

Description:

Box for containing drill cuttings and 10 ¼" HAS ready to begin drilling at 26MW06.

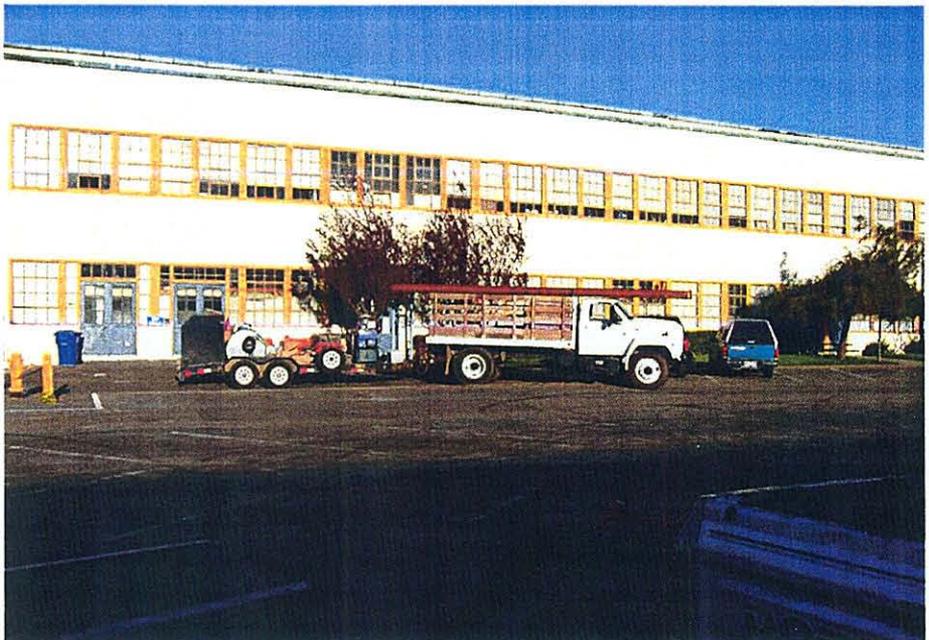

Photograph No. 6

Date:
9-22-06

Description:

Support truck arrives with 9-inch nominal diameter conductor casing for installation at drill location 26MW08D.

Photographic Documentation

Photograph No. 7

Date:
9-22-06

Description:

Driller demonstrates with a short piece of the "9-inch" conductor casing that the drill bit for 8-1/4" diameter HSA will not fit inside the conductor casing. The ID of the casing measured 8-5/8".

Photograph No. 8

Date:
9-22-06

Description:

Box to contain drill cuttings and 14-1/4" diameter HSA ready to begin drilling at 26MW08D.

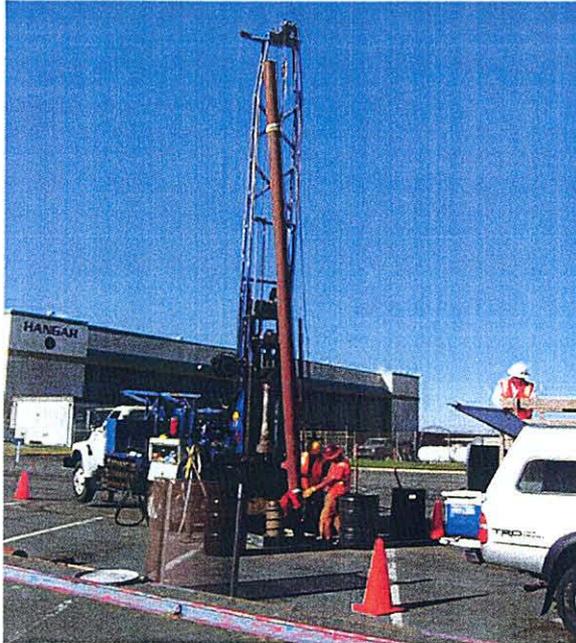

Photographic Documentation

Photograph No. 9

Date:
9-22-06

Description:

Steel conductor casing raised up the drill rig mast prior to installation at 26MW08D.

Photograph No. 10

Date:
9-22-06

Description:

Installed conductor casing at 26MW08D. Casing was used to seal off the shallow groundwater zone prior to drilling through persistent clay layer encountered at 21 ft bgs.

Photographic Documentation

Photograph No. 11

Date:
9-22-06

Description:

Drum storage area at the end of
Monarch Street.

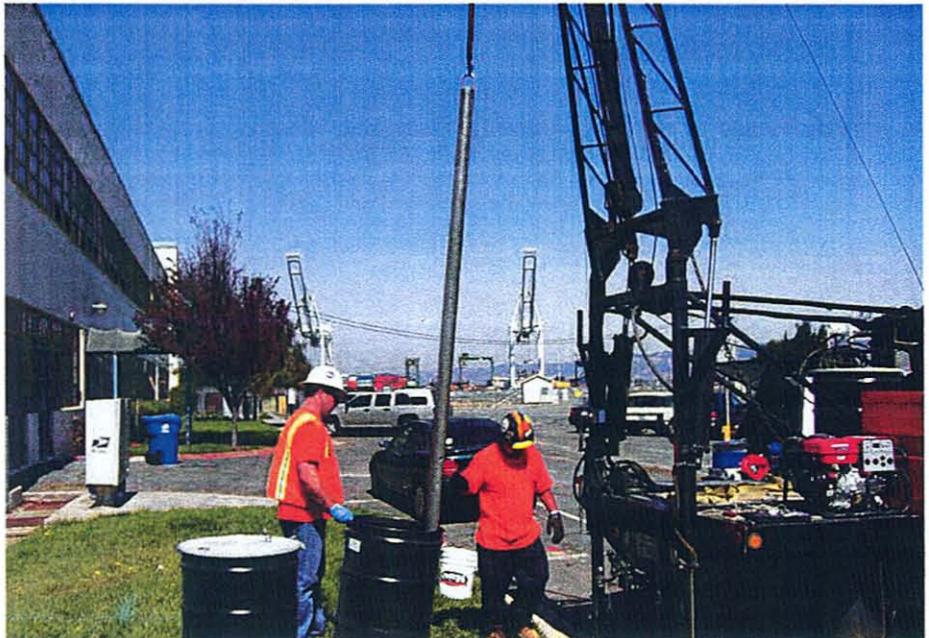

Photograph No. 12

Date:
9-25-06

Description:

10-foot long stainless steel bailer
being used to develop 26MW05.

Photographic Documentation

Photograph No. 13

Date:
9-26-06

Description:
6 1/4" auger inside nominal 9" conductor casing. This was the largest diameter auger available that would fit inside the conductor.

Photograph No. 14

Date:
9-26-06

Description:
Upper 45 feet of clay shown in sample. Clay layer first encountered at 21 feet bgs.

Photographic Documentation

Photograph No. 15

Date:
9-26-06

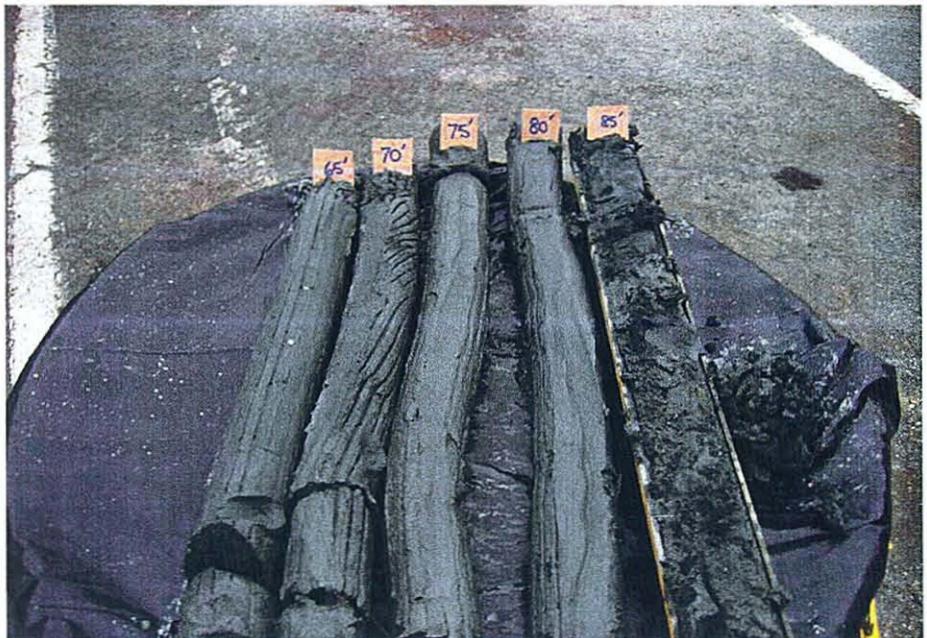

Description:
Fine sands flushed out of hollow stem auger at 55 feet bgs. This was the only indication of coarser grained sediments within the clay unit, other than a few thin seams of sand noted in the core samples collected on 5-foot centers.

Photograph No. 16

Date:
9-27-06

Description:
18" core samples collected on 5-foot centers from 65 ft bgs to 85 ft bgs; all clay.

Photographic Documentation

Photograph No. 17

Date:
9-27-06

Description:
18" core samples collected on 5-foot centers from 90 ft bgs to 101.5 ft bgs; all clay.

Photograph No. 18

Date:
9-27-06

Description:
Grouting the hole after terminating boring at 26MW08D at 101.5 ft bgs.

1.0 ANALYTICAL PROGRAM

Complete summaries of analytical results are presented in the Appendix C of the Site Investigation Report, Data Gap Sampling, Installation Restoration (IR) Site 26, Alameda Point, Alameda, California.

Groundwater sample analyses were conducted in accordance with the requirements specified in the following guidance documents:

- *Test Methods for Evaluating Solid Waste, SW-846 Physical/Chemical Methods* (U.S. Environmental Protection Agency [EPA], 1996)
- *Methods for Chemical Analysis of Water and Wastes* (EPA, 1983)
- *Field Workplan for Data Gap Sampling, Installation Restoration Site 26, Alameda Point, Alameda, CA, Draft Final, August 2006.* (Innovative Technical Solutions, Incorporated (ITSI), 2006)

Curtis and Tompkins, Incorporated (C&T), of Berkeley, California was selected as the primary analytical laboratory. C&T has successfully completed the Naval Facilities Engineering Service Center's (NFESC) Laboratory Evaluation Program. In addition, C&T participates in and is certified under the National Environmental Laboratory Accreditation Program (NELAP). ITSI conducted a verification audit of C&T in October 2004. The sample login and receipt area of C&T was also audited during the Spring 2006 sampling event. These audits did not identify any significant data quality issues.

C&T scanned all hardcopy reports and included them with the appropriate C&T report. All original, unvalidated C&T reports were submitted as Portable Document Format (PDF) files and are included as Appendix C of the main report for reference. C&T's computer data system also produced an appropriate unvalidated laboratory electronic data deliverable for that specific sample delivery group (SDG).

Finally, Validata Chemical Services, Inc. (Validata) of Duluth, Georgia performed independent EPA Level 4 data validation on 20 percent of the results, and EPA Level 3 data validation on the remaining results. Analytical data were reviewed and validated for all test method results according to the procedures specified in the following documents, as applicable:

- *Field Workplan for Data Gap Sampling, Installation Restoration Site 26, Alameda Point, Alameda, CA, Draft Final, August 2006, (ITSI, 2006)*
- *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, (EPA, 1999)*
- *Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, (EPA, 2002)*
- *Test Methods for Evaluating Solid Waste, SW-846 Physical/Chemical Methods (EPA, 1996)*

Detailed data validation procedures are included as Table A-9 of the Workplan (ITSI, 2006). The following analytical quality control (QC) elements were evaluated and used as the basis for qualifying data:

- Holding time and temperature compliance
- Initial calibration verification
- Continuing calibration verification
- Method blank contamination
- Field blank contamination
- Laboratory control sample (LCS) accuracy and precision
- Matrix spike (MS) accuracy and precision
- Internal standard recovery
- Interference check sample recovery (EPA Method 6010B only)
- Inductively Coupled Plasma (ICP) Serial Dilution (EPA Method 6010B)
- Surrogate recovery
- Sample duplicate precision
- Instrument tuning and system performance (Level IV)
- Analyte identification and quantitation (Level IV)

Validata produced a data validation report (DVR) for each sample delivery group. All DVRs are included as Attachment 1. Upon completion of the data review, Validata also provided tables noting any changed data qualifiers. These tables are included as Attachment 2. ITSI personnel ensured that the appropriate validation code was entered into the data summary tables presented in the main report. The data validation codes are merged electronically with the laboratory

electronic data deliverables (EDD) in a MS-Access Database from which a full project electronic data deliverable will be submitted in the Navy Environmental Data Deliverable (NEDD) format.

1.1 QUALIFIED RESULTS

The following qualifiers have been applied as appropriate to the data. Final electronic data deliverable and data tables contain the following data qualifiers as appropriate:

- *J qualifier* denotes the analyte was positively identified, the quantitation is an estimation. The analyte was positively identified but the associated numerical value is an estimated value above the method detection limit (MDL) and below the reporting limit (RL).
- *U qualifier* denotes the analyte was analyzed for, but not detected. The associated numerical value is at or below the reporting limit (RL).
- *UJ qualifier* denotes the associated quantification limit may be inaccurate or imprecise
- *R qualifier* denotes the data are unusable due to deficiencies in the ability to analyze the sample and meet QC criteria

A qualifier may be applied to a result for more than one reason. For example, an analysis that exceeded the allowed holding time and qualified as estimated, 'J', may also be qualified due to an identified problem with the instrument calibration. In the discussion below, only the initial reason for the qualification will be discussed.

The following sections discuss the quality of the data and reasons for qualification. Significant data quality issues (if any) are discussed in Section 2.0.

1.2 ESTIMATED LOW CONCENTRATIONS

C&T and its subcontract laboratories were tasked to report detected analyte concentrations to the MDL and not detected concentrations to the RL. Detected concentrations between the RL and the MDL are qualified as estimated, 'J' because of the increased quantitative uncertainty in the result as the concentration of the analyte approaches the MDL. A total of 128 results were qualified as estimated due to concentrations measured between the MDL and the RL.

Qualification of results as estimated due to low concentrations of analytes is expected due to the sensitivity of the analytical methodology used and the low concentrations of many analytes. Qualification for low concentrations is not due to method performance, or analytical program issues. Results remain usable with qualification, and so data usability is not affected.

1.3 SAMPLE SHIPMENT AND STORAGE

As samples were collected in the field, preservation by cooling was immediately initiated. C&T arranged for a courier service during each day of sampling. Samples were rapidly shipped directly to C&T. In certain cases, insufficient time had elapsed for thermal equilibrium to be reached and the samples to have been cooled to the specified temperature range of 2 to 6 degrees Celsius (°C). In these cases, samples are still considered as being shipped under proper storage conditions. No other samples were received at temperatures outside the specified temperature range.

Upon receipt by the laboratory, samples were immediately entered into the laboratory's data system, and were stored under refrigeration. No results were qualified due to improper sample shipment and storage for this event.

1.4 HOLDING TIME

Some samples for volatile organic analysis were not preserved which reduced the holding time to 7 days (from a normal holding time of 14 days). Holding times were met for all samples.

1.5 LABORATORY AND FIELD BLANK CONTAMINATION

Low levels of detected analytes due to ambient contamination were detected in some laboratory and field blanks. The sensitivity of modern analytical methodology increases the likelihood of detection of low-level contamination. Sources of low-level contamination are difficult to identify, but common sources include dust, volatile organic compounds gradually released from manufactured plastics, and building materials. A total of 40 results were qualified as not detected, 'U', or not detected at an estimated detection limit, 'UJ'. Of these results, the laboratory reported 28 results as estimated values that were lower than the RL, but higher than the MDL.

The levels of detected analytes are not sufficiently high for a result to be rejected. The identified low-level contamination is not sufficient to affect the data usability.

1.6 CALIBRATION

Instrument calibration is performed in accordance with the specified EPA methodology. The acceptance of the calibration is determined by the measurement of a method-specific statistical parameter. Because of the natural variability during the analytical process, an instrument may be later determined to have a calibration that is outside the acceptance limit. The accuracy of a

result associated with a calibration that is later determined to be outside the acceptance limit will have more uncertainty than that result. Depending upon the magnitude of the uncertainty, a result may be qualified. A total of 41 results were qualified as estimated, 'J', or not detected at an estimated detection limit, 'UJ', due to identified problems with the calibration.

On a statistical basis, given the number and types of analytes that are measured in this program, some of the calibrations will occur outside the method acceptance parameters. The number of results qualified is consistent with what is expected, and these results may still be used with qualification. Data usability is not significantly affected.

1.7 SURROGATES AND INTERNAL STANDARDS

Surrogate compounds and internal standards are control compounds used to monitor the analytical process as specified in EPA methodology. The evaluation of the surrogate recovery and internal standard response may indicate that the accuracy of the result is not within the acceptable method-specific parameters. Depending upon the magnitude of the uncertainty, a result may be qualified. A total of 4 results were qualified as estimated, 'J', or not detected at an estimated detection limit, 'UJ', due to identified problems with surrogate recoveries.

The number of results qualified is consistent with what is expected, and these results may still be used with qualification. No results were rejected due to surrogate recovery or internal standard recovery. Data usability is not significantly affected.

1.8 SERIAL DILUTION

For metals analysis, a serial dilution test is used to determine if interferences are present during the analysis. This test is specified in EPA methodology. The measurement of a metal in an undiluted sample is compared to the measurement of the same metal in a diluted sample (and multiplied by the proper dilution factor). Depending upon the magnitude of the uncertainty, a result may be qualified. A serial dilution test may only be evaluated when a measurable amount of analyte is present.

The serial dilution test identified molybdenum and vanadium recoveries that exceeded the control limit. However, the laboratory selected a sample for the serial dilution that was not part of this project. The data validator determined that data qualification was not merited. No results were qualified or rejected due to the serial dilution test.

1.9 LABORATORY CONTROL SAMPLES

Laboratory control samples are synthetic samples prepared and analyzed in the same procedure as normal field samples. Laboratory control samples are used to further monitor the analytical process. No results were qualified or rejected due to the recovery from the laboratory control samples.

1.10 MATRIX SPIKE SAMPLES

One in 20 samples were identified for matrix spike analysis, representing approximately a 5 percent frequency. Matrix spike samples are field samples to which analytes of interest have been added to monitor the analytical process. A total of 3 results for copper have been qualified as estimated, 'J' due to low recovery in the matrix spike samples. The number of results qualified is consistent with what is expected, and these results may still be used with qualification. No results were rejected due to matrix spike results, therefore data usability is not significantly affected.

1.11 DUPLICATE SAMPLES

The laboratory as part of its internal quality control checks also analyzes and reports laboratory replicates. No results were qualified or rejected due to duplicate results

2.0 REJECTED RESULTS

The data review and validation process did not identify any rejected results.

3.0 FIELD DUPLICATES

One in 10 samples were collected as a field duplicate, and were analyzed for the same parameters as the normal sample. A total of 3 field duplicates were collected. Field duplicate results were compared only when an analyte is detected above the reporting limit in both samples. A total of 11 results had analytes that were detected above the reporting limit in both the normal sample and the field duplicate. The Sampling and Analysis Plan specifies that field duplicate results are in agreement when the relative percent difference (RPD) between the field duplicate result and the normal sample result is less than 50. All results are in agreement between the normal sample and its field duplicate. A comparison of field duplicates is included as Attachment 3.

4.0 CONCLUSIONS AND DATA USABILITY

The analytical methods used for this project were selected to provide quality data sufficient to meet data quality objectives and project sensitivity requirements.

4.1 QUALITY ASSURANCE/QUALITY CONTROL SAMPLES

Field QC samples for this project included field duplicates, trip blanks, temperature blanks, and matrix spike/ matrix spike duplicate (MS/MSD) samples. Field duplicate samples were collected in the field at a frequency of 10 percent for each of the thirteen IR sites, and analyzed for the same analytes as their corresponding original samples. Trip blanks were placed in coolers used for wells requiring volatile organic compound (VOC) analysis and analyzed for VOCs as well. Temperature blanks were placed in coolers for cooler temperature checks. MS/MSD samples were collected at a frequency of approximately one for every 20 groundwater field samples.

4.2 COMPLETENESS SUMMARY

Of a total of 1563 results (including normal samples and field duplicates), 87 are qualified as estimated or not detected at an estimated reporting limit. No results were rejected. Estimated results can still be used with qualification. The total completeness is therefore 100 percent. Field duplicate reproducibility is 100 percent for all detected results above the reporting limit.

4.3 FINAL CONCLUSION

The data generated in support of the project are usable with qualifications, and meet the project objectives.

RELEASE SIGNATURE:

Data Qualifier Definitions

- J - The associated numerical value is an estimated quantity.
- R - The data are unusable (the compound/analyte may or may not be present). Resampling and reanalysis are necessary for verification.
- U - The compound/analyte was analyzed for, but not detected. The associated numerical value is the sample quantitation limit.
- UJ - The compound/analyte was analyzed for, but not detected. The sample quantitation limit is an estimated quantity.

DATA QUALIFICATION SUMMARY

Curtis & Tompkins, LTD. - 189171 Organics

SAMPLES: 090506026001A, 090506026002, 090506026003, 090506026004

VOLATILE ORGANICS

SUMMARY

All laboratory data were acceptable with qualifications.

MAJOR ISSUES

There were no major problems associated with this fraction of the SDG.

MINOR ISSUES

I.) Holding Times:

All Holding Time criteria were met.

II.) GC / MS Tuning:

All GC / MS Tuning criteria were met. No action was necessary.

III.) Calibration:

All Initial and Continuing Calibration criteria were met. No action was required.

IV.) Blanks:

Method Blanks:

The following compounds were detected in method blank QC354630:

<u>Compound</u>	<u>Result</u>
bromoform	0.2 ug/L
1,2,4-trichlorbenzene	0.2 ug/L

All positive results for these compounds in the SDG samples, which were less than 5X the blank contamination, were flagged as undetected (U) with results less than the CRQL being raised to the CRQL.

Tentatively Identified Compounds (TIC):

TIC data were not supplied for this SDG. No action was required.

V.) Surrogate Recoveries:

All Surrogate Recovery criteria were met. No action was required.

VI.) Laboratory Control Samples (LCS):

One LCS/LCSD set was analyzed by the laboratory. All LCS criteria were met. No action was taken.

VII.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

MS / MSD analyses were not submitted for this SDG. Data qualification based on MS/MSD criteria was not required. No action was taken.

VIII.) Field Duplicates:

There were no field duplicate samples identified for this fraction of the SDG. No action was required.

IX.) Internal Standards Performance (ISTD):

All ISTD criteria were met. No action was required.

X.) TCL Compound Identification:

All TCL Compound Identification criteria were met. No action was taken.

XI.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL):

All CRQL criteria were met. No action was required.

XII.) Tentatively Identified Compounds (TICs):

TIC data were not submitted for this SDG. No action was taken.

XIII.) Contract Compliance:

All Contract Compliance criteria were met.

Flag Summary Table

Site	Sample	Laboratory ID	Type	SDG	Parameter	Original Reported Concentration (µg/L)	STATUS	Modified Final Concentration (µg/L)	Reason
IR26	090506023001A	190171-1	N	189171	bromoform	0.2J	U	1.0U	Method Blank Contamination

Notes:

N - (normal) Primary Sample

FD - Field Duplicate

EB - Equipment Rinsate Blank

SDG - Sample Delivery Group

Qualifier Codes:

J - Estimated value. Usually a number reported between Practical Quantitation Limit (PQL) and Method Detection Limit (MDL).

< (reporting limit), J - Analyte was analyzed for, but not detected. The associated numerical value is below the reporting limit, and the reporting limit is estimated. The notation '< (reporting limit) J' is equivalent to the 'UJ (reporting limit)' notation used in the data validation reports (DVRs).

< (reporting limit) - Analyte was analyzed for, but not detected. The associated numerical value is below the reporting limit. The notation '< (reporting limit)' is equivalent to the 'U (reporting limit)' notation used in the data validation reports (DVRs).

Data Qualifier Definitions

- J - The associated numerical value is an estimated quantity.
- R - The data are unusable (the compound/analyte may or may not be present). Resampling and reanalysis are necessary for verification.
- U - The compound/analyte was analyzed for, but not detected. The associated numerical value is the sample quantitation limit.
- UJ - The compound/analyte was analyzed for, but not detected. The sample quantitation limit is an estimated quantity.

VOLATILE ORGANICS

SUMMARY

All laboratory data were acceptable with qualifications.

MAJOR ISSUES

There were no major problems associated with this fraction of the SDG.

MINOR ISSUES

I.) Holding Times:

All Holding Time criteria were met. It was noted by the laboratory that the samples were received at 6 degrees and that several samples were tested at a pH of greater than 2. Since the samples were analyzed immediately, using professional judgment, the validator determined that data qualification was not merited.

II.) GC / MS Tuning:

All GC / MS Tuning criteria were met. No action was necessary.

III.) Calibration:

Initial Calibration:

The Percent Difference (%D) of 39% for vinyl acetate in the second source calibration on 8/9/06 on instrument MSVOA08 exceeded the 25% QC limit. Since there were no positive results for this compound in the associated samples, no action was required.

Continuing Calibration:

The Percent Difference (%RD) of 26% for carbon disulfide for the standards run on 9/7/06 at 09:30 on instrument MSVOA08 exceeded the 25% QC limit. The positive and non-detect results for this compound in associated samples 090606026006 and 090606026015 were flagged as estimated (J) and (UJ).

The Percent Differences (%Ds) of 29% for acetone, 26% for 2-butanone and 29% for 2-hexanone for the standards run on 9/6/06 at 11:19 on instrument MSVOA09 exceeded the 25% QC limit. All positive and non-detect results for these compounds in the associated samples were flagged as estimated (J) and (UJ). Only the result for acetone in associated sample 090606026012 was flagged, since the results for the other listed compounds for this sample were taken from another analysis. The other associated samples were 090606026002, 090606026004, 090606026006, 090606026008 and 090606026010.

The Percent Difference (%D) of 30% for vinyl acetate for the standards run on 9/7/06 at 13:21 on instrument MSVOA10 exceeded the 25% QC limit. The non-detect result for this compound in associated sample 090606026012 was flagged as estimated (UJ).

IV.) Blanks:

Method Blanks:

Bromoform was detected at 0.2 ug/L in method blank QC354760. There were no positive results for this compound in the associated samples, so no action was required.

Acetone was detected at 0.6 ug/L in method blank QC354769. All positive results for acetone in the associated samples, which were less than 10X the blank amount, were flagged as undetected (U) with the results less than the CRQL being raised to the CRQL. The associated samples were: 090606026002, 090606026004, 090606026008, 090606026010 and 090606026012.

Methylene chloride was detected at 0.2 ug/L in method blank QC354934. There were no positive results for this compound in the associated samples, so no action was required.

Bromoform was detected at 0.2 ug/L in method blank QC354941. The positive results for this compound in associated samples 090606026006 and 090606026015, which were less than 5X the blank contamination, were flagged as undetected (U) with the results less than the CRQL being raised to the CRQL.

Tentatively Identified Compounds (TIC):

TIC data were not supplied for this SDG. No action was required.

V.) Surrogate Recoveries:

All Surrogate Recovery criteria were met. No action was required.

VI.) Laboratory Control Samples (LCS):

Four LCSs and one LCS/LCSD set were analyzed by the laboratory. The Percent Recoveries (%Rs) of 135% and 131% for tetrachloroethene in the LCS/LCSD samples exceeded the 75-125% QC limits. Data qualification based on LCS criteria was not required. No action was taken.

VII.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

MS / MSD analyses were performed on SDG sample 090606026002. The Percent Recoveries (%Rs) of

141% and 139% for tetrachloroethene exceeded the 75-125% QC limits. Taken in conjunction with the LCS data, using professional judgment, the validator determined that data qualification was not merited based on the absence of tetrachloroethene in the associated samples. No action was taken.

Batch MS/MSD analyses were also submitted for this fraction of the SDG. The results for tetrachloroethene were not usable since the parent sample results were greater than 4X the blank concentration. The Percent Recovery (%R) of trichloroethene was 121%, which exceeded the 70-120% QC limits. It was noted by the validator that the sample result exceeded the linear calibration range of the instrument. Data qualification based on MS/MSD criteria alone was not required. No action was taken.

VIII.) Field Duplicates:

There were no field duplicate samples identified for this fraction of the SDG. No action was required.

IX.) Internal Standards Performance (ISTD):

All ISTD criteria were met. No action was required.

X.) TCL Compound Identification:

All TCL Compound Identification criteria were met. No action was taken.

XI.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL):

Two separate analyses were performed for samples 090606026012 and 090606026013, with the reported results being a composite of the best results. No action was required.

All other CRQL criteria were met. No action was required.

XII.) Tentatively Identified Compounds (TICs):

TIC data were not submitted for this SDG. No action was taken.

XIII.) Contract Compliance:

All Contract Compliance criteria were met.

Notes:

N - (normal) Primary Sample

FD - Field Duplicate

EB - Equipment Rinse Blank

SDG - Sample Delivery Group

Qualifier Codes:

J - Estimated value. Usually a number reported between Practical Quantitation Limit (PQL) and Method Detection Limit (MDL).

< (reporting limit), *J* - Analyte was analyzed for, but not detected. The associated numerical value is below the reporting limit, and the reporting limit is estimated. The notation '< (reporting limit) *J*' is equivalent to the 'UJ (reporting limit)' notation used in the data validation reports (DVRs).

< (reporting limit) - Analyte was analyzed for, but not detected. The associated numerical value is below the reporting limit. The notation '< (reporting limit)' is equivalent to the 'U (reporting limit)' notation used in the data validation reports (DVRs).

RELEASE SIGNATURE:

Data Qualifier Definitions

- J - The associated numerical value is an estimated quantity.
- R - The data are unusable (the compound/analyte may or may not be present). Resampling and reanalysis are necessary for verification.
- U - The compound/analyte was analyzed for, but not detected. The associated numerical value is the sample quantitation limit.
- UJ - The compound/analyte was analyzed for, but not detected. The sample quantitation limit is an estimated quantity.

DATA QUALIFICATION SUMMARY

Curtis & Tompkins, LTD. - 189839 Inorganics

SAMPLES: 100206026001, 100306026003, 100306026004, 100306026005, 100306026006

TOTAL METALS

SUMMARY

All laboratory data were acceptable with qualification.

MAJOR ISSUES

There were no major issues for this fraction of the SDG.

MINOR ISSUES

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) Calibration:

All Calibration criteria were met. No action was required.

III.) CRDL Standards for ICP:

All CRDL criteria were met. No action was required.

IV.) Blanks:

The following results were the highest blank contamination levels associated with the samples:

<u>Blank ID</u>	<u>Analyte</u>	<u>Blank Result</u>	<u>Action Level</u>
CCB3	antimony	0.0217 ug/L	0.11 ug/L
CCB3	barium	0.0357 ug/L	0.18 ug/L
CCB2	cadmium	0.02257 ug/L	0.11 ug/L
CCB2	chromium	0.01252 ug/L	0.06 ug/L
CCB2	cobalt	0.01755 ug/L	0.09 ug/L
CCB2	lead	0.01966 ug/L	0.10 ug/L
PBW	molybdenum	0.19 ug/L	0.95 ug/L
CCB3	selenium	0.02451 ug/L	0.12 ug/L
CCB2	silver	0.01879 ug/L	0.09 ug/L
PBW	vanadium	0.058 ug/L	0.29 ug/L
PBW	zinc	1.3 ug/L	6.5 ug/L

All positive results for these analytes in the SDG samples less than 5X the blank amount were flagged as undetected (U).

V.) ICP Interference Check Sample Results:

All ICP Interference Check Sample Recovery criteria were met. No action was required.

VI.) ICP Serial Dilution Analysis:

Batch Serial Dilution Analysis was submitted for this fraction of the SDG. The Percent Differences (%Ds) for molybdenum at 46% and vanadium at 24% exceeded the 10% QC limit. Since the parent sample was not a client sample and the client site specific QC from other SDGs was within QC limits, using professional judgment, the validator determined that data qualification was not merited.

VII.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met. No action was necessary.

VIII.) Duplicate Sample Analysis:

All Duplicate Sample Analysis criteria were met. No action was required.

IX.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

Batch MS/MSD analyses were submitted for this fraction of the SDG. The following Percent Recoveries (%Rs) were below the 75-125% QC limits:

<u>Analyte</u>	<u>MS, %R</u>	<u>MSD, %R</u>
lead	65%	67%
molybdenum	71%	75%

Since the parent sample was not a client sample and the client site specific QC from other SDGs was within QC limits, using professional judgment, the validator determined that data qualification was not merited.

X.) Internal Standards Performance:

All Internal Standards Performance criteria were met. No action was required.

XI.) Field Duplicates:

There were no field duplicate samples identified for this fraction of the SDG. No action was required.

XII.) Sample Result, Calculation/Transcription Verification:

All criteria were met. No action was required.

XIII.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL):

All CRDL criteria were met. No action was taken.

XIV.) Quarterly Verification of Instrumental Parameters:

Quarterly Verification data were not submitted for this SDG. No action was required.

XV.) Contract Compliance:

All Contract Compliance criteria were met.

ALKALINITY

SUMMARY

All laboratory data were acceptable without qualification.

MAJOR ISSUES

There were no major issues for this fraction of the SDG.

MINOR ISSUES

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) Calibration:

Calibration criteria were not required for this fraction of the SDG. No action was taken.

III.) Blanks:

There were no detections in the blanks associated with this SDG. No action was required.

IV.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met. No action was necessary.

V.) Duplicate Sample Analysis:

All Duplicate Sample Analysis criteria were met. No action was required.

VI.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

Batch matrix spike and matrix spike duplicate analyses were submitted for this fraction of the SDG.

All MS/MSD criteria were met. No action was required.

VII.) Field Duplicates:

There were no field duplicate samples identified for this fraction of the SDG. No action was required.

VIII.) Sample Result, Calculation/Transcription Verification:

All criteria were met. No action was required.

IX.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL):

All CRDL criteria were met. No action was taken.

X.) Contract Compliance:

All Contract Compliance criteria were met.

TOTAL DISSOLVED SOLIDS

SUMMARY

All laboratory data were acceptable without qualification.

MAJOR ISSUES

There were no major issues for this fraction of the SDG.

MINOR ISSUES

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) Calibration:

Calibration criteria were not required for this fraction of the SDG. No action was taken.

III.) Blanks:

There were no detections in the blanks associated with this SDG. No action was required.

IV.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met. No action was necessary.

V.) Duplicate Sample Analysis:

All Duplicate Sample Analysis criteria were met. No action was required.

VI.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

An LCS / LCSD pair were submitted for this fraction of the SDG. All accuracy and precision criteria were met. No action was required.

VII.) Field Duplicates:

There were no field duplicate samples identified for this fraction of the SDG. No action was required.

VIII.) Sample Result, Calculation/Transcription Verification:

All criteria were met. No action was required.

IX.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL):

All CRDL criteria were met. No action was taken.

X.) Contract Compliance:

All Contract Compliance criteria were met.

IR26	100306026005	189839-4	N	189839	zinc	6.3	U	6.3U	Method Blank Contamination

Notes:

N - (normal) Primary Sample

FD - Field Duplicate

EB - Equipment Rinsate Blank

SDG - Sample Delivery Group

Qualifier Codes:

J - Estimated value. Usually a number reported between Practical Quantitation Limit (PQL) and Method Detection Limit (MDL).

< (reporting limit), J - Analyte was analyzed for, but not detected. The associated numerical value is below the reporting limit, and the reporting limit is estimated. The notation '< (reporting limit) J' is equivalent to the 'UJ (reporting limit)' notation used in the data validation reports (DVRs).

< (reporting limit) -Analyte was analyzed for, but not detected. The associated numerical value is below the reporting limit. The notation '< (reporting limit)' is equivalent to the 'U (reporting limit)' notation used in the data validation reports (DVRs).

RELEASE SIGNATURE:

Data Qualifier Definitions

- J - The associated numerical value is an estimated quantity.
- R - The data are unusable (the compound/analyte may or may not be present). Resampling and reanalysis are necessary for verification.
- U - The compound/analyte was analyzed for, but not detected. The associated numerical value is the sample quantitation limit.
- UJ - The compound/analyte was analyzed for, but not detected. The sample quantitation limit is an estimated quantity.

DATA QUALIFICATION SUMMARY

Curtis & Tompkins, LTD. - 189840 Organics

SAMPLES: 100206026001, 100206026002A, 100306026003, 100306026004,
100306026005, 100306026006

VOLATILE ORGANICS

SUMMARY

All laboratory data were acceptable with qualifications.

MAJOR ISSUES

There were no major problems associated with this fraction of the SDG.

MINOR ISSUES

I.) Holding Times:

All Holding Time criteria were met. It was noted by the laboratory that the samples were submitted to the laboratory unpreserved. Since the samples were analyzed immediately, using professional judgment, the validator determined that data qualification was not merited.

II.) GC / MS Tuning:

All GC / MS Tuning criteria were met. No action was necessary.

III.) Calibration:

Initial Calibration:

The Percent Difference (%D) of 27% for carbon disulfide in the second source calibration on 9/29/06 on instrument MSVOA08 exceeded the 25% QC limit. The positive result for carbon disulfide in associated sample 100306026004 was flagged as estimated (J).

Continuing Calibration:

The Percent Differences (%Ds) of 31% for freon 113, 26% for 1,1,1-trichloroethane and 34% for carbon tetrachloride for the standards run on 10/8/06 at 20:03 on instrument MSVOA08 exceeded the 25% QC limit. The results for these compounds in associated sample 100306026004, which consisted entirely of non-detects, were flagged as estimated (UJ).

The Percent Differences (%Ds) of 32% for bromomethane, 26% for 2-butanone and 40% for carbon tetrachloride for the standards run on 10/5/06 at 09:13 on instrument MSVOA11 exceeded the 25% QC

limit. All positive and non-detect results for these compounds in the associated samples were flagged as estimated (J) and (UJ). The associated samples were 100206026001, 100206026002A, 100306026003, 100306026005 and 100306026006.

IV.) Blanks:

Method Blanks:

Acetone and chloroform were detected at 0.3 ug/L and 0.09 ug/L, respectively, in method blank QC359092. All positive results for acetone in the associated samples, which were less than 10X the blank amount, were flagged as undetected (U) with the results less than the CRQL being raised to the CRQL. There were no positive results for chloroform in the associated samples, so no further action was required. The associated samples were 100206026001, 100206026002A, 100306026003, 100306026005 and 100306026006.

Acetone was detected at 0.9 ug/L in method blank QC359440. The positive result for acetone in associated sample 100306026004, which was less than 10X the blank amount, was flagged as undetected (U) with the results less than the CRQL being raised to the CRQL.

Tentatively Identified Compounds (TIC):

TIC data were not supplied for this SDG. No action was required.

V.) Surrogate Recoveries:

The Percent Recoveries (%Rs) of 1,2-dichloroethane-d4 exceeded the 80-120% QC limits for the following samples:

<u>Sample</u>	<u>1,2-dichloroethane-d4, %R</u>
100206026001	126%
100206026002A	125%
100306026003	129%
100306026005	128%
100306026006	127%

All positive results for these samples were flagged as estimated (J).

VI.) Laboratory Control Samples (LCS):

Two LCS/LCSD sets were analyzed by the laboratory. All LCS criteria were met. No action was required.

VII.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

MS / MSD analyses were not submitted for this SDG. Data qualification based on MS/MSD criteria was not required. No action was taken.

VIII.) Field Duplicates:

There were no field duplicate samples identified for this fraction of the SDG. No action was required.

IX.) Internal Standards Performance (ISTD):

All ISTD criteria were met. No action was required.

X.) TCL Compound Identification:

All TCL Compound Identification criteria were met. No action was taken.

XI.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL):

All CRQL criteria were met. No action was required.

XII.) Tentatively Identified Compounds (TICs):

TIC data were not submitted for this SDG. No action was taken.

XIII.) Contract Compliance:

All Contract Compliance criteria were met.

Notes:

N - (normal) Primary Sample

FD - Field Duplicate

EB - Equipment Rinsate Blank

SDG - Sample Delivery Group

Qualifier Codes:

J - Estimated value. Usually a number reported between Practical Quantitation Limit (PQL) and Method Detection Limit (MDL).

< (reporting limit), J - Analyte was analyzed for, but not detected. The associated numerical value is below the reporting limit, and the reporting limit is estimated. The notation '< (reporting limit) J' is equivalent to the 'UJ (reporting limit)' notation used in the data validation reports (DVRs).

< (reporting limit) - Analyte was analyzed for, but not detected. The associated numerical value is below the reporting limit. The notation '< (reporting limit)' is equivalent to the 'U (reporting limit)' notation used in the data validation reports (DVRs).

DATA VALIDATION SUMMARY REPORT

COMPANY: ITSI
SITE NAME: Alameda IR26 Data Gap INV.
CONTRACTED LAB: Curtis & Tompkins, LTD.
QA/QC LEVEL: EPA Level IV
EPA SOW/METHODS: SW-846 & EPA Methodology
VALIDATION GUIDELINES: USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, 1999; USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, 1994
SAMPLE MATRIX: Water
TYPES OF ANALYSES: Total Metals, Alkalinity, Total Dissolved Solids (TDS)
SDG NUMBER: 189863

OVERVIEW

SAMPLES:

<u>Client Sample #</u>	<u>Lab Sample #</u>	<u>Matrix</u>	<u>Total Metals*</u>	<u>Alkalinity</u>	<u>TDS</u>
100406026007	189863-001	Water	X	X	X
100406026008D	189863-002	Water	X	X	X
100406026009	189863-003	Water	X	X	X

* - total metals consisted of 15 analytes by method 6010, one analyte by method 6020 and mercury by method 7470A

DATA REVIEWER(S): Amy L. Hogan, Kevin C. Harmon, Monalisa B. Beasley

RELEASE SIGNATURE:

Data Qualifier Definitions

- J - The associated numerical value is an estimated quantity.
- R - The data are unusable (the compound/analyte may or may not be present). Resampling and reanalysis are necessary for verification.
- U - The compound/analyte was analyzed for, but not detected. The associated numerical value is the sample quantitation limit.
- UJ - The compound/analyte was analyzed for, but not detected. The sample quantitation limit is an estimated quantity.

DATA QUALIFICATION SUMMARY

Curtis & Tompkins, LTD. - 189863 Inorganics

SAMPLES: 100406026007, 100406026008D, 100406026009

TOTAL METALS

SUMMARY

All laboratory data were acceptable with qualification.

MAJOR ISSUES

There were no major issues for this fraction of the SDG.

MINOR ISSUES

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) Calibration:

All Calibration criteria were met. No action was required.

III.) CRDL Standards for ICP:

All CRDL criteria were met. No action was required.

IV.) Blanks:

The following results were the highest blank contamination levels associated with the samples:

<u>Blank ID</u>	<u>Analyte</u>	<u>Blank Result</u>	<u>Action Level</u>
CCB1	arsenic	1.886 ug/L	9.43 ug/L
ICB	copper	1.053 ug/L	5.27 ug/L
CCB2	lead	1.384 ug/L	6.92 ug/L
CCB1	molybdenum	4.468 ug/L	22.3 ug/L
ICB(10/20/06)	thallium	0.0228 ug/L	0.11 ug/L
CCB1(10/23/06)	thallium	0.02412 ug/L	0.12 ug/L
CCB1	selenium	2.646 ug/L	13.2 ug/L
CCB2	zinc	3.393 ug/L	17.0 ug/L

All positive results for these analytes in the SDG samples that were less than 5X the blank amount were

flagged as undetected (U).

V.) ICP Interference Check Sample Results:

All ICP Interference Check Sample Recovery criteria were met. No action was required.

VI.) ICP Serial Dilution Analysis:

All Serial Dilution Analysis criteria was met. No action was required.

VII.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met. No action was necessary.

VIII.) Duplicate Sample Analysis:

All Duplicate Sample Analysis criteria were met. No action was required.

IX.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

Batch matrix spike and matrix spike duplicate analyses were submitted for this fraction of the SDG. All MS/MSD criteria were met. No action was required.

X.) Internal Standards Performance:

All Internal Standards Performance criteria were met. No action was required.

XI.) Field Duplicates:

There were no field duplicate samples identified for this fraction of the SDG. No action was required.

XII.) Sample Result, Calculation/Transcription Verification:

All criteria were met. No action was required.

XIII.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL):

The barium result for sample 100406026007 was taken from the analysis performed on 10/23/06 at 09:40, while the results for all other ICP analytes were taken from the analysis performed on 10/23/06 at 10:15. The Form I is a composite of the results, so no action was required.

All other CRDL criteria were met. No action was taken.

XIV.) Quarterly Verification of Instrumental Parameters:

Quarterly Verification data were not submitted for this SDG. No action was required.

XV.) Contract Compliance:

All Contract Compliance criteria were met.

ALKALINITY

SUMMARY

All laboratory data were acceptable without qualification.

MAJOR ISSUES

There were no major issues for this fraction of the SDG.

MINOR ISSUES

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) Calibration:

Calibration criteria were not required for this fraction of the SDG. No action was taken.

III.) Blanks:

There were no detections in the blanks associated with this SDG. No action was required.

IV.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met. No action was necessary.

V.) Duplicate Sample Analysis:

All Duplicate Sample Analysis criteria were met. No action was required.

VI.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

Batch matrix spike and matrix spike duplicate analyses were submitted for this fraction of the SDG. All MS/MSD criteria were met. No action was required.

VII.) Field Duplicates:

There were no field duplicate samples identified for this fraction of the SDG. No action was required.

VIII.) Sample Result, Calculation/Transcription Verification:

All criteria were met. No action was required.

IX.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL):

All CRDL criteria were met. No action was taken.

X.) Contract Compliance:

All Contract Compliance criteria were met.

TOTAL DISSOLVED SOLIDS

SUMMARY

All laboratory data were acceptable without qualification.

MAJOR ISSUES

There were no major issues for this fraction of the SDG.

MINOR ISSUES

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) Calibration:

Calibration criteria were not required for this fraction of the SDG. No action was taken.

III.) Blanks:

There were no detections in the blanks associated with this SDG. No action was required.

IV.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met. No action was necessary.

V.) Duplicate Sample Analysis:

All Duplicate Sample Analysis criteria were met. No action was required.

VI.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

An LCS / LCSD pair were submitted for this fraction of the SDG. All accuracy and precision criteria

were met. No action was required.

VII.) Field Duplicates:

There were no field duplicate samples identified for this fraction of the SDG. No action was required.

VIII.) Sample Result, Calculation/Transcription Verification:

All criteria were met. No action was required.

IX.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL):

All CRDL criteria were met. No action was taken.

X.) Contract Compliance:

All Contract Compliance criteria were met.

Notes:

N - (normal) Primary Sample

FD - Field Duplicate

EB - Equipment Rinsate Blank

SDG - Sample Delivery Group

Qualifier Codes:

J -Estimated value. Usually a number reported between Practical Quantitaion Limit (PQL) and Method Detection Limit (MDL).

< (reporting limit), J - Analyte was analyzed for, but not detected. The associated numerical value is below the reporting limit, and the reporting limit is estimated. The notation '< (reporting limit) J' is equivalent to the 'UJ (reporting limit)' notation used in the data validation reports (DVRs).

< (reporting limit) -Analyte was analyzed for, but not detected. The associated numerical value is below the reporting limit. The notation '< (reporting limit)' is equivalent to the 'U (reporting limit)' notation used in the data validation reports (DVRs).

DATA REVIEWER(S):

Amy L. Hogan, Kevin C. Harmon, Monalisa B. Beasley

RELEASE SIGNATURE:

A handwritten signature in cursive script, appearing to read "Monalisa B. Beasley". The signature is written in black ink and is positioned to the right of the "RELEASE SIGNATURE:" label.

Data Qualifier Definitions

- J - The associated numerical value is an estimated quantity.
- R - The data are unusable (the compound/analyte may or may not be present). Resampling and reanalysis are necessary for verification.
- U - The compound/analyte was analyzed for, but not detected. The associated numerical value is the sample quantitation limit.
- UJ - The compound/analyte was analyzed for, but not detected. The sample quantitation limit is an estimated quantity.

DATA QUALIFICATION SUMMARY

Curtis & Tompkins, LTD. - 189908 Organics & Inorganics

SAMPLES: 100506026011, 100506026012, 100506026013

VOLATILE ORGANICS

SUMMARY

All laboratory data were acceptable with qualifications.

MAJOR ISSUES

There were no major problems associated with this fraction of the SDG.

MINOR ISSUES

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) GC / MS Tuning:

All GC / MS Tuning criteria were met. No action was necessary.

III.) Calibration:

Initial Calibration:

The Percent Difference (%D) of 26% for hexachlorobutadiene in the second source calibration on 9/21/06 on instrument MSVOA02 exceeded the 25% QC limit. Since there were no positive results for this compound in the SDG samples, no action was required.

Continuing Calibration:

The Percent Differences (%Ds) of 28% for acetone and 31% for 2-butanone for the standards run on 10/6/06 at 10:07 on instrument MSVOA02 exceeded the 25% QC limit. All positive and non-detect results for these compounds in associated samples 100506026011 and 100506026012 were flagged as estimated (J) and (UJ).

The Percent Difference (%D) of 28% for 2-hexanone for the standards run on 10/16/06 at 08:50 on instrument MSVOA2 exceeded the 25% QC limit. The non-detect result for this compound in associated sample 10506026013 was flagged as estimated (UJ).

V.) Blanks:

Method Blanks:

Methylene chloride was detected at 0.90 ug/kg in method blank QC359292. The positive result for methylene chloride in associated sample 100506026012, which was less than 10X the blank contamination, was flagged as undetected (U) with the result being raised to the CRQL.

Tentatively Identified Compounds (TIC):

TIC data were not supplied for this SDG. No action was required.

V.) Surrogate Recoveries:

All Surrogate Recovery criteria were met. No action was required.

VI.) Laboratory Control Samples (LCS):

Two LCS were analyzed by the laboratory. All LCS criteria were met. No action was required.

VII.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

Two sets of batch MS / MSD analyses were submitted for this SDG. The Percent Recoveries (%Rs) of trichloroethene at 149% for both replicates in one set of the MS/MSD samples exceeded the 65-131% QC limits. Data qualification based on MS/MSD criteria was not required. No action was taken.

VIII.) Field Duplicates:

There were no field duplicate samples identified for this fraction of the SDG. No action was required.

IX.) Internal Standards Performance (ISTD):

All ISTD criteria were met. No action was required.

X.) TCL Compound Identification:

All TCL Compound Identification criteria were met. No action was taken.

XI.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL):

All CRQL criteria were met. No action was required.

XII.) Tentatively Identified Compounds (TICs):

TIC data were not submitted for this SDG. No action was taken.

XIII.) Contract Compliance:

All Contract Compliance criteria were met.

SEMIVOLATILE ORGANICS

SUMMARY

All laboratory data were acceptable without qualifications.

MAJOR ISSUES

There were no major problems associated with this fraction of the SDG.

MINOR ISSUES

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) GC / MS Tuning:

All GC / MS Tuning criteria were met. No action was necessary.

III.) Calibration:

All Initial and Continuing Calibration criteria were met. No action was required.

IV.) Blanks:

Method Blanks:

There were no detections in the method blanks associated with this fraction of the SDG. No action was required.

Tentatively Identified Compounds (TIC):

TIC data were not supplied for this SDG. No action was required.

V.) Surrogate Recoveries:

All Surrogate Recovery criteria were met. No action was required.

VI.) Laboratory Control Samples (LCS):

One LCS was analyzed by the laboratory. All LCS criteria were met. No action was required.

VII.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

MS/MSD analyses were performed on SDG sample 100506026013. All MS/MSD criteria were met. No action was required.

VIII.) Field Duplicates:

There were no field duplicate samples identified for this fraction of the SDG. No action was required.

IX.) Internal Standards Performance (ISTD):

All ISTD criteria were met. No action was required.

X.) TCL Compound Identification:

All TCL Compound Identification criteria were met. No action was taken.

XI.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL):

All CRQL criteria were met. No action was required.

XII.) Tentatively Identified Compounds (TICs):

TIC data were not submitted for this SDG. No action was taken.

XIII.) Contract Compliance:

All Contract Compliance criteria were met.

TOTAL PETROLEUM HYDROCARBONS - DIESEL RANGE ORGANICS (TPH-DRO)

SUMMARY

All laboratory data were acceptable without qualifications.

MAJOR ISSUES

There were no major problems associated with this fraction of the SDG.

MINOR ISSUES

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) Instrument Performance:

All Instrument Performance criteria were met. No action was necessary.

III.) Calibration:

Initial Calibration:

All Initial Calibration criteria were met. No action was required.

Continuing Calibration:

The Percent Difference (%D) of 17% for hexacosane in the standards run on 10/15/06 at 12:23 on instrument GC17A exceeded the 15% QC limit. Since the compound is a surrogate, no action was required.

IV.) Blanks:

Method Blanks:

Diesel Range Organics were reported at 0.54 mg/kg for method blank QC359818. All positive results for diesel range organics in the SDG samples were greater than 5X the blank contamination, so no further action was required.

V.) Surrogate Recoveries:

All Surrogate Recovery criteria were met. No action was required.

VI.) Laboratory Control Samples (LCS):

One LCS was analyzed by the laboratory. All LCS criteria were met. No action was required.

VII.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

MS / MSD analyses were performed on SDG sample 100506026013. All MS/MSD criteria were met. No action was required.

VIII.) Field Duplicates:

There were no field duplicate samples identified for this fraction of the SDG. No action was required.

IX.) TCL Compound Identification:

All TCL Compound Identification criteria were met. No action was taken.

X.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL):

All CRQL criteria were met. No action was required.

XI.) Contract Compliance:

All Contract Compliance criteria were met.

TOTAL METALS

SUMMARY

All laboratory data were acceptable with qualification.

MAJOR ISSUES

There were no major issues for this fraction of the SDG.

MINOR ISSUES

I.) Holding Times:

All Holding Time criteria were met. No action was required.

II.) Calibration:

All Calibration criteria were met. No action was required.

III.) CRDL Standards for ICP:

All CRDL criteria were met. No action was required.

IV.) Blanks:

The following results were the highest blank contamination levels associated with the samples:

<u>Blank ID</u>	<u>Analyte</u>	<u>Blank Result</u>	<u>Action Level</u>
CCB2	arsenic	2.107 ug/L	10.5 mg/kg
CCB2	lead	2.466 ug/L	12.3 mg/kg
PBS	molybdenum	0.027 mg/kg	0.135 mg/kg
CCB2	vanadium	1.197 ug/L	6.0 mg/kg

All positive results for these analytes in the SDG samples that were less than 5X the blank amount were flagged as undetected (U).

V.) ICP Interference Check Sample Results:

All ICP Interference Check Sample Recovery criteria were met. No action was required.

VI.) ICP Serial Dilution Analysis:

Two separate Serial Dilution Analyses were submitted for this fraction of the SDG. All Serial dilution analysis criteria were met for sample 100506026011. The Percent Differences (%Ds) exceeded the 10% QC limit for the batch serial dilution analysis for the following analytes:

<u>Analyte</u>	<u>%D</u>
arsenic	14%
barium	28%
beryllium	22%
chromium	23%
copper	12%
lead	27%
nickel	27%
vanadium	19%
zinc	29%

Since the parent sample was not a client sample, using professional judgment, the validator determined that data qualification was not merited.

VII.) Laboratory Control Samples (LCS):

All LCS Recovery criteria were met. No action was necessary.

VIII.) Duplicate Sample Analysis:

All Duplicate Sample Analysis criteria were met. No action was required.

IX.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

MS/MSD analyses were performed on SDG sample 100506026011. The Percent Recoveries (%Rs) were 44% and 45% for copper, which were below the 75-125% QC limits. All positive and non-detect results for copper in the SDG samples were flagged as estimated (J) and (UJ).

Batch MS/MSD analyses were also submitted for this fraction of the SDG. The following Percent Recoveries (%Rs) were below the 75-125% QC limits:

<u>Analyte</u>	<u>MS, %R</u>	<u>MSD, %R</u>
arsenic	66%	48%
beryllium	69%	64%
cadmium	62%	59%
chromium	56%	51%
cobalt	45%	40%
copper	43%	48%

1

<u>Analyte</u>	<u>MS, %R</u>	<u>MSD, %R</u>
lead		38%
molybdenum	61%	57%
selenium	64%	58%
silver	62%	52%
thallium	56%	

Since the parent sample was not a client sample, using professional judgment, the validator determined that data qualification was not merited.

X.) Field Duplicates:

There were no field duplicate samples identified for this fraction of the SDG. No action was required.

XI.) Sample Result, Calculation/Transcription Verification:

All criteria were met. No action was required.

XIII.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL):

All CRQL criteria were met. No action was required.

XIV.) Quarterly Verification of Instrumental Parameters:

Quarterly Verification data were not submitted for this SDG. No action was required.

XV.) Contract Compliance:

All Contract Compliance criteria were met.

EB - Equipment Rinsate Blank

SDG - Sample Delivery Group

Qualifier Codes:

J - Estimated value. Usually a number reported between Practical Quantitation Limit (PQL) and Method Detection Limit (MDL).

< (reporting limit), J - Analyte was analyzed for, but not detected. The associated numerical value is below the reporting limit, and the reporting limit is estimated. The notation '< (reporting limit) J' is equivalent to the 'UJ (reporting limit)' notation used in the data validation reports (DVRs).

< (reporting limit) - Analyte was analyzed for, but not detected. The associated numerical value is below the reporting limit. The notation '< (reporting limit)' is equivalent to the 'U (reporting limit)' notation used in the data validation reports (DVRs).

DATA VALIDATION SUMMARY REPORT

COMPANY: ITSI
SITE NAME: Alameda IR Data Gap INV.
CONTRACTED LAB: Curtis & Tompkins, LTD.
QA/QC LEVEL: EPA Level IV
EPA SOW/METHODS: SW-846 & EPA Methodology
VALIDATION GUIDELINES: USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, 1999; USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, 1994
SAMPLE MATRIX: Water
TYPES OF ANALYSES: Volatile Organics (VOA)
SDG NUMBER: 190137

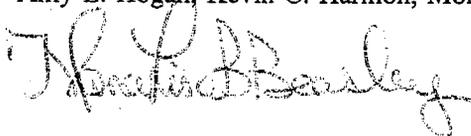

OVERVIEW

SAMPLES:

<u>Client Sample #</u>	<u>Lab Sample #</u>	<u>Matrix</u>	<u>VOA</u>
101706026017A	190137-001	Water	X
101706026014	190137-002	Water	X
101706026015D	190137-003	Water	X
101706026016	190137-004	Water	X

DATA REVIEWER(S): Amy L. Hogan, Kevin C. Harmon, Monalisa B. Beasley

RELEASE SIGNATURE:

Data Qualifier Definitions

- J - The associated numerical value is an estimated quantity.
- R - The data are unusable (the compound/analyte may or may not be present). Resampling and reanalysis are necessary for verification.
- U - The compound/analyte was analyzed for, but not detected. The associated numerical value is the sample quantitation limit.
- UJ - The compound/analyte was analyzed for, but not detected. The sample quantitation limit is an estimated quantity.

DATA QUALIFICATION SUMMARY

Curtis & Tompkins, LTD. - 190137 Organics

SAMPLES: 101706026017A, 101706026014, 101706026015D, 101706026016

VOLATILE ORGANICS

SUMMARY

All laboratory data were acceptable with qualifications.

MAJOR ISSUES

There were no major problems associated with this fraction of the SDG.

MINOR ISSUES

I.) Holding Times:

All Holding Time criteria were met. It was noted by the validator that samples 101706026014, 101706026015D and 101706026016 were not preserved. No action was required.

II.) GC / MS Tuning:

All GC / MS Tuning criteria were met. No action was necessary.

III.) Calibration:

All Initial and Continuing Calibration criteria were met. No action was required.

IV.) Blanks:

Method Blanks:

The following compounds were detected in method blank QC360692:

<u>Compound</u>	<u>Result</u>
acetone	1.2 ug/L
freon 113	0.2 ug/L
carbon disulfide	0.1 ug/L
propylbenzene	0.08 ug/L
1,3,5-trimethylbenzene	0.05 ug/L
4-chlorotoluene	0.06 ug/L
sec-butylbenzene	0.07 ug/L

<u>Compound</u>	<u>Result</u>
1,3-dichlorobenzene	0.1 ug/L
1,4-dichlorobenzene	0.2 ug/L
n-butylbenzene	0.2 ug/L
1,2-dichlorobenzene	0.09 ug/L
1,2,4-trichlorobenzene	0.3 ug/L
hexachlorobutadiene	0.3 ug/L
naphthalene	0.2 ug/L
1,2,3-trichlorobenzene	0.3 ug/L

All positive results for these compounds in associated samples 101706026017A, 101706026015D and 101706026016, which were less than 10X the acetone result and 5X the other listed compound results, were flagged as undetected (U) with the results less than the CRQL being raised to the CRQL.

The following compounds were detected in method blank QC360693:

<u>Compound</u>	<u>Result</u>
acetone	1.2 ug/L
carbon disulfide	0.1 ug/L
propylbenzene	0.07 ug/L
1,3,5-trimethylbenzene	0.05 ug/L
4-chlorotoluene	0.08 ug/L
1,3-dichlorobenzene	0.1 ug/L
1,4-dichlorobenzene	0.1 ug/L
n-butylbenzene	0.2 ug/L
1,2-dichlorobenzene	0.1 ug/L
1,2,4-trichlorobenzene	0.3 ug/L
naphthalene	0.2 ug/L
1,2,3-trichlorobenzene	0.2 ug/L

All positive results for these compounds in associated sample 101706026014, which were less than 10X the acetone result and 5X the other listed compound results, were flagged as undetected (U) with the results less than the CRQL being raised to the CRQL.

Tentatively Identified Compounds (TIC):

TIC data were not supplied for this SDG. No action was required.

V.) Surrogate Recoveries:

All Surrogate Recovery criteria were met. No action was required.

VI.) Laboratory Control Samples (LCS):

One LCS was analyzed by the laboratory. All LCS criteria were met. No action was taken.

VII.) Matrix Spike / Matrix Spike Duplicate (MS / MSD):

One set of batch MS / MSD analyses were submitted for this fraction of the SDG. All MS/MSD criteria were met. No action was required.

VIII.) Field Duplicates:

There were no field duplicate samples identified for this fraction of the SDG. No action was required.

IX.) Internal Standards Performance (ISTD):

All ISTD criteria were met. No action was required.

X.) TCL Compound Identification:

All TCL Compound Identification criteria were met. No action was taken.

XI.) Compound Quantitation and Reported Contract Required Quantitation Limits (CRQL):

All CRQL criteria were met. No action was required.

XII.) Tentatively Identified Compounds (TICs):

TIC data were not submitted for this SDG. No action was taken.

XIII.) Contract Compliance:

All Contract Compliance criteria were met.

FD - Field Duplicate

EB - Equipment Rinsate Blank

SDG - Sample Delivery Group

Qualifier Codes:

J - Estimated value. Usually a number reported between Practical Quantitation Limit (PQL) and Method Detection Limit (MDL).

< (reporting limit), J - Analyte was analyzed for, but not detected. The associated numerical value is below the reporting limit, and the reporting limit is estimated. The notation '< (reporting limit) J' is equivalent to the 'UJ (reporting limit)' notation used in the data validation reports (DVRs).

< (reporting limit) - Analyte was analyzed for, but not detected. The associated numerical value is below the reporting limit. The notation '< (reporting limit)' is equivalent to the 'U (reporting limit)' notation used in the data validation reports (DVRs).

1.0 INTRODUCTION AND SITE BACKGROUND

Aquifer testing was conducted from 30 October through 2 November 2006 at Installation Restoration Site 26 (IR26) in order to establish a radius of influence during pumping for the aquifer and to determine site-specific hydraulic properties such as hydraulic conductivity, specific yield and transmissivity to support the Remedial Design (RD). A field kickoff meeting was held on October 26, 2006 detailing the planned effort (see Attachment 1). Aquifer tests at IR26 consisted of a step test and a 24-hour pump test; step tests were conducted to determine an optimal pumping rate to be used during the subsequent pump test. These tests were conducted in accordance with procedures presented in the Draft Final Workplan (ITSI, 2006, Section 3.6).

Section 4.1 of the Data Gap Investigation Report presents the subsurface geology/hydrogeology within the area of investigation at the site. The targeted zone for the aquifer test is the fill material that is present to depths of approximately 15-feet below ground surface (bgs). The fill is mainly comprised of olive colored poorly-graded sands (SP), with subordinate amounts of silty sand (SM), clayey sand (SC) and both low-plasticity and high-plasticity clays (CL and CH). The poorly-graded sands that comprise the bulk of the fill contain little to no fines (generally < 5%) and minor quantities of very small shell fragments, typical of locally-derived hydraulic fill. The Bay Sediment Unit (BSU) underlies the fill at depths of 15 to 15.5 feet bgs and functions as an aquitard at the site. The depth to water at IR26 is approximately 2.5 feet bgs and the saturated thickness of the unconfined aquifer is estimated to be 13-feet.

The following sections present the field implementation, data evaluation and results of the aquifer testing.

2.0 FIELD IMPLEMENTATION

The aquifer testing consisted of a step test and a 24-hour pump test followed by collection of well recovery data. Well 26MW-03 was selected as the pumping well due to its location at or near the center of the highest VOC concentration. Three piezometers, 26PZ-01, 26PZ-02 and 26PZ-03 were installed to depths of 15-feet (bgs) with similar well construction as that of 26MW-03 and monitored for water levels during the pump test. Three additional monitoring wells, 26MW-01, 26MW-04 and 26MW-07 were also monitored for water levels during the pump test. Figure 1 illustrates the location of the pumping well and the observation wells used for the aquifer test at IR 26. Table 1 lists the well IDs, well types and the distances of each piezometer/monitoring well from the pumping well and its relative location with respect to the VOC plume.

Table 1
List of Wells, Distances from Pumping Well and Location

Well ID	Type	Location with respect to VOC plume
26MW-03	Pumping Well	Located at the center of mass of the VOC plume
26PZ-01	Piezometer	Located 10-feet downgradient and northeast of 26MW-03
26PZ-02	Piezometer	Located 20-feet downgradient and northeast of 26MW-03
26PZ-03	Piezometer	Located 10-feet cross-gradient and south of 26MW-03
26MW-01	Observation Well	Located approximately 60 feet upgradient and west of 26MW-03
26MW-04	Observation Well	Located approximately 40 feet cross gradient and southeast of 26MW-03
26MW-07	Observation Well	Located approximately 60 feet cross gradient and northeast of 26MW-03

The pumping system consisted of a submersible pump, totalizing flowmeter, hoses, and connections to a 500-gallon portable water tank. Accumulated water was transferred into a 21,000 gallon Baker tank placed near IR26 frequently during the pump test. The pump was equipped with a check valve to prevent backflow of pumped water in the pumping well. Electronic pressure transducers (see Attachment 1 for transducer specifications) were installed in each observation well for continuous water level monitoring during the aquifer test. The effects of barometric pressure were accounted for by the intrinsic design of the pressure transducers thereby not requiring a manual correction. Water level

measurements were viewed and recorded as head in feet (above transducer) using software provided by INW. Pressure transducers were operated, calibrated, maintained, and stored in accordance with the manufacturer's specifications (specification sheet presented in Attachment 1). The depth to water in the wells and piezometers at the time of transducer placement was measured with a Solinst water level meter and recorded. The transducer calibration was checked in the field by lowering it exactly 1 foot into the water column and noting the change in the meter response. Water levels were also checked periodically using a water level meter during the aquifer test and immediately prior to transducer removal upon completion of field work. The aquifer test consisted of a step test and a pump test.

2.1 STEP TESTS

The step tests were conducted on 31 October 2006. For the step test, well 26MW-03 was pumped at incremental rates of 0.5, 1.0, 3.0 and 2.2 gallons per minute (gpm) for approximately one-hour durations. The water level in 26MW-03 was measured continuously during the step test to determine the rate of drawdown and a plot of drawdown versus time was generated for each stepped rate. The plots of drawdown versus time were extrapolated over a 24-hour period to confirm if 26MW-03 could be pumped for a 24-hour period at the desired rate without running dry.

A pumping rate of 0.5 and 1.0 gpm resulted in a maximum drawdown of 0.5-feet and 1-foot respectively after two hours of pumping (see Chart A in Attachment 2). A pumping rate of 3.0 gpm resulted in a rapid drawdown of approximately 6-feet in a half-hour of pumping. After reducing the pumping rate to 2.2 gpm, a slower drawdown of approximately 0.5 feet in approximately 2 hours of pumping resulted. This pumping rate of 2.2 gpm was extrapolated to 24-hours as shown in Chart B (Attachment 2) and indicated a projected head of 0.4 feet at the end of 24-hours. Therefore, a rate of 2.0 gpm was selected as the optimal sustainable pumping rate for the aquifer test. The pump controller settings were fixed at 2.0 gpm upon completion of the step test.

2.2 PUMP TEST

The pump test was conducted on 1 and 2 November 2006. The pumping well, 26MW-03 recovered within 6 hours after the completion of the step test. Baseline water levels were collected prior to beginning the pump test. Six observation wells (listed in Table 1) were monitored using pressure transducers during the entire pump test. In addition, 26MW-02, 26MW-05 and 26-MW-06 were

monitored for water levels every 6-8 hours to ascertain the extent of the outer radius of influence during pumping. Well 26PZ-01 had to be discontinued from monitoring after 10-hours of pumping due to boatyard wash operations initiated by the tenant. Storm and rain conditions after 19 hours of pumping resulted in a pump outage (short circuit) for 25 minutes. These events and readings were noted for correction of data during the evaluation phase of this work. Upon completion of the 24-hour pumping period, data collection from transducers continued for 4.5 hours until the wells recovered to 90% of the static water levels (or baseline levels) for analysis of recovery data. Attachment 2 presents the water level data collected during the pump test.

3.0 DATA EVALUATION

The pump test data were plotted on drawdown versus time charts and analyzed using AQTESOLV™ (version 4.02.002; Hydrosolve, Inc.) software designed for analysis of pump test data. Three solution methods were used for evaluation of pump test data: Theis, Cooper-Jacob and Neuman. The Cooper-Jacob and Neuman solution methods were used to evaluate recovery test data.

The primary assumptions for these methods are listed below:

Theis and Cooper-Jacob:

- Aquifer has infinite areal extent,
- Aquifer is homogeneous, isotropic and of uniform thickness,
- Pumping well is fully penetrating and flow to pumping well is horizontal,
- Aquifer is unconfined,
- Water is released instantaneously from storage with decline of hydraulic head,
- Diameter of pumping well is very small so that storage in the well can be neglected,
- No delayed gravity response in aquifer,
- Flow is horizontal and uniform in a vertical section through the axis of the well,
- Flow is unsteady,
- Displacement is small relative to saturated thickness of aquifer.

Neuman:

- Aquifer has infinite areal extent, homogeneous and has uniform thickness,
- Aquifer potentiometric surface is initially horizontal,
- Pumping well is fully penetrating,
- Aquifer is unconfined with delayed gravity response,
- Flow is unsteady,
- Diameter of pumping well is very small so that storage in the well can be neglected.

Site-specific aquifer parameter information such as transmissivity and specific yield were obtained and is presented in data plots contained in Attachment 3. The radius of influence was obtained using the Jacob straight-line distance-drawdown method as shown in Attachment 3.

4.0 AQUIFER TEST RESULTS AND DISCUSSION

Aquifer test results including hydraulic conductivity (K), specific yield and radius of influence (ROI) estimates are summarized in Table 1. The K values were derived from the transmissivity (T) data obtained from AQTESOLV™ and the estimated saturated thickness (b=13 feet) of the unconfined aquifer (i.e., $K=T/b$). The Theis and Cooper-Jacob solution methods provide preliminary estimates on aquifer parameter ranges. The Neuman solution method evaluates the delayed yield responses typical of most unconfined aquifers. Therefore, the hydraulic conductivities obtained from the Neuman solution method are considered most representative of the unconfined aquifer at IR26.

The calculated hydraulic conductivities ranged from 0.023 feet/minute - 0.09 feet/minute. These corresponded with the higher range of hydraulic conductivities for silty sands and fine sands obtained from literature values (Domenico and Schwarz, 1990; Fetter, 2001). Lithologic logs of monitoring wells at IR 26 indicate predominantly fine sands (SP) with some thin interspersed plastic clay (CH) at 26PZ-01, 26PZ-02 and 26PZ-03. Therefore, hydraulic conductivity ranges obtained from the aquifer test evaluation are considered to be reasonably representative of the shallow unconfined aquifer at IR26.

Specific yield (S_y), or effective porosity estimates ranged from 0.07 to 0.37 for the shallow unconfined aquifer at IR26. Literature values of specific yield for fine sand range from 0.1 to 0.28 with an average of 0.21 (Fetter, 1994) and in some cases as high as 0.33 (Morris and Johnson, 1967). Literature ranges for clay/sandy clay range from 0 to 0.12 with an average of 0.03 (Fetter, 1994). The specific yield ranges obtained from this evaluation are consistently within these ranges.

The ROI is estimated to be approximately 110 feet after 100 minutes of pumping. A comparison of water level measurements collected at 26MW-05 located approximately 50-feet downgradient (northeasterly) of 26MW-03 indicated a drawdown of 0.14 feet and 0.13 feet after 5.5 hours and 14.5 hours of pumping respectively. Well 26MW-06 located approximately 160-feet downgradient (northeasterly) of 26MW-03 however, indicated no drawdown during the 24-hour pump test.

Miscellaneous

Gregory Grace will be the main contact for the RIOCC's office.

Staging of equipment and materials

The fenced area on the southeast corner of building 20 in the Protector Boat yard will be the primary work area for the step test and 24-hr pump test to establish an aquifer radius of influence in the IR-26 plume area.

The equipment that will be implemented will consist of a trailer mounted power generator, a 600-gallon trailer mounted water tank, submersible groundwater pump and six data logging transducers that will be installed in the IR-26 area monitoring wells and piezometers. The pressure transducers will be used to record level responses during the 24-hr pump test. Outdoor lighting will be provided to light the entire work area during to required night work.

The first phase of the aquifer will consist of a pump step test at varying pumping rates to determine an optimal pumping rate to be implemented in the subsequent pump test. The pump will equipped with a totalizing flow meter to measure pump rates and total gallons removed. Discharge water will be pumped into the 600-gallon trailer mounted tank and transferred into a 20,000-gallon tank located in a fenced staging area adjacent to the IR-26 site.

Work hours

The step test is scheduled to begin on Tuesday, October 31 at 8am. The subsequent pump test is scheduled to begin on Wednesday, November 1 at 7am and continue through Thursday November 2. The pump test work schedule will consist of two person teams that will remain on site at all times during the 24-hr pump test. Pump rates and water levels will be monitored and recorded periodically during the test. The building 20 tenants (Protector Boats) were informed of the work schedule.

Action Items

- ROICC has requested that flashing barricades be placed around the fenced work area during night work for traffic control.

Meeting/Site Walk Adjourned at 3:00pm
Meeting Minutes by Brian Dee

AGENDA
IR26 Field Meeting for Implementation of the Aquifer Tests
Blg 20, IR26, Alameda Point, Alameda California
10:30 AM, Thursday October 26, 2006
held at the ITSI Alameda Point Field Office

1.0 Introductions

2.0 Brief Description and Schedule of Aquifer Test Activities

Tuesday October 31, 2006 Step Test (start 8am to 4pm)

The key component of this test is establishing the pump rate. The pumping well, 26MW03, must remain barricaded off and clear of any obstructions after the step test is completed to ensure efficient start of the 24-hour pump test the following morning.

Wed Nov 1, 2006 (7am) through Thurs Nov 2, 2006 (3pm) 24-hour Pump Test

Arrive by 0700 AM and set up transducers in observation wells.

Confirm setting on ball valve throttle and start generator for the pump test

- Record flow rate every half-hour
- Download data from transducers every hour for the first 4-hours followed by every 2-4 hour interval.
- Check transducer data vs. field measurements using water level meter every hour
- Empty water buffalo into baker tank every 4-hours (use 55-g drum at Pumping well when emptying water buffalo)
- Set up GFI rated lighting prior to dark for night work

Wednesday November 1, 2006 Shifts:

0700 AM - 1500 PM - Ray Spencer and Scott Lovesy

1400 PM - 1200 AM - Brian Dee and Robyn Chapple

Thursday November 2, 2006 Shifts:

1100 PM - 0800 AM - Eric Ehlers and Robert Overly

0700 AM - 1500 PM - Ray Spencer and Scott Lovesy.

3.0 Traffic/Site Control

ITSI must have continual site access for the duration of pump testing.

4.0 Site Safety Concerns

4.0 Questions or Comments

Lighting Safe Work Procedures

CONTENTS

1. Regulations	1
2. Purpose and Scope	1
3. Definitions.....	1
4. Responsibilities	1
5. Lighting Levels for Construction Projects.....	2
6. Portable Lighting Equipment.....	2

1. REGULATIONS

- 29 CFR 1926.56, Illumination
- 8 CCR 3317, Illumination
- 8 CCR 1523, Illumination
- U.S. Army Corps of Engineers (USACE) Safety and Health Requirements Manual (EM-385-1-1), November, 2003

2. PURPOSE AND SCOPE

The requirements of this procedure apply to employees involved in all operations when portable lighting is (or may be) required, such as work at night or indoors, and describes minimum safety requirements for use of portable lighting at project work sites.

3. DEFINITIONS

- *Intrinsically safe*: This means that the equipment or instrumentation is designed to prevent fire or explosions when being used in a flammable atmosphere by containing any spark producing action internally.

4. RESPONSIBILITIES

4.1. Health and Safety Staff

The Health and Safety staff is responsible for assisting site supervisors in enforcing safe work practices and providing training and guidance for activities which may require portable lighting.

4.2. Site Supervisors

Site supervisors are responsible for verifying that all portable lighting functions correctly, meets the required safety standards, and supplies the necessary illumination for operations.

5. LIGHTING LEVELS FOR CONSTRUCTION PROJECTS

Portable lighting must, as a minimum, meet the regulatory requirements found in the OSHA Construction Standard for illumination. For ITSI project sites, work areas must be lighted to not less than the minimum illumination intensities in the following Table while work is in progress:

Area or Operation	Foot-Candles
General construction area lighting, low activity.	3
Outdoor active construction areas, concrete placement, excavation and waste areas, accessways, active storage areas, loading platforms, refueling, and field maintenance areas.	5
Indoors: warehouses, corridors, hallways, stairways, and exit-ways.	5
General construction plant and shops (e.g. batch plants, screening plants, mechanical and electrical equipment rooms, carpenter shops, rigging lofts and active storerooms, barracks or living quarters, locker or dressing rooms, mess halls and indoor toilets and workrooms).	10
First-aid stations, infirmaries, and offices	30

6. PORTABLE LIGHTING EQUIPMENT

Portable lighting equipment used on construction sites must be operated according with the following safety considerations:

- Portable lighting for confined spaces, where a potential for flammable atmospheres exists, will require intrinsically-safe "explosion proof" lighting.
- Portable lighting set up for night work near roadways will be positioned so that it does not blind oncoming traffic.
- Lighting equipment must be inspected daily.
- Fueling of lighting equipment must be performed in accordance with fueling safety provisions.
- Light towers will be set up with jacks extended, especially in areas with high wind conditions.
- Lighting equipment run indoors will be electrical, with the generator position outside to prevent buildup of carbon monoxide and other exhaust gases.

NAME _____
 DATE _____

By B. Sec Date 11/01/06 Subject Daily log. Sheet No. 1 of 1

Chkd. By _____ Date _____ Project No. 3503-03

1
2 1400: R. Chapple & B. Sec arrived on site with a crew
3 to relieve the 1st field crew of the pump test.
4 1500: First field crew left the site with a crew
5 1700: Logged transducer data from all wells.
6 1800: Protector boat crew was performing maintenance on
7 275 hp. outboard motors in their yard adjacent to
8 our pump test area.
9 - They started a fresh water flush on one outboard
10 motor, after approx 3 minutes of run time I noticed
11 flush water run off had cascaded over the top of the
12 PZ-01 piezometer casing and flooded the entire casing
13 column.
14 - Had the protect workers stop the water flow as soon as
15 the submerged piezometer was discovered. - Stopped logging
16 data on the PZ-01 transducer. sealed the casing as tightly
17 as possible with the well seal to prevent further water inflow.
18 no other piezometers or wells were impacted.
19 - The PZ-01 data logger indicated flooding occurred at 1808
20 after speaking to the workers it was agreed that our motor flushing
21 activities would be postponed until the end of our pump test.
22 2300: E. Chlun and Robert arrived on site.
23 Recorded final transducer readings and water level
24 measurements.
25 - Installed a rain canopy over the work area.
26 2400: Left site with Eric and Robert to take over the
27 next shift.

PT2X Smart Sensor

Range: 15 PSIG

Checkout Sheet

Rental Order #: IAK1000

S/N #: 2315012 Z6MWD7

Rentals

Customer #: 24754

Testing

Date 10/26/06

Initial SM

- Check battery level. 85 % For Rental - Replace if less than 80%
For Repair - Replace if less than 98%
- Verify serial number.
- Verify range.
- Firmware revision: 0.22
- Set sensor clock.
- Remove any field calibrations.
- With dead-weight tester and real time monitor, verify calibration is within .1% FSO
 - Zero: deadweight psi: 0 PT2X psi: -0.011
 - Half scale: deadweight psi: 7.5 PT2X psi: 7.801
 - Full scale: deadweight psi: 15 PT2X psi: 15.005
- Start a session.
- Upload and view data.
- Erase all sessions.
- Desiccant packs in housing.
- Desiccant tube filled.

Packaging

Date 10/26/06

Initial JLL

- PT2X with 25 feet of cable
 - If Rental - Laminated Kit List
 - RS485/232 adapter
 - Communication cable
 - Software Package
 - Version # 1.5.18
 - CD
 - Manual
 - Getting Stated Guide
 - Notes and Flyers
- May only be one per order

Features!

• Clean, calibrated,
precision equipment.
• Long life available.

MECHANICAL**TRANSMITTER**

Body Material	316 stainless steel
Wire Seal Materials	Viton® and Teflon®
Desiccant	High- and standard- capacity packs available

Terminating Connector Available

Weight .80 lbs.

CABLE

OD	0.28" maximum
Break Strength	138 lbs.
Maximum Length	2000 feet
Weight	4 lbs. per 100 feet

ELECTRICAL**PRESSURE**

Static Accuracy (B.F.S.L. 25° C)	±0.1% FSO (maximum) ±0.06% FSO (typical) 0.06% available on request.
Temperature Error (reference 25° C)	±0.5% FSO (maximum) ±0.25% FSO (typical)

**Maximum Zero
Offset at 25° C** ±0.25% FSO

Resolution 16 bit

**Over Range
Protection** 2x (except 300 PSIA)

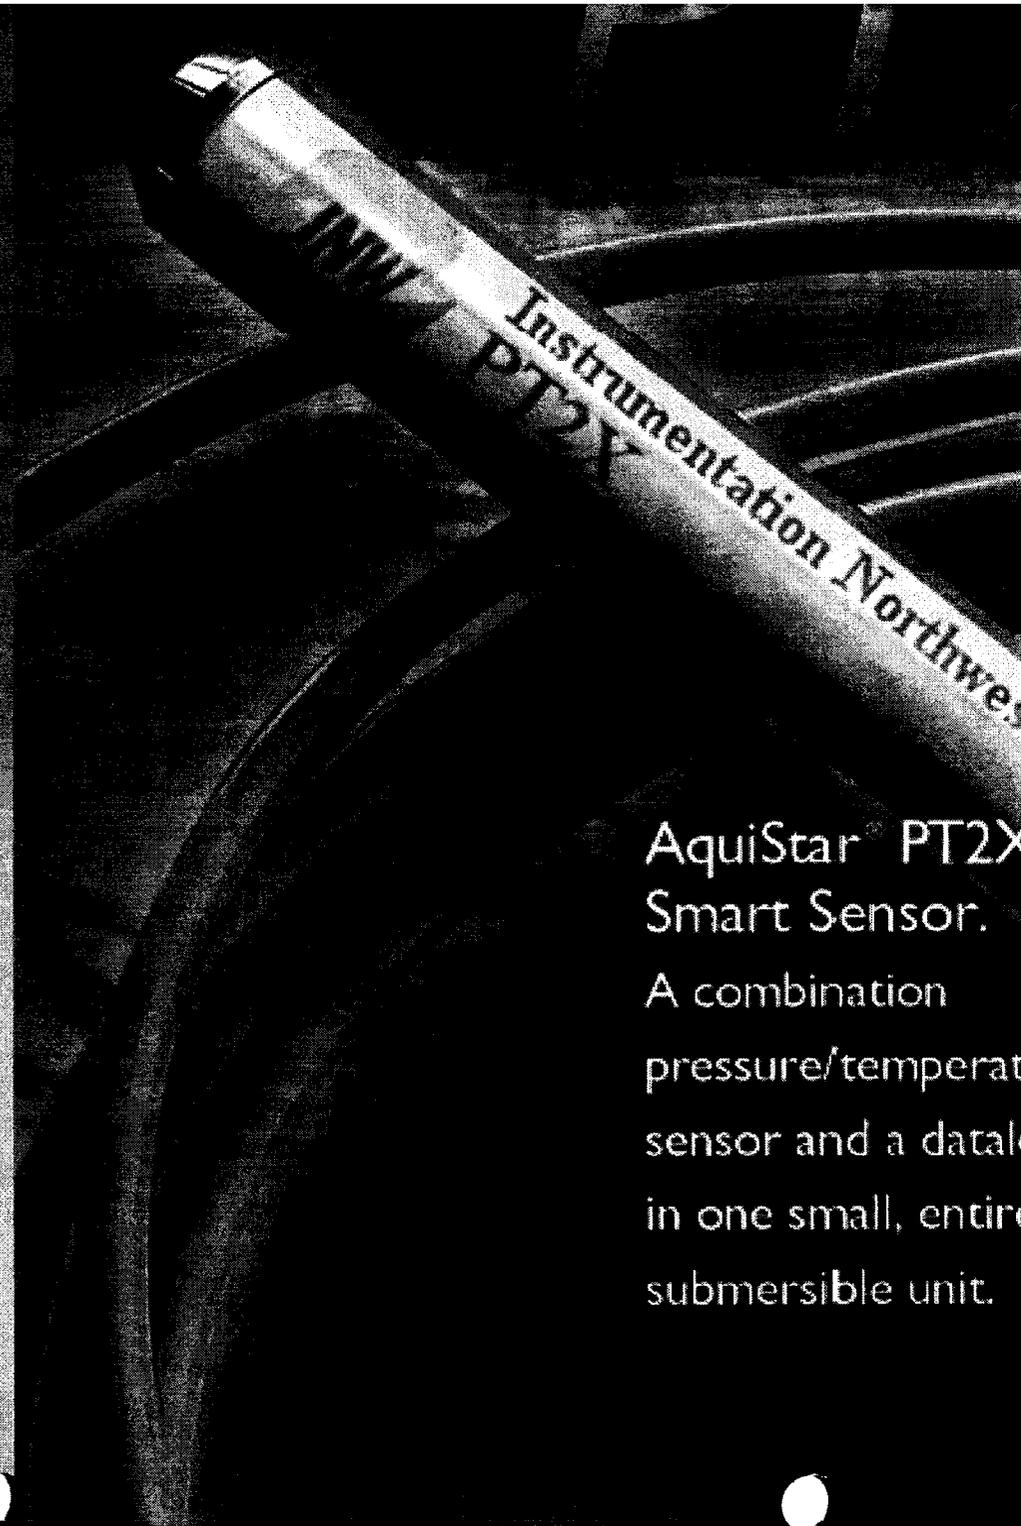

TEMPERATURE

Accuracy	±0.75° C (maximum)
Resolution	0.1° C

TIME

Accuracy	±4 min/yr (maximum) ±2 min/yr (typical)
-----------------	--

**Recommended
Operating
Temperature Range** 0° C to 40° C
Contact factory for
extended
temperature ranges.

Aquistar® PT2X
Smart Sensor.
A combination
pressure/temperature
sensor and a data logger
in one small, entirely
submersible unit.

Pressure Elements Available
15, 30, 50, 100, or 300 PSI

Vented Cable

Uses

- Groundwater monitoring
- Leachate monitoring
- Pump testing
- Tide monitoring
- River flow and level observations
- Tank level control
- Reservoir level monitoring
- Thermal profiling

Dedicated Installations

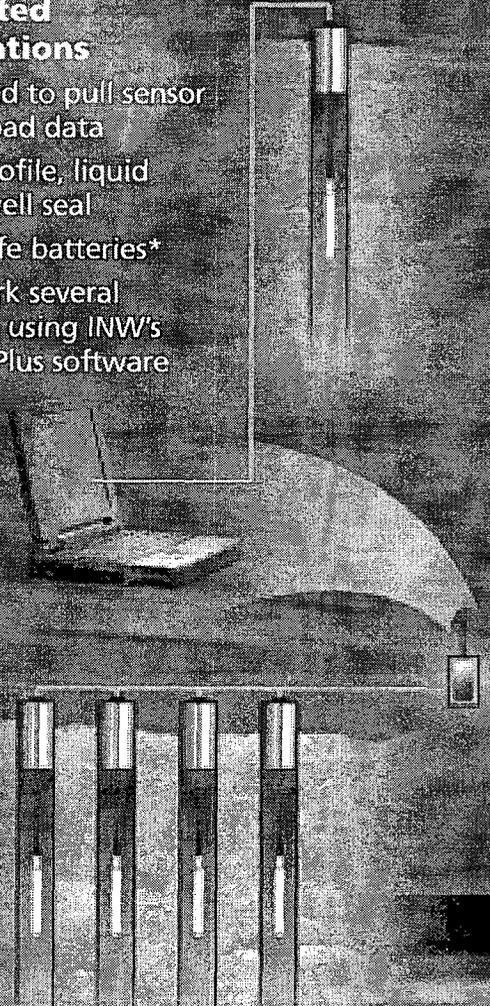

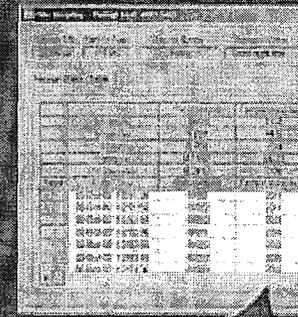

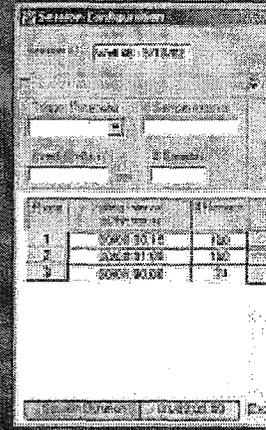

- No need to pull sensor to upload data
- Low profile, liquid tight well seal
- Long life batteries*
- Network several sensors using INW's Aqua4Plus software

program can access se
port can connect to se
several test sessions. E

Access to up to 16
sensors, each with
multiple test sessions.

GENERATOR AND CUSTOMER MUST READ AND SIGN REVERSE HEREOF INITIAL _____
INITIAL _____

TERMS AND CONDITIONS

1. **ACCEPTABLE WASTE.** Customer shall deliver and Company shall accept for disposal or other management purpose only Acceptable Waste. As used herein, "Customer" shall mean both Customer and Generator listed on the reverse hereof. Customer shall deliver the full quantity of Acceptable Waste generated and/or handled by Customer as estimated on the reverse hereof. Acceptable Waste means and includes only such waste as is described on the reverse and which is approved and permitted for management at the Designated Facility listed on the reverse, and shall not include any Nonconforming Waste. As used herein, Nonconforming Waste means waste that: (a) is not in conformance with the description and/or estimated quantity of the waste set forth on the reverse; (b) is or contains any infectious waste, or radioactive, volatile, corrosive, highly flammable, explosive, biomedical, biohazardous material or hazardous, dangerous, or toxic substances, as defined pursuant to or listed or regulated under applicable federal, state or local law, except as stated on the reverse; or (c) is prohibited from being received, managed or disposed of at the Designated Facility by federal, state or local law, regulation, rule, code, ordinance, order, permit or permit condition;

2. **REPRESENTATIONS & WARRANTIES.** Customer represents and warrants that: (a) the description of the waste set forth on the reverse hereof is true and correct in all material respects; (b) all waste delivered to the Designated Facility by Customer shall be Acceptable Waste as defined above and shall not be or contain Nonconforming Waste; (c) Customer shall, and shall cause any carrier with which it contracts to, handle and transport the waste in a safe and workmanlike manner in full compliance with all applicable federal, state and local laws, ordinances, decisions, orders, rules or regulations; and (d) Customer has advised its drivers of Company's prohibition on delivery of Nonconforming Waste, of the definitions and listing of hazardous waste and hazardous substances under applicable federal and state law and regulations and of the definition of Acceptable Waste herein. Company represents and warrants that it shall manage the Acceptable Waste in a safe and workmanlike manner in full compliance with all applicable federal, state and local laws, ordinances, decisions, orders, rules or regulations.

3. **WASTE REJECTION.** Company may inspect, analyze or test any waste delivered by Customer and/or may reject, refuse or revoke acceptance of any waste if, in the opinion of Company, the waste or tender of delivery fails to conform to or Customer fails to comply with the terms of this Agreement, including by delivery of Nonconforming Waste. Company may also reject any waste which (a) Company reasonably believes would, as a result of or upon disposal or other management, be a violation of local, state or federal law, regulation, ordinance or permits, including land use restrictions or conditions applicable to the Designated Facility; or (b) in Company's opinion would present a significant risk to human health or the environment, cause a nuisance or otherwise create or expose Company or Customer to potential liability. Company also shall have the right to refuse to accept or to reject any Acceptable Waste in the event of Customer's failure to pay fees owed by Customer hereunder. In the event Company rejects or revokes acceptance of waste hereunder, Customer shall, at its sole cost, immediately remove or arrange to have the rejected waste removed from Company's control or property. Customer shall pay and/or reimburse Company for any and all costs, damages and/or fines incurred as a result of or relating to Customer's tender or delivery of Nonconforming Waste or other failure to comply or conform to this Agreement, including costs of inspection, testing and analysis.

4. **SPECIAL HANDLING; TITLE.** If Company elects, in its sole discretion, to handle, rather than reject, Nonconforming Wastes, Company shall have the right to manage such Nonconforming Waste in the manner deemed most appropriate by Company given the characteristics of the Nonconforming Waste. Company may assess and Customer shall pay additional fees associated with delivery of Nonconforming Waste, including, but not limited to, special handling or disposal charges, and costs associated with different quantities of waste, different delivery dates, modifications in operations, specialized equipment, and other operational, environmental, health, safety or regulatory requirements. Title to and ownership of Acceptable Waste shall transfer to Company upon its final acceptance of Acceptable Waste. Title to, ownership of and liability for Nonconforming Waste shall at all times remain with Customer. Revocation of acceptance by Company shall operate to re-vest all incidents of ownership in Customer.

5. **INDEMNITY.** Each party hereto (the "Indemnitor") hereby agrees to indemnify, hold harmless and defend the other party, and its owners, officers, directors, employees and agents (collectively, the "Indemnitees"), from and against any and all liabilities, penalties, fines, forfeitures, fees, demands, claims, causes of action, suits, judgments and costs and expenses incidental thereto, including attorneys' fees (collectively, "Damages"), which any or all of the Indemnitees may hereafter suffer, incur, be responsible for or pay out, including for personal injuries, property damage, or contamination of or adverse effects on the environment, to the extent caused by, or arising from or in connection with the breach of any representations or warranties of the Indemnitor set forth in this Agreement, or any negligent actions or omissions or willful misconduct of the Indemnitor, its employees, officers, owners, directors or agents, or the violation of any law, ordinance or regulation, including, without limitation, the Comprehensive Environmental Response, Compensation and Liability Act, 42 U.S.C. § 9601 et seq., as amended. Such indemnity shall exclude Damages to the extent they arise as a result of any negligent actions or omissions or willful misconduct of the Indemnitees or their employees, officers, owners, directors or agents. The indemnification obligation hereunder shall arise only in excess of any available and collectible insurance proceeds and the Indemnitor shall be liable hereunder to pay only its share of the amount of Damages, if any, that exceeds the total amount that all insurance has paid for the Damages, plus the total of all deductible and self-insured expenses paid under all insurance policies. The obligations in this Section 5 shall survive the performance and termination of this Agreement.

6. **UNCONTROLLABLE CIRCUMSTANCES; TERMINATION.** Except for the obligation to pay fees hereunder, the performance of this Agreement may be discontinued or temporarily suspended by either party, and neither party shall be deemed to be in breach of this Agreement, in the event performance is prevented by a cause or causes beyond the reasonable control of the affected party. Such causes shall include, but not be limited to, acts of God, acts of war, riot, fire, explosion, accident, flood or sabotage, governmental laws (including nuisance), permit conditions, regulations, restrictions (including land use), condition of the waste, injunction or actions or omissions of third party transporters or other contractors, suppliers or vendors. Company may immediately terminate management services hereunder upon written notice to Customer in the event Customer breaches any term, provision or obligation under this Agreement, in which case, Customer shall be liable for and shall pay to Company all costs and losses incurred by Company as a result of or relating to any such termination.

7. **MISCELLANEOUS.** This Agreement shall be governed by the laws of the state in which the Designated Facility is located. Every provision of this Agreement shall be severable. This Agreement represents the entire understanding and Agreement between the parties relating to the management of waste, except that, if the parties, or their parent companies, are parties to a national service agreement, the terms of such national service agreement shall govern over any inconsistent terms in this Agreement. No representations, statements or Agreements, unless agreed to by the parties in writing, shall modify, change, amend or otherwise affect the obligations undertaken in this Agreement. No waiver by either party of any one or more defaults or breaches by the other in the performance of this Agreement shall operate or be construed as a waiver of any future defaults or breaches. Customer may not assign this Agreement without the prior written consent of Company. This Agreement shall be binding upon and shall inure to the benefit of the parties' successors and assigns.

THIS IS A LEGALLY BINDING CONTRACT. EACH UNDERSIGNED INDIVIDUAL ACKNOWLEDGES THAT HE/SHE HAS READ AND UNDERSTANDS THE TERMS AND CONDITIONS OF THIS AGREEMENT SET FORTH ABOVE AND ON THE REVERSE HEREOF AND THAT HE/SHE HAS THE AUTHORITY TO SIGN ON BEHALF OF CUSTOMER/GENERATOR AND COMPANY. BY SIGNING BELOW, CUSTOMER AND GENERATOR INDICATE A FIRST HAND KNOWLEDGE OF THE WASTE'S CHARACTERISTICS AND CERTIFY THE TRUTH OF THE INFORMATION ON THE REVERSE HEREOF. AGREED TO AS OF THE DATES BELOW.

RE: Waste Profile for IR26 Site Alameda Point, Alameda, California 94501
Generator: Alameda Naval Air Station (US Navy)
Disposal Facility: Forward Landfill

Dear Mr. Griffith:

This letter is in response your request to Innovative Technical Solutions, Inc. (ITSI), the Generator's contractor, for clarification of the estimated values of acetone and methylene chloride (common laboratory contaminants) reported in two of the composited samples and classification of the waste code designation.

The estimated values of acetone and methylene chloride in Field ID samples 100506026011 and 100506026012 are considered by ITSI and the Navy to be laboratory artifacts based on their extremely low levels, because both are used in large volumes by the laboratory to extract organics from soils and groundwater, and because their use is not historically associated with operations at the site.

Neither ITSI nor the Navy have any specific knowledge of the origins of the TCE present in the groundwater listed under the profile, and therefore classification of this waste as either an F-coded or U-coded RCRA waste is not appropriate. Classification of a waste as either an F-coded or U-coded RCRA waste requires specific knowledge of the origin of the solvents (e.g., an F001 requires the source to be a spent solvent mixture or blend used for degreasing which originally contained 10% by volume or more of specific halogenated solvents [PCE, TCE, 1,1,1-TCA, etc.]). Hence, without specific knowledge of the origins of the solvent used in operations at the site, a classification of the groundwater as either an F- or U-coding is not appropriate for the waste.

If you have any questions or comments, please contact Rachel Hess at (925) 946-3105.

Sincerely,
Innovative Technical Solutions, Inc US Navy ROICC, San Francisco Bay Area

RESPONSE TO RWQCB COMMENTS

Draft Data Gap Sampling Report Installation Restoration Site 26 (IR26), Alameda Point, Alameda, CA February 2007

Review Comments from Erich Simon, Project Manager

Upon review of the *Draft Data Gap Sampling Installation Restoration Site 26*, dated October 2006 we have the following comments:

RWCQB Comment 1: Section 3.1 and Figure 4 – The Hydropunch investigation included sampling at 3 distinct depths to determine if contaminant plumes may be vertically distributed. The Hydropunch samples at the center of the plume (B20-SB-001) included sample depths at 4.5' to 7', 9.5' to 12', and 18.5' to 21', with the highest detections of all contaminants of concern detected in the 9.5' to 12' samples. All other Hydropunch samples, which were taken with the intent to help further delineate the plume both vertically and horizontally, were taken at depths of 7.5' to 10', 12.5' to 17', and 18.5' to 21'. As the B20-SB-001 Hydropunch samples at the center of the plume demonstrated that the highest concentrations may be limited to the 9.5' to 12' range, these other hydropunch samples do not help characterize the horizontal distribution of the plume. Please include more discussion/justification describing how Hydropunch depth-discreet sampling depths were selected, and clearly indicate the limitations of the data presented in characterizing the vertical and horizontal extent of contamination.

RESPONSE TO COMMENT 1:

Sample intervals for multiple discrete-depth hydropunch sampling were selected by the field geologist based on review of the soil lithology determined by collecting and logging continuous core samples from ground surface to the termination depth at each of the hydropunch boring locations. Hydropunch sample intervals were targeted to screen higher permeability sediments (mostly SP sands) and avoided screening clay layers or lower permeability sands. Boring B20-SB-001 was the last hydropunch boring to be drilled and sampled, and in any case, the analytical results from any of the borings were not immediately available to inform the targeting of the screening of hydropunches in the other borings. Please refer to the boring logs in Appendix A to see how the selected intervals for the hydropunch samples correlated with the specific lithology at each location. The text in Section 3.1 will be amended to clarify how hydropunch screen intervals were selected.

It should be noted that the 9.0 and 10 ft bgs sample intervals at the site have been well characterized by hydropunch samples collected prior to the current Data Gap Investigation. Hydropunch samples from those intervals have been collected from borings 192-0028, 192-0029,

192-0031, 192-0032, 193-0033, 26B49, 26B50, 26B51, 26B52, 26B53, 26B54, 26B55, 26B56, 26B57, and 26B58.

RWQCB Comment 2: Section 3.2 and Figure 4 – There needs to be further discussion/clarification on why groundwater monitoring wells were screened across entire aquifer thickness, especially considering the results of the Hydropunch investigation, showing that the vertical extent of the contamination at the center of the plume may be limited to the 9.5' to 12' range. Include discussion of how the dilution within groundwater monitoring wells may under-represent contaminant concentrations in the aquifer. Please elaborate on low flow sampling techniques used and clarify if EPA sampling procedures for low flow groundwater sampling¹ were followed. Also, please discuss how zones of higher contamination identified in the Hydropunch investigation were targeted.

RESPONSE TO COMMENT 2:

The well design used at IR Site 26 was selected based on input from regulatory agencies to address concerns that shorter well screens might miss zones of contaminated groundwater and provide false negative data. In the case of monitoring well 26MW03, located in the middle of the contaminant plume and intended for use as an aquifer test pumping well, ITSI received specific direction to screen the entire saturated thickness of the shallow groundwater zone.

Groundwater samples were collected from the monitoring wells in accordance with EPA guidance on low-flow sampling techniques. The EPA guidance paper, Low-Flow (Minimal Drawdown) Ground-Water Sampling Procedures (Puls and Barcelona, 1996) states that “isolation of the screened interval water from the overlying stagnant casing water may be accomplished using low-flow minimal drawdown techniques. If the pump intake is located within the screened interval, most of the water pumped will be drawn in directly from the formation with little mixing of casing water or disturbance to the sampling zone.” Groundwater wells are monitored for drawdown, and drawdown of less than 0.1 foot are typically maintained. The combination of limited drawdown and stabilized water quality parameters is indicative of groundwater being removed under laminar flow directly from the formation. This assumption forms the underlying basis for following low-flow sampling protocols.

RWQCB Comment 3: Figure 4 – Please include non-detect results on this figure, especially for well 26MW03. These results are needed to demonstrate that 1,2-DCE in groundwater monitoring well 26MW03 was non-detect, whereas 1,2-DCE in the Hydropunch boring immediately adjacent to this well (B20-SB-001) at the 9.5' to 12' depth was 310 ug/L. This discrepancy needs to be addressed in the Section 4.3 of the text.

RESPONSE TO COMMENT 3:

Figure 4 will be revised to show all results (including NDs) for the three main constituents of concern: TCE, cis-1,2-DCE and vinyl chloride. Discussion will be added to the text in section

4.3 to address the apparent discrepancy in the results for well 26MW03 and adjacent hydropunch boring B20-SB-001. It is not uncommon for hydropunch results to show significantly higher contaminant concentration results than co-located monitoring wells. Hydropunch samples typically contain higher amounts of suspended sediments than groundwater samples collected from properly installed and developed groundwater monitoring wells. The higher sediment load in the hydropunch samples may contribute to higher detected contaminant concentrations due to desorption of contaminants from the suspended load during sample extraction at the laboratory. It should also be noted that the groundwater sample from 26MW03 was collected (in accordance with EPA guidance on low-flow sampling) by placing the pump intake at the midpoint of the well screen interval, at a depth of approximately 9 ft bgs; slightly above the screened interval used to collect the hydropunch sample. Future multiple discrete-depth sampling (conducted as part of remedial effectiveness monitoring) to further develop or re-establish a vertical groundwater profile of contamination may help to further explain the apparent discrepancy shown in the above referenced results.

RWQCB Comment 4: General – Clearly indicate on all figures and tables what the results in bold font indicated.

RESPONSE TO COMMENT 4:

Tables and figures will be corrected and revised to indicate that bold font is used to distinguish positive detections from non-detect results. Concentrations exceeding Remedial Goals or MCLs will be highlighted in yellow.

Electronic Mail From: Erich Simon (RWQCB) dated May 25, 2007

Subject: Comment on the Draft Final Report for Data Gap Sampling at IR Site 26

In response to the Navy's RTC to Water Board Comment #1 on the Draft Report, I reviewed the boring logs in Appendix A to evaluate if sampling at the 9.5' - 12' interval was appropriate only for B20-SB-001 at the center of the plume. Based on my review, I concur with the selection of sampling depths for the hydropunch samples at this site.

However, I do have an issue with how the sampling depth intervals for three hydropunch samples in Figure 4 of the Draft Final Report (B20-SB-001, -003, and -005) were modified from the Draft Report to make the sampling intervals all be the same. While this change may make the data in this figure look better on the surface, the sample collection logs in Appendix A clearly indicate that the sampling depths as shown in the Draft Report were correct and the sampling depths as revised in the Draft Final Report are incorrect. Please correct this misleading change made to Figure 4 of the Draft Final document, and include a brief discussion in the text of the report describing how the sampling depth locations were selected.

RESPONSE to COMMENT: The depth intervals shown on Figure 4 were inadvertently all made the same while revisions were being made to the figure in response to previous Draft Report comments. These errors were unintentional, and were not an attempt to present misleading information. The errors on Figure 4 have been corrected to match the text and tables.

A brief discussion describing how the sampling depth locations were selected is presented on page 8, Section 3.1 Hydropunch Investigation, third paragraph, second

and third sentences: *“The HydroPunch® sample intervals were selected (based upon a review of the continuous core logs) to screen zones of higher-permeability materials (mainly poorly-graded [SP] sands) overlying clay beds that might act as a barrier to downward vertical migration. The selected sample intervals were intended to target the presumed likely path of contaminant transport (i.e. higher permeability saturated zones) for chlorinated solvents mobilized as a dissolved phase in groundwater.”*

A revised Figure 4 and replacement pages for the cover, and title and signature pages indicating a Final version will be submitted. This document is now considered final.

RESPONSE TO EPA COMMENTS

Draft Data Gap Sampling Report Installation Restoration Site 26 (IR26), Alameda Point, Alameda, CA February 2007

Review Comments from Anna-Marie Cook, Project Manager

SPECIFIC COMMENTS

EPA Comment 1:

Section 4.4, Contaminant Distribution in Groundwater, Page 15 and Figure 4, Sample Locations and Groundwater Analytical Results: Although the text states that groundwater analytical results “were consistent with previous interpretations of the lateral limits of the groundwater VOC plume as depicted in the relevant RI/FS documents for the site” and the contours on Figure 4 are the same as those used in the Remedial Investigation (RI) Report, the extent of contamination above the maximum contaminant level (MCL) is actually greater than the extent of contamination indicated in the RI. Specifically, the extent of contamination above the MCL (5 micrograms per liter [ug/L] for trichlorethene [TCE]) or the 5 ug/L total VOC contour line should be extended to the south to include new well 26MW04, where the TCE concentration was 10 ug/L. In addition, the total VOCs in hydropunch boring B20-SB-004 (2.6 ug/L) indicate that the 0.5 ug/L total VOC contour should be extended to the north to include this location. The second sentence of this section acknowledges that the extent of contamination is greater, but then the second part of the sentence contains a contradiction because it states that the data collected during the Data Gap Investigation “were consistent with the VOC plume boundaries delineated during previous investigations.” It appears that the axis of the plume may be oriented northeast/southwest rather than east-northeast to west-southwest as shown on Figure 4. Since the RI contours potentially conflict with the new data, Figure 4 should be updated to reflect the most recent data. In addition, the new data suggests that the extent of contamination may not have been determined south of well 26MW04. Please update the contour lines to reflect current VOC data and delete the quoted statements from the first and second sentences of Section 4.4 or revise them to clearly describe the extent of contamination. Please also clarify how the area for in-situ chemical oxidation and bioremediation will be determined since the extent of contamination does not appear to have been determined south of well 26MW04.

RESPONSE TO COMMENT 1:

The Data Gap Investigation was intended to be a limited and focused investigation to determine whether the plume extended beneath Building 20, and to further evaluate the lithology and depth of contamination within the 2006 Final ROD established plume boundaries. The site data obtained confirmed that the Final ROD plume boundaries are reasonably representative of current site conditions and provides sufficient additional information to support the development of the Remedial Design. Figure 4 will be revised to show the extent of concentrations exceeding Remedial Goals based on the more recent data. The figure will reflect the uncertainty of the plume boundary south of 26MW04 by showing a dashed contour. A new figure will be added (Figure 7) to compare the “new” extent to the extent of concentrations exceeding RGs as determined by the previous analytical results. The extent of groundwater exceeding RGs is the basis for determining areas of for remediation treatment areas, which will be discussed in the Remedial Design.

EPA Comment 2:

Figure 4, Sample Locations and Groundwater Analytical Results: It is unclear why the 10 ug/L concentration of TCE for Monitoring Well 26MW04 on this figure is not bolded, since it is above the Remedial Action Objective (RAO) of 5 ug/L. Please provide consistency with respect to bolded concentrations on this figure.

RESPONSE TO COMMENT 2:

Tables and figures will be corrected and revised to indicate that bold font is used to distinguish positive detections from non-detect results. Concentrations exceeding Remedial Goals or MCLs will be highlighted in yellow.

EPA Comment 3:

Table 4, Analytical Results for Groundwater Monitoring Wells: Dissolved Metals and Table 3, Analytical Results for Groundwater Monitoring Wells: Chlorinated VOCs: It is unclear why a duplicate sample is indicated in Table 4 for well 26MW07, when there are no primary sample results. It appears that the designation for a duplicate sample is appending a “D*” to the end of the “Sample ID,” but the footnotes to Tables 3 and 4 indicate that a duplicate sample is designated only with an asterisk (*). Please provide the missing primary metals data for well 26MW07 and reconcile the footnotes for these tables with the designation used in the Sample ID.

In addition, it appears that on Table 4, the concentration of barium in IR26MW07, 1400 ug/L should also be in bold face type since this value exceeds the screening criteria of 1000 ug/L. Please make this change.

RESPONSE TO COMMENT 3:

The "D" designation noted above was part of the original sample ID assigned (incorrectly) by the field technician at the time of sampling. As noted in the table footnotes, duplicates are identified by an asterisk appended to the sample ID number. Tables 3 and 4 will be corrected to show results for primary samples and clearly and consistently distinguish them from duplicates. The barium concentration cited will be shown in bold and highlighted to indicate that it exceeds its screening criterion.

EPA Comment 4:

Appendix A, Sampling and Purge Forms: Although the purge and sample form for Well 26MW03 indicates negative turbidity values, it should be noted that turbidity can not be less than zero. Negative turbidity values may indicate that the meter is out of calibration. Please provide an explanation for the negative turbidity values.

Also, on the sampling forms, it is unclear why the multiplier for casing diameter is crossed out, since 0.64 gallons per linear foot is the approximate volume of a 4 inch diameter casing. As a result, the well volume appears to have been calculated incorrectly. Please resolve this apparent discrepancy.

RESPONSE TO COMMENT 4:

Negative turbidity values mean that the turbidimeter is detecting more light coming through the sample than it did through the standard that was used to calibrate it. This situation may arise if the turbidity meter is not calibrated correctly, possibly due to instrument drift or a slightly clouded (improperly prepared or contaminated) standard. However, ITSI does not believe that to be the case in this instance, since the negative values noted by EPA all fell within the standard accuracy of the instrument (+/- 2% of the reading or +/- 1 significant decimal).

The crossed out multiplier on the purging/sampling forms appears to be a carryover from the field development activity, which uses calculated well volumes (not casing volumes) to determine minimum amount of purging for development. The field crew has been alerted to this and the field forms will be revised to show well/casing volume multipliers as appropriate to the task. The field crew was following low-flow sampling procedures, which depends on stabilization of well parameters, not well or casing volumes, to determine if sufficient purging has been conducted to sample.

DTSC Comments on the Draft Data Gap Sampling for IR Site 26, Alameda Point

1) In Section 2.3 - Site Geology and Hydrogeology, the draft Report presents estimated average horizontal hydraulic gradient, flow direction, and groundwater flow velocity based on previous work at Installation Restoration Site 26. The Report should also present a location-specific analysis of groundwater flow directions, gradients, and velocities based on data from the new monitoring wells and piezometers installed during this investigation. Specifically, the draft final Report should include the following:

- A location-specific water table elevation map.
- Water level elevation measurements from a single event that corresponds to the water table elevation map.
- A groundwater flow velocity or range of velocities estimated using data from the aquifer test and location-specific hydraulic gradients.

A potentiometric surface map (Figure 6) has been added to the report, including an inset table showing the relevant depth to water and groundwater elevation information. Groundwater flow velocity ranges are included in the section discussing the aquifer test results in the REMEDIAL DESIGN (see below).

2) Drawdown data from the aquifer test should be plotted on a figure and used to evaluate aquifer anisotropy. An evaluation of aquifer anisotropy and heterogeneity should be included in Section 6.0 of the draft final Report.

Information derived from treatments of the aquifer test data will be presented in the upcoming REMEDIAL DESIGN documents as part of the ongoing RD/RA for IR Site 26. The timing of the aquifer test precluded inclusion of the results in the Draft version of the Data Gap Investigation so the decision was made to defer a thorough analysis of the aquifer test data until preparation of the Remedial Design for IR Site 26.
